

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

The image shows the front cover of a book. The cover is decorated with a marbled paper pattern featuring large, irregular yellow and gold spots on a dark brown background, with thin veins of red and blue. A rectangular, off-white paper label is pasted in the center. The label contains the text 'Library of the University of Wisconsin' in a serif font, followed by 'PRESENTED BY' in a smaller font, and 'Mrs. E. S. Koelker' in the same serif font. On the left edge of the cover, there is a small, dark blue rectangular sticker. At the bottom right corner, there is a small, metallic silver-colored rectangular object, possibly a clip or a piece of tape.

NOTICE.

THIS SUPPLEMENT comprises many hundreds of additional Memoirs of persons of eminence, which were of necessity—owing to the price and limits of the ENGLISH CYCLOPÆDIA—omitted in the Original Edition. Memoirs of Living Persons, of historical importance, who have attained distinction since, have also been freely introduced; as well as Supplementary Notices of those who were included in the Cyclopædia as Living Persons, but who have since passed away.

BIOGRAPHY.

SUPPLEMENT: PART I.

The abbreviations E.C. and E.C.S. signify the *English Cyclopædia* and the *English Cyclopædia Supplement*.

The asterisk * prefixed to the name indicates that the subject of the memoir is still living.

1 AA, CHRISTIAAN KAREL HENDRIK VAN DER.

ABBADIE, JAMES, D.D.

2

A

AA, CHRISTIAAN KAREL HENDRIK VAN DER, an eminent divine of the Lutheran Church at Haarlem, was born on the 25th August, 1718, at Zwolle, of which town his father was an assistant minister. He studied theology successively at Leyden and Jena; in 1739, was called to the pastorate of the Lutheran Church at Alkmaar, and three years after to that of Haarlem. Here he remained until his death, which took place in the night between the 22nd and 23rd September, 1793. In the previous year, 1792, he had celebrated the jubilee or fiftieth anniversary of his ministry at Haarlem, in commemoration of which festival a silver medal was struck by J. G. Holtzhey, an artist of reputation. His portrait, engraved by Vrijdag, is given in Chalmot's 'Biographisch Woordenboek der Nederlanden.' His motto, "God is Love," was the constant rule of his pastoral conduct, and the motive of a system of divinity which had the characteristic of liberality. As a preacher he had a distinguished reputation. His chief claims to general consideration rest, however, on his connection with the Scientific Society, 'Hollandsche Maatschappij van Wetenschappen,' which he largely contributed to establish at Haarlem, in 1752. He continued, to the time of his death, one of the most zealous and enlightened secretaries of this Society, to the Transactions of which he contributed several articles in Natural History; and in which he was mainly instrumental in instituting, in 1778, a separate branch (*Oeconomischen tak*) for the furtherance of Economical Science.

AA, HILDEBRAND VAN DER, a Dutch engraver who flourished in the early part of the 18th century. He was the brother of Pieter Van der Aa, the celebrated bookseller of Leyden, noticed below, for whose publications he engraved numerous plates. Many of these are unsigned, and are coarsely executed—business rather than artistic works. Among the best known plates to which he put his name are the set of twelve portraits of members of the Visconti family; the portrait of Archbishop Otho in the 'Illustrium Virorum Imagines,' and Adrian Pars' frontispiece to the 'Index Batavicus,' 1701.

AA, PIETER VAN DER, a celebrated jurist, known also under the Latinized form of Petrus Vanderanus, was born at Louvain about the year 1530, and died at Luxembourg in 1594. His parentage is unknown; but it has been claimed for him that he was of an ancient family of Brabant, several of whose members had been variously distinguished for their position and patriotism. His first work, published when the author "had scarcely ceased to be a learner," was called 'Prochiron sive Enchiridion Judiciarum, libris quatuor; cum ampla et utilisima Præfatione de Ordine Judiciario apud Veteres usitato,' Lovanii: typis Steph. Valerii, 1558, 8vo. Van der Aa took his degree as *Utriusque Juris Doctor* on the 3rd of October, 1559; and the next year published his small but suggestive and influ-

ential treatise, entitled, 'De Privilegiis Creditorum Commentarium,' Antwerpæ; apud Johannem Bellerum, 1560, 8vo. The principal topics discussed in this work are,—The Origin and general Doctrine of Privileges; what Creditors are privileged; Forms of Procedure, by which Creditors can claim their Rights; what Heirs are liable to the Creditors of a Person deceased. In the year 1562, Van der Aa succeeded John Ramus as Professor of the Institutes in the University of Louvain. He was appointed assessor to the Supreme Court of Brabant at Mechlin, in 1565; and in 1574 was promoted to an office which he held till his death twenty years after, the Presidency of the High Court of Justice in Luxembourg. He does not appear to have interested himself greatly in the politics of his age and country. His life was rather practical and professional; and, with the exception of the three years during which he lectured on the Institutes at Louvain, he was occupied in the discharge of his judicial functions.

AA, PIETER VAN DER, was a distinguished geographer and bookseller of Leyden, where he commenced business about the year 1682. Of his death nothing is known more precisely than that it took place some time between the years 1729 and 1735. It is probable that he was the grandfather of the Lutheran pastor and savant, Chr. K. H. Van der Aa, noticed above. Among the works published by Pieter Van der Aa are the great collection of Gronovius on Greek Antiquities, 'Thesaurus Antiquitatum Græcarum,' (Lugd. Bat. 1697,) in thirteen volumes; that of Grævius on Roman Antiquities, 'Thesaurus Antiquitatum Romanorum,' (Traj. ad Rhen. 1694,) in twelve volumes; that by Grævius and Burmann on the Antiquities and History of Italy, 'Thesaurus Antiquitatum et Historiarum Italiæ,' (Lugd. Bat. 1704-23), which consists of nine parts in thirty volumes. He also published a similar work, with a similar title, by the same editors, on Sicily, in fifteen volumes (Lugd. Bat. 1723-5); and Leclerc's edition of the works of Erasmus, in eleven volumes (Lugd. Bat. 1703-6). All these works comprise eighty-six volumes in folio, of standard books, a number which no publisher before or since has equalled. Towards the close of his life he published, under the title of the 'Pleasant Gallery of the World,' 'La Galerie Agréable du Monde,' (Leide), a work in sixty-six thin folio volumes, often bound in thirty-three or twenty-two, consisting almost entirely of copper plates, and made up in a very inartificial manner from reprints of the embellishments scattered through many of his previous publications. He was, moreover, the publisher of several works in Dutch, devoted to an illustration of modern geographical enterprise and travels in various parts of the world. The works of Van der Aa are now rather remarkable for their voluminousness, than trusted for their accuracy.

ABBADIE, JAMES, D.D., Dean of Killaloe, was a native of

France, having been born at Nay, in the Basses-Pyrénées, in 1658. His parents being very poor, some of the wealthier members of the Protestant community at Béarn, whose attention had been drawn to the boy's talent, raised a fund for his support at school and college. He studied at Saumur, Paris, and Sedan, where he took the degree of doctor of divinity. The times being unfavourable to his settlement in France, he, about 1681, accepted an invitation to become the minister of a French Protestant church at Berlin, founded by the Elector of Brandenburg, Frederick William I. Here he wrote his '*Traité de la Vérité de la Religion Chrétienne*' (Rotterdam, 1684), which on the Continent quickly acquired a great reputation as well among Roman Catholics as Protestants. On the death of the Elector, in 1688, Abbadié accompanied Count Schomberg to Holland, and thence, in the suite of the Prince of Orange, to England. In the following year he went to Ireland with Schomberg, an important section of whose army, it will be remembered, consisted of French refugees. Returning to London after the battle of the Boyne, Abbadié was made minister of the French church in the Savoy. But London did not agree with his health, and William, whose favour he had won by a spirited vindication of the revolution of 1688, '*Défense de la nation Britannique*,' written in answer to Bayle's '*Avis important aux Réfugiés*,' and who esteemed him as the friend of Schomberg, gave him the deanery of Killaloe, his ignorance of the English language being considered a bar to his holding the richer deanery of St. Patrick's, and no doubt to preferment in the English Church. The rest of his days were spent in writing, preaching, and the performance of the ordinary duties of his office, varied by frequent visits to England and Holland, where most of his books were printed. On one of these visits he was taken ill and died in London, September 25, 1727. His principal writings are—the treatise on the truth of Christianity, mentioned above; '*Traité de la Divinité de Jésus Christ*,' 1695, which he wrote as the conclusion of that work, and which met with nearly equal success, and '*L'Art de se connoître Soi-même*,' 1692, translated in 1694 under the title of '*The Art of Knowing Oneself*.' These books had a prodigious circulation and were long regarded as standard authorities. He also wrote '*La Vérité de la Religion Réformée*,' which was translated by Dr. Lambert, Bishop of Dromore, for circulation among Roman Catholics, and some other vindications of Protestantism, sermons, &c.; besides '*L'Histoire de la Conspiration dernière d'Angleterre*' (London, 1696), and '*Panegyriques*' on the Elector Frederick William (1684) and on Mary II. of England (1694), which are charged with extreme adulation. The history of the Conspiracy of 1696 was written at the request of William III., by whose direction the Earl of Portland and Secretary Trumbull supplied the author with materials: it is extremely scarce.

ABBOT, LEMUEL FRANCIS, a distinguished portrait painter, was born in Leicestershire in 1762. He was the son of a clergyman, and at a very early age was placed as a pupil with Francis Hayman, R.A. But he could have learned little from Hayman, who died in 1776, and he seems to have had no other master. On Hayman's death he is said to have returned into the country, but he was early established in London as a portrait painter and met with much success. The chief attraction in his portraits was their fidelity. He never attempted anything but portraits and seldom ventured beyond the bust. In artistic power and the expression of the subtler and finer phases of intellect, Abbot was far inferior to Reynolds, Gainsborough, and Romney, and perhaps to some other of his contemporaries, but in catching the ordinary everyday aspect he was almost unequalled: and to secure this faithfulness of resemblance he spared no labour. His heads of Nelson, of Cowper, and of Northcote (the last in the National Portrait Gallery) are the most faithful likenesses we possess of those remarkable men; though the nervous exalted expression of the poet, verging on insanity, is rendered with inimitable force in Romney's head of Cowper. Abbot painted Cowper in 1792, and the poet writes to Lady Hesketh that the artist came from London for the purpose, and that he has "been sitting these ten days," the result being that "the likeness is the closest imaginable." With female heads Abbot was less successful. But he had a large practice, and the anxiety produced by his inability to execute his numerous commissions (and he would not employ an assistant), combined with family troubles, preyed on his mind and he became insane. He died in 1803.

ABBOT, ROBERT, Bishop of Salisbury, celebrated amongst the first controversialists of his age, was the eldest brother of Archbishop Abbot, and the son of a cloth-worker at Guildford,

in Surrey, where he was born in the year 1560. He received his first education at the Grammar School of his native town, whence, in 1575, he was sent to Balliol College, Oxford. In 1582, he took his M.A. degree, and, entering into orders, presently acquired considerable reputation as a preacher. Fuller compares the style of the two brothers:—"George was the more plausible preacher, Robert the greater scholar; George the abler statesman, Robert the deeper divine; gravity did frown in George, and smile in Robert." Although comparatively late in arriving at his ultimate dignity, he appears in the earlier part of his career to have taken preferment by storm. A single sermon preached at Worcester procured for him the lectureship of that city, and afterwards the rectory of All Saints' there. Another, preached at Paul's Cross, brought him, through favour of John Stanhope, Esq., one of his auditors, and the patron of the living, the rich benefice of Bingham, in Nottinghamshire. During the time of his retirement in this parish, he laid the foundation of his fame as a polemic, by publishing, with a dedication to Archbishop Whitgift, his '*Mirror of Popish Subtilties*,' 4to, London, 1594. In 1597, Abbot was admitted to the degree of D.D., and, in 1601, published '*The Exaltation of the Kingdom and Priesthood of Christ*, in certain Sermons on the 110th Psalm,' 4to, London. On the accession of King James I. he was appointed Chaplain in Ordinary to his Majesty, who was so much delighted with Abbot's '*Antichristi Demonstratio; contra fabulas Pontificias, et R. Bellarmini de Antichristo Disputationem*,' 4to, London, 1603, that he was graciously pleased to command his own royal and "savoury" Meditations on the Apocalypse to be incorporated with the second edition, 8vo, 1608. Dr. Abbot's masterpiece in the way of controversy was his '*Defence of the Reformed Catholic of Mr. W. Perkins, against the Bastard Counter-Catholic of Dr. Bishop, Seminary Priest*,' Three Parts; 4to, London, 1606, 1607, and 1609; a work which was followed up, in 1611, by a further reply to Bishop, entitled, '*The True Ancient Roman Catholic*; being an Apology against Dr. Bishop's Reproof of the Defence of the Reformed Catholic,' 4to, London.

Through the influence of Bancroft, Archbishop of Canterbury, and Chancellor of the University of Oxford, Abbot was elected to the Mastership of Balliol College, March 5, 1610; two months after was appointed one of the fellows of the College of Chelsea, then newly founded as a school of controversial divinity; and later in the same year (November 27) was admitted a prebendary of Normanton in the collegiate church of St. Mary, Southwell. As Master of Balliol he dignified his position by the success with which he combined suavity with discipline, and furthered amongst the students at once the practice of study, piety, peace, and self-restraint. On the death of Dr. Holland, the merits of Dr. Abbot, fortified by the influence which his brother, the Archbishop, enjoyed with the king, procured for him, March 25, 1612, the Regius Professorship of Divinity in his university. In this office he acquired great reputation for the learning and ability displayed in his lectures, which are characterised by Wood as more moderately Calvinistic than those that had for some time previous been heard from the divinity chair. Yet he appears to have opposed himself to Laud and his opinions with quite as much thoroughness as his brother; and the records of one notable instance of this opposition are preserved in a letter of complaint from Laud to his friend, Dr. Richard Niel, or Neale, at that time (1614) Bishop of Lincoln.

In the year 1615, Dr. Abbot was appointed to his ultimate preferment, the Bishopric of Salisbury, to which see he was consecrated at Lambeth on the 3rd of December, by his brother, the Primate. The king was moved to bestow this promotion upon Dr. Abbot partly by the perusal of his treatise against Garnet, the Jesuit, which was dedicated to his majesty, and entitled, '*Antilogia adversus apologiam Andree Eudæmon-Joannis, pro H. Garneto, Jesuita*,' 4to, London, 1613; and partly by the fame of a course of lectures on the Royal Supremacy, delivered by Abbot as Regius Professor, and published after his death, with the title of '*De Suprema Potestate Regia contra R. Bellarminum et Fr. Suarez*,' 4to, London, 1619. Amongst the first cares of Abbot's episcopate was the repair of his cathedral, which had been suffered to fall into decay through the cupidity of the Chapter. Nor was he more careful for the dead walls than for the living members of the Church, visiting his entire diocese in person, and preaching every Sunday so long as the state of his health permitted. His humility was proverbial, and his hospitality was as large as it was discriminating; so that his chief pleasure in this kind was to provide entertainment for such poor as had no chance of tasting meat but at his table. His incumbency of the diocese of Salisbury was, however, of little more

than two years' duration, being abridged by his unsparing studies and his various activities. His sufferings from stone, the "scholar's disease," were great; but he met his death, which occurred March 2, 1618, with calm dignity and assurance. On the very day of his decease, he is said to have completed his posthumously published treatise against the semi-Pelagian doctrines of Richard Thomson, 'In Ricardi Thomasoni Angli-Belgici Diatribam, de Amissione et Intercisione Justificationis et Gratiae, Animadversio Brevis;' 4to, London, 1618.

Bishop Abbot left many works behind him beside those enumerated above. Of these some have been published, whilst others have been allowed to remain in MS.; and of all a full and classified list is given by Dr. Featley, his chaplain and his biographer in Fuller's 'Abel Redivivus.' The most important of his inedited works is "his most accurate 'Commentary in Latin upon the Epistle to the Romans,' of which he run through all, not with brief notes as others, but large sermons upon every verse; in which he handled, as his text gave him occasion, all the controverted points of religion at this day, and he enclosed the whole magazine of his learning; and great pity it is that the Church should be deprived of such a treasure." This work, in four folio volumes, was presented by Dr. Corbet to the Bodleian Library.

*ABDU-L-AZIZ, 32nd and reigning sultan of Turkey, the second son of Mahmud II. [E. C. vol. iv. col. 48], was born February 9, 1830. As next brother of the late sultan he succeeded to the throne on the death of Abdu-l-Mejid, June 25, 1861. His infancy and boyhood, as was customary with the royal princes of Turkey, were passed in strict seclusion within the walls of the harem; but he appears to have been more fortunate in his European teachers than his elder brother, since he learned to speak English and French, and obtained some familiarity with the condition of western civilization and politics. Even when arrived at manhood he was not permitted to play any part in public affairs; but he formed a model farm at Scutari, the first established by a native, in which he was seen to take much interest; was fond of yachting and shooting; and rumour attributed to him the qualities of economy, temperance, activity, and firmness,—qualities in which his brother was lamentably deficient; and he was supposed to be strictly attached to the older forms of Mohammedanism, which had long been neglected by the court. He had thus come to be regarded with hope, not only by the people at large, but also by the old or orthodox party,—the party which, insisting on the literal interpretation of the Koran, steadily opposes, as a dangerous novelty, everything not mentioned there;—and his accession was hailed with general favour, the only exception being the native Christians, who feared, from his reputation for orthodoxy, a return to the former intolerance.

His earliest measures displayed vigour, firmness, and intelligence. The finances were in utter disorder. Abdu-l-Aziz directed a strict inquiry to be made into the public expenditure, and the minister of finance to be arrested and tried for embezzlement; reduced the civil list to a fifth of the amount at which it stood during the last years of his brother's reign; recalled the depreciated notes, and substituted for them a metallic currency; and ordered the surplus property of religious and charitable corporations to be sold. At the same time he confirmed the hatt-i-sheriff promulgated by his brother at Gulhané, in November, 1839 [E. C. vol. i. col. 13], and announced his full resolve to maintain the equality of all races and creeds in the eye of the law. Abdu-l-Aziz had himself but one wife and a son, and, whilst he placed his family arrangements on a moderate footing, he pensioned off all the members of his brother's harem, except the sultanas or mothers of the princes; and instead of keeping his nephews in confinement, as was the custom, he allowed them entire liberty, naming the eldest of them Pasha, and placing the others in the military school of Constantinople.

His good intentions were only partially successful; and his personal expenditure has become as lavish as it was at first moderate. The officials were corrupt and demoralized, and beyond Constantinople reforms were disregarded. With education wholly neglected; a country almost without roads; with no manufacturing industry, and agriculture backward and unproductive; overburdened with debt, and with a revenue apparently incapable of adequate extension, permanent improvement might well appear chimerical, and futile attempts at amelioration be followed by misgiving and apathy. The reorganization of the army, and the creation of a new naval force, became the objects on which the Sultan seemed, after a time, to have concentrated his purpose; and though other subjects have of late

engaged much of his attention, he has never lost sight of this as his main object. The result is that he has formed a fleet which includes several powerful iron-clads fitted with the latest and best armaments and warlike appliances, while his army has been entirely remodelled according to European plans, the men armed with breech-loaders, and the artillery furnished with rifled cannon, including some powerful Armstrong guns. It is said that Abdu-l-Aziz could, at short notice, place in the field an army of 800,000 efficient; but this may well be doubted; and it is certain that neither arms nor army materials could be provided, nor competent officers found for them. He has military schools and European teachers, but the weak point of his naval and military service will long be his officers. The strain which this enormous military organization has produced on the finances has been hard to meet, and its infliction is not to be justified; but the Sultan's object in it, as in several other recent acts of questionable propriety, has evidently been to raise Turkey in the scale of nations. By the Crimean Treaty, Turkey was recognised as a member of the European system; but Abdu-l-Aziz was conscious that her admission was little more than nominal, and that under the mismanagement of the last years of his brother's reign the country had come to be regarded as utterly worn out, neighbouring powers watching the moment of approaching dissolution that they might possess themselves of their share of the reversion. His purpose was, therefore, to prove that there was yet vitality and vigour. He must have an army strong enough to hold his own against any opponent. He put forward his title to a place in the European system by formally acknowledging the kingdom of Italy, without waiting an invitation or following the lead of other European powers. He would visit the mightiest sovereigns of Europe in their own dominions, or receive them in his, as an equal meeting equals. Having proved that he could move freely among his brother potentates, he would show the world that he was not to be enthralled by oriental tradition and etiquette. It would be a lesson to his own subjects, if it failed to impress foreigners.

The first rude shock given to the etiquette of the palace was by the visit he made, in defiance of all precedent, to Ismail Pasha of Egypt, in 1863. Ismail had received investiture at Constantinople in the February of that year, and Abdu-l-Aziz announced that he came to Egypt, not to exercise authority, but as a visitor to his friend; but he took care to let it be seen that he was master in Egypt as well as in Turkey, by the issue of several edicts and the reversal of some important measures of the Viceroy, one being the grant of a large tract of land to the Suez Canal Company, and another the permission to employ forced labour in the construction of the canal, both of which he peremptorily forbade. The same policy with reference to the Viceroy of Egypt has been repeated by Abdu-l-Aziz quite recently, evidently in order to prevent any assumption of the appearance of independence by the Viceroy, on occasion of the opening of the Suez Canal. [ISMAIL PASHA, in E. C. S.] The difference between the Sultan and the Viceroy has been arranged by the submission of the latter. This determination to force a quarrel with his most powerful and almost independent subject, might appear to be an error in policy on the part of Abdu-l-Aziz; but it must be remembered that the Sultan is not merely the sovereign of Turkey, but the head of the Mohammedan Church, and Commander of the Faithful; and that while what seemed like the assumption of equality on the part of the Viceroy might, if allowed to pass unrebuked, really lower the Sultan in the eyes of good Mussulmans, he would be sure to be sustained by them in resenting it. Whether it is an equally safe policy to impose such harsh terms as he is understood to have done, upon the Viceroy's submission, must be left to time to determine.

In visiting Egypt the Sultan had sorely tried Turkish prejudices; but he set them entirely at defiance by visiting Europe in 1867. The plea was the International Exhibition which was held that year in Paris. He entered Paris July 1, and was magnificently received; had the Palace of the Elysée placed at his service; was sumptuously entertained by the Emperor; and witnessed with seeming interest the various spectacles provided for him in that splendid capital. He afterwards came to London, July 12; was received by the Queen; lodged in Buckingham Palace; enjoyed the hospitality of the Lord Mayor and other public authorities; and was present at a grand naval review at Spithead, and decorated by the Queen with the Order of the Garter. The Sultan was deeply gratified by his reception, and on his arrival at Constantinople his subjects testified in the liveliest manner their delight at the honour which had been paid him, and their joy at his safe return. In the spring of

1869 the Sultan had the further pleasure of receiving the Prince and Princess of Wales at Constantinople, and we need hardly recall the manner in which he played the part of host, the scenes rivalling the wildest tales of oriental romance he provided for their entertainment, and the more than royal provision he made for their comfort. On this occasion he again broke through the formalities of Eastern etiquette, by presiding at a banquet in their honour, and by being present at a grand ball,—both events without precedent in the routine of Turkish sovereignty. A few months later, in connection with the completion of the Suez Canal, he entertained with equal magnificence the Empress of the French, the Emperor of Austria, the Crown Prince of Prussia, and other royal and puissant personages.

His visits to Europe, his observation of the countries he passed through, and his familiar intercourse with sovereigns and statesmen, seem to have deeply impressed him with the conviction of the backward state of his own country, and the urgent need of great changes and improvements, and, if health and mental energy be continued to him, may have important results. The most promising has appeared in the form of an Edict on Public Instruction, issued in 1869. This important document, which contains 198 articles, provides that for the whole empire there shall be five classes of Public Schools: primary, upper, and preparatory schools; lyceums and special schools. Each quarter in a city and every village must maintain a primary school if the population be Mussulman, but if the population be mixed, a school for Mussulmans and one for non-Mussulmans. Children are to receive instruction in the religious book of their persuasion, attendance being compulsory, except in specified instances, during four years, from the age of six to ten for girls, or to eleven for boys. A superior primary school, or two if necessitated by religious differences, is to be instituted, at the charge of the vilayet, in every town of 500 houses. The course in these will likewise extend over four years, and will include Turkish, Persian, and Arabic grammar, arithmetic, book-keeping, geography, history, geometry, and one local language. Preparatory schools are to be open to Mohammedans and others alike. The course of three years will include French, political economy, and natural history. Those Ottoman subjects who have passed an examination in the preparatory schools will be admitted for three years as boarders to the lyceum of each chief town of a vilayet. The highest class of educational establishments includes a normal school; the upper schools of arts and sciences; and the University of Constantinople. The normal school, destined to supply teachers, who must be all Ottoman subjects, will receive 100 students at a time, with certificates from the lower establishments. A corresponding institution will provide female instructors. The University is to contain three faculties—for letters, law, and physical science. There will be instituted at the capital a Council of Education, and an Academic Council in each chief city of a vilayet. The new law likewise contains provisions for the control of private educational establishments throughout the Ottoman Empire.

Should this programme be carried out with any approach to completeness, its effect upon the future of Turkey cannot but be of surpassing importance. The difficulty, however,—beyond the primary, and, as it would seem, almost insuperable one, of overcoming the inertia of officials, and providing a sufficient body of competent teachers,—is the ever-recurring one of finding pecuniary means. The finances of Turkey have been getting from bad to worse, and now the only means of paying interest on the successive loans which press on the Government, is by incurring new loans, which are obtained with increased difficulty, and of course on always harder terms.

But the Government of the Sultan has unquestionably gained greatly in influence and power. The relations of Turkey with its dependent states, with the exception perhaps of Egypt, have been in a great degree disentangled. The insurrection in Crete, which threatened to become chronic, or to end only with its severance from the parent country, has been finally suppressed. Even the quarrelsome little kingdom of Greece seems to have become at last convinced that its safest policy is to be, or profess its desire to be, on terms of amity with its more powerful neighbour. *Abdu-l-Aziz* has yet a difficult and tedious task before him, but he grasps his sceptre with a firmer hand than his predecessors; his country possesses an immense field of undeveloped resources; and the people are beginning to feel renewed confidence in themselves and their ruler.

ABDU-L-MEJID, 31st Sultan of Turkey [E. C. vol. i. cols. 13—15]. The memoir of *Abdu-l-Mejid* was brought

down to nearly the close of the war in the Crimea. A General Treaty of Peace was signed by the representatives of the several powers at Paris on the 30th of March, 1856, and the ratifications were exchanged there on the 27th of the following month. By this treaty (Art. iii.) Russia undertook to restore all parts of the Turkish territory of which it then held possession; and the contracting powers then engaged (Art. vii.) severally to respect the independence and territorial integrity of the Ottoman Empire, and to guarantee in common the strict observance of that engagement; and further to consider any act tending to its violation as a question of general concern. In anticipation of the convention the Sultan had issued (Feb. 18, 1856,) a *hatti-sheriff*, or *firman*, which placed the Christian and non-Mussulman portion of his subjects in a much more secure position than they had ever before held in Turkey, allowing them the free exercise of their religious worship, and putting all classes and sects on an equality in the eye of the law. This important *firman*, the terms of which were understood to have been suggested by the British Ambassador, Lord Stratford de Redcliffe, was referred to, and "its high value recognised," in a distinct article (ix.) of the Treaty of Peace, and it was declared to be "clearly understood that it cannot, in any case, give to the said powers the right to interfere, either collectively or separately, in the relations of his Majesty the Sultan with his subjects, nor in the internal administration of his empire." The effect of the war had thus been to admit Turkey into the general European system, to guarantee its integrity, and, by securing it from external interference, to afford it free scope for social and political improvement. Both were much needed. The country was almost disorganised; the finances were in utter disorder; and dissatisfaction was spreading everywhere. The Sultan made decided promises of reform and retrenchment. But, always feeble and inert, he seemed to have lost the little vigour he ever possessed. Though pressed on all sides by financial difficulties, he gave himself up more and more to indolence and self-indulgence. At length a formidable conspiracy was organised among the partizans of the old or orthodox Mohammedans and many prominent politicians, with a view to seize the Sultan, compel him to abdicate, and place his brother on the throne. The plot was to have been carried out on September 17, 1859, but two or three days earlier the secret was betrayed; the leading conspirators were arrested, and, after a regular trial, several of them were condemned to death or long terms of imprisonment. But the Sultan remitted the sentence of death in every case, commuted most of the punishments, and only banished the leaders. At the same time he promised afresh to initiate a system of administrative reform and strict financial retrenchment.

Soon after this the attention of Europe was drawn to the outbreak of hostilities between the Druses and Maronites in Syria, in which the Turkish troops sent to quell the disturbances openly or covertly aided the fanatical Druses in their outrages. The Great Powers protested, but the Sultan was unwilling or unable to act with the necessary decision, and, having acknowledged his inability to restore tranquillity, a conference was held in Paris, and a convention signed by the representatives of Great Britain, France, Austria, Russia, and Turkey, by which it was agreed that a force of 12,000 men, half to be furnished by France, should be sent to Syria, under the command of a French general, Beaufort D'Hautpont, to suppress the insurrection, Turkey undertaking on her part to punish the guilty leaders, as well as the governor of the province and the military commanders by whose connivance the atrocities had been perpetrated. The character of the country, the tactics of the Druses, who, too crafty to meet the thoroughly disciplined European troops in the open country, took to the mountains, where it was impracticable to bring them to an action, and where pursuit was almost useless, and to a certain extent the want of efficient support from the authorities, rendered the campaign much more tedious and unsatisfactory than was anticipated. Open hostilities, however, were brought to an end, and the European soldiers were withdrawn. The success was but partial, and the security of the Christians was but ill-assured; but the Great Powers were able to enforce the grant of a new constitution for Lebanon, and the appointment of a Christian governor, who was to be assisted by a Consultation Council chosen from each of the religious communities. The measure was perhaps necessary, but the Turks felt that their country had been humiliated. The erection of the united provinces of Moldavia and Wallachia into what was virtually an independent principality, with a single ruler, though nominally under

the suzerainty of the Porte, had been forced upon Turkey by the Great Powers in 1858, and now the same powers had extorted the quasi-independence of another section of the kingdom. Insurrections broke out in the Herzegovina and elsewhere, in which the Turkish troops met with several reverses. The financial difficulties increased, official corruption and incapacity became daily more apparent, whilst the reckless extravagance of the court seemed to be constantly augmenting. The discontent was general and profound, and matters appeared to be hastening to a crisis, when Abdu-l-Mejid died, June 25, 1861. He left six sons, but, according to the law of Turkey, he was succeeded by his brother, Abdu-l-Aziz, the subject of the preceding article.

A'BECKETT, SIR WILLIAM, brother of Gilbert A'Beckett, [E. C. vol. vi. col. 965.] and eldest son of Mr. W. A'Beckett, solicitor, of Golden Square, London, where he was born in 1806. He was educated at Westminster School; studied law, and was called to the bar at Lincoln's Inn in 1829. His professional avocations leaving him considerable leisure he wrote a good deal for newspapers and literary journals; was one of the authors of 'The Georgian Era,' of which he wrote the larger part; and edited a Universal Biography, in 3 vols. 8vo. In 1829 he went to Australia, having been nominated Solicitor-General of New South Wales, and afterwards Attorney-General. Later he was appointed to a judgeship at Port Phillip, and in 1852 he was promoted to be Chief Justice and Judge of the Admiralty Court, Victoria, and received the honour of knighthood. In 1863 he returned to England. He died at his residence, Upper Norwood, on the 27th of June, 1869.

* ABEL, FREDERICK AUGUSTUS, F.R.S., a chemist who has devoted special attention to the application of chemistry to warlike purposes, was born in 1828. He was one of the original students at the Royal College of Chemistry, under Professor Hofmann. Having received the appointment of junior assistant at that college in 1846, he was promoted to the post of senior assistant, which he held a few years. In 1849 he commenced the instruction of military officers and cadets in chemistry at Woolwich. In 1851 he was appointed demonstrator of practical chemistry at St. Bartholomew's Hospital. Mr. Abel succeeded Professor Faraday as lecturer on chemistry at the Royal Military Academy, Woolwich, in 1852. In 1854 he was appointed ordnance chemist, on the first creation of that office; member of the Ordnance Select Committee in 1855; chemist of the war department (on the abolition of the old ordnance office) in 1856; and examiner in experimental sciences to the Council of Military Education in 1859.

Connected with the study of chemical science on the one hand, and with the military departments of the Government on the other, Mr. Abel has been intimately concerned in researches bearing on the subject of military pyrotechny. He has served as a member of Government committees on gunpowder, on gun-cotton, on floating obstructions, on torpedoes, and other subjects. He elaborated and improved the application of tension-electricity to the explosion of mines. He invented electrical fuzes for use in the military and naval services. He effected various improvements in connection with war *matériel*; one of which was a system of manufacturing gun-cotton by pulping and compression. Mr. Abel has made various researches in organic, inorganic, and metallurgic chemistry, the results of which have been published in the Journal of the Chemical Society; and has written papers, reports, and lectures on the application of electricity to the explosion of land and submarine mines, and on the application of chemistry to the improvement of warlike appliances. Numerous distinct scientific reports were written by him and sent in to the Government. The 'Philosophical Transactions' of the Royal Society also contains memoirs and papers by Mr. Abel on cotton, and on the history of explosive agents. One of the important investigations in which Mr. Abel has been concerned was carried on at Portsmouth in November, 1869. Some of the fortified lines at that place being under process of demolition, it was determined to expedite the work by electro-blasting; and it was at the same time seen that the operations would afford the means of testing the comparative action of gunpowder and gun-cotton under both equal and unequal conditions of locality and amount of work, the relative advantages of discs and cylinders of gun-cotton, the advantages and disadvantages of combining gun-cotton with gunpowder in the same explosion, and the relative merits of the Bickford fuze and the Abel fuze, under varying circumstances.

Mr. Abel was appointed Bakerian lecturer to the Royal Society in 1867; and has served on the council of the same society. He

has also filled the offices of vice-president, treasurer, and foreign secretary of the Chemical Society.

ABEL DE PUJOL, ALEXANDRE-DENIS, French painter, was born January 30, 1785, at Valenciennes, and received his early instruction in art at the School of Design in that city. Afterwards he went to Paris, where he studied under David, upon whose manner he formed his own. He obtained the second prize in painting in 1810, and the grand prize in 1811. From Rome he sent to the Salon in 1814 a picture, 'The Death of Britannicus,' which attracted much attention, and was purchased for the Dijon Museum. In 1817 he produced his 'St. Stephen Preaching,' for the church of St. Etienne-du-Mont. It was crowned, and thenceforward his time was pretty much occupied by government commissions. Among his more important works in this class were the representation of the Renaissance of the Arts on the ceiling of the grand staircase of the Louvre, demolished in 1856, but repeated in 1857 on the ceiling of the library; 'Egypt saved by Joseph,' on the ceiling of the Musée de Charles X., in the same palace; a series of frescoes in the chapel of St. Roch; the decorations en grisailles on the ceiling of the Bourse; the Danaïdes for the Gallery at Fontainebleau; a vast allegory for his native city, 'Valenciennes encouraging the Arts,' in which he has introduced his own portrait; 'Benevolence,' another immense allegory for the Hospice Boulard at Saint Maudé, besides a host of religious pictures for churches, and classical and historical subjects for public galleries, such as 'Cæsar proceeding to the Senate on the Ides of March,' for the Palais Royal; 'Achille de Harlay on the day of the Barricades,' for the gallery at Versailles. His easel pictures were less numerous, but were similar in character. Abel de Pujol enjoyed a great reputation, but there is little genuine inspiration or imagination in his works. They are pompous and academic after the David type; clever, but thoroughly artificial in composition; displaying great facility of drawing, and skill of execution, but without power to interest the feeling or to delight the eye by striking combinations, or by brilliancy of colour. Abel de Pujol succeeded Baron Gros as member of the Academy in 1835; and in the same year was made officer of the Legion of Honour. He died at Paris, September 28, 1861.

ABERDEEN, GEORGE HAMILTON GORDON, fourth Earl of, [E. C. vol. i. col. 21]. From his resignation as premier in February 1855, the Earl of Aberdeen ceased to take an active or prominent part in public affairs. In recognition of his services the Order of the Garter was conferred upon him on his retirement, and he had previously received the appointment of Ranger of Greenwich Park. He died December 13, 1860. He was succeeded as fifth Earl by his only son GEORGE JOHN JAMES, LORD HADDO, born 1816, who died March 21, 1864. The fifth Earl of Aberdeen was a man of fervid religious feelings and benevolent purpose, and his early death caused much regret: a Memoir of him by the Rev. E. B. Elliott was printed for private circulation in 1866, but afterwards (1867) published and passed through three or four editions; and in 1869 appeared a new memoir of him and of his second son, a young man of promise, who was killed by the accidental discharge of his rifle at Trinity College, Cambridge, where he was a student, 1868—under the title: 'The True Nobility. Sketches of the Life and Character of Lord Haddo, fifth Earl of Aberdeen; and of his son, the Hon. J. H. Gordon.' By Alexander Duff, D.D., LL.D., &c., 8vo. The present (sixth) Earl, George Hamilton Gordon, eldest son of George, fifth Earl, was born in 1841.

ABILDGAARD, NIKOLAY ABRAHAM, a celebrated Danish painter, born at Copenhagen in 1744, was the son of Søren Abildgaard, also an artist of note in his day. On leaving the Academy of Copenhagen in 1772, Nikolay went to Italy, where he remained five years closely occupied in studying the works of the great masters. He chiefly employed his pencil on historical subjects; acquired the reputation of being the best and most learned painter Denmark had produced, and was commonly spoken of as the Raffaele of the North. He was appointed painter to the king, and in that capacity executed a series of great works, the chief being four large pictures personifying Europe at its four chief historical epochs, for the palace of Christianburg. But these works perished in the fire which destroyed that palace in 1794, and the loss so affected Abildgaard that he scarcely touched his pencil afterwards. His other more important works were 'Orpheus'; 'the Mother of Messalina mourning over her Daughter'; 'Philoctetes wounded,' and other classical subjects, with several from Ossian. In his day he was regarded as a great colourist, but his colour is deficient in brilliancy and transparency, and his manner is academic. For several years he was professor of painting in the Academy of

Copenhagen, and for two years its director, and several of the best of the succeeding generation of Danish artists, including Thorwaldsen, ascribed their success to his instruction. He died at Copenhagen June 4, 1809.

*ABOUT, EDMUND-FRANÇOIS-VALENTIN, popular French author, was born February 14, 1828, at Dieuze, department of Meurthe. At the Lyceum Charlemagne he gained the prize in philosophy; proceeded thence to the École Normale, and in 1851 went to complete his studies at the French Academy, Athens. Whilst in Greece he wrote a monograph, 'l'Île d'Égine,' which appeared in 1854, shortly after his return. But the work by which he became known was one of a more popular character, 'la Grèce contemporaine,' 1855, which met with remarkable success, due as much to the unsparing manner in which he dealt with the modern Greeks, as to the lightness and brilliancy of the style. Almost at the same moment his facile pen threw off without apparent effort, in successive numbers of the 'Revue des Deux Mondes,' the romance of 'Tolla,' a work that was none the less popular for meeting with sharp strictures from the critics. The same year he published a small volume of art-criticism, 'Voyage à travers l'Exposition des Beaux-Arts,' the first of several series of notices of contemporary art written with the easy assurance of a light-hearted man of the world who had evidently never given a serious thought to the subject, but was familiar with the talk of the ateliers; shallow and flippant, but amusing from their light, mocking tone, and having a certain value as reflecting the current gossip of the Parisian art-circles. In 1856, his first play, an unsuccessful comedy in three acts, 'l'Éfronté,' altered subsequently to 'Guillery,' was produced at the Théâtre Française. He now became a regular contributor to 'Figaro' and the 'Moniteur,' in the latter of which appeared the series of short stories, afterwards published under the title of 'Les Mariages de Paris.' In the 'Moniteur' also appeared, as the result of a residence in Rome, part at least of 'la Question Romaine,' the first of several keen attacks upon the papacy, which culminated in the 'Rome Contemporaine' (8vo, Paris, 1860). From this time he has always been a welcome and effective contributor to the journals, and most perhaps of his contributions have been afterwards published separately. Of this class the volume of 'Causeries,' Paris, 1865 (originally published in the 'Opinion Nationale'), is a good example of his light writings, as 'la Nouvelle Carte d'Europe,' and 'la Prusse,' in 1859, are of his more serious compositions. His romances and novels have been very numerous, of course very various in value, but always readable and almost always amusing. Of the skill with which he can sustain the interest in a series of trifling yet improbable events, and of his singularly easy half-mocking style of narrative, one of his latest novelets, 'Étienne,' first published in the 'Revue des Deux Mondes,' is a favourable example, while 'Le Roi des Montagnes,' as a prime favourite, has been published in an edition illustrated with many vignettes by Gustave Doré, and is now being modelled as a libretto by the author himself. But busy as he has been as a journalist and a romance writer, he has been almost as busy as a dramatist, hardly a year having passed without the production of a comedy or farce by him—though in this line he has been by no means invariably successful. During 1869 he has published two romances, 'Les Mariages de Province,' and 'Le Fellah,' in the latter story aiming, as would seem, to do for Egypt what he had previously done for Greece and Rome, but with more apparent artifice and less vigour. M. About has as yet only written trifles, and the writers of trifles are very numerous in Paris, but he is the first of his class, and in his way inimitable. His style is clear, rapid, and pungent, yet adroit; and though perhaps superficial, he is a shrewd observer. His writing is always that of a scholar and a man accustomed to the best society of the French capital.

ABRABANEL, DON ISAAC, the most famous of the Spanish Rabbis, was born at Lisbon in 1437. Of a family that had been ennobled in Spain, Abrabanel was yet prouder of his Hebrew descent, being as he boasts in the Preface to his 'Commentary on the Later Prophets,' of the blood royal of the House of David. His education was the best that could be obtained, and he studied with such success that at the age of twenty, he was allowed to expound the Book of Deuteronomy in the synagogue. But along with his biblical studies he practised business, and acquired so much reputation as to be employed in financial matters by the king, Alphonso V. On his death, however, in 1481, Abrabanel was, with the other ministers, banished from Portugal, and his property confiscated. He fled to Spain, and again engaging in mercantile transactions, acquired a large

fortune. In 1484 he is said to have been consulted by Ferdinand and Isabella, and to have been held in high regard by them; but he was not exempted from the decree of 1492, by which the Jews were driven from Spain, and their property sequestrated. Abrabanel took refuge with his family in Naples, where he was received into the royal favour, but was once more compelled to fly on the capture of Naples by the French in 1494. After various wanderings, he settled in Venice, where he died in 1508. A life like this, when at rest deeply engaged in business, or assisting the councils and providing for the monetary wants of the sovereigns under whom he lived, but for a large part of his time an exile and a wanderer, would hardly seem the best adapted for the production of voluminous and learned theological dissertations. Yet Abrabanel is esteemed one of the most profound as well as brilliant of rabbinical expositors. In truth he wrote everywhere, and he had a fluent pen. His works are a 'Commentary on the Pentateuch,' written in 1495, but first published at Venice, folio, 1579; 'A Commentary on the Earlier Prophets'; 'A Commentary on the Later Prophets'; 'Maajene Hajeshuah,' a commentary on Daniel; 'The Preacher of Salvation,' a defence of Hebraism against Christianity; 'Jeshuoth Meshicho,' an exposition of the Talmudic doctrine of the Messiah; 'Rosh Amana,' the principles of the Jewish Religion; 'the Sacrifice of the Passover'; 'the Inheritance of the Fathers,' a treatise on Jewish antiquities; and several others. His works are written in Hebrew, but Buxtorf, Mayer, and others, have translated many of them, wholly or in part, into Latin.

(Mai, *Dissert. hist. phil. de orig. Vita et Scriptis Isaaci Abrabanielis*, Alt. 1708; Bartoloccus, *Bib. Mag. Rabb.*, iii. 874, &c.; *Biog. Dict. of Soc. for Diff. of Useful Knowledge*, where is given a full list and partial analysis of Abrabanel's writings.)

ABRAHAM A SANTA CLARA, the most famous German preacher of the 17th century, whose real name was Ulrich Megerle, was born July 4th, 1642, at Mösskirch in Suabia, and educated at the grammar schools of Mösskirch, Ingolstadt, and Salzburg. In 1660 he entered the order of Augustins at Maria-brunn in Austria; went thence to study theology and philosophy in the convent of his order at Vienna, and in 1662 was ordained and made doctor of theology. For some time he officiated as priest and preacher in the Maria monastery at Taxa in Bavaria, and then returned to Vienna, where his eloquence attracted the attention of the Emperor Leopold I., who nominated him court-preacher, an office he filled for 20 years. During this long period he was the most popular preacher in the city. His sermons, full of vigour, earnestness, and religious zeal, expressed in the clearest vernacular, and seasoned with the most outspoken directness of appeal and with frequent proverbs and stories of a humorous and occasionally burlesque description, somewhat after the fashion of our own Latimer's, found equal acceptance with all classes. Succeeding generations fancied their language inelegant and the allusions and illustrations coarse, and they fell into neglect; but of late years their popularity has revived, and they have been extensively read by Protestants as well as Catholics.

During his residence at Vienna, Abraham a Santa Clara rose step by step through the different grades of his order till he became prior provincialis and definitor of his province, exhibiting in every office the greatest diligence and probity. In 1689 he went as prior provincialis to the general chapter of his order at Rome, where he preached several times with great effect, and was presented by the Pope, Innocent XI., with a consecrated cross. He died at Vienna on the 1st of December, 1709.

The writings of Abraham a Santa Clara are full of striking and powerfully expressed thoughts, and display great originality, imagination, and knowledge of character, as well as considerable learning. They consist of treatises on points of practical morality and divinity as well as popular sermons. The collections published by himself are:—(1.) 'Judas der Erzscheim, für ehrliche Leut, oder eigentlicher Entwurf und Lebensbeschreibung des Ischariotischen Bosenichts,' 4 vols. Salzburg, 1688—95; 7 vols. Passau, 1834—36; and 7 vols. Lindau, 1856. (2.) 'Reim dich oder ich liss dich,' 4to, Salzburg, 1687. But many of his productions are in neither of these collections. The character of his mind may be guessed from the titles of some of his discourses—'Huy und Pfuy der Welt' (On and shame the world); 'Heilsames Gemisch-Gemasch,' (a wholesome mess, or Mish-mash); 'Sterben und Erben' (To die and to inherit). A collected edition of Abraham a Santa Clara's works 'Sämmtliche Werke,' was published in 21 vols. Passau, 1835—54. Several selections have appeared at different times; the best are perhaps 'Quint-

essenzen aus Abraham's a Santa Clara Werken,' Berlin, 1822—3; and 'Abraham a Santa Clara: Das Gediegenste aus seinen Werken,' 7 vols. Heilbrunn, 1840—44.

ABSALON, or AXEL, Archbishop of Lund, the most remarkable man produced by Denmark in the 12th century, was born in 1128 at Finnestöe in Zealand, and was a descendant of Slagus, who founded the town of Slagelse. He received his early education with his relative Prince Waldemar, and completed his studies at Paris. Having entered the Church, he was in 1158 made Bishop of Roskild, and in 1178, much against his will, Archbishop of Lund. But though he is said to have laboured to improve the condition of the religious institutions of Denmark, he was more distinguished as a statesman and a warrior than as an ecclesiastic. He was the chief adviser of Waldemar I. and his successor, Knud, or Canute VI., surnamed the Great, and it was to his wise counsels and energy that Denmark owed her independence and the consolidation of the kingdom. He not only repressed the encroachments of the great vassals, but entirely subjugated the Wendish and other Slave tribes who had hitherto only admitted a nominal dependence on Denmark, and now made a desperate effort to throw off the yoke entirely. Bishop Absalon commanded the army and fleet, which in 1169 reduced the island of Rügen. Having taken Arcona, the Wendish capital, Absalon destroyed the pagan idols, and compelled the inhabitants to adopt Christianity. He also in a great sea-fight defeated Bugislav and his fleet of 500 vessels; and in 1170 took Julin, the northern entrepôt of a great trade with Persia, Asia Minor, and India. From this time the title of King of the Wendes has been borne by the kings of Denmark. The code of Waldemar was drawn up at the suggestion of Bishop Absalon, and partly by himself. The famous Annals of Denmark were written by Saxo Grammaticus at his command, and in founding the monastery of Sorøe he made it one of the rules that these annals should be continued by the learned members of the house. About 1168 Absalon built himself a palace, Axelhuus, on the eastern coast of Zealand, by a little fishing village, but which has since grown to be the capital of the kingdom. He is thus regarded as the founder of Copenhagen, though the first mention of the town is nearly a century later. Archbishop Absalon died in 1201, and was buried in the church of Sorøe. A skull in the Copenhagen Museum used to be shown as that of the archbishop, but on his grave being opened by command of the king in 1827, the skeleton was found to be intact. His sword, crossier, and some relics found in the grave, are preserved in the museum. Estrup's 'Life of Absalon: Hero, Statesman, and Bishop' (Sorøe, 1826) was translated into German, with additions by Mohnike.

(Illgen's *Zeitschrift für Hist. Theol.* b. i. p. 1, 1832).

ABSCHATZ, HANS ASSMANN, BARON VON, German poet, was born at Würbitz, in Silesia, February 4, 1646. From the public school of Liegnitz he went to Strasbourg and Leyden, where he studied jurisprudence. He afterwards travelled in Holland, France, and Italy; was appointed Governor of the principality of Liegnitz; and deputy to the diet of Breslau. As a statesman he obtained some distinction, and also as Silesian ambassador to the emperor at Vienna. His last years were spent in retirement. He died, April 22, 1699. Abschatz was one of the most esteemed poets of his time, and his works were collected after his death under the title of 'Poetische Uebersetzungen und Gedichte,' 2 vols. 8vo. Leipzig and Breslau, 1704. After a long interval of neglect, the poems of Abschatz have of late gained some notice; but though there is much feeling and power in many of them, they are for the most part disfigured by the faults and affectation of the time, and are not likely to retain any hold of the public mind, except in selections. Some of his hymns have a place in the church-service books. Among his works is a translation of Guarini's 'Il Pastor Fido,' which was at one time very popular.

ABU-ABDALLAH, MOHAMMED [ALMOHADES, E. C. vol. i. col. 165].

ACCIAJUOLI, DONATO, a distinguished Italian statesman and scholar, born at Florence in 1428, was descended from the same family as the seneschal Niccolo Acciajuoli. He was the friend of Piero and Lorenzo de' Medici; was gonfaloniere of the republic, and employed in several important missions. In one of these, whilst on his way to Paris as ambassador from the Florentines to Louis XI., he was seized with illness, and died at Milan, 1478. The news of his death caused general grief; he was decreed a public funeral; his family were declared exempt from taxes, and his daughters were apportioned from the public treasury. Donato was celebrated as an orator and a writer as well

as a politician. He translated and remodelled Leonardo Bruni's 'History of Florence' (Venice, fol. 1476); some of 'Plutarch's Lives' (Florence, fol. 1478); and wrote commentaries on the ethics and politics of Aristotle.

ACCIAJUOLI, NICCOLO, a distinguished Italian statesman, was born at Florence, September 12, 1310, of a good, though not noble family. He was sent by his father to Naples, where he had extensive business transactions, but Niccolo resolved to push his fortune at court, where he ingratiated himself with the Princess of Taranto, and was entrusted with the education of her three sons. After the death of King Robert, 1343, he secured the favour of Queen Joan, whose confidence he retained till his death. On the murder of her husband, Andreas of Hungary, it was Acciajuoli who procured her marriage with his old pupil, Prince Louis of Taranto; baffled the vengeance of King Louis of Hungary, the brother of Andreas; and obtained the sanction of the Pope to the coronation of Joan and Louis in 1352. Acciajuoli was now created grand seneschal, and became the virtual ruler of the kingdom. King Louis having died in 1362, the seneschal procured the marriage of Joan in the following year with James, Prince of Minorca. Acciajuoli died in 1366, and was interred by order of Joan in the Church of the Certosa, near Florence, of which he was the founder, and where a splendid monument to his memory was erected from the designs of Orcagna, with sculpture in low relief by Donatello. Acciajuoli was a sagacious and vigorous statesman, and thoroughly devoted to Joan. He was wealthy, ostentatious, and haughty, but he appears to have been generous, and wished to be esteemed a patron of men of learning and genius. Petrarch felt flattered by his condescension; Zanobi di Strada received substantial favours at his hands; and Boccaccio was invited by him to Naples, but soon retired in disgust.

(Palmieri, *Vita di Nic Acciajuoli*, Florence, 1588; Pignotti, *Storia della Toscana*, vol. iv.)

ACCOLTI, BENEDETTO, Italian lawyer and historian, born at Arezzo in 1415, studied law at Florence and Bologna; was made professor of law at Florence; on the death of Poggio in 1459 was elected Chancellor of the republic, and died in 1466. He was regarded as one of the ablest jurisconsults of his time, and as an accomplished writer. His chief work was a history of the crusade under Godfrey of Bouillon, in four books. Written in Latin, and inscribed to Piero de' Medici, it afforded to Tasso the materials for his 'Jerusalem Delivered.' It was first printed at Venice, 4to, 1532, and reprinted at Basel, 8vo, 1544. The last edition was Groningen, 8vo, 1731. It has been translated into Greek, Italian, and French. He also wrote a dialogue in Latin, 'De præstantia virorum sui ævi,' printed for the first time at Parma, 8vo, 1689, and 12mo, 1692; at Augsburg, 8vo, 1691.

CARDINAL BENEDETTO ACCOLTI, grandson of the above, has been by more than one writer mistaken for the author of both the history and the dialogue. He was born at Florence in 1497; studied at Pisa and Florence; was made successively Bishop of Cadiz and of Cremona, and Archbishop of Ravenna; was secretary to Pope Clement VII., who created him cardinal in 1527; played a leading part in ecclesiastical politics; was imprisoned in 1532 by Paul III. for an unknown offence, but released on payment of a heavy fine; retired from Rome, and died at Florence in 1549. Cardinal Accolti wrote some much-praised Latin verse, and was the patron of learned men.

ACCOLTI, BERNARDO, named l'UNICO, from the grace of his versification and his skill in improvising verses to a musical accompaniment, was the son of the historian, Benedetto Accolti. Neither the year of his birth nor death is known; he was still living in 1534, though he is supposed to have died shortly after. As a young man he was attached to the Court of Urbino; later he gained the favour of Leo X., who made him one of his apostolic secretaries. At Rome, according to the testimony of his contemporaries, Cardinal Bembo, P. Cortese, and Aretino, he acquired unbounded popularity. Aretino says that "when it was known in Rome that the celestial Bernardo Accolti intended to recite his verses, people shut up their shops, and all hastened to participate in the pleasure. On these occasions he was surrounded by the bishops and principal persons of the city, and attended by a numerous body of the Swiss guard." Even the Pope was carried away by the general enthusiasm, and addressed him as the incomparable (*l'Unico*, the only). But his verses by no means sustain the admiration of his contemporaries. Roscoe wrote that "one circumstance only is wanting to his glory—that his works should have perished along with him;" and the passage is quoted with approbation by Sismondi, who says that "his style is hard and poor, his images are affected, and his taste

perverted by affectation." But Tiraboschi had long before described him as a mediocre poet. It was the fascination of his manner and the effect of fashion that wrought the charm. His poems were printed for the first time at Florence in 8vo, 1513—"Virginia Comedia, Capitoli e Strambotti;" and 'Opera Nuova,' Venice, 1519; and they have been many times reprinted. The comedy of Virginia, founded on one of the novels of Boccaccio, written in ottavo and terzo rima, was one of the earliest Italian dramas.

ACCOLTI, FRANCESCO, called, like others of his family, Aretinus, one of the most famous jurists of the fifteenth century, was the younger brother of Benedetto Accolti, the historian, and was born about 1418. He studied literature under Francesco Filelfo (Philadelphus), and, according to Mazzuchelli, jurisprudence, under Antonioda Pratovecchio and Lodovico Pontano, while others say he learnt law from Mincuccius. Accolti was appointed professor of law in the university of Bologna in 1440; and in 1445 professor of civil law at Ferrara. In 1455 he went to Siena, but returned to Ferrara in 1457 as professor of the civil and canonical law. In 1461 he was induced to enter the service of Francesco Sforza, Duke of Milan, as secretary—an office he held for about five years. By Sforza he was sent on an embassy to Rome to compliment the new Pope, Paul II., and the oration he delivered on this occasion was afterwards printed. In 1466 he was elected to the chair of jurisprudence at Siena, which he retained till 1479. Whilst here he pronounced strongly in favour of Florence and Lorenzo de' Medici in opposition to the claims of the Pope, in consequence of which the Duke of Calabria, as papal general, made a formal demand of the magistracy of Siena for his surrender, but was refused. In 1478 he was made senior professor of law at the university of Pisa. According to Fabbrucci and Manni, as cited by Tiraboschi, Accolti died in 1483 at the baths of Siena, whither he had gone in hope of relief from calculus, with which he was afflicted; but other authorities say that on account of his increasing infirmities he was allowed to retire from his professorship in 1484, retaining his salary, and that he died at Siena about the end of 1485. Francesco Accolti had the reputation of being the greatest and most erudite jurist, one of the ablest orators, and the most successful advocate of his time. But he is said to have been avaricious, and he died enormously rich. He intended to leave his wealth for the foundation of a college, but, dying intestate and unmarried, it passed to his natural heirs, among others, Cardinal Accolti, the subject of the following article. The only legal works he published were his 'Commentaria super Lib. II. Decretalium,' Bol. 1481 (reprinted at Pavia in 1496 and at Venice in 1581); 'Consilia seu Responsa,' Pisa, 1481; and 'Repetitiones aliquae Libelli.' But subsequently appeared—printed, it is said, from notes taken at his lectures—his 'Lectura in Codicem,' Pavia, 1502; 'Lectura in Digestum Vetus,' 1514; 'Lectura in Digestum Novum,' 1514; and 'Lectura in Infirmitatum,' 1514. He also translated the letters of Philaris from the original Greek into Latin. Erasmus refers disparagingly to a translation he had read by Accolti of Chrysostom's Homilies on the First Epistle to the Corinthians; some sonnets by him are printed by Crescimbeni in 'L'istoria della volgar Poesia,' while others are said to exist in manuscript in the libraries of Strozzi and Chigi; and a manuscript translation of the 'Iliad' in the library of the Vatican is ascribed to Accolti and L. Valla jointly. He also wrote or edited a treatise on the Baths of Puzzuoli, Naples, 4to, 1475.

ACCOLTI, PIETRO, known as Cardinal of Ancona, son of the historian Benedetto and nephew of the famous jurist Francesco Accolti, was born at Florence, March 15, 1455. His father died when Pietro was only eleven years old, but he was carefully brought up by his mother, received a good education, and studied law at the University of Pisa. He then practised for awhile as an advocate; was appointed professor of law at Pisa; afterwards settled at Rome and was appointed auditor of the rota by Alexander VI. Having taken ecclesiastical orders, his wealth, connections, and ability rendered his path smooth. He was elected Bishop of Ancona in 1505, and on his resigning the bishopric in favour of his nephew, in 1511, he was made Cardinal and at the same time Bishop of Cadiz, but on the opposition of the King of Spain he was transferred to the French bishopric of Mailleza. Later he was made Bishop of Arras; in 1524 Archbishop of Ravenna, but exchanged it with his nephew Benedetto for the bishopric of Cremona, and some months later became successively Cardinal Bishop of Albano, of Palestrina, and of Sabina. He filled at various times the offices of cardinal legate, secretary of the papal briefs, and cardinal vicar of Rome, and had im-

mense influence in the papal councils: according to Pallavicino the Bull against Luther, dated June 15, 1520, was drawn up by Cardinal Accolti. He died at Florence in 1549. A treatise against the heresy of Luther is ascribed to him, but does not appear to have been printed. He also wrote on the papal rights, and one or two legal essays.

ACCORSO, BUONO, or Buonaccorso Pisano, as his name is frequently written, a celebrated Italian scholar, born at Pisa about the middle of the 15th century. He was for a time professor of elocution at Ferrara, and afterwards founded a school of rhetoric at Milan. He acquired great celebrity by the publication of a series of commentaries on Greek and Latin authors, commencing with Cæsar, Ferrara, 1474, and closing with the Familiar Epistles of Cicero, Milan, fol. 1485. He also published a Greek and Latin Lexicon; but his name will probably be longest preserved as having been the first to give to the world the printed text of a Greek author. This was Planudes' collection of Æsop's Fables, which Accorso accompanied with a Latin translation. It is without date, but was published at Milan, about 1478, and bears the colophon *Accurstus impressit*, the only one of his books so marked.

ACHARIUS, ERIK, a Swedish physician and botanist, was born at Gefle, October 13, 1757. After studying in his native town, and then under Linnæus at Upsal, he was employed by the Academy of Sciences at Stockholm to prepare drawings on Natural History subjects, to be engraved for their Transactions. He received a degree in Medicine in 1782; was appointed physician to the town of Landskrona in 1785; physician to the province of East Gothland in 1789; and professor of Botany at the Wadstena Academy in 1801. He was an active and successful physician, but is chiefly remembered for his researches on cryptogamic botany, especially the family of lichens. In 1798 he published 'Lichenographiæ Suecicæ Prodomus,' which, with two other works in 1803, paved the way for his chief publication, 'Lichenographia Universalis,' Göttingen, 4to, 1810. In this he traced the physiology, structure, and relations of all lichens then known, classifying them into 41 genera and more than 1300 species; his system was founded on the structure of their reproductive organs. In 1814 he published 'Synopsis Methodica Lichenum,' a sort of epitome of his great work. He had also numerous papers on lichens and other natural-history subjects in the Transactions of the Stockholm Academy. Acharius died October 13, 1819, at Wadstena, in East Gothland.

ACHEN, HANS VAN, German painter, was born in 1552 at Cologne, where he learned painting under Jerrigh. He afterwards went to Italy, where, under Rems, he acquired the secrets of Venetian colouring, and then completed his studies at Florence and Rome. A 'Nativity' which he painted for the Church of the Jesuits at Rome was greatly admired, and Achen was invited by the Elector of Bavaria to visit Munich. Here he remained several years and painted some of his best works, notably a 'Crucifixion' for the Kreuz Kapelle. He accepted an invitation from the emperor Rudolph II. to go to Prague, where, with the exception of visits to Augsburg and Munich, he remained the rest of his life, and died in 1615. Sixteen of his pictures are in the Vienna Gallery, one of the most celebrated is a 'Bathsheba, Bathing.' Achen acquired great temporary fame from having been one of the first of the German painters to break away entirely from the hard manner of the mediæval artists, but his works are tasteless and affected. Several of his classical and religious subjects and some portraits, have been engraved by the best German engravers.

*ACHENBACH, ANDREAS, German painter, was born at Cassel, September 29, 1815. He studied painting under Schadow, but from the commencement of his independent practice devoted himself to landscape, and soon took a foremost place among the landscape painters of Germany. His pictures are however seldom mere views of places. Incidents of some kind are almost invariably introduced, and generally very effectively. At one time he painted coast scenery most frequently, and his representations of the sea have more truth and feeling than those of most of his countrymen. He also depicts architecture very skilfully. In woodland scenery he appears less at home. His range of subjects is shown by the titles of a few of his more successful works:—'Coast of Sicily—fair weather'; 'A Stormy Sea on the Coast of Sicily'; 'Ostend Quay at High-water'; 'A Village Festival by Moonlight'; 'Dutch Festival.' Herr Achenbach is a member of the Royal Academy of Berlin; honorary member of the Academies of Antwerp, Amsterdam, and Philadelphia; and a knight of the French Legion of Honour. His brother, *OSWALD ACHENBACH, born at Düsseldorf in 1827, is also dis-

tinguished as a landscape painter. He was educated in the Dusseldorf Academy, and formed his style on that of his brother, but gradually adopted a more independent manner. Among his works are 'Pilgrims approaching Rome'; 'A Mass in the Campagna', and the like; but they are more often merely 'an Italian Landscape', a 'View near Naples', or other views of places.

ACHENWALL, GOTTFRIED, termed the founder of the science of statistics, was born at Elbing, Prussia, October 20, 1719; studied in the universities of Jena and Leipzig, 1738-43; and then resided for three years at Dresden as tutor to the sons of Baron von Gersdorf. In 1746 he was admitted as extra professor (privatdocent) at Marburg university, where he lectured on history, international law, and social science, giving in outline the views which he afterwards elaborated into a system. His teaching having attracted the notice of Münchhausen, the Hanoverian minister, he was offered and accepted a chair in the new University of Göttingen, where he remained from 1748 till his death, which occurred on the 1st of May, 1772. He was nominated professor of philosophy in 1753, of law in 1761. From the commencement of his teaching at Göttingen he made statistics, or as it was then called states-science (*Wissenschaft der Staaten*), the subject of his principal course, and in 1749 published his 'Abriss der neuesten Staatswissenschaft der vornehmsten europäischen Reiche und Republiken,' (Outline of recent Statistics of the principal European Kingdoms and Republics). His views were more fully developed in his constitution and condition of the European kingdoms ('Staatsverfassungen der europ. Reiche im Grundrisse,' Gott., 1752), of which he published revised editions in 1762 and 1768. To collect materials for these later editions he made journeys in successive years in England, Holland, France, and Switzerland, and the last edition may be taken as the complete expression of his idea. Achenwall was not the first to teach statistics, still less was he the originator of the science; but he was the first to give it a distinct form, to define its purpose, to develop its capabilities, to impart to it clearness of purpose and precision of method. With him statistics (the title was invented by him, *scientia statistica*), was not applied merely to the collection of facts and figures, but made to embrace the entire social condition, political organisation, and economical resources of a state. As it has been neatly put, Achenwall "defines politics as the theory of what a state ought to be, statistics the account of what it really is, and civil history as the account of how it has become what it is." On all these subjects Achenwall sought to obtain sound knowledge and clear views, and he made all of them the subject of his teaching. Great as was the influence of his writings, that of his oral instruction was probably even greater. His other published works include a Theory of Law ('Elementa Juris Naturæ,' Gott., 1758); Theory of Politics, 1761; and others on European state-rights, politics, and diplomacy. His wife, SOPHIE ELEANORE WALTHER, a woman of unusual learning and ability, wrote poetry and essays: and her collected works were published in five volumes, Göttingen, 1751.

ACHERLEY, ROGER, a political writer of some notoriety during the first half of the 18th century. Of his life little is known. Born probably near the close of the 17th century, he was a barrister, and describes himself as "of the Middle Temple, Esquire." The work by which he became known was entitled 'The Britannic Constitution, or the Fundamental Form of Government in Britain, demonstrating the Original Contract entered into by King and People; wherein is proved that the placing on the throne King William III. was the natural fruit and effect of the Constitution;' fol. London, 1727. The hypothesis of an original contract was not of course new, but Acherley regarded it as a positive historical fact, the result of a convention held for the purpose by the inhabitants of Britain not long after the Flood. The work is that of an enthusiast, and, apart from the history, is consistent throughout. It was written against, laughed at, and defended, but probably convinced nobody. Acherley was a devoted supporter of William and the Revolution of 1688; and in the reign of Anne he showed equal devotion to the House of Hanover, at the same time that he stoutly upheld the rights of the legislature, in a work entitled 'Free Parliaments; or an Argument on their Constitution; proving some of their powers to be independent: to which is added an Appendix of Original Letters and Papers which passed between the Court of Hanover and a Gentleman at London, touching the right of the Duke of Cambridge [afterwards George I.] to reside in England and sit in Parliament;' 8vo, London, 1731. He is also the author of the tract entitled 'Jurisdiction of the Chancery as a Court of Equity re-searched,' of which a third edition appeared in 1736;

BIOG. DIV.—SUP.

and 'Reasons for Uniformity,' 1741. A second edition of his 'Britannic Constitution' was published in 1759. Acherley is believed to have died some time previously.

(*Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

ACHERY, DOM JEAN LUC D', a learned Benedictine, was born in 1609, at St. Quentin, in Picardy; professed at the Benedictine monastery in that town, but quitted it in 1632 to enter the abbey of La Ste Trinité at Vendôme, belonging to the congregation of St. Maur, where the rule was more strict. In 1637 his health rendered a residence near Paris desirable, and he removed to the abbey of St. Germain des Prés, where he spent the remainder of his days. He was the librarian of the abbey, and he re-arranged, greatly increased, and catalogued the books. The Popes Alexander VII. and Clement X. held him in high esteem, but the feebleness of his health, and the laborious nature of his studies, confined him close to his abbey, and made him regardless of honours. His piety, his learning, and his gentleness caused him to be much consulted in religious and literary difficulties. His studies were mainly directed to the early history of the Church, in which his researches were of great value. He published editions of the Catholic Epistles of St. Barnabas in Greek and Latin, with the notes of P. Ménard, 4to, 1645; the works of Lanfranc, with a life and appendix, Paris, fol. 1648; the Life and Works of St. Guibert, Paris, fol. 1651; the early ascetic writings, 'Asceticorum vulgo Spiritualium, Opusculorum, quæ inter Patrum Opera reperiuntur, Indiculus,' &c., Paris, 4to, 1648; and several other learned works, but his great works are the two following: 'Veterum aliquot Scriptorum, qui in Galliæ Bibliothecis, maxime Benedictinorum, latuerant Spicilegium,' Paris, 13 vols. 4to, 1655-77, an immense collection of documents, memoirs, and papers of all kinds, illustrating the history, theology, and literature of the middle ages, drawn from many of the monastic libraries, put together without any attempt at classification, but with a preface to each volume explaining its contents. The 2nd edition by La Barre, Paris, 3 vols. folio, 1723, is more convenient for reference; but the prefaces, in which are much of D'Achery's peculiar erudition, have been cruelly abridged. Even this great work was outdone by the 'Acta Sanctorum ordinis S. Benedicti in Sæculorum Classes distributa,' Paris, fol. 1668, &c. Seven volumes of this vast work were published during D'Achery's life. Of these the materials were for the most part collected and arranged by D'Achery, but the notes, observations, and tables, as well as the learned prefaces, were by Mabillon, who had also assisted D'Achery in the compilation of his 'Spicilegium,' [MABILLON, E. C. vol. iv. col. 1]. D'Achery died at St. Germain des Prés, April 29, 1685.

ACKERMANN, RUDOLPH, printseller and publisher, was born at Stolberg, in the Saxon Harz, April 20, 1764, the son of a coach-builder and harness maker, who removed his manufactory in 1775 to Schneeberg, in the public school of which town Rudolph received his education. At the age of 15 he entered his father's workshop, but after a little time gave his chief attention to drawing, and became an expert draftsman and designer. On the completion of his apprenticeship he visited several German towns, and then stayed for awhile at Paris as pupil and assistant to Carrossi, then the leading designer for coach-builders. From Paris he came to London, where he found ample employment at a time when a carriage was regarded as a work of art: among his designs were the state carriage of the Lord-lieutenant of Ireland, 1790, and that of the Lord-mayor of Dublin, 1791. Having saved some money and married an English wife, he, in 1795, took a house in the Strand, No. 96, and commenced the business with which his name is chiefly associated, of a print-seller and fine-arts publisher. The following year he removed to larger premises, No. 101, Strand, and, along with his proper business, reopened the rooms known as Shipley's Drawing School, as a school of art, which he continued with success till 1806. Later he commenced holding in his large room weekly evening gatherings, for social intercourse, of artists, literary men, and persons of taste, at which the new prints, pictures, and artistic nick-nackeries were exhibited, and which are described as having contributed greatly to the promotion of a love of art and acquaintanceship with artists. But it was as a publisher of illustrated works that he was best known, and had most influence on the public taste. Although many of his publications were almost necessarily addressed to the passing modes of thought, many were at once costly and of permanent value. Chief among these were the various series illustrating the universities and grammar schools, public build-

ings, and picturesque localities. Such were the 'University of Oxford, portraits of the founders, and costume,' in all 133 plates by Pugin, Mackenzie, and Uwins; a companion volume of Cambridge University, with 111 plates after the same artists; the colleges and schools of Eton, Harrow, Winchester, Westminster, &c.; Westminster Abbey, 84 plates after Pugin and Mackenzie, 1813; 'Palace of Brighton,' by Nash, 1826; and 'Picturesque Tours,'—of the English lakes, with plates after Fielding and Walton; of the Thames with plates after Westall and Owen; of the Seine with plates after Pugin and Gendall; of the Rhine, after Von Gerning; and other series of South America, India, &c. Another important class of illustrated books was that to which belonged 'The Microcosm of London,' 3 vols. 1809-10, with 104 plates after Pugin and Rowlandson, a very different work from Pyne's 'Microcosm,' 120 plates, 1822; 'Select Views of London,' 76 plates, 1810-15; 'Views of Country Seats of the Royal Family, Nobility, and Gentry,' 'Views of Cottages and Farm Houses of England,' 52 plates, after Chalon, Prout, Cristall, Varley, &c., 1816. Books like Blake's designs to Blair's Grave (engraved by Schiavonetti), 1818; 'Albert Durer's Prayer Book,' 45 plates, 1817; and 'Subjects from the Works of T. Stothard, R.A.,' 61 plates, 1830—were among those published by him. He also published, and for the most part suggested, those books which owed their extraordinary popularity to the exuberant pencil of Rowlandson rather than to the pen of his literary colleague, Combe, and of which the Tours of Dr. Syntax and Johnny Newcome, may be cited as the representatives. Several of his more expensive illustrated works were published in parts, but besides these Mr. Ackermann initiated the publication of an illustrated art periodical, in 'the Repository of Arts, Literature, Fashions, &c.,' which he continued for about 20 years, 1809—28. 'The Poetical Magazine' was another periodical started by him, but it did not last long. Another, 'The World in Miniature,' was continued through 43 volumes. The elegant but flimsy Christmas or New-Years' *Annals* which for some years enjoyed so extraordinary an amount of public favour, owed their origin to Mr. Ackermann, who in 1822 brought out his 'Forget-Me-Not,' and was quickly followed by numerous imitators. We have named these as characteristic examples of Ackermann's illustrated publications, but they are only a very few out of many; a tolerably full list may be seen in 'Notes and Queries,' 4th series, vol. iv. pp. 111, 129, &c. Mr. Ackermann was the first to render lithography practically available in England. Struck by its capabilities he set up presses, and opened an establishment for carrying out the various processes of the art; translated Senefelder's 'Manual,' and induced Prout and some other skilful artists to turn their attention to its practice; and when mechanical and other difficulties proved serious obstacles to its success, he went to Germany to discuss them with Senefelder, and in 1822 gave to artists the benefit of his investigations in a 'Complete Course of Lithography.' He also spent much time and money in endeavouring to improve the process of aquatinta, a process by which the plates of many of his publications were executed. Nor was his interest confined to inventions connected with art. His was one of the first houses in London lit with gas, he having had works for its manufacture erected on his premises, and liberally assisting the inventor in his experiments. In 1815 he published 'Accum's Treatise on Gas Lighting.' He also laid before Government a scheme for applying balloons in time of war. Waterproofing of woollen-stuffs, leather, &c., was another project at which he laboured, having waterproofing works for some time in successful operation at Chelsea. By his countrymen he was, however, most esteemed for his philanthropy, he having been the promoter and secretary of the subscription (1813) for the sufferers by the war in Germany, which raised a sum of £100,000, besides the vote of a similar sum by Parliament. He was likewise earnest and successful in assisting the distressed French and Spanish exiles, and in procuring them opportunities for turning their talents to account. He continued actively engaged in business till 1830, when he was disabled by an attack of paralysis. He removed to Finchley, where he died March 30, 1834.

ACONTIUS, JACOBUS (ACONZIO, GIACOMO), distinguished as a philosopher, jurist, theologian, and engineer, was born at Trent, early in the 16th century. The year 1566 is ordinarily, and it would seem with propriety, assigned as that of his death; and this statement is greatly fortified by the testimony of Grasserus, who in an edition of the 'Stratagemata Satanae,' of Acontius (1610), says that the author died soon after its first publication in 1566. It is probable, therefore, that Francis Cheynell was mistaken in his assertion ('The Divine Triunity,' London,

1650, p. 443) that Acontius "was living in the year 1613." He himself states that he was educated for the profession of the Law; and it is further said, on evidence less conclusive, that he subsequently spent several years in a Court. Literary activity was the adoption of a later period. In 1557, he abandoned the communion of the Church of Rome; and became, with others, an exile from his native country, for the sake of enjoying a wider liberty of theological speculation. At first he took refuge in Switzerland; afterwards at Strasbourg; and finally, about 1558, came over to England, where he spent the remainder of his life. His abilities as an engineer recommended him to the favour and patronage of Queen Elizabeth, from whom he enjoyed a pension. An interesting record of his activity in this capacity is preserved at varying length in the 'Statutes at Large,' in Dugdale's 'History of Imbanking,' and in Hasted's 'History of Kent.' It was represented to Parliament, in the fifth year of Queen Elizabeth (1563), that two thousand acres of land in the parishes of Erith, Plumstead, and Leases, which in former times were good pasture grounds and meadows, had lain waste during thirty years owing to the breaches in the river walls, and the consequent inundation of the Thames. It was further represented that "one Jacobus Acontius, an Italian, and servant to the Queen, had undertaken at his own charges their recovery, in consideration of a moiety of them for his charges." An Act of Parliament was necessary for the undertaking, on account of the opposition of many of the proprietors whose interests seemed to be threatened by the project; and it was accordingly enacted that "the said Jacobus and his assigns, and their servants, &c., should at his cost and charges, after the 10th of March, 1563, during the term of four years next following, inne, fence, and win the said grounds, or any parcel of them," the recompense to be as already stated. A commission, issued in the seventh year of Queen Elizabeth, gave in a report on the last day of the following January, to the effect that six hundred acres had been won and 'inneed,' and walls, banks, and other defences thrown up to protect them from the water and flood of the river Thames, according to the tenour of the Act. From another act of the eighth year of Queen Elizabeth, it appears that Acontius farmed out his privilege to John Baptista Castilion and others whose names are repeated in the powers granted or confirmed to them in a further act of the twenty-third of Elizabeth; and assigned to them the part—the East Marsh—which had been allotted to himself. It is fair to infer that failing health alone could have induced a man of the energy and ingenuity of Acontius to relegate to other hands the continuance of such a task; and thus we are again brought to the probable conclusion that his death happened, according to Grasserus and the generally received account, in the year 1566.

Acontius expresses his obligations to the Queen in a dedication to her Majesty of his work on the Devices of the Devil, 'Stratagemata Satanae, Libri Octo,' 12mo, Basilæ, 1565; of which three other editions were published at Basel, 1582, 1610, and 1620, and one at Amsterdam, 1624. An octavo edition issued from Oxford in 1631, with a letter addressed by the author to J. Wolfius. An English translation of the first four books appeared in 1648, under the title of 'Satan's Stratagems; or, the Devil's Cabinet-Council Discovered,' 4to, London; and another, in 1651, entitled, 'Darkness Discovered; or, the Devil's Secret Stratagems laid open; whereby he labours to make havock of the people of God by his wicked and damnable designs for destroying the kingdom of Christ. Wherein is contained an exquisite method of disputation about religion, and putting an end to all controversies in matters of conscience. Written by Jacobus Acontius.' Editions of this work appeared, with more or less promptness after its first publication, in the leading languages of Europe. The 'Stratagemata Satanae' was the occasion of much controversy, and Peltius speaks of its author as "clandestinus Socinianorum assecla;" whilst Cheynell says that "he gives the right hand of brotherly fellowship to the Socinians." On the other hand, Arminius calls him "divinum prudentiæ et moderationis lumen;" and it has been more recently affirmed that some of the finest passages of Milton's 'Areopagitica' may be traced to Acontius. It is, at least, conceded on all hands, as well by orthodox as by heterodox readers, that the author of this book was an Antitrinitarian.

Acontius was a member of the Dutch Church in Austin Friars; and as, in the words of Strype ('Life and Acts of Archbishop Grindal'), a suspicion arose that he was "touched with Anabaptistical and Arian principles," proceedings were instituted against him, in 1560, before Grindal, then Bishop of London, and *ex officio* "superintendent of the Foreigners' churches in

London." Dr. Grindal gave judgment against Acontius; and Strype says that the latter was "withheld by the bishop's sentence from receiving the holy sacrament, forbidding both the Dutch or any other Church to admit him; for which he wrote a long expostulatory letter to the said Dutch Church, which is extant [1710] in the library of the said Church of St. Augustin's." The principal works of Acontius, besides the one already mentioned, are a treatise on method, 'De Methodo; hoc est, de recta investigandarum tradendarumque Artium ac Scientiarum ratione Libellus,' 12mo, Basilæ, 1558; 8vo, Genève, 1582; 18mo, Lugd. Bat. 1617; and another on fortification, 'Ars Muniendorum Oppidorum,' Genève, 1585.

ACUNA, CRISTOVAL DE, Spanish Jesuit, was born at Bruges in 1597; entered the order of Jesuits in 1612, and was sent as a missionary to the Indians in South America. After several years thus employed, he was made rector of the college of Cuenca. In 1639, it being decided to send Pedro Teixeira, the Portuguese traveller, to make a new and more thorough exploration of the Amazon river, Acuña and another Spanish Jesuit, Andres de Arteida, professor of Theology at Quito, were directed to accompany him, in order to draw up a report to send to Spain. The expedition, which consisted of 45 canoes, with 70 soldiers and 1200 native rowers and slaves, embarked at Archidona, February 16, 1639, and reached Para in ten months, but several months were spent in attacks on the Indians, whom the Portuguese treated with great cruelty. Having to remain there some months while waiting for a ship for Spain, Acuña availed himself of his enforced idleness to write an account of the voyage and observations on the country. The book was published at Madrid in 1641 under the title 'Nuevo Descubrimiento del gran Rio de las Amazonas.' Acuña writes in the third person, briefly, and well. He estimates the length of the river from what he supposed to be its source at 1356 Castilian leagues; states the number of tribes inhabiting its banks to be about 150, each speaking a different tongue; and gives ample particulars about the race of Amazons, respecting whom he made very particular inquiries, and of whose existence he fully convinced himself. Acuña strongly urges the King of Spain to take possession of the country, with a view particularly to the conversion of the natives, volunteering himself and his order for the undertaking. But the times were unpropitious, and nothing was done; the king it is said even sought to suppress the book, with a view to preventing the Portuguese from availing themselves of the information afforded by it respecting the country. Certain it is, the book became excessively rare, though it was translated into French by Gomberville ('Relation de la Rivière des Amazones,' 4 vols. 12mo) in 1682, and from the French into English, one vol. folio, in 1698. Southey has given a summary of Acuña's account in his 'History of Brazil' (vol. i. chap. xviii.). Failing in his hopes of exciting the royal sympathy, Acuña proceeded to Rome as procurator of the Jesuits; served some time in Spain as censor of the Inquisition, and eventually returned to South America. He was living in Lima in 1675, and died there probably shortly after.

(*Bibliotheca Scriptorum Soc. Jesu Opus inchoatum*, Rome, 1677; Rodriguez, *El Marañon y Amazonas*, Madrid, 1684; Southey; Denis, in *Nouv. Biog. Générale*; T. Watts, *Biog. Dict. of U. K. S.*)

ACUÑA, HERNANDO DE, an eminent Spanish poet, was born near the beginning of the 16th century. His family, of Portuguese origin, was of noble rank, and Hernando himself entered the army, in which he rose to a good position, distinguishing himself particularly in the expedition of Charles V. against Turin, in 1535. By some Spanish critics Acuña's verse is preferred to that of Garcilaso de la Vega, especially in his translations; he is, however, seldom read now. His first work was a poetic translation, made at the request of Charles V., of Olivier de la Marche's 'Chevalier délibéré,' but much altered; it was published at Antwerp in 1553, 4to, with 20 engravings on wood, and several times reprinted. None of his other writings were published during his life. He died in 1580 at Granada, whither he had gone to prosecute his title to the countship of Buendia. His widow published his remaining works at Madrid, in 1591, under the title of 'Varias Poesias,' in which are included an original poem of 92 stanzas in octave verse on the story of Narcissus, numerous sonnets and short pieces, and several translations from Ovid.

ACUNA, DON PEDRO BRAVO DE, governor of the Philippines, born towards the middle of the 16th century, was of the family of the Counts of Buendia, and, according to the custom of Castile, assumed his mother's name (Acuña) in addition

to that of his father (Bravo). Adopting the profession of arms, he distinguished himself in the campaign of Lepanto against the Turks, 1572; in the wars of Naples and Portugal, and in resisting the attack of Drake upon Cadiz in 1587. In 1593 he was appointed Captain-General of the province of Carthage and Tierra Firme, and in 1602 Governor of the Philippines. Here he was for some time occupied in repelling the aggressions of certain English and Dutch buccaneers, and then in quelling an insurrection of the Chinese who had settled in the suburbs of Manila. This last he put down with merciless severity, having slaughtered at least 23,000. This was the number given in the official report, but it is said to have been understated, in order that it might not appear that a larger number of Chinese had been allowed to settle there than the royal orders directed. From the first Acuña had determined to dispossess the Dutch of the Moluccas, and he was now able to direct all his energies to this purpose. In January, 1606, he sailed at the head of a large force, and on the 1st of April attacked and took Ternate, after a desperate resistance. Having captured the King of Ternate, Acuña compelled him to swear homage to the King of Spain, and grant a monopoly of the spice trade to the Spaniards. Taking the King of Ternate with him, Acuña returned to Manila, which he reached on the 9th of June. He was received with unbounded joy by his partisans, but a small though powerful section who had predicted the failure of the expedition, continued their enmity, and his death, which occurred on the 1st of July, was attributed to them. No evidence of this has, however, been brought forward, and the charge of poisoning was in those days as often made without as with cause.

ADAM, ADOLPHE CHARLES, a prolific French musical composer, was the son of Jean Louis Adam, a composer of pianoforte music. He was born at Paris on the 24th of July, 1803; studied solfeggio and the pianoforte under his father; and in 1817 entered the organ class at the Conservatoire de Musique. He now studied composition and counterpoint under Reicha; and pursued further musical studies under Boieldieu, whose style greatly influenced him in after years. He became known to the public as the composer of songs for vaudevilles, many of which were very popular. His engagement as pianoforte accompanist at the Théâtre Gymnase facilitated his introduction to singers and players. About this time Adam composed a number of fantasias and variations on airs in popular operas by Auber, Rossini, Boieldieu, &c. After composing the music for several trifling operettas, for the Gymnase, Vaudeville, and Nouveauté theatres at Paris, he advanced to regular comic opera, in which his first production was 'Pierre et Catherine' (1829). To this rapidly succeeded 'Danilowa' (1830); three in 1831, viz., 'Trois jours en une heure,' 'Le Morceau d'Ensemble,' and 'Le Grand Prix'; 'His First Campaign,' for Covent Garden Theatre, London (1832); 'Le Proscrit,' and 'Une Bonne Fortune,' (1833); 'Le Châlet' (1834). In 'Le Proscrit' he first clearly showed Boieldieu to be his favourite master, and this was further shown in 'Le Châlet.' Adam continued to compose comic operas until the number exceeded forty. The best known, in addition to those above-named, are 'Le Postillon de Longjumeau,' 'Le fidèle Berger,' 'La Reine d'un Jour,' 'Le Brasseur de Preston,' 'Le Roi d'Yvetot,' 'La Bouquetière,' 'Richard en Palestine,' and 'Giralda.' He also composed the music for many of the grand ballets so popular in Paris—including 'Faust,' 'La Jolie Fille de Gand,' 'La Fille du Danube,' 'Giselle,' 'Le Diable à Quatre,' 'La Filleule des Fées,' and 'Le Corsaire.' Two masses, composed by him in 1847 and 1850, have been much played at the Paris churches. Adam invested his accumulated means in building a new opera house, the Théâtre National, at Paris; but it occasioned him a direct loss of 80,000 francs, and liabilities for 60,000 more. He afterwards wrote musical criticisms in the 'Constitutionnel' and 'L'Assemblée Nationale.' Adam (who was one of the members of the Académie des Beaux Arts and Professor of Composition at the Conservatoire) used to admit to friends that, in composing for a living, he composed too rapidly for fame. He was found dead in his bed on May 3rd, 1856. A posthumous work by him, 'Souvenirs d'un Musicien,' was published in 1857.

ADAM, LAMBERT SIGISBERT, eminent French sculptor, was born at Nancy in 1700. From his father Jacob Sigisbert Adam (born at Nancy in 1670 and died there 1747), a sculptor of more than local celebrity, he acquired the elements of his art; at the age of 18 went to Metz, where he was employed some months; and then proceeded to Paris, 1719, and entered the schools of the Academy. Having won the grand prize by a bas-relief of Joachim, he was sent in 1723 as royal pensioner to

Rome. Here he remained ten years, and executed, among other things, a Mars and Venus for the King, Louis XV.; and a design for the fountain of Trevi, which was selected from its competitors by Pope Clement XII., but was not executed, owing, as is affirmed, to the intrigues of the Italian sculptors. Adam's chief employment whilst at Rome appears to have been what is called *restoring* antique sculpture found in Rome and its vicinity. For Cardinal de Polignac he added missing members to a large number of statues, and he purchased many more statues to carry back with him to Paris. This restored collection was purchased, in 1742, by Frederick II. of Prussia for Sans-Souci, but unhappily the works mischievously renovated by Adam are not confined to that gallery. Adam was elected a member of the Academy of St. Luke, Rome, in 1733, and the following year of that of St. Clement, Bologna. He returned to Paris in 1733, and was at once employed upon a colossal group in stone, of the 'Junction of the Seine and the Marne,' under the figures of a river-god and a nymph, which was placed above the cascade at St. Cloud. Louis XV. admired the work and engaged Adam to execute other groups for the gardens of Choisy; the 'Triumph of Neptune and Amphitrite' for Versailles, and several other works. A group emblematic of Fishing was presented by Louis XV. to Frederick the Great for the gardens of Sans-Souci. Among the more admired of Adam's works was a statue of St. Jerome, executed for the Invalides, and a bust of Louis XV. as Apollo. Adam was a clever sculptor in the manner of Bernini, but his style was affected and meretricious. He was elected into the French Academy in 1737, and professor in 1744. In 1754 he published a 'Recueil de Sculptures Antiques, Grecques et Romaines,' folio, engraved after his own drawings. He died in 1759. Two of his brothers also excelled as sculptors.

FRANÇOIS-GASPARD ADAM, born at Nancy, 1710, worked with his brothers at Rome, acquired some reputation, and obtained the appointment of court-sculptor to Frederick II. of Prussia. He died at Paris in 1759.

NICOLAS-SEBASTIEN ADAM, born in 1705, was instructed like his brothers by his father; worked at Paris and Montpellier; afterwards proceeded to Rome, assisted his brother Lambert during several years; but executed a 'Prometheus,' the mausoleum of the Queen of Poland, and other important works on his own account; was elected member of the Academy and professor of sculpture; and died in 1778.

ADAM, MELCHIOR, a German biographer, who, as Bayle remarks, for the indefatigable diligence with which he selected, arranged, and published the lives of a very great number of learned men, deserves that a like service should be rendered to him, was born in the latter part of the 16th century at Grotkau in Silesia; studied for many years at the gymnasium of Brieg, where he became thoroughly imbued with Protestant ideas; in 1598 proceeded to Heidelberg, where in 1601 he was made magister philosophiæ and laureate; and was soon after appointed teacher in the Heidelberg gymnasium. In 1606 he was made conrector of the gymnasium, and subsequently received other promotion, but of what nature is not clear. He died in 1622. Melchior Adam published 'Dissertatio de Virtute Morali,' 4to, Heidelberg, 1602; 'Apographum Monumentorum Heidelbergensium,' 4to, Heid. 1612; 'Parodiæ et Metaphrasæ Horatianæ,' 8vo, Frankfurt, 1616; and one or two other things, but the great work of his life was his 'Vitæ Germanorum Philosophorum,' &c., which appeared in four series, 8vo, Frankfurt, 1615—20, devoted respectively to eminent philosophers, divines, physicians, and jurists, a fifth decade being assigned to memoirs of twenty divines who were not Germans. All the persons commemorated are Germans or Flemings, and all the theologians Protestants. The series were several times reprinted separately, and in 1705 published together in one folio volume, which has, however, the reputation of being very inaccurate. Adam's biographies were charged by the Roman Catholics with unfairness, by the Lutherans with partiality. To readers of the present day they seem sufficiently free from intentional unfairness. Adam spent every spare hour in collecting and digesting the materials for his biographies, but like too many industrious students, found himself unable to work up more than a comparatively small portion of what he had so laboriously accumulated. All subsequent investigators have found his Lives an ample treasury.

ADAMI, ADAMO, Bishop of Hierapolis, was born in 1610 at Mühlheim on the Rhine. In his eighteenth year he became a member of the order of St. Benedict in the abbey of Brauweiler, near Cologne. In 1633 he received the priestly ordination, and in the following year was appointed rector of

the College of the Benedictines at Cologne. He now took the degree of D.D., and in 1637 was elected Prior of the Benedictine Convent of St. James, near Mainz. Thence he was transferred, in the same capacity, to the abbey of Murhart in Suabia, in order that he might there support, by his writings and personal influence, the intentions of the Emperor Ferdinand III., who wished to recover from the conquered Protestants the property they had formerly taken from the Catholics. The negotiations which in 1643 took place successively at Osnabrück and Münster, and which preceded the Treaty of Westphalia, by which the Thirty Years' War was brought to a conclusion, opened up for Adami a field of still more brilliant activity; for he acted at these negotiations as the representative of the abbots and administrators of the monasteries of the Duchy of Wirtemberg, and greatly facilitated the business of the commissioners by the fulness and variety of his information, and the prudence of his advice. His conduct, indeed, so won the admiration and esteem of Cardinal Chigi, that when, two years after he was sent to Rome to bring back with him the *pallium* for the Archbishop of Cologne, the Pope, Innocent X., acting on the cardinal's representations, appointed Adami Bishop of Hierapolis. Under this title it was, that for nearly ten years he administered the diocese of Hildesheim, giving proofs of his virtue and his zeal for the good discipline of the Church. He died March 1, 1663, leaving behind him the reputation of having fulfilled his various offices with honesty, boldness, tact, and ability. His literary productions are all but confined to a 'History of the Congress of Westphalia,' a work which he had composed in the first instance for his own use and that of his friends, and which, although printed in 1698, was not published till 1707, 4to, Frankfurt-on-the-Main. Another edition, under the care of J. G. de Meiern, appeared in 1737, with the title of 'Adami Episcopi Hierapolitani relatio Historica de Pacificatione Osnaburgio-Monasteriensis,' 4to, Lipsiæ. Another task, which Adami had undertaken, 'Histoire de la Congregation de Bursfeld,' was left incomplete by the pressure of affairs, secular and ecclesiastical, and by the prematurity of his death.

ADAMNAN, or ADOMNAN, SAINT, an Irish abbot of Iona, was descended from Nial, King of Ireland, and was born at Rathboth, now Raphoe, in Donegal County, about 624. He was probably educated in the monastery founded by his kinsman, St. Columba, at Iona (Hii), as he assumed the religious habit there, and on the death of Faílbbh in 679, was elected abbot. His time was spent in study, instruction, and the governance of the monastery. About 697 he went over to Ireland, where he collected materials for his life of St. Columba. About the end of the century he was sent by his countrymen to Ailfrid, King of Northumberland, on a mission apparently of importance, though its purpose is not clear, as he stayed some time in the country. During his sojourn in Northumberland he became a convert to the Roman rule for the celebration of Easter—then a question of primary importance among the ecclesiastics of Britain. He preached the new rule in Ireland, and on his return to Iona in 702 or 703, endeavoured to persuade his monks to adopt it, but failing therein, died of chagrin, before the next celebration of Easter (704), says Bede, on the 23rd of September, 703, according to the Irish annalists. Adamnan's 'Life of St. Columba' is a tedious and inaccurate work, full of the most improbable marvels, but curious, and of considerable biographical and historical value. It was first printed by Canisius in 'Antiquæ Lectiones,' vol. v., and has been several times reprinted: all previous editions, however, are rendered superfluous by that of Dr. Reeves from the exquisite Schaffhausen MS., published by the Irish Archaeological and Celtic Society, 1857. Adamnan also wrote a very curious account of the Holy Land, which he says he derived from Arculf, a French bishop, who, on his return from Palestine, was shipwrecked on the west coast of Britain, and after much wandering found hospitable shelter in the monastery of Iona, where he related to Adamnan his travels, and described the wonders of the Holy country. Adamnan presented his book to King Ailfrid, who, being greatly delighted with it, caused several copies to be made for the instruction of his subjects. Bede, a contemporary of Adamnan, wrote an abstract of it, and makes it the subject of two chapters of his 'Ecclesiastical History' (Book V. chapters xvi. and xvii.). It appears to have become very popular, and no doubt did much to stimulate the interest felt in this country respecting the Holy places. Adamnan's 'De Situ Terræ Sanctis' was first published by the Jesuit Jacob Gretser at Ingolstadt in 1619, and afterwards included in vol. iv. of Gretser's collected works, 17 vols., fol., Ratisbon,

1734—41. It was also printed in tome 1, par. 2 of *Mabillon's 'Acta Sanctorum.'*

*ADAMS, CHARLES FRANCIS, an American politician and diplomatist, is grandson of John Adams, second President of the United States [E. C. vol. i. col. 33], and son of John Quincy Adams [E. C. vol. i. col. 36]. Charles Francis Adams was born at Boston, Massachusetts, August 18, 1807; received much of his education while residing with his father at St. Petersburg and London, and graduated at Harvard University in 1825. In 1828 he was elected a member of the legislature of Massachusetts. He was an unsuccessful candidate for the Vice-Presidency of the Republic in 1848, on what were known as "Free Soil" principles. He became member of Congress, and Chairman of the Committee of Manufactures in 1860. In 1861 Mr. Adams came to England as Ambassador from the United States—therein following in the footsteps of his grandfather and father. His occupancy of this post from 1861 till 1868 was an arduous one, owing to circumstances connected with the civil war in his own country. In 1861 the 'Trent' affair nearly plunged England and America into war. Soon after this, Messrs. Laird, of Birkenhead, built a fast and strong steamer, which evaded the watchfulness of the authorities, escaped to sea, took in a crew and an armament, and, as the 'Alabama,' cruised about under the flag of the Confederate States, inflicting a vast amount of injury on the Federal shipping. This was regarded by the United States Government as a violation of neutrality; and Mr. Adams was engaged almost continuously from that time until 1868 in diplomatic correspondence concerning this affair. Mr. Adams resigned his post in February, and left England in September, 1868, on the arrival of his successor, Mr. Reverdy Johnson. In the 'Alabama' question Mr. Adams of course maintained the views of his Government: but the tact, courtesy, and discretion with which he conducted the discussion, as well as the fairness and judgment displayed by him on all occasions, did much to preserve good feeling between the two countries in trying times, and secured for himself very general esteem.

ADAMSON, PATRICK, a distinguished Scottish prelate, an estimate of whose true character and position it is difficult to disentangle from the conflicting accounts of partizans, was born in March, 1536, at Perth, where his family had been established for about 150 years. He was the eldest of the three sons of Patrick Constan, Constantine, or Adamson, who appears to have been a baker, and who was a magistrate of Perth in the year 1541. His classical education was commenced at the Grammar School of his native city, whence he proceeded to St. Mary's College, St. Andrews. After taking his Master's degree, which he did in 1558, as *Patricius Constynne*, he appears to have acted as a tutor in the university. In 1560 he passed the examinations of the General Assembly, and soon after was appointed minister of the parish of Ceres in Fife. His first publication was a poetical attack on the doctrines and practices of the Roman Catholic Church, which he addressed to the Papists of Aberdeen, "*Ad Papistas Abŕdonenses*," with the title, "*De Papistarum Superstitionis Ineptiis, Patricii Adamsoni, alias Constantini, Carmen*," Edinburgh, 1564.

Having been refused, in June of the same year, the Assembly's permission to travel on the Continent, he presently threw up his charge, and set out for France in the capacity of tutor to the eldest son of Sir James Macgill, of Rankeilour, in Fife, his friend and patron, and one of the senators of the College of Justice. Adamson remained about two years in Paris, at the end of which time he contrived to excite the jealousy of the French Government by the impulsive loyalty with which he rushed to celebrate the birth of the son of Mary Queen of Scots (afterwards James VI.), in a Latin poem of about 300 hexameters, and by the extraordinary terms of the title, in which he styled the infant, Prince of Scotland, England, France, and Ireland. The title further sets forth that the work was sent to press on the 25th June ("*typis commissum, 25 Junii, sexto a partu die, 1566*") six days after the birth of the Prince. This jubilant but unfortunate poem bore as a title, "*Serenissimi ac Nobilissimi Scotiæ, Angliæ, Franciæ, et Hybernæ, Principis, Henrici Stuardi Illustrissimi Herois, ac Mariæ Reginæ amplissimæ filii Genethliacum*." It required all the interest of the Scottish queen with the French Court to procure the limitation of Adamson's punishment for his too loyal escapade to a six months' imprisonment. After his enlargement he proceeded successively to Poitou and Padua, where he and his pupil together commenced the study of the civil and canon laws, a pursuit which, after brief sojourns at Geneva and Paris, they continued during a seven months' stay at Bourges, probably in

1567 or 1568. Whilst Adamson continued in this city—he "sepulchre," as he himself called it, from the concealment he was obliged to practise, and the daily fear in which he as a Protestant was kept for the safety of his life—he wrote his translation of the Book of Job in Latin hexameters—"*Jobus, sive de Constantia*"—as well as a Latin tragedy on the death of Herod. The date of Adamson's return to his native country has been much debated; for if he were in Paris, as his partizans allege, during or about the time of the massacre of St. Bartholomew, August, 1572, it is all but proved that he could not have preached at St. Andrews on the 8th of February in the same year, a sermon, imputed to him by Calderwood and others of his opponents, the purport of which was to attack and to ridicule the order of bishops. The date of the dedication (February 18, 1572) of his Catechism to King James, however, goes to establish the fact that Adamson was at St. Andrews very close upon the time when the sermon was preached; and, on the whole, it seems fair to conclude that he had returned to Scotland as early as the year 1570. The Catechism referred to was written in Latin hexameters, and was prepared for the use of the young king, to whom, as we have said, it was dedicated. It bore as a title, "*Catechismus Latino Carmine redditus, et in Libros quatuor digestus*." Of this work a second edition appeared in 1581. In 1572, Adamson's Latin translation of the Scottish Confession of Faith was published at St. Andrews, under the title of "*Confessio Fidei, et Doctrinæ, per Ecclesiam Reformatam Regni Scotiæ receptæ*."

On his first return to Scotland, Adamson had married Elizabeth, the daughter of William Arthor of Kernis, and had begun to practise at the bar. He yielded, however, to the request of the Assembly that he should resume his original profession, and was thereupon appointed to be minister of Paisley. In 1575 he was one of a deputation selected by the General Assembly to confer "upon the jurisdiction and policy of the Kirk," with commissioners nominated by the regent Morton, by whom in the following year he was advanced to the primacy, then vacant by the death of Archbishop Douglas. He refused to "submit himself to the trial and examination of the Assembly (October, 1576), and receive the office of a bishop according to the injunctions and conditions registered in their books;" and from that time forward his life was an unintermitted struggle with the extreme Presbyterian party, now becoming every day more powerful in the Church, even whilst the system still continued to be mainly episcopalian in its forms. Between the years 1577 and 1580 it would appear that the primate had made two or three several submissions to the Assembly, to whom he had, either by his assumption or his imprudence, given occasion of complaint and censure. New cause of offence arose in 1582, from the fact of the Archbishop voting in Parliament, and collating to benefices. The Assembly, which met in October of that year, relegated him to be dealt with on these charges by the Presbytery of Glasgow; from whose animosity he was saved for a time by an attack of illness, to which he gave the name of a "fœdity," and which confined him to "his castle, like a tod [fox] in a hole," as Calderwood expresses it. He owed his cure to medicines prescribed for him by a poor woman, named Alison Pearson, who, four years after, in 1588, expiated her skill in leechcraft by being burned as a witch. The Archbishop, of course, thereafter lay under the imputation of having sought healing from the agents of the devil. From whatever cause, his recovery was coincident with the arrival of the king at St. Andrews, in June, 1583, before whom he preached with an unction and eloquence he had never previously manifested. One effect of his zeal was that in December of the same year he was commissioned by James as his ambassador to the Court of Elizabeth, for the purpose of facilitating in Scotland the establishment of such a form of episcopacy as should further the union of the two countries when James should become king of both. Adamson had but one audience of the Queen; and both at this and at other times scandal was busy with his name and character in England as well as in Scotland, where, indeed, he laboured under a sentence of suspension by the General Assembly. His preaching, on the other hand, is said to have been very attractive to the English people; so much so, in fact, as to rouse the jealousy of the queen, lest the eloquence of the ambassador should stir up too great an enthusiasm on behalf of his master. Adamson returned to Scotland early in May, 1584, and sat in the Parliament which met at Edinburgh in that month, by which Presbytery "was altogether thrown down, almost within the space of twenty-four hours." The Archbishop now stood high in the graces of King James, and was the constant preacher before the Court. But

the royal favour served only to increase his unpopularity, of which many particulars, betraying so much rancour as to forbid their being received as entirely credible, are still extant.

Whilst his enemies were busy with the circulation of libels, the eloquent pen of the Archbishop was occupied in drawing up a paper which was published in the beginning of the following year, and which in 1587 was printed in Thynne's continuation of Holinshed's 'Chronicle,' under the title of a 'Declaration of the King's Majesty's Intention in the late Acts of Parliament.' The return of Andrew Melville, the great champion of the Kirk, in company with the noblemen who had fled to England after the raid of Ruthven, however, brought about the downfall of the Earl of Arran's administration and the re-establishment of the Presbyterian party. The result was Adamson's ruin. Spurred on by the fierce invective of James Melville, the nephew of Andrew, the Synod of Fife, which met at St. Andrews in April, 1588, passed a formal sentence of excommunication upon the Archbishop, who two days after made a forceless attempt at retaliation by a counter-excommunication of the Melvilles and some of their associates. Through the influence of the Court, however, and at the price of a very humble submission, his peace was made with the Church at the next General Assembly. But he soon became involved in further troubles, and charges of various kinds were brought against him before the Assemblies of 1587 and August, 1588. As he did not appear on citation, his case was remitted to the Presbytery of Edinburgh, who in the following June found him guilty of falsehood, double dealing, erroneous doctrine, opposition to the discipline of the Church, &c., and thereupon deposed him from all his functions in the ministry till he should make satisfaction for his delinquencies. At this crisis the unhappy Archbishop experienced the folly of putting confidence in princes. In 1590 he published, with a dedication to King James, a version in Latin elegiacs of the Lamentations of Jeremiah, 'Threnorum, sive Lamentationum Ieremiæ Prophetæ, F. Elciæ Libellus, Latino carmine redditus'; and another, in hexameters, on the Book of Revelation, 'Apocalypsis S. Joannis Theologi, Latino carmine reddita.' James, however, was not to be moved either by admiration or compassion; and was, indeed, so scandalized at the charges against the Archbishop as to alienate from him the revenues of his see, in favour of the Duke of Lennox. Adamson, thus left in poverty and sickness, sought peace and relief at the hands of his old opponent, Melville, who taking compassion on him, prevailed on the Presbytery of St. Andrews to absolve him from the excommunication on condition of his making a full acknowledgment of his errors of life and doctrine. A full and complete 'recantation' was accordingly made in three several instalments, bearing the dates of the 8th of April, 12th of May, and 10th of June, 1591. The documents thus obtained from the miserable prelate were probably published immediately, although the oldest printed edition extant bears the date of 1598, and has for its title, 'The Recantation of Maister Patrik Adamson, sometime Archbishop of Saint-Andrewes in Scotlande,' the address of 'the Printer to the Reader' being headed with the portentous word, 'Pseudoeiscopomastix.' Archbishop Adamson died at St. Andrews on the 19th of February, 1592, and for fifteen years afterwards his see remained without an incumbent.

A collected edition of the Archbishop's works was published by Thomas Wilson (Latinæ, Volusenus), his son-in-law, an advocate, who dedicated it to James I. This work bore as its title, 'Reverendissimi in Christo Patris, Patricii Adamsoni, Sancti-Andree, in Scotia Archiepiscopi Dignissimi ac doctissimi, Poemata Sacra, cum aliis Opusculis, Studio ac industria Tho. Voluseni I. C. Expolita et Recognita. Londini, apud Joannem Billium, anno M.DC.XIX.' Wilson also published two or three separate tracts of the Archbishop's, and some of the more elaborate works of the latter, to which he alludes in his 'Recantation,' have never seen the light.

ADELARD of Bath [ATHELARD in E. C. S.].

ADLER, GEORG CHRISTIAN, German teacher and theologian, a descendant of the celebrated divine, Kaspar Adler, best known by his Latinised name of Aquila [AQUILA in E. C. S.], was born Nov. 1, 1674, at Wohlacht, in Silesia, and studied theology in the universities of Leipzig and Halle. After acting for a time as teacher in a noble family, he, about 1700, established a high class private school at Königsburg, which met with such success as to attract the notice of the king, who granted it the title of royal school. It afterwards became the Gymnasium of Königsburg, and is now the Collegium Fridericianum. In 1706 Adler was appointed teacher of the Pædagogium, Halle;

and in 1706 rector of the school of Alstadt-Brandenburg. Here he continued till his death, August 30, 1741, having however been elected diaconus of St. Gotthard's Church in 1708, and archidiaconus in 1714. Adler was not only a highly successful schoolmaster, but an esteemed author. His best known publications are 'De Liberalium Artium in Ecclesia Utilitate, si rite tractentur,' Stargard, 8vo, 1702; 'De Morte eruditorum Philosophica,' Berlin, 8vo, 1707.

ADLER, GEORG CHRISTIAN, son of the preceding, was born at Alstadt-Brandenburg, May 6, 1734; studied at Halle; was appointed preacher at Arnis in 1755, pastor at Sarau in 1758, and rose eventually to be royal Danish provost of Pinneburg and Altona, and chief pastor to the Lutheran Church at Altona. He died Nov. 2, 1804. Adler was a conscientious pastor and a learned theologian, but is now best known as an erudite archæologist. Besides a learned description of Ancient Rome (Altona, 1781), which has been superseded by later publications, he wrote 'Nachricht von den Pontinischen Sümpfen,' Hamburg, 8vo, 1784, and edited Frontinus 'De Aquæductibus Urbis Romæ,' Leipzig, 8vo, 1792.

ADLER, JACOB GEORG CHRISTIAN, a distinguished Oriental scholar, son of the second Georg Christian Adler, was born at Arnis in December, 1755. He went early to Rome, where he diligently studied the Eastern languages. On his return to his own country he was nominated professor of Syriac at the university of Copenhagen, and in 1788, professor of theology. He died in 1805. His chief works are 'Codices sacri recte scribendi leges, ad recte æstimandos codices manuscriptorum antiquos,' 4to, 1779; 'Descriptio codicum quorundam cæcorum . . . in bibliotheca regia Hafniensi servatorum,' 1780; 'Musæum cæficum Borgianum,' 2 vols. 4to, 1782-92; 'Bibliotheca biblica Wurttembergici ducis, olim Lorchiana,' 4to, 1787; 'Novi Testamenti versiones Syriacæ . . . illustratæ,' Copenhagen, 1789; 'Reise-bemerkungen auf eine Reise nach Rom,' 8vo, 1784.

ADLER, KASPAR [AQUILA, C., E. C. S.].

ADLER, PHILIP, German engraver, called by a mistake of Florent le Comte, *Paticina*, was born at Nürnberg in 1484; the year of his death is not known. Adler was among the first to adopt the art of etching, and he carried it at once to great perfection. His plates are highly valued, especially those he executed after Albert Dürer. His best print, or that most sought for by collectors, is a representation of the Virgin crowned, under an arch, on which is inscribed, 'Hoc opus fecit Philippus Adler Patricius. MDXVIII.' It was this inscription which by some strange confusion Le Comte read *paticina* instead of *patrician*, which led to the supposition that there was an engraver named *Paticina*.

ADRIAN, ABBOT, a learned divine of the latter part of the seventh century, was, according to Bede (who calls him Hadrian, 'Hist. Ecc.' l. iv. cap. 1), an African by birth, and, at the time he first mentions him, abbot of a monastery near Naples. On the death of Deusdedit, sixth Archbishop of Canterbury, July 14, 665, Egbert, King of Kent, desired to have the priest Wæghard, of the English race, to succeed him, and accordingly sent him to Rome with a request that the pope would confirm the appointment, and ordain him bishop. The pope, Vitalian, however, preferred an archbishop of his own selection, and fixed on Abbot Adrian as a man well skilled in all divine and secular knowledge. But Adrian shrunk from the charge, and eventually, on his recommendation, Theodore, a learned Greek, was appointed, with the condition, however, that Adrian, as being acquainted with the way and the people, should accompany him and prevent him from intruding any of the customs of the Greek Church, or other innovations. The two set out from Rome on the 27th of May, 668, but being detained some time in France, owing to suspicions entertained of their purpose, Theodore did not reach England till towards the end of 669, and Adrian some months later. Theodore appointed Adrian Abbot of St. Peter's, afterwards St. Augustine's, Canterbury, and the archbishop and abbot soon after visited together all parts of the island, Theodore being, according to Bede, the first archbishop whom the whole of the English obeyed. Their first object was to enforce conformity to Rome in rituals and the keeping of Easter, but beyond that they sought to raise the standard of learning among the clergy; founded numerous schools, and made the monastery of St. Peter's a great seat of learning; so that, as Bede writes, both the archbishop and abbot being instructed alike in sacred and secular literature, they collected together a crowd of scholars, and daily there flowed from them rivers of knowledge to water the hearts of their hearers. By the early writers Adrian is indeed considered as the first to introduce among the English the arts and

sciences, including sacred music, astronomy, arithmetic, and the Greek and Latin tongues, as well as sacred literature. Bede relates as a proof of Adrian's learning that his scholar and successor Albinus (from whom Bede derived much assistance in the compilation of his 'Ecclesiastical History') was thoroughly instructed in the study of the Scriptures, knew the Greek tongue well, and the Latin as perfectly as his native English. Abbot Adrian presided over his monastery for 39 years, dying in the year 709. A life of Adrian was compiled by Goscelin, chiefly from Bede's 'Ecclesiastical History,' with the addition of numerous miracles, and also an account of the translation of his relics.

(Bede; Capgrave, *Nova Legenda*; William of Malmesbury, *De gestis Pontif. Angl.*; *Acta Sanctorum*, vol. i. p. 595.)

ADRIAN DE CASTELLO, Italian cardinal, and predecessor of Cardinal Wolsey as Bishop of Bath and Wells, was born at Corneto in Tuscany about 1450. Distinguished as an accomplished scholar, and well skilled in civil affairs, Adrian was sent to England by Pope Innocent VIII. in 1488 to endeavour to bring about a reconciliation between James III. of Scotland and his subjects. When, however, Adrian arrived in London he received intelligence of the death of James; and he stayed in England, being warmly recommended by Cardinal Morton to the king, Henry VII., who, in the words of the old English version of Bacon's Life of Henry, "much phantasied and more favoured this Legate Adrian, inasmuch as he was his orator and solicited his cause, both to Innocent and also to Alexander VI., bishops of Rome. And after this for his diligent service, he so loved and favoured him that he made him Bishop of Hereford (1502), and shortly after (1503), that resigned and given over, he promoted him to the bishopric of Bath and Wells." Adrian in his visits to Rome had received many marks of the pontifical favour; he was made papal collector in England; prothonotary, secretary, and treasurer to Pope Alexander VI.; and now, to crown his English honours, he was made cardinal. Yet it is of Cardinal di Corneto, as he is henceforth usually called, that the story is told of his being invited to a banquet at the Vatican, when the vessel, by means of which the pope intended to poison the cardinal, was, by the negligence of a servant or the contrivance of Adrian, who suspected the design, taken by the pope himself, and caused his death, Aug. 18, 1503. The story is probably untrue, but it is illustrative of the character of the times, the place, and the men, that it could be generally repeated and believed. Under Pius III. and Julius II. Adrian lived in good repute, was known as an accomplished orator, and, himself an elegant writer, as the patron of learned men. By Pope Leo X. he was regarded with disfavour and suspicion. On the discovery of the alleged conspiracy of Cardinal Petrucci, June, 1517, Adrian was one of three cardinals whom the pope charged with complicity. Petrucci fled, but being induced to return to Rome under a safe conduct, solemnly confirmed by the verbal assurance of the pope, was seized, consigned to prison, and there strangled. Adrian and his associates were persuaded to confess their guilt, and were pardoned, on condition of paying a fine of 25,000 ducats. They paid that sum; but were then told that the fine was to be paid not jointly, but by each. Adrian resolved to escape from Rome. He succeeded, it was said, in doing so; but what became of him afterwards was never known. A report appears to have been circulated that he was murdered by his servant for the sake of the gold he had taken with him to assist his flight. The pope, through Cardinal Giulio de' Medici, a few months later, formally announced to Cardinal Wolsey the vacancy of the bishopric; and Henry VIII. at once conferred it upon Wolsey. Adrian, himself an excellent Latinist, was one of the first and most successful advocates of the adoption of a purer and more classical Latin style. He wrote 'De Vera Philosophia ex quatuor doctoribus Ecclesie,' Bologna, 1507; 'De Sermone latino et modo latine loquendi,' Basel, 1513, and several times reprinted; 'De Venatione, et Julii III. iter,' and some Latin verses printed in the 'Carm. Illustr. Poet. Ital.,' tome v.

ADUARTE, DIEGO, a Spanish friar, missionary, and historian, was born at Saragossa in 1569. Having joined an order of preaching friars, he went to the Philippines in 1594; and from that year till 1603 he went through a series of adventures which called forth indomitable firmness and perseverance. He learned the Chinese language so well as to be able to preach and catechise in it. He then accompanied Alonzo Ximenes, father provincial of his order, to Cambodia, with a large staff of assistant teachers; but a revolution in the country placed the Spaniards in great peril, and with difficulty they escaped to Cochin China. From thence they were speedily expelled; and Aduarte, while escaping, was wounded in a contest with a pirate. After recovering

from his wound at Malacca, he went to Manilla; but the ship took fire on the way. During a second expedition to Cambodia, he was wrecked on Babuan Island; and during a mission to Canton he was imprisoned and tortured. In later years he was made procurator of his order, prior of Manilla, and bishop of New Segovia. Aduarte published in 1632 an 'Account of the Martyrdom of Converts in Japan,' and in 1633 a history of the missionary labours of his order. After his death was published his 'Historia de la Provincia del Sancto Rosario de la Orden de Predicadores,' folio, Manilla, 1640, the first volume of which contains an account of his travels and labours in Cambodia, Cochin China, and Canton. Aduarte died in 1637.

AELST, EVERT VAN, Dutch painter, was born at Delft in 1602. He painted with great success what is technically termed still-life, especially dead birds, hares, and game generally, and sporting and warlike implements. A good colourist and finishing with great care, his works have always been attractive and still command high prices. He died in 1658.

AELST, NICOLAS VAN, engraver and printseller, was born at Brussels in 1526. In 1550 he was established as a publisher of prints at Rome, and he continued so employed till 1600: he is supposed to have died shortly after. N. Van Aelst engraved the 'Virgin and Child' of Giulio Romano in the Dresden Gallery, a 'Venus and Adonis' after Ghigi, and some other works, but the larger part of the prints which bear his name, and all those which have *formis* added, were either merely published by him or engraved by pupils and journeymen under his direction, as is the custom now-a-days with wood engravers. This kind of art-manufacture was extensively practised in the latter part of the 16th century, and N. Van Aelst was one of its most successful practitioners.

AELST, WILLEM VAN, Dutch painter, born at Delft in 1620, was the nephew and pupil of Evert Van Aelst, whom he followed in the class of his subjects, but excelled as a painter of fruit and flowers. He visited Italy, where he was known as Guglielmo d' Odlanda, and painted several pictures for the Grand Duke of Tuscany, which are still preserved in the Pitti Palace, Florence. On his return he stayed some time in Paris, but ultimately settled in Amsterdam, where his works were in great request. He died in that city in 1679. The pictures of Willem Van Aelst are more frequently met with in public galleries than those of his uncle: they are superior in arrangement, richer in subject, and more attractive.

AERTSZ, RYKAERT, Dutch historical painter, was the son of a fisherman at Wyck in North Holland, where he was born in 1482. While yet a boy his leg was burned so severely that it was found necessary to amputate it, and hence he was afterwards known as Wooden-legged Dick (Ryk met de Stelt). To while away the time during his tedious convalescence, Ryk used to draw with charcoal the various objects about him, until he became so expert that his father was persuaded to place him with a painter. He was accordingly sent on his recovery to Jan Mostaert in Haarlem, under whom he worked for a considerable time, chiefly painting friezes and other decorations in private houses. From Haarlem he went to Antwerp, where he settled; acquired reputation; was elected a member of the Academy in 1520; and died at the ripe age of 95 in 1577. His principal work was a diptych, or rather the wings of an altar-piece, for the principal church at Haarlem, representing incidents in the life of Joseph.

AERTSZEN, PIETER, called from his stature Long Peter, by the Italians Pietro Lungo, a celebrated Dutch historical painter, was the son of a stocking weaver at Amsterdam, where he was born in 1520. He was a pupil of Allard Claessen, and at the age of 18 had made himself known as a painter of homely interiors. But he abandoned this line and was employed by the civic authorities to paint a large altar-piece of the Death of the Virgin in the church of Our Lady at Amsterdam; another in four compartments representing the Annunciation, the Nativity, the Adoration of the Kings, and the Circumcision, for the new church in that city; an Adoration of the Magi for the new church at Delft, and one or two more, all of which were destroyed during the religious disturbances a few years later. He afterwards settled at Antwerp, where he was admitted a full member of the Academy of St. Luke, his name being entered in the books of the Academy as *Langhe Peter, schilder*. He was admitted burgher of Antwerp in 1552; married an aunt of his pupil, J. Buckelaer, and died at Amsterdam, June 2, 1573. One of the best of his small easel pictures, a Crucifixion, clearly painted and full of incident, is in the Antwerp Museum (No. 159). Three of his sons, PIETER (born 1540, died 1602); ALLARD

(born about 1545, died 1604); and DIRK (born about 1550, killed at Fontainebleau in 1620), followed their father's profession and acquired some celebrity.

AFFO, IRENEO, a distinguished critic, philologist, and historian, was born at Busseto, a small city which had once been the capital of the ancient Stato Pallavicino, on the 10th of December, 1741. His baptismal name was Davide, which he changed for Ireneo when, after prosecuting his studies at Bologna, and fulfilling a twelvemonth's novitiate at Busseto, he entered the Franciscan order, having just completed his twentieth year. In the beginning of May, 1767, he was appointed to the chair of philosophy of his order—the *Minori Osservanti*—at Ferrara; and about the middle of the same year was transferred in the same capacity to their convent at Parma. In 1768 the Duke of Parma promoted him to the chair of philosophy in the public school of Guastalla; the ecclesiastical and civil history of which he illustrated severally in his works, '*Antichità e pregi della Chiesa Guastallese*,' 1744, and '*Memorie Istoriche di Guastalla dell' Origine sua fino al 1539*,' in six books, 1775. The fame of these works, enhanced by that of his Poetical Dictionary, '*Dizionario precettivo, critico, e istorico, della Poesia volgare*,' 8vo, Parma, 1777, procured for Affo, April 7, 1778, the appointment of sub-librarian of the Ducal library at Parma, which had been created in great measure by his friend Paciaudi, the principal librarian; to whose office, upon his death in February, 1785, Affo succeeded. The same year he commenced the publication of his enlarged history of Guastalla, in four volumes, entitled '*Istoria della città e ducato di Guastalla*,' 4to, Guastalla, 1785-87; and in 1789 put forth the first volume of his biographical work of the writers and learned men of Parma, '*Memorie degli Scrittori et Letterati Parmigiani, Raccolte dal Padre Ireneo Affo, Minor Osservante, Bibliotecario di S.A.R., Profess. onor. di Storia nella R. Università e Socio della R. Accad. delle Belle Arti in Parma*,' 4to, Parma, 1789; of which four more volumes appeared before his death. The work has been since continued by Angelo Pezzana, one of Affo's successors in the office of librarian of the Parma library, who has devoted the whole of the sixth volume (Parma, 1825) to an elaborate biography of Affo, and a catalogue raisonné of his works, printed and not printed, to the number of more than a hundred. In 1791, Affo published '*Saggio di Memorie sulla Tipografia Parmense del Secolo XV.*'; in 1792, the first volume of his history of Parma, '*Storia della Città di Parma*,' of which three more volumes were subsequently published; and in 1794, a Biography of Cardinal Pallavicino, the historian of the Council of Trent, '*Memorie della Vita e degli Studj del Card. Sforza Pallavicino*.' Affo's death occurred May 14, 1797, of typhus fever, which attacked him whilst at his native town of Busseto, whither he had repaired for the sake of visiting a convent of his order; and the event was the occasion of a deep and a lively regret not in Parma alone, but in the whole of Italy, and indeed throughout the world of letters generally. He left behind him many memoirs, dissertations, and minor productions, some of which have been published since his death. The most remarkable of his works of posthumous issue, and one the publication of which was for a long time interdicted by the government of Parma, is his *Life of Pier Luigi*, which, completed in 1778, first saw the light under the care of Count P. Litta, in 1821, '*Vita di Pier Luigi Farnese, primo Duca di Parma*,' Milan. Affo was a true lover of literature, warm-hearted, honest, and indefatigable; and he has done more than any other writer to illustrate the history of his native duchy of Parma in all its branches. It should perhaps be mentioned, to complete his distinctions, that in his youth he had cultivated Italian poetry, and especially that he was the author of some satirical sonnets, which he published under an assumed name, '*Sonetti pedanteschi di Don Polipodio Calabro Pedagogo*.'

AFFZELIUS, ADAM, an eminent Swedish botanist, was born at Lång, in West Gothland, October 18, 1750. He studied under Linnæus at Upsal for several years; took his degree of magister philosophiæ in 1776; was appointed reader in Oriental literature in 1777, and demonstrator in botany in 1785—all at Upsal. In the last-named year he published, conjointly with Waldstrom, a treatise '*De Vegetabilibus Suecæ Observationes et Experimenta*.' In 1789 he visited England and Scotland. After declining an invitation to join Lord Macartney's embassy to China, he went, in 1798, to Guinea and Sierra Leone, as botanist to the Sierra Leone Company. He made botanical collections in Africa, and wrote two reports to the Company on the natural productions of Sierra Leone. After his return he was made Secretary to the Swedish Embassy in 1797; received the diploma of M.D. from

Upsal University in the same year, and was elected foreign member of the Royal Society in 1798. Returning to Sweden in 1799, he remained there till his death, January 30, 1836. For a part of the time he was professor of materia medica and dietetics in the University of Upsal. Afzelius contributed many botanical papers to the Linnæan Society of London and the Royal Academy of Stockholm. Besides his strictly scientific papers, he wrote a notice of the Life of Linnæus, with extracts from his Diary; '*Egenhändig Anteckning af Carl Linnæus om sig sjelf med Anmärkingar och Tillägg*,' Upsal, 4to, 1823; of which a German translation by K. Lappe was published at Berlin in 1826. Two of his brothers distinguished themselves—JOHAN, born 1753, died May 20, 1837, as professor of chemistry in Upsal University; and PEHR, born 1760, died Dec. 2, 1839, professor of medicine at Upsal, and physician to the King at Stockholm, by whom he was ennobled.

AGARDE, ARTHUR, styled by Camden *Antiquarius insignis*, was born about 1540 at Foston in Derbyshire. He was brought up to the law, but accepted a clerkship in the Exchequer Office, and in 1570 was made Deputy-Chamberlain of the Exchequer, a post he retained for 45 years. Having the charge of a large number of the national records, he now devoted himself to their study, and came to be regarded as one of the most accomplished antiquaries of the age, ranking in the estimation of his fellow-labourers along with his friend Sir Robert Cotton and Camden. Agarde was one of the original members of the Society of Antiquaries founded in 1572. Of the '*Collection of Curious Discourses*, written by eminent Antiquaries,' published by Hearne, six are by Agarde—1. '*Opinion touching the Antiquity, Power, Order, State, Manner, Persons, and Proceedings of the High Court of Parliament in England*;' 2. '*On the Question, Of what Antiquity Shires were in England?*' 3. '*On the Dimensions of the Lands of England*;' 4. '*The Authority, Office, and Privileges of Heraults in England*;' 5. '*Of the Antiquity and Privileges of the Houses or Inns of Court, and of Chancery*;' 6. '*On the Diversity of Names of this Island*.' He also wrote a treatise on the meaning of the terms in Domesday Book (Cottonian Lib., Vit. C. ix.), but it is not of much value; and a catalogue of the records under his charge, which was printed by the Record Commissioners, '*The Ancient Kalendars and Inventories of the Treasury of His Majesty's Exchequer*, 1836. Agarde died August 22, 1615, and was interred in the cloisters of Westminster Abbey, by the door of the Chapter House. He is said to have left 20 volumes of his MS. collections to his friend Sir Robert Cotton, but they are not mentioned in the catalogue of the Cotton MSS.

AGARDH, KARL ADOLF, a celebrated Swedish botanist, was born at Båstad, on the Gulf of Laholm, January 22, 1785, and completed his education in the University of Lund. From an early period he pursued the study of botany with great zeal, devoting his particular attention to the cryptogamia, in which he came to be regarded as the leading authority. In 1812 he was nominated professor of botany and rural economy in Lund University, but he also lectured on general economics. His thoughts having received a theological bent, he was ordained priest in 1816, and appointed to pastoral duty. At the same time he took an active part in politics, was elected deputy of his diocese in 1817 and 1823; and from his appointment in 1834 to the bishopric of Karlstad was a foremost Liberal in the Diet. But it is as a botanist, and chiefly by his writings on the Algæ, that he acquired European celebrity. On this branch of the science he contributed a large number of papers to the Natural History societies, but he also published several distinct works. Of these the most important were his '*Species Algarum*,' Lund, 3 vols., 8vo, 1820-28; '*Icones Algarum*,' Lund, 1828-35; and '*Systema Algarum*,' Lund, 1820; in which he not only embodied all that had been previously published on the subject, but added an immense body of original matter and developed a systematic arrangement, which, with some modifications, has since been very generally adopted. Another important work was his '*Lärobok i Botanik*' (Handbook of Botany), 2 vols., Malmö, 1829-32; of which the first volume was translated into German by Mayer, and the second by Creplin. He also published a '*Memoir of Linnæus*,' and some treatises on economics and theology. He died January 28, 1859. His son

* JAKOB GEORG AGARDH, born at Lund in 1813, has successfully pursued his father's special study; succeeded him as professor of botany at Lund University in 1854, and has greatly increased his vast collection. His chief works are—'*Synopsis Generis Lupini*,' Lund, 1835; '*Recensio Generis Pteridis*,' Lund, 1839; '*Algæ Maris Mediterranei et Adriatici*,' Paris, 1842; 'In

Systemata Algarum hodierna adversaria, Lund, 1845; '*Theoria systematis plantarum*,' Lund, 1858; and '*Om Bank-väsendet och pennig-theorien*,' edited by J. G. Agardh, 8vo, Stockholm, 1865.

AGAS, RADULPH, or AGGAS, RALPH, the designer of the earliest published map of London, flourished in the last half of the 16th century. Agas is included by Walpole in his *Catalogue of Engravers*, but there is no evidence that he practised engraving, and the probability is that he did not. The actual engraver of the maps he published appears to have been Augustine Ryther. Agas was a land-surveyor, and resided at Stoke, near Nayland, Suffolk, but made occasional or periodical visits to London, and probably to Oxford and Cambridge, to receive commissions. By way of advertising his qualifications, he issued hand-bills, of one of which a copy is in the British Museum; and apparently with the same object he published a quarto pamphlet entitled '*A Preparative to platting of Landes and Tenements for Surueigh*,' London, 1596. He had at this time "practised in survey more than forty years." A letter dated 1597, preserved among the Burghley Papers (Lansdowne MSS. vol. lxxxiv. No. 32), shows that he was then engaged in operations for improving the Fens. In 1593 he had addressed a memorial to Lord Burghley (preserved among the Lansd. MSS., vol. lxxiii. No. 29), which gives a curious and minute account of the improved method of land-surveying practised by him, and to the superiority of which he desires to call his lordship's attention.

Agas's Map of London is rather a bird's-eye view of the city than a map or plan of it. It measures 6 feet 3 inches long, by 2 feet 4 inches wide, and was engraved upon eight blocks of wood. The first edition of the map is sometimes positively stated to have been issued in 1560, and a copy with that date is said to be in the possession of Mr. J. Crace of London. But the inscription in the later edition, *Civitas Londinum circuitu Ano. Dni. M.D.LX.*, does not necessarily imply that it was originally issued in that year. Certain it is that in the verses printed on his map or plan of Oxford, '*Celeberrimæ Oxoniensis Academiæ Aularum et Collegiorum*, . . . 1578,' but not published till 1588, Agas distinctly states that for "near ten years past" he has been in doubt whether he should not lay aside his Oxford map "until he first had London platted out."

"Which still he craves, although he be denied
He thinks the Cities now in hiest pride,
And would make shewe how it was best besene,
The thirtieth years of our most noble Queene."

The 30th year of Elizabeth's reign began Nov. 17th, 1587, and it is quite clear that Agas had not published, and was not ready to publish, his map of London then. The copy in the Library of the City of London, Guildhall, appears to have been one of a new issue made in or about the first year of James I., 1603-4, the arms of James drawn with a pen being pasted over those of Elizabeth. Subsequent issues, with slight alterations and additions to the buildings, appear to have been made pretty frequently; and in the reign of William a copy, the size of the original, was engraved, apparently by one of the Dutch engravers then in England, on eight plates of pewter. This was published by Vertue in 1737, with his name attached, '*Vertue, Soc. Antiq. Lond. excudit*,' from which Walpole concludes that he re-engraved it. Besides the maps of London and Oxford, Agas designed one of Cambridge; and Vertue mentions that he had seen a plan made by Agas in March, 1589, on a large sheet of vellum, of the town of Dunwich, in Suffolk, with the adjacent villages. The year of Agas's death is unknown, but, as we have seen above, he was living in 1597.

AGELET, JOSEPH LE PAUTE D', French astronomer, was born at Thone-le-Long, near Montmédy, November 25, 1751, and studied astronomy under Lalande. In 1773 he joined Kerguelin's expedition to the Antarctic Seas, and on his return the following year, presented to the Academy of Sciences at Paris a journal of 1600 observations on planets and stars. In 1777 he was made professor of mathematics at the *École Militaire*, and in 1785 was elected Member of the Academy of Sciences. In 1783 he presented *Memoirs on the aphelion distance of Venus, and the length of the year*. In 1785 he sailed with La Perouse on his ill-fated expedition. The last letter received from him was dated from Botany Bay, March 1, 1788. His observations were lost with him, La Perouse having forbidden the communication of any during the voyage.

AGOSTINI, LIONARDO, a distinguished Italian antiquary,
BIOG. DIV.—SUP.

was born at Siena near the end of the 16th century. At the beginning of the pontificate of Urban VII., 1623, Agostini was at Rome, in the service of Cardinal Francesco Barberini, the pope's nephew, engaged in collecting works of art for the Barberini palace. By Pope Alexander VII. he was appointed pontifical antiquary and commissary or examiner of antiquities in Rome and Latium. Whilst thus employed he gave to the world the works by which he is now remembered: '*La Sicilia di Filippo Paruta, con la Giunta di Lionardo Agostini*,' fol. Rome, 1649. Paruta's work appeared originally in 1612; Agostini figured 400 additional medals, but gave no descriptions; these were afterwards added by Meier in his edition of 1697, but are of no value. The best edition of the work is that of Sigebert Haverkamp, 3 vols. fol. Leyden, 1723. Agostini's other work was '*Le Gemme Antiche Figurate di L. A., con le annotazioni del. Sig. Gio. Pietro Bellori*,' 4to, Rome, 2 parts, 1657 and 1670; the first part is said to have been originally published in 1636, though a copy does not appear to have been traced in any of the great libraries. The two parts were reprinted together at Rome, 1686, with a preface by Marinella. From the preface we learn that Agostini had been some years dead: he appears not to have long survived the publication of the edition of 1670, when he speaks of himself as already very advanced in years. The '*Gemme Antiche*' is chiefly valuable for the engravings by Galestruzzi, and the edition of 1670 is much the most prized, the plates having been retouched for the edition of 1686, and again for the augmented edition, by De Rossi and Maffei, of 1707. A Latin version by Gronovius appeared at Amsterdam in 2 vols. 4to, 1685.

AGOSTINO DI MUSI, or, as he is usually but incorrectly termed, AGOSTINO VENEZIANO, a celebrated early Italian engraver, was born towards the close of the 15th century. His earliest signed plates are after Campagnolo and Albert Dürer, the latter bearing the date of 1514. In 1515 he was in Florence, where he engraved several of the designs of Baccio Bandinelli and A. del Sarto. Agostino now repaired to Rome, where he remained till the death of Raffaele in 1520, engaged with Marco di Ravenna, assisting Marcantonio Raimondi in engraving the well-known plates after the great painter. Under Marcantonio, Agostino greatly improved his manner, but he never acquired the largeness and brilliancy of his master. Perhaps his best work of this period is the '*Christ bearing his Cross*,' after Raffaele. After the sack of Rome, 1527, Agostino fled to Mantua, where he engraved some of Giulio Romano's designs, under that master's supervision. Returning to Rome about 1530, he continued busily employed with his burin, but during the latter years of his life (1534—36) he seems to have been exclusively occupied upon portraits, and among these are some of his best works, such as Pope Paul III., 1534; Barbarossa; Francis I. of France; Charles V.; and Ferdinand I. Agostino's plates are very numerous, but good impressions are scarce, and highly prized. Heineken and Bartsch have published full catalogues of them. Passavant ('*Peintre-Graveur*,' vol. vi. pp. 51—66,) gives a list of 188, arranged under Scriptural subjects; virgins and saints; historical subjects; mythological and allegorical subjects; fantasy and genre subjects; portraits; architecture, vases and ornaments. The British Museum possesses many fine impressions of his works. Agostino's engravings have the immense advantage of being from the greatest painters and designers that Italy has produced, and executed under their immediate direction; but they are inferior as engravings to those of Marcantonio and the other chief masters of the art. Agostino drew but indifferently, and his original designs are decidedly poor.

AGRICOLA, GEORG, an eminent mineralogist, was born at Glaucha, near Meissen in Saxony, March 24, 1490. Having studied medicine at Leipzig and in Italy, he commenced practice as a physician at Joachimsthal, in Bohemia, in 1529. Geology and mineralogy being his favourite studies, he removed in 1531 to the mining district of Chemnitz, in Saxony, where he was appointed professor of chemistry. The Duke of Saxony gave him a pension to enable him to devote most of his time to researches on the geology and mineral resources of that country. In the year 1546 he published three works—'*De Ortu et Causis Subterraneorum*,' '*De Natura eorum quæ effluunt e Terra*,' and '*De Natura Fossilium*.' These works, written in elegant Latin, treated of minerals, lavas, bitumens, springs, &c., and discussed various theories concerning their formation. Not only was Agricola the first mineralogist of his day, but he raised mineralogy to a science. His other more important works were—on fossils, '*De Animantibus Subterraneis*,' 8vo, Basel, 1549; and on metallurgy, '*De Re*

Metallica, published with a new edition of the former, folio, Basel, 1556, and copiously illustrated with woodcuts on mining and metallurgy. These works have been several times reprinted; an edition of his mineralogical works in German, by E. Lehmann, was published in 3 vols. 8vo, Freyberg, 1806-10. Agricola also wrote on classical subjects and on some passing matters of controversy, but only his mineralogical writings are now of any interest or value. Agricola died at Chemnitz, November 21, 1555. Owing to religious bigotry his remains could not be interred at Chemnitz; they were buried at Zeitz.

AGRICOLA, JOHANN, a Saxon divine, one of the most distinguished German writers of the 16th century, and the reputed founder of Antinomianism, was born on the 20th of April, 1492, at Eisleben, the native place of Martin Luther. His real name was Johann Schnitter, Schneider, or Sneider, which, according to the fashion of the age, he Latinized as Agricola; whilst, from his birthplace, he sometimes called himself "Magister Eisleben," or "Magister Islebius." At the university of Wittenberg, where he studied theology and philosophy, he was the pupil and friend of Luther, whose opinions he enthusiastically embraced, and whom, in 1519, he accompanied to Leipzig, to the great meeting of German divines which is known by the name of the "Leipziger Religionsgespräch." To this assembly Agricola acted as secretary, and received, along with Melancthon, who was also present, the degree of baccalaureus from the university of Leipzig. For several years he worked in perfect harmony with Luther, by whom he was deputed, in 1525, to settle the ecclesiastical affairs of Frankfurt-on-the-Main. After a month's stay at this place, he visited his native town of Eisleben, where he was appointed preacher of the Nicolai Kirche, and soon after was made court preacher to John, Elector of Saxony, in which capacity he was present, in 1526, at the Diet of Spire, and took a part in the presentation of the Augsburg Confession in 1530. In the year last named he became court preacher to Count Albert of Mansfeld. The name of Agricola occurs immediately after that of Melancthon amongst the signatories of the Schmalkalden Articles of Faith, A.D. 1537; in which year he again went to Wittenberg. It was now that he began to carry out the great Lutheran doctrine of justification by faith, to the extreme of asserting the indifference of the law, and its inapplicability to the Christian as an authoritative rule of life and conduct. He held that nothing was required for salvation but faith in Christ, and repudiated the obligation even of the Ten Commandments. Obedience was not due to the law, but only to the gospel. This cardinal doctrine, on which other subordinate ones depended, received the adhesion of many of the Protestant divines, who, on account of their tenets, were called Antinomians. The disputes which followed, and the bitter animosity of Luther against the too logical Agricola, had the effect of compelling the latter, in 1542, to flee for protection to Berlin, where Joachim II., Elector of Brandenburg, conferred upon him the offices of court preacher and superintendent-general (archdeacon), which he held till his death, September 22, 1566. The Elector of Brandenburg endeavoured to bring about a reconciliation between Agricola and his former friends; but was unable to effect anything more favourable to his protégé than that Agricola should alternatively return to await the decision of judges appointed by the Elector of Saxony, or deliver in writing a recantation of his errors and of the injurious aspersions he had cast upon Luther. It was with the second condition that Agricola elected to comply, and he accordingly published at Berlin a volume in which he asked pardon of those whom he had offended, and especially of Luther, whom he designated as "that man of God." But Luther was little moved by protestations to which he did not attach the credit of sincerity, and Agricola remained at Berlin for the rest of his life. The versatility, fickleness, and ambition of Agricola had the result of inducing harsh judgments upon his character. His heresy was exaggerated and misrepresented; the heartiness of his recantation was denied by his opponents; and the part which he took, conjointly with Julius Phlugs and Michael Heldingus in drawing up the famous 'Interim' of Augsburg (1548)—which was conceived in a spirit of accommodation that satisfied neither Catholics nor Protestants—laid him open to unwarranted suspicions, and even to accusations of a desire to return to the Church of Rome.

Besides his numerous writings in exegetical and controversial theology—some of which are in Latin, but the greater part in German—Agricola has left behind him several works which have tended, in a degree second only to those of Luther himself, to elevate and fix the German language, and to consolidate

German nationality. He was the first to make a collection of German proverbs, which, to the number of 750, he published, with a concise, lively, and ingenious commentary. These proverbs appeared in two different collections. The first was published in Low German, and a few months after, in High German also. The Low German edition, which is extremely scarce, has the title, 'Dre hundert gemeiner Sprekwörde, der wy Düdschen uns gebruken, unde doch nicht wetten wo har se kamen, dorch D. Johann Agricolam von Islewe,' Magdeburg, 1528, 8vo. The High German edition appeared at Eisleben, 1528, 8vo. The second collection, which contains 450 proverbs, appeared without the name of the place of publication in the year 1529, 8vo, under the following title: 'Das ander Teyl gemeiner deutscher Sprichwörter mit yhrer Auslegung, hat fünffthalbhundert newer Wörter.' These two collections were afterwards frequently printed together, as at Hagenau, in 1537 and 1584; at Eisleben, 1548; at Wittenberg, 1582. The most correct edition is that of Wittenberg, in 1592, under the title, 'Siebenhundert und Funffzig deutscher Sprichwörter, erneuert und gebessert durch Johann Agricola. Mit vielen schönen lustigen und nützlichen Historien und Exempeln erklaret und ausgelegt.'

AGRICOLA, MARTIN, a German musical writer and composer, was born at Sorau, in Silesia, about 1486. He settled at Magdeburg in 1510 as a teacher of music and languages. In 1524 he was appointed professor of music and cantor at the college. During a long residence in Magdeburg he wrote largely on musical subjects. In musical composition he substituted notes for the tablature previously in use, to mark degrees in pitch and in duration. One of the most curious of his works was 'Musica Instrumentalis,' 1529, an account of all the instruments then in use, with woodcuts representing most of them. They comprised the flute, shawm, cornet, reed-pipe, bag-pipe, bomhart, trumpet, trombone, thürmer-horn (sounded by watchmen from church-towers), fixed and portable organs, regal, clavicord, clavicembalo, virginal, lyre, lute, quintern, four sizes of violin, viola, violoncello, dulcimer, harp, psalter, drum, keyed violin, and keyed zittern or cithern. The book, a thin duodecimo (of which there is a copy in the British Museum), is curious and instructive, showing in what particulars and in what degree the best known musical instruments have undergone changes of form and appearance during three centuries and a half. Other works by Agricola, all written in Latin, were—'Musica Choralis,' 1532; 'Musica Figuralis,' 1532; 'Melodiæ Scholasticæ,' 1512; 'De Proportionibus Musicis'; 'Rudimenta Musicæ,' 1539; 'Scholia in Muscam,' 1540; 'Quæstiones Vulgariore in Muscam,' 1543; 'Cantiones cum Melodiis,' 1553—the work which entitles him to rank among the earliest German composers of church music. He died June 10, 1556. Five years after his death appeared his 'Duo Libri Musices, continentes Compendium Artis et illustria Exempla,' 1561, edited by his friend, Georg Rhaw, the learned printer of all his works, and himself an excellent musician and critic.

AGRICOLA, MICHAEL, one of the early Swedish reformers, and celebrated as the translator of the New Testament into Finnish, was born at the village of Torsby, in the parish of Pernå, in Nyland, about the beginning of the 16th century. He was one of the eight students whose education at some foreign university, and especially at Wittenberg, was imposed by Gustavus Vasa as a tax upon the revenues of the just constituted Protestant see of Abo. When, in 1539, Agricola returned from the University of Wittenberg, where he had studied theology and medicine, he was the bearer of a letter from Luther, in which he was recommended to the King of Sweden as a youth of excellent learning, manners, and capacity, who was likely to be of service. His first appointment, conferred upon him in the same year, was the rectorship of the school at Abo; and conflicting assertion makes it probable, but less than certain, that shortly afterwards he was sent by Gustavus as missionary to Lapland. In 1548 he was appointed assistant to Martin Skytte, the first bishop of Abo, on whose death, in 1554, he was advanced to the superintendence of the diocese, less the diocese of Wiborg, which, previously a part of that of Abo, was now conferred upon Justen, the successor of Agricola in the rectorship of the school at Abo. Two years after, Agricola accompanied the Archbishop of Upsal, Laurentius Petri, to negotiate with Ivan Vassilevich, Grand Duke of Muscovy, who was at war with Sweden, and to hold conferences with the Russian clergy. A peace was concluded, but on his way home Agricola sickened and died, in the village of Kyroniem, in the parish of Vikyrkio, on the 7th of April, 1557.

The greatest monument of the zeal and learning of Michael

Agricola is his Finnish translation of the New Testament, the publication of which assisted considerably in the dissemination of the principles of the Reformation. The work was printed at Stockholm, in quarto, in the year 1548. A Finnish translation of the Book of Psalms, and other portions of the Old Testament, and the production of a Finnish Prayer Book, are also referred to him. He translated, into Swedish, the 'Sea-Laws,' or maritime code, of Wisby; a work which was not published till 1689, when it appeared at Stockholm under the editorial care of John Hadorph.

AIKIN, LUCY, daughter of John Aikin, M.D., the author of 'Evenings at Home,' and sister of Arthur Aikin [E. C. vol. i. col. 70], was born at Warrington, November 6, 1781. When she was three years old her father removed to Yarmouth, where he practised as a physician till 1792, when he settled in London. In 1797, on account of his failing health, he gave up his profession and retired to Stoke Newington, where he continued, till his death in 1822, busily occupied in the various literary works noticed in the article above referred to, and in which Miss Aikin rendered him valuable assistance. She had received a careful training, and, though in infancy called "the little dunce," soon exhibited unusual intelligence, obtained a wide acquaintance with historical literature, and was familiar with the best Italian and French authors. Her first publication was a translation of 'The Adventures of Rolando,' which was long a popular book with young people. In 1814 she published 'Lorimer; a Tale.' She also wrote 'Poetical Epistles to Women,' and various occasional verses, as well as numerous articles in the 'Annual Register' and other publications edited by her father. These, however, were only preparatory to the series of works on which her claim to remembrance rests:—'Memoirs of the Court of Queen Elizabeth,' 2 vols. 8vo, 1818; 'Memoirs of the Court of King James the First,' 2 vols. 8vo, 1822; and 'Memoirs of the Court of King Charles the First,' 2 vols. 8vo, 1833; all of which, but particularly the first two, are works of real value, though of course suffering from the deficiency in the curious private and personal matter since brought to light in the Calendars and other publications of the Rolls Office, and also perhaps from the author not having seen the importance of the illustrations to be obtained from the ephemeral literature of the several reigns, and which Macaulay has turned to such excellent account in his history. But the works are carefully and well written, tolerably free from prejudice, and very interesting. Her latest work, 'The Life of Joseph Addison,' 2 vols. 8vo, 1843, was less successful, and had the misfortune to be severely criticised by Macaulay. In 1824 she had published the literary remains and a pleasing biography of her father, 'Memoirs of John Aikin, M.D., with a Selection of his Miscellaneous Pieces, Biographical, Moral, and Critical,' 2 vols. 8vo.

Shortly after her father's death, Miss Aikin removed to Hampstead, and there, with a brief interval, she spent the last forty years of her useful and blameless life, the centre of a circle of attached friends, and there died on the 29th of January, 1864. Her grave, in the old churchyard of Hampstead, is next to that of Joanna Baillie, for many years her beloved friend and neighbour. In 1864 was published a volume of 'Memoirs, Miscellanies, and Letters of Lucy Aikin,'—the letters chiefly to Dr. Channing, and extending over a period of sixteen years,—with a brief memoir of Miss Aikin by Mr. P. H. Le Breton, from which most of the above facts have been taken.

AIKMAN, WILLIAM, a celebrated Scotch portrait-painter, was born in 1682 at Cairney in Aberdeenshire. He was intended for the law, but, preferring painting, became a pupil of Sir John Medina, then the leading painter in Scotland. In 1707 he sold an estate he had inherited at Arbroath, and went to Rome, where he stayed three years studying the works of the great masters. He then visited Turkey, and returned by way of Italy and London to Scotland, 1712, where he found a warm patron in the Duke of Argyll. Eventually, about 1723, he settled in London, and soon obtained a good share of patronage. But his health gave way and, after a lingering illness, he died in June, 1731, at his house in Leicester Fields (afterwards Leicester Square), leaving unfinished a large painting of the royal family. Aikman was a man of literary tastes and social habits, and numbered among his friends Sir Godfrey Kneller, Swift, Pope, Allan Ramsay, and James Thomson. In the Second Exhibition of National Portraits, 1867, were paintings by him of himself, William Carstairs, and Fletcher of Saltoun, all characteristic, and evidently faithful though somewhat coarse likenesses. His portrait of the poet Gay was esteemed one of his most successful works. This was in the same exhibition, but by an odd blunder was ascribed

to Ferdinand Bol, who died some years before Gay was born. A portrait of the poet Thomson in this exhibition was said to be "by William Aikman," but was really the portrait of the portly bard by Peyton, which Lord Chatham described as "beastly like." Aikman's portrait of Thomson is a very different one. His own portrait belongs to the National Gallery of Scotland; another is in the Gallery of Painters' Portraits at Florence.

AILRED, or ALURED, of RIEVAULX, English abbot, saint, and historian, was born about 1109, at Hexham, Northumberland, and was brought up at the court of David, king of Scotland, with whose son he is said to have been educated. Capgrave states that he became a favourite of the king, who offered him a Scotch bishopric, which he refused, and entered as a monk the recently-founded Cistercian Abbey of Rievaulx in the North Riding of Yorkshire, where, on account of his studious habits and piety, he was entrusted with the superintendence of the novices. Some of his early biographers state that he left Rievaulx to become abbot of Revesby in Lincolnshire; but this appears to be an error arising from the similarity of the names. At any rate he was elected Abbot of Rievaulx in 1146, and did not again leave it, except to attend a meeting of the chapter of his order at Cîteaux; to visit Westminster in order to assist at the translation of the relics of Edward the Confessor; to make a missionary journey, in 1164, to the wild Pictish population of Galloway in the south-west of Scotland; or on some like pious duty. During the last ten years of his life he was sorely afflicted with stone and gout. He died January the 12th, 1166, at Rievaulx, where he was interred. When Leland wrote, his tomb was richly adorned with gold and silver ornaments, but no trace is left of it now. Abbot Ailred enjoyed a high reputation for learning, piety, self-denial, and the austerity with which he governed his monastery. During his abbacy, Rievaulx increased greatly in numbers, wealth, and character: at his death it contained 150 monks and 50 lay brethren. Ailred was canonised in 1191.

As a writer of history, Ailred does not hold a foremost place. He is addicted to legend, fond of trivial matters, and has little critical discernment. Yet his works are not without a positive value, while incidentally they afford much insight into the life and modes of thought of the latter half of the 12th century. The chief of his historical compositions are—'De Sanctis Ecclesiæ Hagustaldensis et eorum Miraculis liber,' an interesting account of Hexham Church and of Sts. Acca and Alcmund, bishops of Hexham, printed in Mabillon, 'Acta Sanctorum,' vol. iii. i. p. 204, ed. Venet.; 'Vita Niniani, Pictorum Australium Apostoli,' an account of Ninian and his conversion of the Picts, full of alleged miracles, printed in Capgrave's 'Nova Legenda Angliæ,' 'Vita et Miracula Confessoris Christi Edwardi Regis Anglorum,' written on occasion of the translation of the Confessor's relics, printed in Gibbon's 'Opera Divi Aelridi Rhievallensis,' Douay, 1616-31, and reprinted in the 'Magna Bibl. Veterum Patrum,' Cologne, 1618; in the 'Acta Sanctorum,' Jan. 1, 292; and in Migne's 'Patrologia.' The metrical 'Vita S. Edwardi Confessoris, Regis Angliæ,' in six books, is also attributed to Ailred, but seemingly without sufficient authority: on both these Lives the reader should consult Mr. Luard's Preface to the 'Lives of Edward the Confessor,' published among the 'Chronicles and Memorials of Great Britain and Ireland.' 'Eulogium Davidis, Regis Scotiæ,' printed in Twysden's 'Decem Scriptores,' and in Pinkerton's 'Vitæ Sanctorum Scotiæ,' and by Fordun, but with some omissions by each: 'De Genealogia Regum Anglorum,' of little if any historical value, but a curious work; partly printed in Twysden's 'Decem Scriptores': 'Vita S. Margaritæ Reginæ Scotiæ': 'Chronicon ab Adam ad Henricum I.:' and several more of which only the titles are known. Ailred also wrote a 'Compendium Speculi Charitatis'; 'De Vinculo Perfectionis'; 'De Lectione Evangelica'; 'De Natura Animæ'; 'De Amicitia, sive Dialogus inter Hominem et Rationem,' a Book of Homilies; and several other theological treatises. A complete collection of his previously printed works is given in vol. cxcv. of the Abbé Migne's 'Patrologiæ Cursus completus.' For special information respecting any of Ailred's historical writings, the reader should consult Mr. T. Duffus Hardy's 'Descriptive Catalogue of Materials relating to the History of Great Britain and Ireland,' vol. i. p. 638; vol. ii. pp. 247 and 293, and the references there given.

*AINMULLER, MAXIMILIAN EMANUEL, a distinguished painter on glass, was born at Munich, February 14, 1807. He was intended for a learned career, but by the advice of Gärtner, the architect, who had detected his peculiar talent, he was induced to make decorative art, and particularly that of the mediæval German artists, his study; and later, at the instigation

of Hess, he directed his attention specifically to the investigation of early glass painting, both in its technical and artistic aspects. In this he was so successful that, in 1828, King Ludwig of Bavaria made him inspector of his newly established Royal Painted Glass Manufactory, Munich; and from that time he has laboured continuously to improve the materials and the processes of the art. The painted glass prepared under Ainsmüller in the Royal Munich works has long secured a European reputation, and is in its way unrivalled. Much of it has even been placed in British churches, but it is very different in kind to English painted glass, and its admission depends upon a different principle to that which has long ruled in this country. Here the main object has been to form the design by setting up, in a leaden frame work, comparatively small pieces of differently coloured glass, so that, by a sort of mosaic, the glass itself, with little aid from the pencil, makes the picture; and hence this, which is the method of the glass-workers of the Middle Ages, is sometimes termed the Mosaic method. The method adopted by Ainsmüller in the Royal Munich works is to employ larger sheets of glass, upon which the design is actually painted or enamelled, the painting as it advances being submitted to repeated "firings" in a furnace of an equable and carefully regulated temperature. In this, which is a modification of the method of the glass-workers of the Renaissance, and known as the Enamel method, the window is a transparent painting. Under Ainsmüller have been painted the windows added, since 1828, to the cathedrals of Regensburg, Augsburg, Basel, and Cologne; many churches in Bavaria; St. Nicholas, Hamburg; the Wilhelmina Schloss, Stuttgart; the church of St. Peter and St. Paul at Rome; and many other continental churches, whilst here we may note Kilndown Church, Kent; St. Peter's College, Cambridge; St. Paul's Cathedral, London; Glasgow Cathedral; and one or two churches in Ireland. Herr Ainsmüller is not merely an able and learned director of artistic work, but is himself a good designer and executant. Much of the architectural ornament and framing, a rather prominent feature in the Munich windows, has been designed by Ainsmüller. He also paints oil pictures of architectural subjects with much skill and taste. German critics especially praise his views of Westminster Abbey, and the Interior of St. George's Chapel, Windsor, painted from sketches made during a visit to England in 1849. Views of St. Mark's, Venice; the Cathedral of St. Stephen, Vienna; Ulm Cathedral; and the like, have appeared at the Munich exhibitions, and many of his works are to be seen in German galleries.

AINSWORTH, HENRY, an eminent Nonconformist divine and commentator, first mentioned in 1590, when he joined the followers of Robert Brown, then called Brownists but afterwards Independents [ROBERT BROWN, E. C. vol. i. col. 952]. With many of his fellow separatists Ainsworth fled from persecution at home to Holland, where he joined a Brownist congregation, of which Francis Johnson was the minister, and in which Ainsworth was a recognised teacher. Ainsworth was a scholar, a man of wide theological learning, a keen controversialist, and had a fluent pen; and with a view to moderate the opposition of the Dutch clergy, especially that of Arminius, then the leading minister at Amsterdam, Ainsworth drew up, in conjunction with Johnson, 'The Confession of Faith of certain English People living in the Low Countries exiled,' 1596. It was reprinted in 1598 with some alterations and a dedication "To the reverend and learned men, students of Holy Scripture in the Christian universities of Leyden in Holland, of St. Andrews in Scotland, of Heidelberg, Geneva, and other the like famous schools of learning in the Low Countries, Scotland, Germany, and France," and again republished in 1602 and 1604. But differences both as to doctrine and discipline broke out in the Brownist church and led to considerable secessions, and much unseemly recrimination, which Heylin, after his manner, has greatly exaggerated. With a view to allay the strife Ainsworth seems to have withdrawn for awhile to Ireland. After his return to Amsterdam old controversies were revived, and eventually Ainsworth and Johnson took opposite sides on the questions of baptism and church government. As neither could convince the other, and neither would remain silent, Ainsworth and his followers withdrew in 1610, and founded another church at Amsterdam, of which Ainsworth became pastor, the two congregations being known as Johnsonians and Ainsworthians, and each party is said to have excommunicated the other. Johnson, who seems to have been the more impetuous, shortly after withdrew with his adherents to Embden, where he died, and his church was broken up. Three or four strongly worded tracts were published by Ainsworth in connection with these disputes, but amidst

them all he was more usefully employed in the preparation of a work which has been found of service by divines of all denominations, and which has been highly praised by many who differed most widely from Ainsworth's peculiar views: 'Annotations on the Five Books of Moses, the Psalms, and the Song of Songs.' It comprises a literal translation of the books named as well as a commentary, and was published in separate parts in 1612 and following years, and reprinted in London in a single volume in 1627 and 1639, and several times since. The last edition, we believe, was in parts, Glasgow, 1842-43. A Dutch translation of the whole work was published at Leuwarden in 1690, and a German translation of the commentary on Solomon's Song at Frankfurt in 1692. The work is that of a good Hebrew scholar and a learned and able divine. Besides his occasional controversial publications, Ainsworth wrote one of more lasting value, and which may still be referred to with advantage, against the Church of Rome—'An Arrow against Idolatry taken out of the Quiver of the Lord of Hosts'; he also wrote some valuable non-controversial works, as a 'Treatise of the Communion of Saints,' 'The Book of Psalms, Englished both in Prose and Metre,' and 'The Orthodox Foundation of Religion,' a posthumous work published in 1641, with a preface by the editor, Mr. Samuel White. Ainsworth died at Amsterdam suddenly in 1623. Neal relates a strange story of his having been poisoned by a Jew, but as it is quite unconfirmed, and inherently improbable, it is not worth while to repeat it.

AITON, WILLIAM, gardener and botanist, was born in the neighbourhood of Hamilton, Scotland, in 1731. In 1754 he was engaged as assistant to Mr. Miller, author of the 'Gardener's Dictionary,' and curator of the Physic Garden at Chelsea. Here his assiduity and ability gained him friends, and he was appointed by George III. in 1759 to form the Botanic Garden at Kew. This he accomplished successfully, and during the 34 years the Gardens were under his direction he raised them to an unexpectedly high rank. Their excellence is well shown in his work 'Hortus Kewensis, or a Catalogue of the Plants cultivated in the Royal Botanic Garden at Kew,' 3 vols. 8vo. 1789, which also proves him to have been for the time a tolerable botanist, as well as a first-rate gardener. A second edition of the work, edited by his son and successor at Kew, William Townsend Aiton, but having the advantage of the revision of Robert Brown, was published in 5 vols. 1810-13. William Aiton died Feb. 1, 1793, and was buried in Kew churchyard, near the graves of his friends Zoffany and Gainsborough, the celebrated painters.

AKEN, JEROME VAN, called BOSCH, from his birthplace Hertogenbosch (Bois-le-Duc), a distinguished early Dutch artist, was born about 1450, though Immerzeel says 1470. Of his life nothing authentic is known. Van Aken painted in the neat sharp manner of the Van Eycks and their followers, but the treatment of his subjects was essentially different. He was the originator of that fantastic style of which Breughel is considered the chief exemplar. Temptations, scenes with demons and strange animals, towns on fire, and grotesque medleys seemed to have an irresistible attraction for him. In the Berlin Museum is a curious 'Last Judgment' from his pencil. Another characteristic work, 'The Temptation of St. Antony,' is in the Antwerp Museum (No. 41). Of this there is a well-known engraving on wood, which (on the authority of Immerzeel) is generally attributed to the painter; but it bears the date 1522, when he had been dead for four years, and it is improbable that he ever engraved on wood (Passavant, 'Peintre-Graveur,' tome ii. 285). He executed, however, several good engravings from his own designs (Passavant has identified 15), including 'The Sufferings of Job,' 'Christ between the Madonna and St. John,' 'Christ delivering the Patriarchs from Hades,' a battle, and two or three grotesques. The date of Van Aken's death is ascertained from an entry of it under 1518 in the register of the brotherhood of Bois-le-Duc (*Broederschap te s'Hertogenbosch*), of which he was a member, "*Hieronymus Agnen, alias Bosch, insignis Pictor.*" Kugler, Passavant, and some other recent writers have, since the discovery of this entry, written his name Van Agnen, but there is no doubt that Van Aken is the correct spelling. (See M. A. Pinchart in the *Bulletins de l'Académie royale de Belgique*, tome iv.)

ALABASTER, WILLIAM, was born in 1567, at Hadleigh in Suffolk, "and by marriage," says Fuller, "was nephew to Dr. John Still, Bishop of Bath and Wells. He was bred a fellow in Trinity College, in Cambridge," and took his degree of M.A. at that university, being afterwards, July 11, 1592, admitted *ad eundem* at Oxford. In June, 1596, he accompanied the expedition sent against Cadiz, as chaplain to the Earl of Essex, the

commander-in-chief of the land forces. While in Spain he went over to the Church of Rome. He published a vindication of the step thus taken; and his pamphlet, or pamphlets, gave rise to a controversy which had not terminated in the year 1604. Alabaster appears to have remained abroad till 1610, in which year he either first, or at least permanently, returned to his native country, and became reconciled to the Church of England. About four years after his adoption of the Romish faith, he addicted himself to what is termed Cabalistic divinity, or the Secret theology (*arcana theologia*) as he calls it, which consists in the combination of particular words, letters, and numbers, by which it is pretended that a clear insight into the sense of Scripture may be obtained. Of this kind of learning he gave evidence in a quarto volume, which he published at Antwerp in 1607, with the title of '*Apparatus in Revelationem Jesu Christi*.' This treatise was so ungratefully received by the ecclesiastical authorities at Rome, as to be put into the '*Index Librorum Prohibitorum*' in the beginning of the year 1610; a circumstance which, conjoined with the persecution and danger which he had to encounter in consequence, at Rome and elsewhere, operated very powerfully upon his mind in the direction of re-conversion to Protestantism. Upon his return to England, and his rehabilitation as a member of the Anglican communion, he took his degree of D.D., and improved the occasion by delivering himself of a discourse which was saturated with Cabalistic learning. This "*Clerum*" was founded on the text, "*Adam, Seth, Enos,*" the three opening words of the first Book of Chronicles, in which, according to Fuller, whose admiration of such a style of exposition is greater than his confidence, "he mined for a mystical meaning, Man is put or placed for pain or trouble." It was not long before Alabaster was made a "prebendary of St. Paul's, and rector of the rich parsonage of Therfield, in Hertfordshire." He died in the beginning of April, 1640.

Alabaster was the author of various theological treatises, of which may be mentioned his work entitled '*Ecce Sponsus Venit; Tuba Pulchritudinis*,' &c. 4to, London, 1633; in which he seeks to determine the date assigned to the existence of the world, and also that of the Church of Rome, his former love for which had now turned to bitterness. It is in reference to this work that Herrick, in his '*Hesperides*,' addresses a poem, which is not without suspicion of satire, "*To Doctor Alabaster*," a recognised variety of the name of Alabaster, as may be further seen by its use in Mr. Collier's '*History of Dramatic Poetry*,' where some '*Divine Meditations*, by Mr. Alabaster,' find a place. Another work of Alabaster's is a dictionary or vocabulary in five languages, entitled '*Lexicon Pentaglotton, Hebraicum, Chaldaicum, Syriacum, Talmudico-Rabbinicum, et Arabicum*,' folio, London, 1637. In addition to his prose works, Alabaster enjoyed in his own day a high reputation for his poetic genius, which was principally, though not exclusively, based upon his Latin tragedy of '*Roxana*,' for which, however, it has been discovered that he was indebted, without thinking it necessary to avow his obligation, to the Italian tragedy of '*La Dalida*,' written by Luigi Groto, commonly called the Blind Man of Hadria. Spenser speaks of Alabaster's poetry in terms of unmeasured admiration; and Fuller, referring expressly to '*Roxana*,' describes its author as "a most rare poet as any our age or nation hath produced." '*Roxana*' was acted in Trinity College Hall, Cambridge, probably in or before the year 1592; but was never fully or correctly published till its author rescued it from pirates and plagiarists by bringing out an exact edition in 1632.

ALAIN OF LILLE, in Flanders (Latinized ALANUS DE INSULIS), who is frequently confounded with another Alain of Lille, a slightly elder contemporary, whom it is difficult at all times to discriminate with precision, was born about the year 1114; a date the probability of which is fortified by his own assertion—supposing him, as is most reasonable, to have been the author of the Commentary on the Prophecies of Merlin—that he was 'a little boy' (*puerulus*) in the year 1128. He was so famous as a theologian and philosopher as to have received the title of 'the universal doctor' (*doctor universalis*); and it is natural, that, in default of authentic biography, of which we have scarcely a trace, a thousand fables should group themselves about a man who had any pretensions in his age to be distinguished by such a designation. An assertion of Henry of Ghent (*Henricus Gandavensis*), whose death occurred less than a century after that of Alain, makes it probable that Alain was rector of the ecclesiastical school at Paris; but the circumstance is not mentioned by other writers of, or near, his own time. Alain died about the year 1202, in the Abbey of Cîteaux, whither he had retired, according to the most natural explana-

tion, in order to exchange the literary bustle and rivalry of the schools for the religious seclusion of the convent; but, according to the traditions which are so free with his name, in a spirit of remorse for his presumption in having undertaken to explain the mystery of the Trinity. The most noteworthy of the numerous writings of Alain are (1.) the '*Anticlaudianus*,' or *Encyclopædia*, a moral allegory in Latin hexameters, in nine books. It has been published several times. The poem is an imitation of Claudian's poem against Rufinus, whence its title of *Anticlaudianus*. (2.) '*Doctrinale Minus* [sometimes called '*Doctrinale altum*,' a title which properly belongs to another work of the same writer] seu *Liber Parabolarum*,' a collection of proverbs and maxims in elegiac verse. The maxims relate sometimes to morals, sometimes to natural philosophy, and are often weighty and well expressed. A translation in French verse was published at Paris, A.D. 1492, in quarto. (3.) A treatise against Heretics and Unbelievers, in four books. The first two books were printed by Jean Masson, 8vo, Paris, 1612; and, again, with the beginning of the third, in the collection of Alain's works by De Visch. The authors of the '*Histoire Littéraire de la France*' vindicate Alain's claim to the authorship of the Commentary on Merlin's Prophecies, in opposition to several writers of good reputation, who ascribe it to Alain, bishop of Auxerre. The work, from internal evidence, was written by a member of one of the monastic orders, and between the years 1167 and 1183. It shows considerable acquaintance with English history. Alain's poetical works are his best. His controversial pieces are also considered good, but his other theological works have little in them that deserves notice.

ALASCO, or À LASCO, JOHN, whose real name was JOHN LASCZKI, was born in the year 1499, in Poland, and belonged to a family of so high a rank that he is stated by Fox the Martyrologist, his contemporary, to have been uncle to King Sigismund the First. By way of complement to the education he had received at home, he visited the most celebrated universities on the continent of Europe, especially those of Italy, France, and the Netherlands. At Zurich he became acquainted with Zwingli, and imbibed the doctrines of the Swiss reformers, which he afterwards advocated at large in his various writings. In 1525 he spent some time at Basel, where he contracted an intimate friendship with Ecolampadius and Pellicanus, but especially with Erasmus, of whose library, after the death of that eminent scholar, he became the possessor. On his return to Poland in 1526, he was appointed provost of Gnesen, and afterwards of Lencicz also. When, ten years later, two bishoprics were offered to him at once, the religious opinions which he had long been cherishing and developing forbade him to accept either of these high offices; and he received permission from King Sigismund to resume his travels in foreign countries. This permission had been sought by Alasco from a twofold desire of extending his knowledge and of practically carrying out his religious views with greater freedom than was tolerated in his own country. In 1537 he stayed for some time at Mainz, after which he spent two years at Louvain, where he married. In the course of these two years he also visited Wittenberg, and made the acquaintance of Melancthon. Soon after 1540 he went to Emden, in East Friesland, where he enjoyed the confidence of Count Enno, and after his death, of the Countess Anna; and where he found the ecclesiastical atmosphere so congenial that, after a short visit to his native country in 1542, he returned to Friesland. He acceded to a request that he should undertake the office of preacher to the Protestant community at Emden, and the superintendence of all the newly-established Protestant communities in the country. In the face of considerable difficulties and obstacles he achieved the completion and final settlement of the Reformation in this part of Holland. He wrote a Manual of the reformed doctrines, in which he followed the views of the Swiss reformers, his adhesion to which, especially those in reference to the Lord's Supper, stood in the way of his acceptance of a brilliant offer made to him by Albert, Duke of Prussia, who wished him to settle in his dominions. The publication of the Augsburg '*Interim*' (1548) embarrassed his operations in Friesland, so that he was glad to comply with an invitation given him by Archbishop Cranmer, at the request of King Edward VI., to come over to England. Here he added to the duties of chief preacher to the congregation of foreign Protestants, then sojourning in London in large numbers as refugees from the intolerance of their several countries, the superintendence of all their churches and schools. For this congregation, which in the year 1554 consisted of more than 3000 members, Alasco drew up an admirable constitution, '*Forma ac Ratio*

totius Ecclesiastici Ministerii Eduardi VI., in Peregrinorum, maxime Germanorum, Ecclesia,' London, 1550. In connection with this work it may be mentioned that he subsequently published at Emden, 'Simplex et fidelis Narratio de Ecclesia Peregrinorum in Anglia,' Emdæ, 1553; a work which was preceded by an admonitory letter to Christian, King of Denmark. The accession of Queen Mary, in 1553, necessitated the departure of Alasco, and the breaking up of the congregation, more than 300 of whom accompanied him to Denmark, where he trusted to find a place of refuge for them. But in the winter of the same year, Alasco was obliged to quit Denmark, in consequence of his declared disapproval of the ritual adopted in that country, and especially of the manner in which the Lord's Supper was administered. The Danish king, however, tempered the severity of dismissal from his territories by various acts of kindness to Alasco and his friends. Alasco repaired first to Emden, and afterwards to Frankfurt-on-the-Main, where he attempted to organize the body of foreign Protestants who had taken up their abode there, and many of whom had been members of the ecclesiastical corporation which had been established in London. In 1556 he finally retired to his native country, where he became one of the first and most active reformers in Poland. He was one of the eighteen divines who co-operated in the Polish translation of the Bible, which was published in 1563. Alasco, however, was denied the gratification of witnessing the completion of the work, as his death took place on the 13th of January, 1560.

It may be surmised that his literary, as well as his practical, controversies, were principally concerning the Lord's Supper. The most remarkable of his works, which are all in Latin, are, besides those already named, his 'Defensio veræ Doctrinæ de Christi Domini Incarnatione adversus Mennonem Simonis,' 1545; 'Brevis et dilucida de Sacramentis Tractatio,' 8vo, London, 1552; 'Epistola continens Summam Controversiæ de Cœna,' and 'Confessio de nostra cum Christo Domino Communionem, et Corporis item sui in Cœna Exhibitionem,' London, 1552; 'Catechismus Major,' London, 1551; 'De recta Ecclesiarum instituendarum Ratione Epistolæ III.' 1556; and 'Purgatio Ministrorum in Ecclesia Peregrinorum Francofurti adversus eorum Calumnias,' Basel, 1556, 8vo. His other writings, which consist chiefly of letters of a controversial nature, are scattered in various works.

ALBER, ERASMUS (Latinized Alberus), a German theologian, born about 1500, though the precise year is uncertain, and whose native place is variously stated to have been the Wetterau, and Spredlingen, near Frankfurt, was a contemporary and zealous friend and partisan of Luther. He was educated at Nidda and Mainz; and in 1520 was a student of theology under Luther, at Wittenberg. After the completion of his studies, he introduced the doctrines of the Reformation into various parts of Germany, having been successively teacher or preacher at St. Ursel, Götzenham, Spredlingen, Neubrandenburg in the Mittelmarch, Staden, Babenhausen, and Magdeburg. He was a constant martyr to the unsparing faithfulness of his ministry; and his inclination to satire and his resolute opposition to what he conceived to be abuses in church or state, involved him in continual change of scene and pastoral duty. His dismissals inveterately followed almost immediately upon his appointments. During 1552, and the commencement of the following year, he lived as a private person at Hanburg; from which seclusion he was appointed to be superintendent-general at Neubrandenburg in Mecklenburg. He had scarcely assumed the duties of his office when he died, May 5th, 1553.

Alber's character exhibits qualities which are almost antithetical. He was one of the most learned and witty men of his age, zealous and indefatigable as the champion of the Reformation, the interest of which he advanced by controversial and broadly satirical writings. As a fabulist he achieved considerable success; and as a hymnographer, is considered to be inferior to Luther alone of all the sacred singers of his time, whilst by some he is even reckoned as equal to Luther. Most of Alber's works are in High German, but a few are written in Low German. One of the most remarkable is his abridgment of the 'Conformationes S. Francisci' of Bartholomæus Albicicus of Pisa, in which the resemblance of S. Franciscus to Christ is set forth and supported by various miraculous occurrences of his life. Alber added to these stories numerous satirical and sarcastic notes, which made the work so popular that it was translated into Latin, French, and Dutch. It was first published, without date or place, in a duodecimo volume, entitled 'Der Barfüsser Münche Eulenspiegel und Alkoran, mit einer schönen Vorrede Martin Luther's.' It was reprinted at Wittenberg,

1542, 4to, and without place in 1573, 8vo. Another edition appeared at Halle, 1615, 4to. The fact of the preface having been written by Luther, led Conrad Badius, who translated it into French, into the mistake of attributing the entire work to the reformer. Alber's other productions are his News from Rome, 'Neue Zeitung von Rom,' &c., 4to, 1541, a bitter satire upon the Pope; a satirical dialogue on the Augsburg 'Interim,' 4to, 1548; two satirical attacks upon George Wizelius, whom, on account of his return to the Church of Rome, after having embraced Lutheranism, Alber compares to Judas Iscariot; a kind of Epic Poem in honour of Luther; a book on Marriage; several Hymns; and a collection of forty-nine Fables in verse, which bore the title of the Book of Wisdom and Virtue, 'Das Buch von der Tugend und Weisheit, nemlich xlix Fabeln, der mehrere Theil aus Esopo gezogen und mit guten Rheimen verkleidet,' 4to, Frankfurt, 1550; reprinted at Frankfurt, 1579.

ALBERT, PRINCE CONSORT. The memoir of the Prince Consort, in the BIOGRAPHICAL DIVISION of the E. C., vol. i., col. 86, was brought down to the year 1856. Beyond that period there is little of a public nature to record. The Prince's sympathy with all benevolent objects; his interest in the progress of the fine and industrial arts, and generally in whatever might tend to promote the well-being of the people at large, have been there sufficiently noticed. But about this time it seemed as though the events of the past years had led him to take a more decided part in the great social movements of the day. The impression appeared to have been deepening in the mind of the Prince that what most urgently demanded public consideration, or that which it lay most within his own line of duty and capacity to direct attention to, was the necessity for extending and improving primary instruction. He longed to see what he termed "the right of knowledge" recognised as the patrimony of all: and by endeavouring to render its possession attainable he believed that he should best assist in bringing about what he regarded as, in the actual state of society, the object which every one should desire, a more genuine feeling of mutual sympathy and good-will between the different classes in the country. Hence we find him present alike at the opening of the day-schools in the wretched district of Golden-lane, Barbican, in March, 1857; at the inauguration of the Art Treasures Exhibition, Manchester, in the following May; and in June presiding at the Educational Conference, London. In his address at the opening of the Manchester Art Treasures Exhibition, whilst expressing his warm admiration of "the building and the wonderful treasures of art which it displays," as well as of "the wealth and spirit of enterprise of this country" of which it is a sign, it is with its educational purpose he feels most sympathy, and especially "that generous feeling of mutual confidence and good-will between the different classes of society within it, of which it affords so gratifying a proof." At the opening of the Golden-lane schools, while recognizing the difficulties and hindrances in the way of the very poor sending their children to school, he exhorted those who had influence with them to urge the immense benefits of education to their children upon "the minds and hearts of parents, and to place before them the irreparable mischief which they inflict" by withholding it. With even greater earnestness were his sentiments expressed at the meeting of the Society for Improving the Condition of the Labouring Classes: "Depend upon it, the interests of classes too often contrasted are identical, and it is only ignorance which prevents their uniting for each other's advantage. To dispel that ignorance, to show how man can help man notwithstanding the complicated state of civilized society, ought to be the aim of every philanthropic person; but it is more particularly the duty of those who, under the blessing of Divine Providence, enjoy station, wealth, and education." It was in this spirit, and deeply impressed with the sense of this duty, that the few remaining years of the Prince's life were spent. How much he might have accomplished, as his disinterested earnestness of purpose came to be more and more clearly understood and appreciated, in furtherance of the mental and physical improvement of the ignorant and suffering, and in promoting a better feeling among all, it is now, of course, impossible to say, and would be idle to speculate. But it is necessary to recognise this as the governing principle of the Prince's later years in order to appreciate properly his public acts.

It was in June, 1857, that the title of Prince Consort was formally conferred on Prince Albert. In January, 1858, his eldest child, the Princess Royal, was married to the Crown Prince of Prussia—a union which had long been an object of warm interest to him. He did not live to witness the marriage

of another of his children, but the formal announcement was made to Parliament in May, 1861, of that between the Princess Alice and Prince Louis of Hesse. In August, 1858, the Queen and Prince Consort visited the Emperor Napoleon at Cherbourg, on occasion of the opening of the Napoleon Docks.

We have in the former notice spoken of the share which the Prince had in promoting the Great Exhibition of 1851, and the interest which he felt in exhibitions of objects of industrial art, and especially those of an international character. During the autumn of 1861 his time and thought were much occupied by the International Exhibition, which had been fixed to be held at South Kensington in May, 1862, and which, profiting by the experience gained in 1851 and by the French Exhibition of 1857, he was anxious should surpass all previous efforts. This exhibition was the last matter of public interest on which he was engaged. Immediately after attending a meeting in November for making the general arrangements, he was seized with the illness which terminated in death on the 14th of December, 1861. His body was placed temporarily in the vaults of St. George's Chapel, Windsor, but it has since been removed to a magnificent mausoleum, erected by the Queen for its reception, at Frogmore. At the same time, what was known as the Wolsey Chapel, Windsor, has been restored and fitted in a very costly manner by the royal children, as a memorial of their father.

The unexpected death of the Prince at the early age of 43, in the full enjoyment of an unusual measure of domestic happiness, in the midst of his projects for promoting the well-being of the people with whom his lot had been cast, and just at the time when his character had come to be clearly understood and his single-heartedness appreciated by all ranks and parties, caused profound and universal sorrow for the public loss, and the deepest sympathy with the bereaved Queen. Public testimony to the general feeling was given by providing a fund, partly by a parliamentary vote, partly by a public subscription, for the erection of a memorial, on the site of the first Great Exhibition of 1851, of a richer and more costly description than any public monument previously erected in England. And near it, as an additional memorial, and in order partly to carry into effect the Prince's frequently expressed wishes and views, a vast amphitheatre is being erected, to be called the Royal Albert Hall of Arts and Sciences. Memorials taking the form of statues, crosses, painted windows, schools of design, day-schools, local museums, mechanics' institutes, new wings to hospitals, or some other object of ornament or utility have been erected, not only in almost every great town in the kingdom, but in very many of the smaller towns, in testimony of the general respect with which the Prince's memory is cherished.

The public estimate, indeed, was not excessive. The Prince had devoted himself to the service of the country as no one in his position had previously done. We mentioned in the previous notice that one of the earliest acts after his marriage was to go through (1840-41) a regular course of reading on the constitution of England with Mr. Selwyn, an able nisi-prius barrister and a sound and learned constitutional lawyer, with a special view to fitting himself to fill rightly his place by the throne. And during the years he occupied that place his interest in all public affairs was unceasing, and his influence decided; but, always careful to observe strictly his true position as the partner of a constitutional sovereign, his influence was never obtruded, and by many hardly suspected. Statesmen of all parties, and, indeed, men of every calling and rank who were brought into association with the Prince for what we may call business purposes, have borne willing and ample testimony to the Prince's clearness of apprehension, soundness of judgment, and readiness of resource, and equally so to the earnestness with which he gave time and labour to the furtherance of the matter in hand, and the attention and courtesy with which he listened to every suggestion. Of his private character and domestic habits it is unnecessary and would hardly be becoming to speak, but something has been shown us of both by the Queen herself in 'Leaves from the Journal of Our Life in the Highlands from 1848 to 1861.' To Her Majesty, also, we are indebted for full and authentic materials for ascertaining the Prince's matured views on many social and some political matters, and for an ample and carefully-written biography. The former we find in the 'Speeches and Addresses delivered on different Public Occasions by the Prince Consort,' 8vo, 1863; the biography in 'The Early Years of H.R.H. the Prince Consort, compiled under the direction of Her Majesty the Queen, by Lieut.-General the Hon. C. Grey,' 8vo, 1867. This latter volume, written originally "for the use and study of his children," and at first printed only for

Private circulation among the royal family and a few personal friends, consists, as stated in the Introductory Remarks (p. xxiv.), of "a compilation of letters and memoranda, the greater part" by "the Prince himself and the Queen," and traces "the whole career of the illustrious Prince—his progress from boyhood to manhood," down to the end of the first year of his married life. The continuation, which will carry on the narrative "from manhood to the grave," has been entrusted to Mr. Theodore Martin, who, for its "prosecution will have the same advantages as to information from authentic sources that have been enjoyed in the preparation of the present volume" (*Preface*, p. xiii.).

ALBERTINI, GIORGIO FRANCESCO, by his monastic name, Giorgio Maria, an Italian theologian, was born on the 29th of February, 1732, at Parenzo, in Venetian Istria. In his thirteenth year he entered the order of St. Dominic; and after the completion of his studies at Venice, speedily acquired great reputation as a preacher throughout the whole of Italy. In 1787 he was summoned to Rome by the Cardinal Antonelli, and commissioned by Pope Pius VI. to investigate a difficult question in ecclesiastical order; an answer to which he delivered in a long and erudite dissertation in two volumes, which drew on him many enemies, and for the publication of which he was chagrined to find he could not procure the necessary sanction. He was, however, appointed by the Pope to the chair of dogmatic theology in the college of the Propaganda at Rome; and about three years afterwards, to the principal chair of theology in the university of Padua, then vacant by the death of Father Antonio Valsecchi, who had recommended Albertini as his successor. He discharged the duties of this chair, till its suppression by the new government of Italy in 1807; when he retired to his native town of Parenzo, and continued teaching theology in the seminary there till his death on the 29th of April, 1810, at the age of 78.

The works of Albertini are numerous, and amongst them may be distinguished his 'Osservazioni,' &c., Ferrara, 1781; some observations, published anonymously, in opposition to an irreligious French publication, 'Le Philosophe Militaire,' and to an answer to it, by Count Francesco Riccati, entitled 'L'Antifilosofo,' which was, in Albertini's opinion, hardly more orthodox than the work it professed to refute. His 'Dissertazione dell' Indissolubilità del Matrimonio' was published at Venice in 1792; to which, in reply to the attacks of Pellegrini, one of the disappointed competitors for the chair of Padua, he afterwards added an Epistle and Dissertation on the Marriage Question, 'Epistola e Dissertazione,' &c., Padua, 1804. The most important work of Albertini, however, and the one which was the immediate cause of the vehement assault of Pellegrini, was his 'Acroasi ossia la Somma di Lezioni teologiche,' Padua, 1798, Venice, 1800-2; a summary of his theological lectures, in five volumes, to which he afterwards added a sixth, entitled, 'Scholia,' Venice, 1808. The sermons, upon which the reputation of Albertini was originally founded, were, in spite of the remonstrances of his friends, committed to the flames by their author, some time before his death; but he left behind him several unpublished works.

ALBIN, ELEAZAR, an excellent draftsman of natural history, was born towards the end of the 17th century, but the years of his birth and death are alike uncertain. He was established in London as a teacher of drawing, when, having been employed to make some drawings of insects, he was led to a close study of objects of natural history, and in 1720 published an expensive quarto volume entitled 'A Natural History of English Insects, Illustrated with a hundred copperplates, curiously engraved from the life, and exactly coloured by the author.' Some of the plates are dated as early as 1713. A second edition was published in 1724, and a third in 1749. It also appeared with a Latin title and text, 'Insectorum Angliæ Naturalis Historia,' 4to, 1731. Other works by him are, 'A Natural History of Spiders and other curious Insects,' 4to, London, 1736, containing 53 coloured plates, and a portrait of Albin on horseback, by J. Scotin: of this an extended edition, "revised, enlarged, and designed anew by T. Martyn," appeared in 1794; 'A Natural History of Birds,' 3 vols. 4to, 1731-38, illustrated with 306 copperplates "engraved from the life and exactly coloured by the Author; to which are added Notes and Observations by W. Derham;" 'A Natural History of English Song Birds, and such of the Foreign as are usually brought over and esteemed for their singing: to which are added figures of the Cock, Hen, and Egg of each species, exactly copied from Nature by E. A.,' 12mo, London, 1737: of this work the author published a second edition in 1747, and a third in 1759, which is the last known of

him, and he probably died not long after. A new edition of the 'Song Birds' was issued in 1779, and in 1794 appeared a folio volume entitled 'The History of Esculent Fish, with 15 coloured plates drawn and engraved by Eleazar Albin: with an Essay on the Breeding of Fish and the Construction of Fish Ponds by Roger North.' Albin's drawings are admirable; his written descriptions are loose and valueless.

ALBINUS, BERNARD, a celebrated German anatomist and physician, was born at Dessau, January 7th, 1653. After studying at Bremen and Leyden, and obtaining a medical degree at Leyden University, he travelled in France and in Flanders, and was then appointed Professor of Medicine at Frankfurt-on-the-Oder. He acquired a high reputation as a practitioner, and was invited to Potsdam as physician to the great elector, Frederick William. Returning to Leyden in 1702, he held the Professorship of Medicine in that University for nineteen years, the medical school attaining great distinction under his direction. He died Sept. 7, 1721. His *éloge* was pronounced by the celebrated Boerhaave. Albinus published above fifty memoirs and dissertations, among the chief of which were 'De Corporeculis in Sanguine Contentis'; 'De Tarantula Mira'; 'De Sacro Freydenwaldensium Fonte'; 'De Melancholia'; 'De Epilepsia.' His lectures were published in 1792-95, under the title 'Causæ et Signa Morborum.'

ALBINUS, BERNARD SIEGFRIED, son of the preceding, was an anatomist of much greater fame. Born at Frankfurt-on-the-Oder, February 24, 1697, he studied medicine at Leyden under his father, but paid especial attention to anatomy, in which the university professors were of unrivalled eminence, and which continued to be his favourite study during the remainder of his life. Among his instructors were Boerhaave, Rau, Ruysch, and Senac. At the early age of twenty-two, in 1719, he succeeded Rau in the chair of anatomy at Leyden. He became almost equally eminent as a teacher and as an original investigator, during his professional career of more than fifty years. Some of his engraved plates of bones and muscles were regarded as of high value; and as publishers feared the expense, he bore much of the cost of publication himself. Besides editing the works of Harvey, and the anatomical works of Vesalius, Fabricius, and Eustachius, he published 'De Ossibus Corporis Humani' (1726); 'Historia Musculorum Hominis' (1734); 'Annotationes Academicæ,' in eight books, 1754-68; Treatises on the Vascular System of the Intestines, and on the Bones of the Fœtus; and numerous other works. He died at Leyden, September 9, 1770.

ALBRECHTSBERGER, JOHANN GEORG, musical composer and writer, was born February 3, 1736, at Klosterneuburg, near Vienna. He entered young as a choir boy in the church of St. Martin in that town, where the organ on which he learned is still preserved as a valued relic. After studying accompaniment and counterpoint under Mann, chief organist at Mölk, he was employed as organist at Raab, Maria-Tafel, and Mölk. In 1768 he married Rosalie Weiss, daughter of Bernard Weiss, a sculptor. Four years afterwards he obtained the post of organist to the Court of Vienna, and in 1792 that of kapellmeister at St. Stephen's Cathedral in the same city. During more than twenty years' residence in Vienna he was the centre of a large and influential musical circle; his compositions were greatly admired; he was regarded as the chief of contrapuntists; Haydn formed a high estimate of his powers; and he was one of the very first of teachers, numbering among his pupils Beethoven, Hummel, Seyfried, Moscheles, Eybler, and Weigl. He was a voluminous writer of music. His published works include eleven fugues for the organ, three preludes for the same instrument, four fugues for the pianoforte, eighteen string quartettes, several sonatas and quintettes, &c.; but Fétis gives a much longer list of music still in MS., and belonging to Prince Esterhazy, comprising masses, gradualls, vespers, litanies, psalms, Te Deums, motetts, allelujahs, oratorios, canticles, and other sacred pieces. Albrechtsberger is better known at present, however, for his treatises on 'Harmony, Thorough Bass, and Composition,' and the 'Theory of Music,' which superseded earlier works by Fuchs and Marpurg, and have become standard authorities. His treatise on Harmony was first published in 1790; but his pupil Seyfried, kapellmeister and opera director at Vienna, afterwards edited a collection of this and his other works. There is an English translation, but from a French edition. Albrechtsberger, who had a numerous family of nine sons and six daughters, died at Vienna, March 7, 1809.

ALCOCK, JOHN (Alcok, Alkok), son of William Alcock, sometime burgess of Kingston-on-Hull, was born at Beverley, in Yorkshire, where he received his elementary education. Thence

he repaired to the University of Cambridge, where he achieved great distinction, particularly for his knowledge of the civil and canon law. He commenced LL.D. in or before 1461, in which year he was called to the rectory of St. Margaret's, New Fish Street, London; and was advanced, on the 29th of April, 1462, to the deanery of the Chapel Royal, St. Stephen's, Westminster. In 1468 he obtained a prebend in the cathedral church of Salisbury, and another in that of St. Paul, London; and there is reason to believe that about the same period he was suffragan to the Bishop of Norwich. His civil advancement, according to the fashion of the time, fully kept pace with his ecclesiastical preferment. In 1470 he was named a Privy Councillor, and in March of that year, a few months before the short return of Henry VI. to regal power, was employed by Edward IV. on an embassy to John II., King of Castile. On the 29th of April, 1471, immediately after the battle of Barnet, which replaced Edward IV. upon the throne, Alcock was appointed to the Mastership of the Rolls; and on the 26th of August, in the same year, was at the head of the English commissioners empowered to treat with the Scottish ambassadors for a perpetual peace between the two kingdoms. When Thomas Rotherham was translated to the see of Lincoln, Alcock was preferred to succeed him in the diocese of Rochester, March 17th, 1472, having on the previous day resigned the Mastership of the Rolls to John Morton; and when Stillington, Bishop of Bath and Wells, and Lord Chancellor, gave up the duties of the latter office on account of a temporary illness, the Great Seal was placed, September 20th, 1472, in the hands of Bishop Alcock, who, as keeper thereof, opened the parliament which assembled on the 6th of October following. This parliament was prorogued by Lord Chancellor Stillington, who had by this time recovered his health, on the 5th of April, 1473. In July of the last-named year Alcock resigned the vicarage of Caster St. Trinity, in Norfolk, and was instituted, May 28th, 1474, to the rectory of Wrensham, in Suffolk. In this year the Bishop of Rochester was created by patent tutor to the Prince of Wales, afterwards Edward V., and president of his council, an office of which he actively performed the duties when he was sent by the king to reside with the prince and Earl Rivers (gubernator principis) in the Marches of Wales. Similar duties were for several years of occasional recurrence to Alcock, who is known as the first holder of the dignity of Lord President of the Council of the Marches of Wales, or, more popularly, Lord President of Wales. "A curious instance of the royal favour occurred in the year 1475, when both Alcock and Rotherham held the title of Lord Chancellor for several months together, affording a solitary instance in the history of this kingdom of two chancellors acting at the same time. The fact is incontestably proved by the evidence of numerous Privy Seal bills addressed to both by the same title, from April 27th to September 28th, 1475. This extraordinary circumstance may be thus explained:—When the king planned his invasion of France he intended to be accompanied by his Lord Chancellor, Bishop Rotherham, and, feeling it necessary to provide for the business of the chancery in England, he nominated Bishop Alcock to take the duty during the chancellor's absence. Instead, however, of pursuing the customary practice of making him merely Keeper of the Seal, he, as a mark of special favour, invested him with the title of Chancellor, intending that the regular Chancellor should be with him during the whole period of his absence in France. It happened, however, that from some cause or other the armament was delayed from April to July, so that during these months Privy Seal bills were addressed to both officers in England, frequently on the same day, and from the same place. The last writ of Privy Seal addressed to Bishop Alcock is dated on September 28th, after which Bishop Rotherham, having returned from France, resumed his functions as sole Chancellor." The foregoing quotation is made from Mr. Foss's 'Judges of England,' because that gentleman is the first at once to state and to explain an unparalleled circumstance. In 'Athenæ Cantabrigienses,' the fact of the joint occupancy is barely mentioned as one "of which no similar example is known;" whilst Lord Campbell ('Lives of the Chancellors') is at a loss to understand what he conceives to be the arbitrary deposition and the arbitrary reinstatement of Rotherham, whose performance of the business of the chancery had been more than commendable. The fact, as now laid open, is that neither deposition nor reinstatement took place at all.

In 1476 Bishop Alcock was translated to the see of Worcester, the temporalities of which were restored to him on the 25th of September. Over this diocese he presided for the rest of the reign, during which he enlarged the church of Westbury, and

founded a school at Kingston-on-Hull, where he built a chapel over the remains of his parents at the south of the church, endowing a chantry there also. In 1478 he is found actively engaged in the performance of his duties as Lord President of Wales; and he was a trier of petitions in the last parliament of Edward IV. On the death of that monarch in 1483, he was removed from the preceptorship of his infant successor by the protector, Richard, Duke of Gloucester, by whom, however, he was exempted from imprisonment, and treated altogether with more kindness and consideration than mostly fell to the lot of the young king's faithful servants. On the return of Henry VII. as conqueror and king from Bosworth field, August 22, 1485, Bishop Alcock, for the second time, was appointed Lord Chancellor. The date of the delivery of the Great Seal to him is not recorded; but he was present, as "Cancellarius Magnus Angliæ" at the coronation, October 30th, and on the 7th of November assisted at the opening of the first Parliament of Henry VII.; in which he skillfully and efficiently superintended the difficult questions it had to decide. The most important of these turned upon the effect of the attainder, by a parliament of Richard, of a great number of the temporal peers now summoned, and even of the sovereign himself, as Earl of Richmond. The chancellor and the judges decided with unanimous loyalty, "that the descent of the crown of itself takes away all defects and stops in blood by reason of attainder," which has ever since been received as a maxim of constitutional law; and "no doubt," says Lord Campbell, "was relied upon by the Jacobites, who attempted to restore the princes of the House of Stuart, attainted under King William, Queen Anne, and George I." The services of Lord Chancellor Alcock were rewarded by his being translated by a bulla provisionia, dated October 6th, 1486, to the Bishopric of Ely. He obtained the royal assent and the temporalities on the 7th of December following, and was enthroned on the 17th of the same month. There seems, however, to have been little serious intention to employ Bishop Alcock after the government of Henry VII. was fairly started; and the king reserved his more intimate confidence for John Morton, who had been in exile with him, who had been attainted for adhering to him, who had mainly contributed to his elevation, and whose advancement to the primacy it was which had left the see of Ely vacant for Alcock. Morton succeeded Alcock as Lord Chancellor, but the exact date of the transfer of the Great Seal to the former is not known, as it is not recorded in the Close Roll. It is supposed, however, to have taken place in August, 1487; and was certainly before November in that year, when there were bills addressed to him as chancellor, which are still extant. Whilst holding the incumbency of the diocese of Ely, Alcock performed the baptismal ceremony on the Princess Margaret, afterwards Queen of Scotland; as it had fallen to him, whilst Bishop of Worcester, to baptize Prince Arthur, of whose Council of the Marches of Wales he is found acting as president, January 31st, 1494.

His political career was now drawing to a close, for on the 27th of April, of the same year, Bishop William Smyth was Lord President of Wales. Alcock's name occurs, however, so late as the twelfth year of Henry VII. (1496-7), as one of the triers of petitions. The remaining years of his life were occupied with the affairs of his diocese; and he died at his castle at Wisbeach, October 1st, 1500, leaving behind him a great reputation for learning, tact, and ability, and greater still for virtue and sanctity. He was esteemed and respected by his contemporaries, and was named by Judge Lyttelton as the supervisor of his will. Coke, in relating this fact, calls him "a man of singular piety, devotion, chastity, temperance, and holiness of life." Bishop Alcock was buried under a tomb bearing his effigy in the beautiful chapel—lately restored at the cost of Jesus College—which he had erected for himself at the north-east end of Ely Cathedral. He had great skill in architecture, which, along with the revenues of his various preferments, he lavished upon the erection, repair, and adornment of ecclesiastical edifices in various parts of the country from Malvern to Hull and Beverley. He was a benefactor to Peterhouse; but his most memorable act of munificence was the foundation, in 1497, of Jesus College, Cambridge, on the site of the ancient but reduced nunnery of St. Rhadegund, which had been founded by Malcolm, King of Scots.

Besides 'Homilies,' 'Meditations,' and 'A Poetical Paraphrase of the Seven Penitential Psalms,' Bishop Alcock wrote several small works, as the 'Spousage of a Virgin to Christ,' 4to, 1486; 'Galli Cantus ad Confratres suos Curatos in Synodo apud Bernwell,' printed in 4to, London, 1498, by Pynson, and Wynkyn Worde; 'Mons Perfectionis ad Carthusianos,' 4to, London, 1501; and 'Abbatia Spiritus Sancti,' an 'Abbey of Saint Spirit'

BIOG. DIV.—SUP.

that is founded in a Place that ys clepyd Conscience.' This was published in Latin at London, 1531, in 4to, and again in English at Westmestre by Wynkyn Worde, in 4to. There are three MS. copies of it in the library of the University of Cambridge, and one in the Harleian collection, Codex, 2046, art. 41. In the Abbey of the Holy Spirit, which this work describes, Charity is the abbess, Wisdom the prioress, and Meekness sub-prioress.

ALCOCK, JOHN, organist and musical composer, was born in London, April 11, 1715. In 1722 he entered as a choir-boy at St. Paul's Cathedral, and in 1729 was placed under the tuition of Stanley, organist of the Temple Church and of St. Andrew's Holborn. Alcock was appointed organist at St. Andrew's Plymouth, in 1737; at Reading in 1742; and at Lichfield, in 1749. He passed the remainder of his long life as organist and choir-master of Lichfield Cathedral, receiving the degree of Mus. Bach. Oxon. in 1755, and Mus. Doc. in 1785. He composed and published a large number of hymns, psalms, motetts, services, Te Deums, Jubilates, &c. His chief collected works are:—'Harmonia Festi,' consisting of canons, airs, &c.; and 'Harmony of Sion,' an arrangement for four voices of about a hundred psalms. Alcock died in 1806, in his ninety-first year.

ALDHELM, Anglo-Saxon scholar, bishop and saint, was born in Wessex, about 650 or 656, the son of Kenter, a kinsman of King Ina. There is some difficulty as to whether the celebrated Adrian who came over to Kent with Theodore [ADRIAN, E. C. S.] was his first teacher in Greek and Latin, or Meildulf, an Irish monk who settled as a hermit in what was then the Forest of Wiltshire, and, finding teachers few, gathered about him a number of youths from the nearest villages, whom he instructed in Latin and rhetoric. Be that as it may, Aldhelm was one of Adrian's earliest scholars, and under him made so rapid a progress as to astonish alike his teachers and his schoolfellows.

On his return to Wessex, Aldhelm, finding that Meildulf's scholars, the master being dead, had continued the hermitage as a seminary, joined them, assumed the religious habit, and after a brief visit to his old master, Adrian, settled down to diligent study and teaching. His superior attainments, prudence, and piety, led the brethren to elect him as their head, and under his guidance the school acquired so high a reputation that scholars resorted to it not only from the neighbourhood, but even from Ireland and France. Aldhelm himself, according to his first biographer, Faricius, was so well skilled in the Greek language that he could both write and speak it like a native; was the ablest Latin scholar since the days of Virgil; read the Psalms of David, the Books of Solomon, and the Laws of Moses in the original Hebrew; played excellently on all the musical instruments then in use; and was a persuasive orator. The establishment was now formed into a regular monastery, and Aldhelm was ordained, and appointed abbot by Eleutherius, bishop of Winchester. His rule was strict, and the abbey so flourished that Meildulfesbyrig, as the houses which had gathered about the original seminary were called by the people, grew into a town, the name being gradually softened down into Malmesbury.

In 687 Aldhelm was invited to Rome by Pope Sergius I.; stayed there some time, and obtained from the pope the exemption of his monastery from episcopal jurisdiction. On his return he built a church at Malmesbury; founded dependent religious houses at Frome-Selwood: made many converts by preaching in the open air, and several times journeyed to Canterbury at the request of the archbishop. At the Synod called by King Ina, about 698, with a view to induce the Britons to adopt the Roman reckoning for the celebration of Easter, Aldhelm was appointed to write a letter to the King of Cornwall on the subject, and the reading of this letter, Bede, writing but a few years later, assures us, persuaded many of the Britons who were subject to the West Saxons to adopt the Roman rule. ('Hist. Eccl.' B. V. cap. 18.) In 705 Aldhelm was appointed first bishop of Sherborne. He died whilst on an episcopal visitation at Douling, in Somersetshire, May 25, 709, and his body was carried to Malmesbury for interment. The date of his canonisation is not clear. His relics were translated by Abbot Warin in 1080.

Aldhelm has been called the father of Anglo-Latin poetry, and King Alfred placed him in the first rank of Anglo-Saxon poets. His Latin, however highly esteemed in his own day, was regarded as corrupt when William of Malmesbury wrote, though some of his pieces were still popular. His most celebrated Latin poems are a celebration of the saints and martyrs who had devoted themselves to a life of chastity ('De Laude S.S. Patrum et Virginum,' or 'De Virginum') on which subject he also wrote a prose treatise; and a collection of riddles entitled 'Ænigmata,' both of which are in hexameter verse: these and other verses

E

attributed to him have been often printed, and are given both in the 'Maxima' and the 'Magna Bibliotheca Vit. Patrum.' None of his vernacular poems have come down to us, unless, as is not improbable, the version of the Psalms, printed by Mr. Thorpe, is by him; or, it may be, modified from the translation he is said to have made. His principal prose work is the treatise 'De Virginitate' already referred to, but several 'Epistles' have been printed in the collections just mentioned, as well as elsewhere. All his writings which have been preserved are given in 'S. Aldhelmi Opera,' 8vo, 1842, forming the first volume of 'Patres Ecclesiæ Anglicanæ,' edited by Dr. Giles.

The earliest life of Aldhelm was written by Faricius, a native of Arezzo in Tuscany, by profession a physician, who came over to England, was admitted a monk of Malmesbury, and there wrote the life of Aldhelm. He subsequently was made Abbot of Abingdon, gained the favour of Henry I. who wished to make him Archbishop of Canterbury, and died in 1117. The life is full of wild stories of miracles wrought by Aldhelm during his life, and by his remains subsequently, but it is the chief source of our information respecting him. A second life, by William of Malmesbury, compiled in 1125, partly as he states from the former life by Faricius, but with additions from his own local knowledge and the information of certain old monks of Malmesbury. The narrative is less overlaid with marvels than that of Faricius, and brings the history of the abbey of Malmesbury down to the time of the writer. Both lives have been several times reprinted; as has likewise an abridgment of William of Malmesbury's 'Vita S. Aldhelmi.' There is also a metrical 'Life of Aldhelm the Confessor' in old English verse attributed to Robert of Gloucester, of which there are three copies among the MSS. of the British Museum, and as many in the Bodleian Library.

(Lives by Faricius and William of Malmesbury; *S. Aldhelmi Opera*; Bede, *Hist. Eccl.*, B. v. cap. 18; *Biog. Dic. of Soc. for the Dif. of Useful Knowledge*; Wright, *Biog. Brit. Lit.*, vol. i.; Hardy, *Desc. Cat. of MSS.*, vol. i. p. 389, &c.)

ALDRED, or EALDRED, known also as Aldredus, Alredus, and Ealredus, who was Archbishop of York in the 11th century, was originally a monk of Winchester, and afterwards abbot of Tavistock. He stood high in the favour of Edward the Confessor, by whom he was preferred, in 1046, to the diocese of Worcester. He was the first English bishop who made, 1050, a pilgrimage to Jerusalem, which he accomplished by way of Hungary. Upon his return he was charged by King Edward with a mission to the Emperor Henry II., requesting him to obtain the return from Hungary of Edward Atheling, the son of Edmund Ironsides, and spent nearly a year in Germany. He administered the see of Wilton for three years during the absence of Bishop Herman, and the see of Hereford for four years from 1056. On the 25th of December, 1060, Aldred was raised to the Archbishopric of York, and permitted by the King to retain the see of Worcester *in commendam*, as, it is affirmed, some of his predecessors had done. Upon his going to Rome for his pallium, 1061, Pope Nicholas II. not only refused it, but deprived him of his former dignities on the alleged ground of simony. Thus disappointed, he took leave of Rome, but in crossing the Alps he and his party were plundered, so that they were obliged to return to Rome for succour. With much importunity he succeeded in obtaining his confirmation in the archiepiscopal see at the hands of the Pope, who, however, yielded to him only on condition that he should relinquish the bishopric of Worcester. With this condition he formally complied, although by the King's consent he retained twelve manors or towns belonging to the see. Aldred's acts of ecclesiastical munificence and discipline include the restoration of St. Peter's, Gloucester, in 1058; the building of refectories for the canons at York and at Southwell; the finishing of the one at Beverley, and the introduction of a uniform habit for the clergy of his province. Aldred strongly favoured the claims of Harold to the English throne, and officiated at his coronation. On hearing of the death of that prince on the field of Senlac, Aldred, with archbishop Stigand, assembled the citizens of London, and in a hurried folk-mote proclaimed Edgar the Atheling king. But he soon saw the hopelessness of resistance, and with Edgar and the leading citizens of London repaired to Berkhamsted and submitted and gave hostages to William the Conqueror, whom, in default of the willingness or eligibility of Stigand, archbishop of Canterbury, to perform that office, he afterwards crowned. He appears to have kept William in a more than wholesome dread of the powers of the Church, and of his own in particular. On one occasion it is said that the King, overwhelmed by the vehement expostulation of the indignant archbishop, knelt at

his feet till he was appeased. After a year, however, Aldred fled into Scotland with Edgar, and thus broke his allegiance to William. His death took place on the 10th of September, 1069, and he was buried in York Cathedral; being succeeded in his province by Thomas, a canon of Bayeux. The death of Aldred is variously stated to have been caused by his disgust at the exactions of the Conqueror, and by vexation and grief at the insurrection of the inhabitants of his province, who, supported by an invading party of Danes, under Sueno, had declared for Edgar Atheling, whose cause there is every reason to believe the archbishop himself favoured in his heart. Aldred is said to have written a treatise entitled 'Pro' Edgardo Rege contra Tyrannidem Normanorum,' in which the whole matter of the English succession is examined.

ALDRICH, ROBERT, whose name varies as Aldridge and Aldryge, in Latin Aldrisius, or Aldrigus, was born at Burnham in Buckinghamshire, towards the close of the 15th century. He was educated at Eton, and became scholar and fellow of King's College, Cambridge. About the time of his proceeding to his M.A. degree he attracted the regard of Erasmus, who speaks of him as "blandæ eloquentiæ juvenis," and whom he accompanied as friend and interpreter, on the occasion of the pilgrimage made by the great scholar to our Lady of Walsingham. In 1523 Aldrich was one of the preachers sent forth from the University, to preach in different parts of the kingdom, as there was at that time a great scarcity of persons qualified for such an office. From the frequency of similar commissions to men of eloquence, arose the appointment, in many colleges, of College Preachers, who were allowed to hold livings with their fellowships, as an encouragement for them to do their duty in the circuits which they used to make throughout the nation. The elegance and purity of Aldrich's Latin style were so remarkable that we find him, according to an entry in the Proctor's Book, for 1527, employed by the University to write three letters to the King, "Magistro Aldryg pro tribus literis missis ad Dominum Regem, 10s." On the 18th of July, 1528, he was appointed to a stall, "centum solidorum," in the cathedral church of Lincoln; which in the following January he quitted for the more substantial prebend of "decem librarum." Aldrich proceeded to his D.D. degree in April, 1530; and on the 30th December, 1531, was preferred by the king to the archdeaconry of Colchester. He was appointed a canon of Windsor, by patent dated May 3, 1534, and was installed four days after; and in the same year was made registrar of the Order of the Garter. In 1537 he became chaplain and almoner to Queen Jane Seymour; provost of Eton, of which he had been successively a pupil, a master, and a fellow; and finally, on the 24th August in the same year, received the temporalities of the see of Carlisle, to which he had been nominated by the king in the preceding month of July. It says much for the versatility and the powers of accommodation of Bishop Aldrich, that he was able, in spite of the changes in church and state incident to twenty years of unsettlement, to retain the incumbency of his diocese until his death, on the 5th of March, 1556. This event took place in a manor-house belonging to the bishops of Carlisle, at Horncastle in Lincolnshire; and here Aldrich was buried. He was the author of several small productions in literature and theology. His first writings were chiefly against Robert Whittington, a grammarian of the time. As registrar of the Order of the Garter, he devoted himself to the illustration of its antiquities; and translated into Latin and abridged the 'Registrum Chartaceum,' which his predecessors had written in French. As Bishop of Carlisle, his replies to 'Queries put concerning some Abuses of the Mass,' are printed in Burnet's 'History of the Reformation,' part ii., book 1, Collection of Records, No. 25. And Wood, in his 'Athenæ Oxonienses,' refers to Aldrich certain Resolutions concerning the Sacraments, and concerning bishops, priests, and other matters relating to the Reformation.

ALEANDRO, GIROLAMO (ALEANDER, JEROME) was the son of a physician at Motta, in Friuli, where he was born, on the 13th of February, 1480. At the age of 13 he applied himself to the study of belles lettres at Venice, where, in the year 1500, he gave public lectures on the 'Tusculan Questions' of Cicero. His reputation won for him the admiration and esteem of Aldus Manutius, who, in 1504, dedicated to him, as to a perfect master, not only of the Latin, Greek, and Hebrew, but also of the Chaldean and Arabic languages, a mathematician, a musician, and a poet, his celebrated Greek edition of Homer. So high was Aleandro's character, that Pope Alexander VI. invited him to Rome, and intended to make him secretary to his son, Cæsar Borgia—a questionable promotion, which Aleandro

escaped by a timely illness, during a mission as the pope's envoy to Hungary. During his stay in Venice he had been admitted to the intimacy of Erasmus, with whom he resided at the house of Andrea Asolano, the father-in-law of Aldus. In 1508 he visited France, at the invitation of Louis XII., who conferred upon him the professorship of belles lettres and the Greek language, and afterwards the rectorship of the University of Paris. He remained in France till the year 1514, when he was made chancellor to Everard de la Marck, Bishop of Liège, by whom he was subsequently sent to Rome, to negotiate with the Pope for his promotion to the dignity of cardinal. This mission was successfully performed by Aleandro, who so well conciliated the good opinion of the pontiff, Leo X., that he was detained at the Papal court, and at length appointed librarian of the Vatican, in succession to Zenobio Acciajuoli, in 1519.

At the commencement of the following year he was sent by the Pope to oppose the spread of the doctrines of Luther in Germany, and was appointed to officiate as papal nuncio at the Diet of Worms. The excitement in favour of Luther in that portion of Germany through which Aleandro had to pass was so great as to expose him to neglect, insult, and discomfort, so that he approached Worms with feelings of exasperation and animosity against the Reformers. To the influence of Aleandro at the Diet of Worms the shameful treatment of Luther, the proscription of his person, and the burning of his books, are generally ascribed. The edict against the reformer, which was finally adopted by the emperor and the diet, was drawn up by Aleandro, who designated the Lutherans as "a motley rabble of insolent grammarians, licentious priests, disorderly monks, ignorant advocates, degraded nobles, misled and perverted plebeians." Such language was not likely to be lost on a man like Luther, who retaliated with invectives the most bitter against Aleandro, whom he declared to be a Jew, who did not believe in the Resurrection, and whom he accused of covetousness, lust, arrogance, pride, and vanity. It is certain that the zeal of Aleandro was fiery and impetuous, and that he was given to luxury and ostentation; yet it should not be forgotten that, if Protestant historians speak of his "Epicurean morals," Romish authors, on the other hand, applaud his "blameless life."

The violent conduct of Aleandro disgusted the more moderate of his own party, and especially Erasmus, from whom he was now completely estranged; but he did not forfeit the pontifical favour and confidence, for in 1523 Clement VII. made him Archbishop of Brindisi and of Oria, and despatched him as nuncio to the French court. In this capacity he was present with Francis I. at the battle of Pavia, in 1525, and shared the captivity of that monarch. A considerable outlay of money procured the enlargement of Aleandro in 1526, when he returned to Rome, from which city, however, he was glad to retire in 1527, on account of the outrages and the enmity of the Colonna faction. He sought safety in his diocese of Brindisi, and remained there until 1531, when the Pope recalled him to Rome, and sent him again to Germany to the Diet of Spire, which subsequently met at Ratisbon in the spring of the following year. The violence of his former proceedings frustrated his strenuous exertions to prevent the emperor concluding a truce with the Protestant princes of Germany, and he went as nuncio to Venice, where he remained until 1535, when the then Pope, Paul III., desirous of rewarding his devotion to the church, recalled him to Rome for the purpose of creating him cardinal. But this dignity was, on political grounds, withheld till 1538, in which year Aleandro went into Germany, for the third time, as legate from the Pope. He returned in 1539 to Rome, where he continued to reside until his death, on the 31st of January, 1542.

His principal works in print are 'Lexicon Græco-Latinum,' folio, Paris, 1512, now very scarce; 'Tabulæ sane utiles Græcarum Musarum Adyta Compendis ingredi volentibus,' 4to, 1515, an abridgment of the Greek grammar of Chrysoloras; and a piece in Latin verse, entitled 'Ad Julium et Næseram,' and inserted in the collection of Math. Toscanus, 'Carmina Illustrium Poetarum Italorum.' Aleandro's verses manifest considerable poetical aptitude. At the time of his death, the earliness of which prevented him from filling the presidency of the Council of Trent, for which he was designed, Aleandro was engaged upon a treatise 'De Concilio Habendo,' of which he left only four books, but which, incomplete as it was, was often consulted for the regulation of the proceedings of the Council of Trent. But of all the works which Aleandro has left, that which Mazzuchelli, his biographer, in the 'Scrittori d'Italia,' considers as most important, is a MS. volume, which contains the letters and other documents relating to his legations against the heresies of Luther,

which are preserved in the library of the Vatican, and from which Pallavicino has largely drawn for the early part of his 'History of the Council of Trent.'

ALEANDRO, GIROLAMO, commonly called the younger, born at Motta, in Friuli, July 29, 1574, was distinguished, like his great-uncle, the cardinal, by remarkable precocity, as an instance of which, it is stated that at the age of 16 he composed paraphrases of the Seven Penitential Psalms in the form of odes, which were greatly admired, and in 1593 published, under the title of 'La Lagrime di Penitenza.' At the age of 26 he published his commentary on the Institutes of Caius, which obtained for him the offer of the chair of jurisprudence in several Italian universities. For 20 years he served as secretary to Cardinal Ottavio Bandini, and only resigned, in 1624, to take the same office under Pope Urban VIII. In 1625 he accompanied Cardinal Barberini as councillor to France, where the unaccustomed good living brought on an ill state of health; which caused him to return to Rome, instead of proceeding with the cardinal to Spain. Aleandro died at Rome, March 9, 1629, and was interred with great splendour at the cost of Cardinal Barberini. He was regarded as one of the most learned Italians of his time, and Rossi greatly praises the purity and elegance of his style. Besides the Commentaries and Penitential Psalms, he wrote some Latin and Italian poems, and several treatises on antiquities and other subjects. A list of his writings is given in Mazzuchelli's 'Scrittori d'Italia.'

ALEKSÆEV, or ALEXEJEV, FEODOR YACOVLEVICH, a distinguished Russian artist, was born in 1755; studied in the Academy of the Fine Arts, St. Petersburg, where he carried off several prizes, and then went to Italy. Here, devoting himself particularly to the representation of architecture, he fixed his residence for some time at Venice, and acquired, from the class of subjects and style of his paintings, the title of the Russian Canaletti. On his return to St. Petersburg, 1779, he was appointed scene painter at the Imperial Theatre. This office he retained till 1787, from which time he occupied himself with painting small architectural pieces in oil. In 1801 he was commanded by the Emperor Paul to visit the chief cities of the empire, and take views of the public buildings, &c. He returned laden with drawings and sketches, from which he executed a series of paintings, now in the gallery of the Hermitage, and which are of great interest, not only as works of art, but as affording a tolerably complete and faithful idea of the appearance of the cities of Russia half a century ago. The views of Moscow afford almost the only trustworthy representation of its architecture prior to the conflagration of 1812. Aleksæev was elected member of the Academy of Fine Arts in 1794, and professor of perspective in 1803. He died November 23, 1821. His works are neatly and carefully drawn, well composed, and cleverly executed. The pictures painted during the last five years of his life are, however, much feebler than his earlier works.

ALEMAND, LOUIS AUGUSTIN, French writer, was born at Grenoble in 1653, and brought up as a Protestant, but abjured that faith in 1676. He was educated for the bar, and practised with success at his native place, but changed his career, studied medicine, and in 1693 was admitted to the faculty at Aix. Not meeting with success as a physician, he after a time went to Paris and devoted himself to literature; but towards the end of his life returned to Grenoble and to the practice of his first profession. He died there in 1728. Alemand is a good and useful writer, though his works are now probably never read, and seldom referred to. They comprise—'Nouvelles Obligations, ou guerre civile des Français sur la langue,' 12mo, Paris, 1618: a series of critical remarks on the history of separate words. Alemand promised six more volumes, but its continuation is said to have been prevented by the interference of the French Academy. Goujot, in his 'Bibliothèque Française,' praised the work very highly. 'Nouvelles Remarques de M. de Vaugelas sur la langue Française, ouvrage posthume, avec des observations de M. . . . Avocat au Parlement,' 12mo, Paris, 1690; 'Histoire Monastique d'Irlande,' 12mo, Paris, 1690. This work was dedicated to the exiled James II., his wife and son, is carefully and fairly written, and formed the foundation of the more pretentious work of Captain Stevens, 'Monasticon Hibernicum,' London, 1722. 'Journal Historique,' 8vo, Paris, 1694. This was to have been an annual volume, something like our Annual Register, but only one was published. Alemand announced his intention to publish abridgments of Dugdale's 'Monasticon Anglicanum,' and 'Baronage,' but they never appeared.

ALEOTTI, GIAMBATTISTA, Italian architect and engineer, was born at Argenta, in Ferrara, in 1546. Of humble origin, he

worked first as a mason, but by diligence and study, particularly of mathematics, he gradually raised himself, and in 1571 was taken into the service of Duke Alfonso II. of Ferrara as his engineer. After the death of Alfonso, in 1597, Ferrara being annexed to the Papal States, Aleotti was directed by Pope Clement VIII. to erect the citadel. He was subsequently employed by several of the princes and nobles of this part of Italy, Mantua, Modena, Parma, and elsewhere. His chief work was the great theatre at Parma, erected for Ranuccio I., and opened in 1619, which excited great admiration as one of the first designed in what was called the modern style: a full account of it was published by Donati, 'Gran Teatro Farnesino di Parma,' 1817. Aleotti was the founder of the Academy degli Intrepidi, at Ferrara, in 1600. He wrote 'Considerazioni d'Architettura di Geometria e d'Idrologia'; took part in the engineering discussions caused by the serious inundations in Ferrara, Romagna, and Bologna; and edited Hero of Alexandria's treatise on Pneumatics. He died in 1636. His daughter, VITTORIA ALEOTTI, attained some eminence as a musical composer. She studied at first under Pasquino, but afterwards in the musical school of the convent of St. Viti at Ferrara, where she passed the rest of her days. She published a 'Ghirlanda de' Madrigali,' Venice, 1593.

ALES, ALEXANDER (or ALESS, ALESSE, ALANE, ALESIUS), an eminent theologian of the 16th century, was born at Edinburgh, on the 23rd of April, 1500. He was educated at the University of St. Andrews, and obtained a canonry in the collegiate church there. At an early age he entered into controversy as an opponent of Luther, and also withstood the doctrines which had been imported from Marburg by Patrick Hamilton. His zeal for the Roman Catholic religion was staggered by the discourses of Hamilton, who was a young man of high rank, and of excellent parts and attainments, and the constancy and meekness with which he encountered martyrdom at the stake, February 28th, 1528. A too frank avowal of sympathy with the opinions of the Reformers, and a vigorous attack, in a sermon before the Synod of St. Andrews, on the corrupt lives of the clergy, brought Ales into peril for heresy; so that, after having been three times imprisoned, and as often liberated by his brother canons, he fled, in 1534, first to England, and afterwards to Germany. In 1535 he again visited England, where he became acquainted with Thomas Cromwell, and through him with Henry VIII., and many of the English Reformers, including Cranmer, Archbishop of Canterbury. The king regarded Ales with so much favour, as to speak of him as "his scholar." Upon the fall of Cromwell, he was obliged once more to seek refuge in Germany; and was appointed, in 1540, professor of theology at Frankfurt on the Oder, by the Elector of Brandenburg, who deputed him, with two others, to the Conference of Worms, 1541, in the discussions of which, however, he was forbidden by Cardinal Granville, who presided for the Emperor Charles V., to take a part. The next year, in a public disputation at Frankfurt, Ales maintained the power and the obligation of the civil magistrate to punish fornication; a proposition which was so distasteful to the laity generally, and so particularly obnoxious to the court of Brandenburg, that the too bold champion of purity was glad to retire, 1543, to Leipzig, where he was chosen professor of divinity, and held the office till his death on the 17th of March, 1565. On the 29th of November, 1560, in a public disputation held in the University of Leipzig, Ales maintained the necessity and merit of good works, thus espousing and affirming the doctrine of G. Major, who had raised the question. The works of Alexander Ales are numerous and miscellaneous, although for the most part they arrange themselves very naturally into three groups or divisions—(1) Commentaries on various Books of the Old and New Testament; (2) Works in favour of reading the Scriptures in the vernacular tongue, and against the bishops and others who are unwilling to concede the privilege; and (3) Works of Controversy on questions agitated between the Roman Catholics and the Protestants.

ALESSANDRI, ALESSANDRO (ALEXANDER AB ALEXANDRO), was born at Naples, about the year 1461. He was early destined for the legal profession, and, by way of preparation for his technical education, seems to have enjoyed a careful classical training. At Naples, he is said to have studied under Guinaiio Maio, a scholarly person, who is at present chiefly known for his devotion to the study of oneirocritics. Between the years 1475 and 1481, it would appear that Alessandri was prosecuting his studies at Rome; after the completion of which he began to practise both at Rome and Naples, and in the latter city he is said to have held the office of royal prothonotary in 1490. The iniquity

of the bench, to quote his own testimony, at length compelled the abandonment of his profession; and the latter years of his life, which were spent at Rome, were made tolerable through the kindness of the Pope, who conferred upon him some sinecure appointments, of which the emoluments just reached the limits of comfort. Alessandri died at Rome, on the 2nd of October, 1523, in the 62nd year of his age.

He published, in what year is unknown, four Dissertations on Dreams, Spectres, &c., the substance of which is embodied in four chapters of his 'Dies Geniales,' fol. Rome, 1522; a work in six books, each of which comprises from 26 to 32 chapters. Alessandri's stories of prophetic dreams, terrible spectres, mermaids, &c., would imply great credulity, if there were not good reason to question his veracity. His style is easy, the matter sometimes interesting, and sometimes frivolous. Great part of the book is occupied with desultory discussions on Roman antiquities; occasional legal difficulties are started, but even in discussing them, the philologist preponderates; they read like extracts from the note-book of one who had opportunities of hearing the conversation of good scholars.

*ALEXANDER II., NICOLAIEVICH, Emperor of Russia (styled Tzar, and Autocrat of all the Russias), was born the 29th (O.S. 17th) of April, 1818. The eldest son of the Emperor Nicholas, he was educated with a special view to his succession to the throne, the general supervision of his studies being assigned to General Mörder and B. Schukovski, but the Emperor is said to have himself directed his military training, and carefully watched against the intrusion of any anti-Russian ideas. The stern discipline to which he was subjected is supposed to have fostered, if it did not induce, the silent and almost morose disposition which distinguished him even when a young man. At the age of 16 he was declared of age, promoted to high office in the army, and made aide-de-camp to the Emperor. The state of his health causing disquietude, he was sent to visit the German courts; and in 1841 he married the Princess Wilhelmine Auguste Sophie Maria, daughter of the late Ludwig II., Grand-Duke of Hesse, who, before her marriage adopted the Greek faith, and received the name of Maria-Alexandrowna. The prince was now sent as Governor to Finland, where he carried out as far as practicable his father's directions for the "Russification" of the province. In 1850 he made a tour of inspection through Mid-Russia, the Crimea, Circassia, and other Russian provinces, and on his return was decorated with the order of St. George. Between the Archduke Alexander and his brother Constantine there had long been ill-feeling, which had on more than one occasion found vent in acts of open hostility; but before his death their father commanded them in his presence to promise friendship and mutual support when Alexander should be sovereign, and outwardly at least there has been no subsequent breach, though Alexander is accused of placing his brother in situations which may interfere with his popularity, or tend to lower him in the eyes of his countrymen.

The Emperor Nicholas died on the 2nd of March, 1855, and Alexander was without opposition proclaimed Emperor. In a manifesto addressed to the country, he declared his intention to continue in the line of policy inaugurated by his father, and to act in all things with a view to the furtherance of the strength and glory of the empire. Before long, however, he dismissed his father's most trusted ministers, and showed a strong desire to bring to a close the war with Turkey and the Western Powers, which had proved so disastrous for Russia, and to which he is said to have been always privately opposed.

The treaty of peace was signed at Paris in March, 1856, and the Emperor was now free to carry out the policy of internal improvement which he had declared to be his primary purpose. Among the improvements contemplated the most important were the reform of the system of administration; an amelioration of the criminal laws and improvement of the judicature; a better organisation of the army; an extensive development of the resources of the country; construction of railways and improvement in the means of communication generally; extension of education, and enlargement of the liberty of the press. These intentions, it is needless to say, have only been in part effected. Yet the improvement has been real. Administrative reform has proved a nullity, as all acquainted with the almost universal malversation of the government officials throughout the empire expected it would. The conscription has been rendered easier, and the condition of the soldier raised. Education extends but slowly, but something has been effected for its improvement and extension alike in the

universities and the schools of a lower grade. The primary schools now number nearly 1000, with a return of about 1,000,000 scholars on the books. Something has also been done for the culture of self-reliant habits by the grant of representative institutions for local government, imperfect in themselves and fenced about with formidable restrictions, but containing perhaps the germ of a wider freedom. They consist of departmental and general councils, which, by a Ukase of January 1, 1864, came into operation in 1865. The members are elected for three years; persons of all classes are eligible for the office, and they deal, within certain limits, with the economic and administrative questions relating to the district. By another Ukase promulgated in April, 1865, the press was relieved to a certain extent from the previous rigid censorship exercised over it. It is still surrounded with strict police regulations, but it exercises considerable freedom of political and almost unlimited licence in social discussions. The consideration of the broader, and, so to speak, abstract subjects of political and social science, in the periodicals is practically unrestrained. Scientific studies are of course not interfered with, and the Emperor has evinced a strong disposition to support those branches of science which bear on the physical condition of the country, and to assist scientific travel: in statistical inquiries, however, Russia is suffered to remain sadly in arrears. Efforts have been made at the Emperor's instigation to reorganise the financial department of the government, and also to improve the banking and monetary system of the country. The revenue has greatly increased, but the expenditure has more than kept pace with the increase; the deficiency has consequently had to be met by loans, which have added considerably to the national debt. Trade and commerce have largely augmented, and are evidently capable of an immensely greater development, as is shown by the continuous annual growth of both the exports and imports. The most striking advance, however, is in the railways and telegraphs, to which the Emperor lends all the aid in his power: at the present time there are above 3000 miles of railway completed, or approaching completion, and 25,000 miles of telegraph. These have been for the most part laid out primarily with a view to military and departmental service, but they cannot fail to assist enormously in the development of the national resources.

But the grand reform which will render the reign of Alexander II. an epoch in the history of Russia is the emancipation of the serfs. A Ukase of March the 3rd, 1861, declared the serfs of both classes—those who as peasants held a certain portion of land, for which they gave in return a fixed amount of labour; and those who, having no land, were virtually the property of the nobles and landowners—to be personally and civilly free. Both classes of serfs, in number about 23,000,000, were entirely subject to their lords, without whose permission they could not quit their homes or enter upon any new occupation, and by whom they could be punished, and even flogged, if disobedient. By the new decree they were removed from the jurisdiction of the proprietor, and admitted to the same rights, and made amenable to the same laws, as their fellow-subjects. Regulations were laid down for the grants of land to the emancipated serfs, and their payment by labour, or under certain conditions by means of a Government loan, and a period of transition was allowed to proprietors and serfs till 1870, when there will be entire freedom. The measure has, with some necessary qualifications, been persistently carried out. Opinions as to the consequences that have resulted from it to the present time differ considerably among even qualified and seemingly impartial observers. Of its ultimate benefits to all classes we cannot permit ourselves to doubt. Thus far the proprietors have unquestionably suffered greatly. But the benefit to the serfs themselves has been far from unalloyed. Morally the condition of the first or tenant class of serfs has improved, but materially they are said to be generally worse off. The second or *dvorori* class have changed little in their outward circumstances, but their social position has been greatly altered, and their chances of bettering their condition vastly improved.

The adoption and resolute accomplishment of so complete a scheme in the face of all opposition and difficulty afford perhaps the strongest proof of the Emperor's force of will and persistency of purpose. From the first it was opposed by the whole body of the nobles, by the old Russian party, and family and governmental traditions. But the Emperor refused to postpone, and was hardly brought to modify, his original decree. The nobles believed that it was put forth with the view to subvert their power, and for a time it seemed as though there would be a grave conflict. At an assembly of the nobles, held in January,

1862, it was formally moved to take into consideration a resolution calling upon the Emperor to abdicate in favour of his eldest son, and the motion was only lost by a majority of 18, the votes being 165 for, and 183 against it. This was a symptom of disaffection not to be overlooked. Stringent measures were adopted for the security of the Emperor's person and the safety of the seat of government, and military precautions were taken against any outbreak. But it was understood that the vote was intended rather as an intimation of dissatisfaction with the particular measure than of any purpose of revolt; and it was resolved to make some concessions. These somewhat hampered the working of the emancipation scheme, but did not materially alter it. Time was, however, gained, and the Emperor was able to use the emancipated peasantry as a check upon any hostile movement of the proprietors. The nobles have on the whole been compelled to acquiescence; any subsequent attempt at hostile action has met with a stern rebuke, and their power of deliberation and control by means of their territorial assemblies seriously abridged. Thus, the nobles of Moscow having met in full assembly, June, 1865, to claim guarantees which were refused, passed a resolution asserting the necessity for public representation, the provincial assembly of the nobles having been rendered nugatory by the institution of the provincial parliaments, whilst the political rights formerly possessed by the assemblies of nobles were only partially transferred to the popular parliaments. To this the Emperor replied by a letter addressed to the Minister of the Interior, in which, after referring to the reforms already accomplished by him, he declares that "the right of initiative in the various parts of the work of gradually perfecting those reforms belongs alone to me, and is indissolubly allied to the autocratic power confided to me by God. No class has legally a right to speak in the name of any other class, nor is any individual entitled to intercede with me in favour of the general interests, or with regard to what they consider necessities of state." Further, he wished them to understand for the future that any such deviations from the regulated order would only serve to retard the development of his plans.

Shortly after he ascended the throne the Emperor visited Warsaw. The nobles and merchants presented an address, and implored his favour. The reply contained the usual phrases of goodwill and benevolent intentions, but with them was the significant warning, "the order established here by my father must be maintained: no dreams!" Year after year the Poles found the iron hand pressing harder upon them. They were to be awakened from their fond dream of a national existence in any sense. The people were disarmed, the few constitutional safeguards were declared inapplicable to them. Any person of position who gave public expression to his dissatisfaction, and many who were only supposed to be dissatisfied, were arrested, and mostly exiled to Siberia. At length a harsh edict of conscription, which would have forced into the Russian army pretty nearly the whole manhood of Warsaw, brought matters to a crisis. Insurrection spread rapidly, and though for the most part with only improvised arms, the Poles maintained through 1863 a long and desperate struggle. They were of course beaten. The British, French, and Austrian Governments had proposed mediation, and even ventured to remonstrate against the Russian measures, but their interference was haughtily repulsed—"The insurgents must throw down their arms, and submit themselves to the clemency of the Emperor." When that hour of necessity came, the clemency was such as the character of the Emperor entitled them to expect. It is possible that the cruelties said to have been perpetrated may have been exaggerated; but the Emperor had fixed his mind on the Russification of Poland, on its absolute absorption into the empire, and he, autocrat and pope, had been defied, and his edicts disregarded. He had probably little thought of vengeance; but his decrees must be enforced, and his impassive temperament was utterly regardless of the suffering occasioned or endured. His task he believed to be to get rid of Poland and Poles as a distinct existence, and he has done his best to accomplish it. Tartar insurrections, Circassian revolts, he has treated in the same way. All such tribal or sectional efforts after a national existence must be suppressed; the cost in human life and suffering is a matter of pitiless indifference.

On the 16th of April, 1866, as the Emperor was about to enter his carriage at the gate of the Summer Garden, St. Petersburg, he was fired at by a man named Karakosoff, but the assassin's arm was seized by a bystander, who, diverting the pistol upwards, caused it to discharge harmlessly in the air. Karakosoff was a Russian of noble family; Kommisaroff, who saved the Emperor's life, was a journeyman hatter, but was ennobled on

the spot for his conduct. Great numbers of suspected persons, students, Poles, and the like, were arrested, but there was only questionable evidence of the crime being part of a conspiracy. A year later a similar attempt was made in Paris, where the Emperor was on a visit to the Emperor of the French. As the two Emperors were in a carriage in the Bois de Boulogne, a Pole named Berezowski took aim at the Tzar and fired, but Napoleon's equerry, M. Rainbeaux, observing his movement, rode forward, and his horse received the shot, the life of Alexander II. being thus a second time saved from the assassin. Berezowski was condemned to imprisonment with hard labour for life: Alexander had requested that his life might be spared.

Looking at the state of Russia during the 17 years of the reign of Alexander II., we see that it has been eminently a period of transition, and that to the personal character of the sovereign its special phase may be in an unusual degree assigned. His main purpose has been the unification, as it is called, of the empire, and in this he has been in a great measure successful. With ceaseless progression Poland, Courland, Livonia, and Esthonia have been "Russified"—the national laws, administration of justice, education, language having had to make way for those of Russia. He has also succeeded to a certain degree in improving the trade and developing the resources of the country. Like his predecessors, he has never lost sight of the extension of his territories. Convinced that the time was inopportune for actual aggression on Turkey, he has yet constantly sought to weaken her by encouraging disaffection in the Christian provinces, and making use of the ambitious tendencies of the Greeks. But, compelled to abstain from direct aggression in this quarter, he has found employment for his army by unceasing encroachment in Asia until he has brought the Russian power, if not actual Russian territory, into immediate contact with Bokhara, Afghanistan, China, and Japan, and as some fancy, into inconvenient proximity with British India. Whether the ultimate purpose or tendency of this vast extension shall prove hostile or pacific, whether it shall lead to the subjugation of ancient Asiatic kingdoms, and a struggle for ascendancy with European powers, or more happily to the opening of new and profitable channels of trade and friendly intercourse, only time can determine. But the fact cannot be without immense influence on the future of Russia, second, it may be, but only second to that resulting from what will undoubtedly remain the grand achievement of the reign of Alexander II., the emancipation of the serfs.

By his wife, the Empress Maria Alexandrowna, the Emperor has had six sons and a daughter. The eldest son, Nicolas, born September 20, 1843, died at Nice, April, 1865. The present heir to the throne, the Grand-Duke Alexander, was born March 10, 1845, and married the Princess Dagmar of Denmark, Nov. 9, 1866. The other children of Alexander II. are—Vladimir, born April 22, 1847; Alexis, born January 14, 1850; Maria, born October 7, 1853; Sergius, born May 11, 1857; and Paul, born October 3, 1860.

* ALEXANDER, WILLIAM LINDSAY, D.D., an eminent Congregational divine, was born at Leith, on the 24th of August, 1808. He was educated at first under Dr. Jamieson, at East Linton, and afterwards at the universities of Edinburgh and St. Andrews. He was distinguished for his essays on subjects in moral philosophy, and very soon began to attain a reputation as an author. After finishing his university course he was appointed classical tutor in the Independent College, Blackburn, and continued during four years to discharge the duties of his office. He then became the minister successively of Newington Chapel, Liverpool, and of Argyle Chapel, Edinburgh. This important pastorate, on which he entered in 1835, he still carries on, but in a larger and more beautiful building, erected in 1861, and named the Augustine Church. Since the death of Dr. Ralph Wardlaw, in 1853, Dr. Alexander has held, in addition to his pastorate, the professorship of theology and Church history in the Theological Hall of the Congregational churches of Scotland. He is a man of various and extensive learning, and is favourably known as a sacred poet and as a contributor of articles to the 'Encyclopædia Britannica,' as well as to 'Kitto's Cyclopædia of Biblical Literature,' 1847, of which work he lately edited a new and improved edition. He was also at one time editor of the 'Scottish Congregational Magazine.' Dr. Alexander enjoys a high reputation as a philologist and as an adept in Biblical literature, and is one of the most voluminous and scholarly of living writers. The following are among his principal works:—'The Connection and Harmony of the Old and New Testaments,' being his 'Congregational Lecture,'

1841 and 1853; 'Lectures to Young Men,' 1842; 'Anglo-Catholicism,' &c., in reply to 'Tracts for the Times,' 1843; 'Switzerland and the Swiss Churches,' 1846; 'The Ancient British Church,' 1852; 'Christ and Christianity,' 1854; 'Memoir of Life and Writings of Dr. Wardlaw,' 1856; and 'St. Paul at Athens,' 1865.

ALEYN, CHARLES, a poetical writer of considerable reputation in his day, though now almost forgotten, was born near the end of the 16th century. On the completion of his education at Sidney Sussex College, Cambridge, he came to London, and was engaged as assistant in the celebrated grammar-school kept by Thomas Farnaby, at Goldsmith's Rents, Cripplegate. He was afterwards tutor in the family of Edward Sherburne, Esq., Clerk to the Ordnance, and his pupil, afterwards Sir Edward Sherburne, attained considerable eminence as a scholar, and testified to the gratitude and friendship he felt for his teacher in some verses he addressed to him in 1638. Aleyn first appeared as a poet in 1631 in a volume of 138 pages, entitled 'The Battles of Crescey and Poitiers, under the Fortunes and Valour of Edward the Third of that Name, and his Son, Edward Prince of Wales, named the Black.' The two poems are in stanzas of six lines, consisting of a quatrain with alternating rhymes, closed by a couplet in the heroic measure, and though the metre becomes monotonous when protracted through a long poem, it is not unskillfully handled, and the story is tersely and vigorously told. A third poem of similar construction appeared in 1638, under the title of 'The Historie of that wise and fortunate Prince Henrie, of that name the Seventh, King of England; with that famed Battaille fought between the said King Henrie and Richard III., named Crook-back, upon Redmore, near Bosworth.' Several sets of commendatory verses prefixed to this poem show the admiration which the previous volume had excited. In 1639 Aleyn published 'Eurialus and Lucretia,' freely rendered, according to Oldys, from a story found among the epistles of Æneas Sylvius. He died in 1640, or, as some accounts say, in 1643, and was buried in St. Andrew's, Holborn.

ALFARABUS, the Latinized surname of a learned Arabian philosopher, who was born in Transoxiana in the 10th century. He went to Bagdad to study Arab philosophy, and also Greek philosophy through the medium of Arabian writers. After visiting Egypt (A.D. 941-2), he settled at Damascus, where he resided till his death in 950. He was a man of great learning in languages and the sciences, and wrote sixty different works on philosophy, dialectics, physics, metaphysics, optics, astronomy, &c. He was highly esteemed by Jews as well as Arabs, who translated many of his works into Hebrew and Latin. One of his writings on the elements of music gave an account of the Arab musical notes, and figures of the instruments. Some authorities credit him with the introduction of the method of sol-fa-ing, or syllable-singing. The two works which gained for him his great celebrity were the 'Ihsâ-l-olûm', or Review of the Sciences; and a parallel between the philosophical systems of Aristotle and Plato. Alfarabius was in high favour with the Sultan Seyfu-d-daulah.

ALFARO Y GAMEZ, JUAN DE, celebrated Spanish painter, was born at Cordova in 1640; received a good general education; studied painting in his native city under Antonio del Castillo, and then entered the school of Velasquez at Madrid, by whose advice he copied the works of Titian, Rubens, and Vandyck, in the Royal Gallery, and thus acquired the brilliant style of colouring to which he owed his subsequent success. His first commission on returning to Cordova was to paint a series of subjects from the life of St. Francis for the cloister of the convent named after that saint. In the designs he was said to have borrowed a good deal from engravings, but he placed *Alfaro pinxit* conspicuously under each picture. To abate his pride, his old master, Castillo, obtained permission to fill one of the unfinished compartments, and put under his picture *Alfaro non pinxit*. Alfaro painted many religious and historical pictures, both in Cordova and Madrid, but his works in this line are not of much worth. He had studied little, drew indifferently, and designed without originality or power. His strength lay in portraiture. He seized the distinctive character, produced a pleasing likeness, and coloured well. For his patrons, the Regidor Don Pedro de Arce, and the Admiral of Castile, he painted portraits of many of the most distinguished personages of the day: that of Calderon was suspended over the great dramatist's tomb in the church of San Salvador. Alfaro, who seems to have been a light-hearted and somewhat frivolous, but accomplished man, wrote verses, and made biographical notes on the painters with whom he had associated, which were arranged after his death by his brother, Henri

de Alfaro, a physician, and proved of much service to Palomino in the compilation of his 'El Parnaso Español Pintoresco laureado.' Alfaro died in 1680.

ALFEZ, RABBI ISAAC BERABBI JACOB, one of the most celebrated of the Jewish Talmudists, was born in 1013, at a village near Fez, in Africa, whence his designation, Alfez or the Fezite. He had spent a long life in his native place, teaching the principles of the Talmud, not only to his countrymen but to foreign Jews who flocked to him from all parts, when, at the age of 75, he was compelled to quit Africa through the intrigues of an opponent. Alfez took refuge in Cordova, then the flourishing capital of the Moorish kingdom, and the principal seat of Hebrew learning. He was received with great honour by the chief rabbi, and remained there for seven years lecturing on the sacred books and laws; but eventually withdrew to the quieter town of Alusina (probably the present Lucena), where he continued his studies and teaching until his death, in 1103, at the age of 90.

Alfez has always been regarded by Jewish writers and theologians with the utmost reverence, and his writings are only placed below the Talmud in point of authority. The most important, sometimes called 'The Lesser,' or 'The Little Talmud,' 'The Institutions of Rabbi Alfez' (*Hilcuth Rab Alfez*), and sometimes simply 'Alfezi,' is a sort of abstract of the Talmud, or of so much of that work as appeared to Alfez to be applicable to his time. It was first printed at Constantinople, in folio, 1509; the second edition appeared at Venice, 3 large volumes folio, 1521-22, and has been often reprinted. The best edition is that published at Sabionetta, in Italy, 1534. Many commentaries on the Little Talmud have also been published.

(Bartolocci, *Bib. Mag. Rabb.* vol. iii.; Wolfius, *Bibl. Heb.*; Buxtorf, *Bib. Rab.*, art. *Alphesi*; *Biog. Dict. of U. K. S.*, and the authorities there cited.)

* ALFORD, HENRY, D.D., Dean of Canterbury, was born in London, in the year 1810; was educated first at Ilminster Grammar School, Somerset, and afterwards at Trinity College, Cambridge. He was a wrangler, and Bell's university scholar; and took his degrees of B.A., M.A., and B.D., respectively in 1832, 1835, and 1849. His first literary production was entitled 'Poems and Poetical Fragments,' Cambridge, 1831; followed, in 1835, by 'The School of the Heart, and other Poems,' in two volumes, a work of which several editions have been published both in this country and in America. In 1834, Mr. Alford became a fellow of his college of Trinity; and was vicar of Wymeswold, Leicestershire, from 1835 to 1853. He published his 'Chapters on the Poets of Greece,' in 1841; and in 1841-42 delivered the Hulsean lectures in the University of Cambridge, which he published in 1842, under the title of 'The Divine Revelation of Redemption.' From 1841 to 1857 he acted as Examiner in Logic and Moral Philosophy in the University of London; and from 1853 to 1857 was known as the eloquent minister of Quebec Street Chapel, London. In 1854-5 he published two volumes of 'Quebec Chapel Sermons.' On the death of Dr. Lyall, in 1857, Dr. Alford was appointed by Lord Palmerston to the deanery of Canterbury. His greatest work is that entitled 'The Greek Testament, with Notes,' the first instalment of which appeared in 1849, and the whole of which was completed in 1861. The different volumes of which it consists have gone through several editions; and notwithstanding the drawback to the worth of the whole work, arising from some modifications on the part of the author during its progress, its value as a scholarly production is generally recognised. Dean Alford is also the author of several magazine articles on 'The Queen's English,' 'Journeys in Italy,' 'The Right Use of the Gospels,' &c., some of which have since been published separately; and he is the editor of 'The Contemporary Review.' He published, in addition, 'The Year of Prayer,' and 'The Year of Praise,' (1867), the latter of which is a hymnal, containing 326 hymns, of which 55 are his own. A fourth edition of his poetical works appeared in 1865, containing many pieces then for the first time collected. As a poet, he is pleasing, devout, and various; and some of his sonnets especially may be regarded as very felicitous. The last result of his poetical activity is found in the publication of 'The Lord's Prayer,' illustrated artistically by Mr. F. R. Pickersgil, R.A., and by Dean Alford, by means of a lyrical drama, with appropriate chorus, metrical dissertations, and descriptions.

ALISON, SIR ARCHIBALD, Bart. [E. C. vol. i. col. 152.] 'The History of Europe, from the Fall of Napoleon, in 1815, to the Accession of Louis Napoleon, in 1852,' was completed in eight volumes in 1859, but there was nothing in the later vo-

lumes to modify the unfavourable opinion expressed of the work in the memoir above cited. Of the original 'History of Europe . . . to the Restoration of the Bourbons in 1815,' a tenth edition, in 14 vols. 8vo. was published in 1860. The only subsequent publication of any consequence given to the world by Sir Archibald was, the 'Lives of Lord Castlereagh and Sir C. Stewart, the second and third Marquesses of Londonderry,' 8vo. Edinb. and Lond. 1861. Sir Archibald Alison died May 23rd, 1867, aged 74.

ALLAMAND, JEAN NICOLAS SEBASTIAN, was born at Lausanne in 1713. Here he studied theology, and on being admitted to the ministry, accepted an appointment at Leyden. He had now an opportunity of gratifying his taste for science; and so successful was he, that the celebrated Professor S'Gravesande made him tutor to his children, and afterwards his literary executor. On the death of S'Gravesande he was about to quit Leyden to fill a scientific post, when the university authorities persuaded him to remain, and obtained for him the chair of philosophy. His first lecture, 30th March, 1749, was an *éloge* on his patron and friend, S'Gravesande. Some years later he was also called to the chair of natural history, which, with that of philosophy, he occupied until his death, 2nd of March, 1787. He often received specimens from various parts of the world, with which, together with his private collection, he enriched the botanic garden and museum of the university. His name is associated with that of Muschenbröck as being the first in Holland to repeat the experiment of the electric shock, discovered by Cuneus. Priestley ('Hist. Electricity') refers to him as one who "makes approaches to the discovery of negative electricity." There is also a letter by Allamand in No. 477 of the Transactions of the Royal Society of London (1745) on the phenomena of the Bologna phial, containing an account of some experiments by an Italian philosopher, which he repeats and extends. Allamand's scientific papers display no powers of original research. Most of his time was occupied in translating or editing the works of others, not only in natural science, but also in theology, for which task he seems to have been well fitted by his modesty (he always omitted, or endeavoured to omit, his own name), integrity, and industry. His translation of Buffon's great work, which extended to 38 vols. 4to, was published at Amsterdam between 1766 and 1779.

ALLEGRI, GREGORIO, an Italian musical composer, was born at Rome about 1580. Having composed several motetts and sacred vocal pieces, he entered the service of Pope Urban VIII. in 1629, in the choir of the Sistine Chapel. Here he remained till his death, February 18, 1652. He was a voluminous composer of masses, motetts, hymns, psalms, and other kinds of ecclesiastical music; but his fame rests chiefly on a *Miserere* for a double choir, sung in the Sistine Chapel in the Holy Week. It was so highly esteemed by the papal court that the printing and even the copying were prohibited; but Mozart secretly wrote it out while listening to it, and Dr. Burney contrived to obtain a copy of it for printing in 1771. The *Miserere*, though not remarkable either for melody or harmony, has an intensity of mournfulness about it which has never been adequately rendered, except in the chapel for which it was composed, or rather perhaps we should say, is never so deeply felt elsewhere,—much of the impression being no doubt due to the perfect manner in which it is performed and to the solemnity of the surrounding circumstances.

ALLEGRI, FRANCESCO, a celebrated Italian painter, was born at Gubbio in 1587. A scholar of Cesari d'Arpeni, he painted at first in the vitiated manner of his master, his chief works at this time being the frescoes of the Sacrament in the cupola of the Duomo, and others in the church of the Madonna de' Bianchi at Gubbio. He afterwards painted numerous works in the cathedral and palaces at Savona, in the Durazzo Palace at Genoa, and finally settled at Rome. By this time his powers were matured and his style greatly improved. He executed a large number of frescoes in the churches of San Marco, San Pietro in Montorio, Delle Virginie, and SS. Cosimo and Damiano. Both Ratti and Baldinucci highly commend several of his works; but at best he is only a painter of the second order. Though properly a fresco painter, he executed some oil pictures, and he occasionally painted the figures in the landscapes of Claude Lorraine. He died at Rome in 1662. His son FLAMINIO, and his daughter ANGELICA ALLEGRI, were his pupils, and painted in his manner. Flaminio assisted his father, but some works painted in the Vatican on his own account are commended by Italian critics.

FRANCESCO ALLEGRI, a designer and engraver, born at Florence 1729, died at Rome about 1785, must not be confounded

with the painter. The later Allegrini, in conjunction with his brother, GIUSEPPE ALLEGRINI, also an engraver, brought out a new edition of the 'Regiæ Familiæ Mediceorum Etruriæ Principum Effigies,' with many additional portraits; a series of 'Portraits of Illustrious Persons of Tuscany,' and separate portraits of illustrious Italians, from Cimabue, Giotto, and Dante, to Michelangelo, Petrarch, and Boccaccio. Giuseppe engraved subject pieces and architecture as well as portraits.

ALLEINE, JOSEPH, an eminent nonconformist divine, was born at Devizes, Wiltshire, in 1633; was educated at Lincoln and Corpus Christi colleges, Oxford; and in 1655 became curate to Mr. Newton of Taunton, with whom he was ejected for non-conformity in 1662. Alleine continued, however, to preach with greater frequency and fervency than ever, until he was committed to Ilchester jail, May 26, 1663. He was tried the following August on the charge of causing by his preaching a riotous and seditious assembly, and though the evidence only proved that when he exhorted his family in his own house other persons were present, he was condemned and sentenced to a fine of 100 marks, and in default of payment was imprisoned for a year, all but three days. On his release he resumed his former practice, but was again committed to prison, July 10, 1665. "From the jail to which he was consigned by the victorious Cavaliers he addressed to his loving friends at Taunton many epistles breathing the spirit of a truly heroic piety. His frame soon sank under the effects of study, toil, and persecution: but his memory was long cherished with exceeding love and reverence by those whom he had exhorted and catechised" (Macaulay, 'History of England,' vol. ii. p. 165). He died in November, 1668, at the early age of 35.

To the precepts and example of Alleine, Macaulay attributes the maintenance at its height of the puritanical spirit for which the people of Taunton were long remarkable. But Alleine's writings and example had probably considerable influence in keeping up the same spirit throughout the country. His life, written by Richard Baxter, had a large circulation, while his famous work, 'An Alarm to the Unconverted, or the Sure Guide to Heaven' (not a tract, as Macaulay styles it, but a book of some bulk), was long one of the most popular of religious manuals, and still continues to be reprinted. Alleine's 'Familiar Explication of the Assembly's Shorter Catechism' was also much used in religious instruction. His other works are 'A Call to Archippus, being an Earnest Motive to the Ejected Ministers to continue in the Ministry,' 'Divers Cases satisfactorily resolved,' and a posthumous volume of 'Sacramental Addresses, Letters, &c.'

(Life by Baxter; Newton, *Sermon at the Funeral of Mr. Joseph Alleine*; Palmer, *Nonconformist Memorial*.)

ALLEN, ETHAN, who achieved a composite reputation as a soldier and a Deistical writer, was born at Litchfield, in Connecticut, North America. He emigrated when young, with four of his brothers, to the tract known as the New Hampshire Grants, which now forms the State of Vermont; and about 1770 headed the "Green Mountain Boys" in the opposition they made to the claim put in by the authorities of New York to the territory they had occupied. The dispute was still pending, when, a few days after the battle of Lexington, at the request of the legislature of Connecticut, Allen collected a body of 230 Green Mountain Boys, and marched to surprise the forts of Ticonderoga and Crown Point. After being joined by a body of troops under Colonel Arnold, they arrived in the night of the 9th of May, 1775, on the banks of Lake Champlain, opposite to Ticonderoga. With some difficulty boats were obtained sufficient for the transportation of the troops; and both Allen and Arnold embarked with the first body, consisting of 83 men, who effected their landing without being discovered. Day now dawned, and no more men could follow. It was thus necessary either to abandon the attack or to prosecute it with so small a number. All volunteered to follow Allen, and they immediately marched against the fort, which was completely surprised, and surrendered without firing a single gun. Crown Point was taken immediately after, by Colonel Seth Warren, without opposition. These successes of the Congress had a great effect both in America and England, and the name of Ethan Allen, as the captor of Ticonderoga, became well known. His vanity and presumption, however, led to disaster; for in the autumn of the same year, 1775, whilst employed on an expedition to Canada, and marching to attack Montreal, he fell in with the British troops, and was taken prisoner. He remained a prisoner upwards of two years and a half, a short time of which he spent in England, in confinement in Pendennis Castle, near Falmouth. He made great

complaints of the severity of his treatment as a prisoner, and published 'A Narrative of Colonel Ethan Allen's Captivity,' Philadelphia, 1779. On his release, by exchange, on the 6th of May, 1778, Allen was received with great respect by Washington, and his arrival among the Green Mountain Boys was celebrated with the firing of guns and every demonstration of joy. He found that during his absence Vermont had become a State, although its independence was still disallowed by the State of New York. As a mark of gratitude for his services, Allen was appointed general of the State militia, and chosen a representative to the assembly of the State. The Congress of the United States also gave him the commission of colonel. When peace was concluded he retired to his agricultural pursuits, and died suddenly of apoplexy at Burlington, in Vermont, on the 13th of February, 1789. He was the author of four works, of which one has been already mentioned. The others are:—'A Narrative of the Proceedings of the Governor of New York,' in the affair of the Green Mountain Boys, Hartford, 1774; 'A Vindication of the Opposition of the Inhabitants of Vermont to the Government of New York, and of their Right to form an Independent State,' 1779; and 'Reason the only Oracle of Man, or a Complete System of Natural Religion,' Bennington, 1784. This work is remarkable as being the first published in America in direct opposition to Christianity. It abounds with absurdities, but affords no countenance to the assertion, often made, that Allen was a believer in the Pythagorean doctrine of the Metempsychosis. His system is that of a pure Deism.

ALLEN, WILLIAM, whose name is also written Alan and Alleyn, and who is generally known by the name of Cardinal Allen, was born in 1532, at Rossall, in Lancashire, whither his grandfather, a member of an old and respectable family in Staffordshire, had migrated. In the fifteenth year of his age he was entered of Oriel College, Oxford, and profited so much by his own parts and industry, and the tuition of Morgan Philips, that in 1550 he was unanimously elected fellow of that society. In 1551 Allen seems to have suffered on account of his religion: but during the reign of Mary, when the Roman Catholic faith was in the ascendant, he became, about the year 1556, principal of St. Mary's Hall. In 1558 he was appointed a canon of the cathedral church of York. Upon the accession of Queen Elizabeth, Allen retired to Louvain, in the Spanish Netherlands, where he was entrusted with the education of some English youths of his own communion. His health giving way, however, he was recommended to try the restorative effects of his native air, and he accordingly came over to England, where he spent about three years, at the end of which time the notoriety of his efforts to make proselytes forced him again to leave the country. Returning in 1565 to the Spanish Netherlands, he selected a monastery at Mechlin for his place of retirement. Here, being yet only in deacon's orders, he prepared himself for the priesthood, and published his first work, which was an answer to one by Bishop Jewell, and was entitled 'A Defence of the Doctrine of Catholics concerning Purgatory and Prayers for the Dead,' 1565. Towards the end of the year 1567 Allen went to Rome, in company with Morgan Philips, his old tutor, and Dr. Vendeville, king's professor in the newly-established university of Douay, and afterwards Bishop of Tournay.

"An accidental discourse they had upon the road," says the Roman Catholic historian of the English Church, "was the first rise of the English College at Douay, and, by degrees, of all the other colleges and communities which have since furnished England with missionaries." When they returned together next year, Vendeville invited Allen to come with him to Douay, and there finish his academical degrees. He accepted the invitation, and in the very year, 1568, of their return from Rome, Allen, zealously supported by Vendeville, opened an English Roman Catholic college at Douay. The college in a short time, under Allen as president, prospered greatly, and, having begun with six members, soon numbered 150, "whereof," says Dodd, "eight or nine were eminent doctors of divinity." Allen took the degree of bachelor of divinity, January 31st, 1570, and that of D.D. July 16th, 1571, in the University of Douay. In 1570 he was appointed a royal professor of the university, and a canon of the church of Cambrai; and in 1575 made a very successful pilgrimage to Rome on behalf of his college. But papal favour could not frustrate the effects of popular jealousy, and the college at Douay was broken up by a proclamation of the magistrates dated March 21st, 1578. Thereupon the college migrated to Rheims, where, in numbers and efficiency, it flourished not less than it had flourished at Douay. In 1580 Allen was summoned to Rome, to give the benefit of his experience for the government

of a college similar to that at Rheims, which Gregory XIII. had endowed in 1579 for the education of English Roman Catholic priests.

Whilst at Rome, Allen had interest enough to procure the despatch of a small Jesuit mission to England; and this mission, and the labours of Allen's seminarists, together provoked Queen Elizabeth to the issue of a proclamation which forbade her subjects in any way to encourage or to countenance the English seminarists abroad, or to harbour or relieve any Jesuit or seminarist in this country. It was in answer to this proclamation that Allen, in 1581, after his return from Rome, wrote and published his 'Apology for the English Seminarists,' the language and tone of which are remarkable for their loyalty and respect towards the Queen. The subsequent publication of the defence of the executions of Roman Catholics, which bore the significant title of 'The Execution of Justice,' and was written by Lord Burleigh himself, called forth a reply from Allen, who published in 1584 'A True, Sincere, and Modest Defence of the English Catholics that suffer for their Faith, both at home and abroad, against a slanderous Libel entitled "The Execution of Justice in England."' This work of Allen's excited a great sensation, and was replied to by Mr. Stubbs, of Lincoln's Inn, under the immediate direction of Lord Burleigh. One Alfield was indicted on the 3rd of July, 1585, for high treason, for bringing the book into England, was found guilty, and executed.

On the 7th of August, 1587, Allen was raised to the Cardinalate, with the title of St. Martin in Montibus; a promotion accorded by Pope Sixtus V. to the request of Philip II. of Spain, who, on the eve of despatching the Invincible Armada to England, wished to have a prince of the church ready, on the success of the expedition, to proceed to England, superintend the affairs of religion, and invest the conqueror with the English crown. As the preparations for the Spanish invasion of this country drew nearer to completion, Allen, by command of the Pope, prepared an address to the Roman Catholics in England, calling on them for assistance. He wrote, or caused to be written, accepting all the responsibilities of authorship, the 'Admonition to the Nobility and People of England,' in which Elizabeth is charged with being a usurper and "an incestuous bastard," a heretic, a tyrant, and steeped in lust, and which calls on all persons to rise in favour of the King of Spain's liberating army, and free themselves from the disgrace of having "suffered such a creature, almost thirtie yeares together, to raigne both over their bodies and soules, to the extinguishinge not only of religion but of all chaste livinge and honesty." A large impression of this work was printed at Antwerp, and was afterwards put on board the Armada to be carried to England. An abridgment also was prepared, which bore the title, 'A Declaration of the Sentence of the Deposition of Elizabeth the Usurper and pretended Queen of England.' When the invincible Armada was defeated, all the copies both of the 'Admonition' and the 'Declaration' that had been designed for distribution in England were destroyed.

The Pope kept Allen at Rome with him after he was created Cardinal, and even refused to allow him to leave for his archiepiscopal see of Mechlin, to which in 1589 the King of Spain appointed Allen, with the hope that he would reside within its limits. Allen spent at Rome the remainder of his days, living in wealth and splendour, having unbounded influence over Sixtus V. and his next two successors; the chief agent of the King of Spain for the management of his interests, and distribution of his bounties, among the English Roman Catholic exiles in the Spanish Netherlands and at Rome, and the recognised head of that party among the English Roman Catholics which was known as the Spanish party, and which desired to place the English crown after Elizabeth on the head of the daughter of the King of Spain. Cardinal Allen died of strangury, on the 6th of October, 1594, and was buried with great pomp in the chapel of the English College at Rome. History would be at a loss to furnish an instance of a man more thoroughly denationalising himself than did Allen, for the sake of his faith; and it is very difficult to believe that, irreproachable in his private life, he followed in his public course the dictates of his conscience, and that, in leaguering himself with England's foreign foes, he did so, thinking the tie of religion above that of country, and the Roman Catholic faith indispensable to the happiness and prosperity of England.

Allen's literary productions are, 'Brief Reasons concerning the Catholic Faith'; 'A Defence of the Doctrine of Catholics concerning Purgatory and Prayers for the Dead,' Antwerp, 1565; 'Treatise made in Defence of the lawful Power and Authority of the Priesthood to remit Sins. The People's Duty for Confes-

BIOG. DIV.—SUP.

sion of their Sins to God's Ministers. The Church's Meaning concerning Indulgences, commonly called Pope's Pardons, Louvain, 1567; 'Of the Worship due to Saints and their Relicks'; 'De Sacramentis in genere, de Sacramento Eucharistie, et de Missæ Sacrificio,' Antwerp, 1576; 'Apology and True Declaration of the Institution and Endeavours of the two English Colleges, the one in Rome, the other now resident in Rheims, against certain sinister Informations given up against the same,' Mons in Hainault, 1581; 'A true, sincere, and modest Defence of the English Catholics that suffer for their Faith, both at home and abroad, against a slanderous Libel entitled "The Execution of Justice in England,"' 1584; 'Epistola de Daventriæ Redditione,' Cracow, 1588; 'An Admonition to the Nobility and People of England concerning the present Warres made for the execution of His Holiness's Sentence by the high and mighty King of Spain,' 1588.

Besides these works, Allen had a principal share in the execution of the Roman Catholic translation of the Bible, which goes by the name of the Douay Bible, of which the New Testament was published at Rheims in 1582, whilst he was there as president of the English Roman Catholic College, and the Old Testament at Douay some years after his death, in 1609.

ALLESTREE, or ALLESTRY, RICHARD, whose personal adventures were of a more striking character than commonly diversified the lives of scholars and divines, even of the turbulent 17th century, was born at Uppington, in Shropshire, in the year 1619 (according to Wood, 1621). His father, Robert Allestree, was a member of an ancient family formerly settled at Alveston, in the county of Derby. After receiving the first rudiments of education in a seminary in the neighbourhood of Uppington, Richard was sent to the Grammar School at Coventry, of which Philemon Holland, known as the "Translator-general of his age," was at that time master. In the Lent term of 1636, he became a commoner of Christ Church, where he had the advantage of being under the tuition of the famous Richard Busby, and of which society, about six months after his admission, Dr. Samuel Fell, the dean, made him a student; "which title," says Bishop Fell, son of the dean, who afterwards acted as Allestree's biographer and literary executor, "he really answered by great and happy application to study, wherein he made remarkable progress; as a testimony and encouragement of which, so soon as he had taken the degree of Bachelor of Arts [October 24th, 1640], he was chosen Moderator in Philosophy, and had the employment renewed year by year, till the disturbances of the kingdom interrupted the studies and repose of the university." In 1642 Allestree was amongst the foremost of the Oxford students who appeared in arms for the king, placing himself under the command of Sir John (afterwards Lord) Byron. He then joined Prince Rupert in the West; and, after the relief of Worcester, returned to Oxford, where, in accordance with its then twofold character of university and garrison, he alternated, and even combined, the prosecution of his studies with the duties of a soldier. Frequently, we are told, might he be seen "holding his musket in one hand and his book in the other, and making the watchings of a soldier the lucubrations of a student." It was Allestree's good fortune, whilst in charge of his college, in the absence of the dean and his family, to preserve by a clever ruse the contents of the Christ Church treasury from the rapacity of the Parliamentary troops under Lord Say; for which success he was happy enough to suffer the penalty of only a very short detention. In June, 1643, he proceeded Master of Arts; and in the same year his life was endangered, and his activities, whether academical or military, suspended by an attack of a pestilential disorder, which then raged within the garrison of Oxford, and which had been bred by the crowded state of the city. Immediately on his recovery, though now a fellow of his college, he joined the regiment of students which had lately been embodied for the king's service; and in this employment continued till the unhappy contest resulted in the triumph of the Parliament. Then "betaking himself to that warfare to which his education had designed him, he entered orders at a time when there was no prospect of temporal advantage, and when his being in the service of God threatened no less danger than being in the service of the prince."

In the parliamentary visitation for the reform of the University, Allestree shared the disabilities at that time incident to loyalty, being (July, 1648) deprived of his preferment and ejected from the University; "so that being put to his shifts," as Wood expresses it, he retired to his native county, where he was entertained as chaplain in the family of the Honourable Francis Newport, afterwards Lord Newport, of High Ercall. Here he

F

remained, with the exception of a journey to France in the interests of his patron, till the defeat and retirement of Charles the Second; when his reputation for tact, discretion, and diplomacy recommended him as a fitting channel of communication between the exiled prince and his adherents in this country. Among other transactions, the negotiations respecting the means of preserving the episcopal succession in the Church of England were entrusted to his management. He had succeeded in safely performing several journeys, when, on returning from Brussels, in the winter of 1659, he was seized at Dover, conveyed in custody to London, and imprisoned in Lambeth Palace by a committee of the Council of Safety. The dawn of the Restoration was, however, already discernible, and a period of six or eight weeks was the measure of his imprisonment. Whilst carrying on these negotiations, Allestry had his head-quarters for several years at the house of Sir Anthony Cope, of Hanwell, near Banbury, a royalist of quality and fortune, who gladly conceded to him the liberty of going and coming as the royal occasions demanded.

Shortly after the restoration of Charles the Second, in 1660, Allestry was made canon of the eighth stall of Christ Church; on the 3rd of October in the same year, took the degree of D.D.; and was almost concurrently appointed one of the king's chaplains in ordinary. In September, 1663, he was elected Regius Professor of Divinity; and, two years after, achieved his ultimate preferment, the provostship of Eton, which was conferred upon him by the personal favour of the king, August 10, 1665. Throughout his exercise of the functions of this office, it is recorded to Allestry's honour, that Eton College—to which, in various ways, he was an important benefactor—presented but one united family. There, accordingly, he determined to end his days, although so strongly solicited to fill a higher dignity, as fully to justify that clause of his epitaph which declares, "Episcopales infulas eadem industriâ evitavit, quâ alii ambiunt"—he shunned the episcopal dignity as anxiously as other men seek it. Perceiving his sight and health begin to fail, Dr. Allestry resigned his chair at Oxford in the year 1679; and when further symptoms of decay culminated in dropsy, he repaired, for the sake of commanding the best medical assistance, to London, where he died, January 28, 1681. He was buried in the chapel of Eton College, on the north side of the communion-table, where his monument still remains. "He was," says Wood, "a good and most affectionate preacher; and for many years by his prudent presiding in the professor's chair, he did discover perhaps as much learning as any, and much more moderation, as to controverted points, than most of his predecessors. He was also a person richly furnished with all variety of choice solid learning, requisite to recommend him with the greatest advantage, to the more intelligent world for one of the most eminent divines of his age." The chief productions of Dr. Allestry are his *Discourses*, which are distinguished by their vigour and vivacity, scriptural insight and felicity of diction. These discourses, which had for the most part been preached, on various occasions, before the king, and many of which had been published singly in the life-time of the author, were after his death collected and edited by Dr. John Fell, Bishop of Oxford, with the title of 'Forty Sermons, whereof twenty-one are now first published, the greatest Part preached before the King, and on solemn occasions,' 2 vols. fol. Oxford, 1684. Wood attributes to Allestry the authorship of a pamphlet entitled 'The Privileges of the University of Oxford in Point of Visitation, in a Letter to an honourable Personage,' 4to, 1647. This little work, which was the occasion of a controversy, has been variously referred to Dr. John Fell, and to Philip Fell, his brother, and a fellow of Eton. Further, and finally, a Judgment by Allestry on a case of divorce, is printed in Bishop Barlow's 'Miscellaneous and weighty Cases of Conscience,' 8vo, London, 1692.

ALLESTRY, JACOB, English poet and scholar, born in 1653, was the son of James Allestry, a London bookseller, whose property was destroyed in the great fire of 1666. Jacob Allestry received his early education at Westminster School; in 1671 was entered at Christ Church, Oxford; took the degree of B.A. with credit; in due time proceeded M.A.; was made music reader in 1679; and terræ filius in 1682. In the University he won great credit alike for his knowledge of languages and skill in poetry, his poetic powers being largely employed in preparing the verses and pastorals spoken before the Duke and Duchess of York on occasion of their visit to Oxford, May 21, 1681. He died October 15, 1686, his end being hastened by excesses, if we may believe Anthony à Wood, who in his solemn, purblind, blundering way, says, "being exceedingly given to the

vices of poets, his body was emaciated and worn away by his juvenile extravagances." Allestry's poems were much admired and sought after; some were printed in the 'Examen Poeticum,' others in 'Miscellany Poems,' 1727; but they do not seem to have been collected for separate publication. They are evidently the productions of a scholar, and there is in them much grace and refinement; often considerable elevation of thought.

*ALLINGHAM, WILLIAM, the son of a manager of the Provincial Bank at Ballyshannon, was born in that town about the year 1828, and was educated at a school in Ireland. Early in life he began to contribute to periodical literature; and in 1850, published his first volume of 'Poems,' with a dedication to Leigh Hunt, who encouraged his literary attempts, and afterwards befriended him in matters of more importance. In 1854, Mr. Allingham published his 'Day and Night Songs,' which he inscribed "to my friends, known and unknown"; and of which an enlarged edition, illustrated by Millais and other artists, appeared in the following year. In 1854, he also published 'Peace and War: an Ode.' 'Laurence Bloomfield in Ireland; or the New Landlord,' a poem in twelve chapters, which first appeared in 'Fraser's Magazine,' was published in 1864. Of this work a cheaper issue, with a preface of some length, was put forth in 1860. In 1864, the year in which Mr. Allingham obtained a literary pension, he edited 'The Ballad Book; a Selection of the choicest British Ballads.' In 1865 he published 'Fifty Modern Poems,' six of which had already appeared in one of his earlier volumes. The dedication of this volume to his friend A. F. offers a modest self-estimate of the author's poetical position and pretensions. "My 'Works,'" he says, "for so far (trivial enough works!) are now in three volumes, counting one hundred and thirteen poems, long and short. These claim to be genuine in their way, and beyond this the writer thinks or cares very little about them." Mr. Allingham holds an appointment in the Customs, in England.

ALLIX, PIERRE, was born at Alençon, in 1641. At an early age he became minister of the Reformed Church at Rouen; quitting it, with a great reputation for eloquence, for the pastorate of the church of Charenton, near Paris, the members of which were amongst the most distinguished of the professors of the Reformed faith in France. The fame he had acquired as a preacher preceded him, when, on the Revocation of the Edict of Nantes, in 1685, he took refuge in England. Here he was most warmly received. The University of Cambridge conferred upon him the degree of Doctor of Divinity; and, in 1690, he was appointed treasurer of the cathedral church of Salisbury. Notwithstanding that his great application presently acquired for him a competent mastery over the English language, Allix does not appear to have exercised his gifts of preaching in this country, although with his pen he was, to almost the end of a protracted life, the untiring apologist and champion of the Protestant cause. He died in London, on the 21st of February, 1717, leaving several children, the eldest of whom was a clergyman of the Church of England.

The controversial writings of Allix, directed against the Church of Rome, on the one hand, and, on the other, against the Arian heresy, were held in great estimation by his contemporaries; but his claims to present consideration and esteem are founded rather on his more general works on the evidences of Christianity, and others relating to the history of the early Protestant churches on the Continent. Long lists of his works occur in Niceron, and in the *Biographia Britannica*; the most important are the following:—'Ratramne, ou Bertrand, Prêtre, du Corps et du Sang du Seigneur,' Rouen, 1672, 8vo; 'Dissertatio de Sanguine Christi,' Paris, 1680, 8vo, in the same volume with two other small treatises; 'Anastasi Sinaitæ anagogicarum contemplationum Lib. xii.' in Greek and Latin; 'Douze Sermons sur divers Textes,' second edition, Rotterdam, 1685, 12mo; 'Reflexions upon the Books of the Holy Scripture, to establish the truth of the Christian Religion,' 2 vols. London, 1688, a French edition of which had appeared at Rotterdam in 1687, making it probable that the work was originally composed in the author's native tongue; 'Determinatio F. Joannis Parisiensis de Modò existendi Corpus Christi in Sacramento Altaris,' London, 1686, 8vo; 'Some Remarks on the Ecclesiastical History of the ancient Churches of Piedmont,' London, 1690, 4to; 'Remarks upon the Ecclesiastical History of the ancient Churches of the Albigenes,' London, 1692, 4to; 'The Judgment of the Ancient Jewish Church against the Unitarians, in the Controversy upon the Holy Trinity,' London, 1689, 4to; and 'De Messias duplici Adventu Dissertationes duæ adversus Judæos,' London, 1701, 8vo, in which the author fixed the date of the Second Coming of our Lord as 1736, at the latest. In addition to the above, Allix published several works of practical piety, including

a 'Preparation for the Lord's Supper'; several occasional Sermons; and a number of temporary pamphlets. He is also understood to have composed an elaborate 'History of the Councils,' on the invitation of a body of English ministers; but it was never printed, for want of a sufficient number of subscribers.

ALMON, JOHN, a celebrated political writer and publisher, was born at Liverpool, about 1738; educated at Warrington; and apprenticed to a bookseller in his native place. Growing tired of the drudgery and confinement of the shop, he went to sea about 1756, and remained abroad till 1758, when he returned, and soon after established himself in London. Here he formed the acquaintance of Goldsmith and Wilkes, and commenced the career of a political writer with a pamphlet entitled 'The Conduct of a late noble Commander [Lord George Sackville at the Battle of Minden] Examined,' 8vo, 1759, which passed into a second edition. This was followed by the 'Military Dictionary,' a compendious history of famous battles and sieges from the time of Charlemagne to the year of publication, 1760. It was a folio, issued in sixpenny weekly numbers; and, with a certain liveliness, was laudably free from research or good writing. He was now engaged as a writer of letters (corresponding to our leaders) for the 'Gazetteer' daily newspaper, the circulation of which was threatened by the 'Public Ledger,' started in 1760, to which Goldsmith was a contributor. Almon's contributions to the Gazetteer were published separately, under the title of 'A Collection of Interesting Letters from the Public Papers,' in four vols. 12mo, and reprinted in two vols. 8vo. His fertile pen also produced 'A Review of the Reign of His late Majesty, George II. 8vo, 1761, which passed through two editions. On the resignation of Lord Chatham, October, 1761, he published a volume entitled 'A Review of Mr. Pitt's Administration,' which reached a fourth edition, and secured for Almon the substantial friendship of Lord Temple, to whom it was dedicated. His connection with Lord Temple led him, when that nobleman quarrelled with his brother, George Grenville, to write, under his old Gazetteer signature of "An Independent Whig," 'A Letter to the Right Hon. George Grenville,' which was answered by Mr. Grenville's private secretary, Charles Lloyd, both the pamphlets obtaining a large circulation.

Almon having accidentally called on Wilkes a few minutes after his arrest on a general warrant for publishing No. 45 of the North Briton, Wilkes in a low tone informed him of the circumstances, and begged him to apprise Lord Temple. Almon not being known, was permitted to leave the house, for which, as he states, the officers "were afterwards severely reprimanded." The issue of the affair is well known. Almon gave full particulars of it in his 'Memoirs of John Wilkes,' and wrote a pamphlet or two on the subject. He also wrote, about this time, 'A Review of Lord Bute's Administration,' and 'An Impartial History of the Late War, from 1749 to 1763.'

But he was now to extend his sphere of activity. Pamphlets were the chief instruments for bringing public opinion to bear upon the government, but so personal were they commonly, and often so virulent, that, in face of the law of libel as then administered, it was difficult to find publishers willing to incur the risk of issuing them. Almon had become personally known to most of the leaders of the opposition; he was a man of irrepressible activity, fond of notoriety, of tried courage and audacity; and he had the double advantage of being a ready writer, and of having been brought up as a bookseller. He was easily persuaded to enter into the business; he was assured of the support of the party, and of immunity from personal loss. He accordingly, in 1763, opened a shop in Piccadilly, opposite Burlington House, for the sale and publication of political pamphlets, which soon became and long continued the resort of the members of the opposition, and rendered Almon himself a political oracle in a small way. The political pamphlets published by him during the following years are far too many for enumeration; the fortune of his shop was made by the earliest of them, the well-known Candor pamphlets, which almost rivalled 'The Letters of Junius' in popularity, and have been by some supposed to be from the pen of Junius himself. Of the famous Junius Letters, Almon published an edition without the consent of the author. But Almon did not confine himself to publishing, or even writing pamphlets. In 1765 he published in an octavo volume a 'History of the Minority, during the years 1762—1765: exhibiting the Conduct, Principles, and Views of that Party.' This work was issued anonymously, but was soon known to be Almon's, and to be a sort of manifesto of the party he represented, and above 10,000 copies of it were sold within six months. He now started a monthly 'Political Register,' which was continued

for two years. 'The New Foundling Hospital for Wit,' begun in 1768, was another successful venture.

It is not to be supposed that Almon was looked upon by the government with much tenderness; but the occasion selected for punishing him was not a little remarkable. The Letters of Junius were at the height of their popularity, and the 'Letter to the King,' one of the most violent, and, consequently, most read of the series, was reprinted in a magazine called 'The London Museum.' For selling a copy of this in his shop, Almon (who was not the publisher, and had no connection with the magazine,) was tried in the Court of King's Bench; and, being convicted, was sentenced by Lord Mansfield to pay a fine of ten marks, and to give security for his good behaviour for two years, himself in 400*l.*, his sureties in 200*l.* each. Such a judgment did little hurt to Almon; but the charge of the Chief Justice called forth 'A Letter to Lord Mansfield,' which was one of the most bitter of the Junius series. Almon of course published 'The Trial of John Almon,' in which he reprinted all the offensive matter, but he was not further disturbed.

In 1774 Almon commenced the publication of 'The Parliamentary Register,' in which the debates in parliament were very fairly reported, and which met with a large measure of success; he also published a continuation of the debates from the conclusion of Chandler's reports, in 1742, to the commencement of the 'Parliamentary Register.' Other serials issued by him were 'The Remembrancer,' a monthly collection of letters relating to the American war, which extended to 20 volumes; and an 'Asylum for Fugitive Pieces,' a sort of continuation of his 'New Foundling Hospital for Wit,' several times reprinted in 4 volumes. His larger works include 'A Collection of all the Treaties of Peace, Alliance, and Commerce between Great Britain and other Powers, from the Revolution in 1688 to 1771,' 2 vols. 1772, reprinted with considerable additions in 1781, and again in 1785: this was a work on which he a good deal prided himself, and it has some value; 'Protests of the House of Lords,' 8vo, 1772; 'A Letter to the Earl of Bute,' 1773; 'Free Parliaments; or, a Vindication of the Parliamentary Constitution of England,' 8vo, 1783.

About this time Almon, having secured a competence, retired from business to a pleasant residence at Boxmoor, in Hertfordshire, where, however, he continued to employ his pen. But he yearned for the old activity, and having married the widow of Mr. Parker, printer of the 'General Advertiser,' he became the proprietor of that publication, and determined to undertake its management. In this, however, he was unsuccessful. He became insolvent, was imprisoned for a libel, and was outlawed. Eventually he was enabled to return to Boxmoor, and again resumed his pen with all his old diligence. Besides political and occasional pamphlets, he wrote 'Anecdotes of the Life of the Right Honourable William Pitt, Earl of Chatham, and of the Principal Events of his Time, with his Speeches in Parliament, from the year 1736 to 1778,' 2 vols. 4to, 1792. In the preparation of this work Almon was assisted by Lord Temple and other political friends. Like most of Almon's productions, though put together with little skill, it was suited to the requirement of the hour, and sold largely, a sixth edition (in 3 vols. 8vo) being necessary to meet the demand. 'Biographical, Literary, and Political Anecdotes of several of the most Eminent Persons in the present age,' 3 vols. 1797, is a one-sided and not very trustworthy book, but it is amusing, and contains a good deal of information respecting the prominent personages of the time. Almon's last work was 'The Correspondence of the late John Wilkes with his Friends, printed from the original Manuscripts, in which are introduced Memoirs of his Life,' 5 vols. 8vo, 1805—of all Almon's writings the crudest, and perhaps the least successful. It is, in fact, a mere heap of materials brought together without order, and left incomplete. Almon did not long survive its publication, dying at Boxmoor on the 12th of December, 1805. Few will now turn to Almon's books for amusement, and any who may will be disappointed; but the student of the history of the last half of the 18th century will find in them a vast amount of suggestive matter—to be used, of course, with discrimination.

ALOISI, BALDASSARE, called IL GALANINO, Italian painter and engraver, was born at Bologna in 1578, and educated there in the school of the Carracci, to whom he was related, and of whom he was one of the ablest scholars. He painted a Virgin and Child, with St. Francis and St. John, for the Osservanza, and a Visitation for the Carità, Bologna, which were greatly admired; and after he settled in Rome he executed several altarpieces for the churches of that city and the neighbourhood, but he was most successful in his portraits of illustrious men, of

which he painted a large number, and which obtained for him the cognomen of the Italian Vandyck. His portrait of himself, in the Painters' Gallery, Florence, is a good example of his skill in that way. He also etched 50 plates, 'Historia del vecchio Testamento,' from the loggie of Raffaele, and a few others after the Carracci, Guido, &c.; but good impressions of these are now rare. Aloisi died at Rome in 1638.

ALPHEN, DANIEL VAN, Dutch jurist, was born Nov. 7, 1713; was educated at Leyden University; in 1735 was made professor of jurisprudence in the university, and in 1749 griffier, or city clerk. From this office he retired in 1778, devoting the remainder of his days to literature. Besides a valuable work on the 'Rights of the Magistracy with reference to the Church,' 8vo, 1755, of which a second edition was required in the following year, he wrote the latter half of the history and description of the city of Leyden ('Beschryving der Stad Leyden,' folio, vol. ii. 1770, and vol. iii. 1784), of which the first volume had been completed by his friend Mieris in 1762. Van Alphen collected materials for a fourth volume, but died before putting them in order, and it remains unpublished. The work is the standard history of the city of Leyden, and is illustrated with admirable engravings. Daniel Van Alphen died on the 16th of July, 1797.

ALPHEN, HIERONYMUS, Dutch theologian, son of Hieronymus Simons van Alphen, professor of theology at Utrecht, noticed below, was born May 9, 1700, and was successively minister at Nieuw Loosdrecht, at Leeuwarden, and at Amsterdam, in which last city he died, April 20, 1758. His principal writings are (1) a dissertation on Zechariah, chap. 9, v. 1; 'De Terra Chadrach et Damasco ejus quiete,' 12mo, Utrecht, 1723, reprinted in vol. vii. of Ugolini's 'Thesaurus Antiquitatum sacrarum,' a work showing an extensive acquaintance with the Arabic and Syriac languages as well as the Hebrew; and (2) a commentary on the 24th and 25th chapters of St. Matthew, 'Verklaring over Matth. xxiv. en. xxv.,' 2 vols. 8vo, Leeuwarden, 1734.

ALPHEN, HIERONYMUS VAN, a celebrated Dutch poet, grandson of the famous Utrecht professor noticed below, was born August 8, 1746, at Gouda, of which town his father was syndic; studied at the universities of Utrecht and Leyden, at the latter of which, on taking the degree of master of laws, in 1768, he published a thesis on the Roman jurisconsult Javolenus Priscus. His acquirements, ability, and high moral character secured for him general confidence, and he held successively the important posts of procurator-general of the court of Utrecht, pensionary of the city of Leyden, and treasurer-general of the Union. These functions he resigned when the French invaded Holland, in 1795, and retired to the Hague, where he died, April 2, 1803.

The leisure he could snatch from his public employments Van Alphen gave to the cultivation of poetry and the literature of art, and he was among the first of his countrymen to study and appreciate the new development of German poetry and æsthetics. His first poetic publications were 'Proeve van Stigtelijke Mengelpoezij' (Specimens of Miscellaneous Moral Poetry), in two series, 8vo, Utrecht, 1771-72, written in conjunction with P. L. van de Kastele, and his countrymen find it difficult to assign to either his respective share. Subsequent poems, of which he alone was the author, were—'Gedigten en Overdenkingen' (Poems and Meditations), 1777; 'Nederlandsche Gezangen' (Dutch Songs), 1779, many of which are of exceeding beauty; 'Kleine Gedigten voor Kinderen' (Short Poems for Children), 1781, a work often reprinted, universally popular in Dutch households, and by general consent one of the most charming volumes of children's poetry extant; 'Digkundige Verhandeligen' (Poetical Dissertations), 1782; 'Mengelingen in Poezij' (Poetic Miscellanies), 1783; and 'Proeven van Liederen en Gezangen voor den Oppenbaren Godsdienst' (Specimens of Hymns and Songs for Divine Service), 1801-2, which contains some of his purest and noblest efforts; one piece in particular, 'De Starrenhemel' (The Starry Heavens), says a competent critic, Mr. Thomas Watts, "is a poem which will probably last as long as the language in which it is written." But while it was as a poet that he shone brightest and will be longest remembered, his pen was not confined to poetry. In 1778-80 he published a translation from the German of Riedel's 'Theory of the Fine Arts and Polite Literature,' which, with some observations in the Introduction he prefixed to it, led to a controversy with De Perponcher, published in 1783. Van Alphen also wrote several religious essays in prose, the most important perhaps being 'The Christian Spectator,' 'Some Doctrines of the Protestant Religion defended against Eberhard,' and a treatise on 'The Superiority of the Legislation of Moses to that of Solon and Lycurgus,' which was

awarded the gold medal of the Teylerian Society of Haarlem, and is printed in vol. ix. of their Transactions. Van Alphen's posthumous papers were published at Utrecht in 1813, under the title of 'Nagelatene Schriften, van Van Alphen, gevonden in Dezelfs Papieren.' A collected edition of his poetical works, with a memoir, appeared at Utrecht, in 3 vols. 8vo, 1838-39.

ALPHEN, HIERONYMUS SIMONS VAN, one of the most distinguished of the Dutch Protestant theologians, was born May 23, 1665, at Neuhanau, in Hesse Cassel, the son of a merchant in that town, driven from Holland by the religious persecutions. After studying Greek and Latin at the schools of Hanau, and Hebrew at home under a learned Jew, the young Van Alphen went in 1681 to Leyden, where he pursued his studies for five years under Gronovius, Schaaf, and F. Spanheim, thence proceeded to Franeker, where he was for two years under Vitringa, and was then about to remove to Groningen, intending to complete his course at Heidelberg; but his abilities had already attracted notice, and he was chosen pastor of a church at Warmond, near Leyden. Here he remained four years; was then two years pastor at Zutphen, and afterwards 20 years at Amsterdam. His reputation constantly increasing, he was now (1715) chosen professor of theology at the University of Utrecht. This office he held for 27 years, ranking as the first theological teacher in Holland, and attracting large numbers of students to the university. H. S. Van Alphen was the embodiment of the great old scholars of Holland. Every hour of his long life was devoted to his work, and all his actions were regulated with reference to it. He was thrice married; his first wife he took "to manage his household affairs, the second to look after the children, and the third to take care of himself." He survived the last, dying on the 7th of November, 1742. His son and grandson, both distinguished men, are noticed above.

H. S. Van Alphen's principal Latin works comprise, 'Specimina Analytica in Epistolas Pauli quinque ratione ordinis temporis quo scriptæ sunt priores,' an analysis of the first five Epistles of St. Paul in the order of time, namely, those to the Thessalonians, the Galatians, and the Corinthians, in 2 huge 4to volumes, Utrecht, 1742; a similar commentary on St. Paul's epistle to the Ephesians, 'Specimen Analyticum in Epistolam Pauli ad Ephesios,' 4to, Utrecht, 1742; 'Economia Catechesis Palatina,' an elaborate explanation of the Heidelberg Catechism; and a short grammatical treatise, 'De Usu Accentuum.' His writings in Dutch are numerous; the following are perhaps the most important—'On the ninth Chapter of Daniel,' 4to, Amsterdam, 1716; 'On the Epistle of Peter,' 2 vols. 4to, Amsterdam, 1734; 'On Psalm cxi.,' 4to, Amsterdam, 1735; 'On Psalms xxi., xli., xlvii., and cxii., and the Song of Moses,' 4to, Amsterdam; 'On the two Epistles of Paul to the Corinthians,' 2 vols., Utrecht; and 'On the First Epistle to the Thessalonians,' 4to, Utrecht, 1741. He also published a volume of religious poems, 'Gezangen,' of which a second edition appeared at Amsterdam in 1748. (Chalmot, *Biographisch Woordenboek der Nederlanden*; Geysbeek, *Biog. Woord. der Nederduitsche Dichters*; Kok, *Vaderlandsch Woordenboek*; T. Watts, in *Biographical Dictionary of Soc. for Diff. of Useful Knowledge*, and the authorities there cited for all the Van Alphens here noticed. Between 50 and 60 more, of greater or less celebrity, are given in the *Woordenboeken*.)

ALPHERY, REV. NICEPHORUS, a clergyman of the Church of England in the 17th century, was descended from a branch of the imperial family of Russia, but in consequence of the disturbances incident to the contests for the crown was in the beginning of the 17th century, probably in 1605, sent over to England in the care of Mr. Bidell, a Russia-merchant, and entered as a student at Oxford University. Having completed his terms he took orders in the English Church, and in 1618 was presented to the living of Wooley in Huntingdonshire. It is said that he was more than once invited back to Russia to take upon him the government of that country, but preferred his quiet cure. Here he remained till 1643, when he was forcibly ejected by a file of parliamentary soldiers, who dragged him from his pulpit one Sunday morning, and turned his wife and children, with his household goods, out of the parsonage. For a week they were forced to live in a sort of booth he constructed under the trees opposite the parsonage, but he afterwards obtained a small house in which he dwelt for several years in great poverty. Eventually he went to reside with his son at Hammersmith, but after the Restoration went back to his living, where, however, he remained only a short time, returning to his son's house, where he died at an advanced age, though in what year is not mentioned. One of his descendants was living in 1764, the wife of a Mr. Johnson, a cutler in Huntingdon, and

was treated with marked respect by her neighbours on account of her descent.

(Walker's *Sufferings of the Clergy in the Grand Rebellion*, pt. ii. p. 183; *Biographia Britannica*; *Biog. Dict. of U. K. Soc.*; Lysons' *Env. of London*, vol. iv. p. 264.)

ALPINUS, PROSPER (Prospero Alpini), the most eminent botanist of his age, was born November 23, 1553, at Marostica in Venice. On quitting school he enrolled himself in the army of Milan and served some time, but quitted it in obedience to the wishes of his father, a physician of some note, and entered the University of Padua as a student of medicine. Here his progress was rapid; he was chosen as syndic of the university and deputy rector. In 1578 he was admitted doctor of medicine, and commenced practice at Campo San Pietro, a small town in Padua. Whilst here he diligently carried on his botanical pursuits, but with the few books and imperfect knowledge then existing of the science, he felt that his only hope of obtaining the information he desired was by travel. For this an opportunity was afforded by an offer of accompanying G. Emo, the newly-appointed Venetian consul, as his physician to Cairo. Alpinus left Venice in September, 1580, and remained abroad about six years. During his stay in Egypt he carefully investigated the botany and natural history of the country, but he complains bitterly of the difficulty he found in obtaining assistance in his researches or even accurate information. He was resident almost three years in Cairo, made journeys up the Nile, visited Alexandria, and travelled in Candia and other islands of the Grecian archipelago. On his return to Venice in 1586 he accepted the appointment of physician to Andrea Doria, Prince of Melfi, and resided some time with him at Genoa. His celebrity as a physician and man of science was greatly extended by his work on Egyptian medicine, the first work in which he gave some of the results of his Egyptian studies—*De Medicina Egyptiorum*, libri iv. 4to, Venice, 1591—in which he described their manner of bleeding, cupping, scarifications, and various processes and medicines not then in use in Italy, with notes of the climate of the country, and the food, dress, and habits of the people as far as they influenced their health. The following year appeared another elaborate work, in the form of a dialogue, on the balsams, under which name he included the numerous gummy exudations from trees then much in vogue for medicinal purposes: *De Balsamo*, dialogos; in quo verissima balsami plantarum, opobalsami, carpobalsami, et xylobalsami cognitio plerisque antiquorum atque juniorum medicorum occulta, nunc elucescit, 4to, Venice, 1591; 2nd ed. 4to, Padua, 1639; and translated into French by A. Colin, 8vo, Lyon, 1619. A more important work, and that by which he mainly acquired his fame as a botanist, was *De Plantis Egypti Liber*, in quo non pauci, qui circa herbarum materiam irrepserunt, errores deprehenduntur, quorum causa hactenus multa medicamenta ad usum medicinarum admodum expetenda, plerisque medicorum, non sine artis jactura occulta atque obsoleta jacuerunt; 4to, Venice, 1592. In this treatise on the plants of Egypt with reference to their use in medicine, Alpinus described and figured (in very clear woodcuts) above 50 plants, of which 23 were previously undescribed: among these is the coffee-plant, with the method of preparing the now familiar infusion. This work was afterwards remodelled and combined with the author's other writings on the natural history of Egypt, but remained in MS. till 1735, when it was published at Leyden in 4to with a good commentary by Vesling, the successor of Alpinus at Padua, under the title of *Historiæ Naturalis Egypti libri quatuor, opus posthumum, nunc primum ex auctoris autographo diligentissime recognito*. It is illustrated with numerous engravings of the animals, plants, and other natural productions of Egypt, and includes the earliest published figures and descriptions of the Egyptian lotus and the laserpitium.

The publication of these works led the Venetian government to offer Alpinus in 1593 the chair of botany at Padua, with a salary of 200 florins, which was afterwards, as his celebrity extended, increased to 750. He held the chair for 20 years with a constantly increasing European renown, but during his latter years he suffered from feeble health, deafness, and gout. He died on the 5th of February, 1617, leaving four sons, who each attained some eminence—MARCANTONIO (died in 1631), as a jurist; ALPINO (died 1637), professor of botany at Padua, who edited his father's work on exotic plants referred to below; MAURICE (died 1634), a learned theologian; and PAOLO, who distinguished himself as a soldier.

Besides the works above named Alpinus published *De Præ-sagienda Vita et Morte ægrotantium*, libri vii.; in quibus ars

tota Hypocratica prædicendi in ægrotis varios morborum eventus, cum ex veterum medicorum dogmatibus, tum ex longa accurataque observatione nova methodo elucescit, 4to, Venice, 1601. This work was long considered as the best guide for the student of medicine, and as such was recommended to be used as the physician's text-book in the Leipzig *Acta Eruditorum*. It was reprinted at Pavia the same year in 4to, at Frankfurt in 8vo in 1621, under the title *Medicinalium Observationum Historico-criticarum*; at Leyden, with a preface by Boerhaave, 4to, 1700; at Hamburg, 1734; and at Venice, 1735. Another work, *De Medicina Methodica*, libri xiii. folio, Venice, 1611, was an attempt to determine the views of the ancient sect of the Methodists. A posthumous work, *De Plantis Exoticis*, libri duo, edited by his son, contains descriptions of rare exotic plants cultivated in the Botanic Garden of Padua, of which Alpinus was the founder. Linnæus dedicated to the memory of the great Venetian botanist, the genus *Alpinia* of the order of the Zingiberaceæ.

ALS, PEDER, a celebrated Danish painter, was born at Copenhagen in 1725. He studied in the Academy of Copenhagen, where in 1755 he carried off the first great prize given for painting, and then proceeded as pensioner to Rome, where he entered the school of Mengs. Here he made many copies from the pictures of Raffaele, and on his return to Copenhagen painted several historical pictures, in which the influence of Mengs was very perceptible. He was more successful as a portrait painter, especially of men, and examples of his portraits are numerous in the public and private galleries of his native country: but his best works are over-elaborate and tame. He died in 1775.

ALSTED, JACOB HEINRICH (or ALSTEDIUS), a German theologian and historian, was born in 1588, at Ballersbach, near Herborn, Nassau; received a learned education; in 1610 was made extraordinary and in 1615 ordinary professor of philosophy at the pedagogium of Herborn; and in 1629 accepted the chair of philosophy and theology in the newly-founded university of Weissenberg in Transylvania, which he retained till his death, November 8, 1638. Alsted is now only remembered as a most laborious compiler; his industry procured for him, whilst yet living, the anagram of *Sedulitas*, but his erudition and judgment were then alike honoured. His principal works are—*Theatrum Scholasticum*, 8vo, Herborn, 1610, 2nd ed. 1620; *Lexicon Theologicum*, 8vo, Hanover, 1612, and many times reprinted; *Artificium perorandi*, Frankfurt, 1612; *Theologia Naturalis*, 4to, Frankfurt, 1615, 2nd ed. 1622; *Thesaurus Chronologicus*, 8vo, Herborn, 1624; reprinted 1628, 1637, and 1650. But his great work was his *Encyclopædia Philosophica*, of which the first edition in 2 vols. folio appeared at Herborn in 1620, and a second in 1630; it being again reprinted at Lyon in 1649. With the somewhat doubtful exception of that of Acquaviva, of which nothing but the title is known, this was the first encyclopædia written, and was a work of prodigious labour, the whole of it, and the work extended to 2444 closely-printed folio pages, double columns, being written by Alsted himself. Though an encyclopædia, it is not arranged in alphabetical order, the author aiming at making it a methodical abridgment or compendium of all the sciences, to be read continuously, the only assistance to the reader being the divisions and subdivisions, which, however, in their extent and minuteness, have proved, according to Nicéron, rather bewildering than helpful. The work, though esteemed as a vast repository of knowledge, was probably never much read, and has of course been long obsolete, but it has secured to Alsted the honour of having produced the first known and complete encyclopædia. In 1626 Alsted published a *Compendium Lexici Philosophici*, but in his dictionary he is nearly as regardless of alphabetical order as in his encyclopædia.

ALTENSTEIN, BARON VON. [STEIN, BARON VON, E. C. Biog. Div. vol. v. col. 680.]

ALVENSLEBEN, PHILIPP KARL VON, a distinguished Prussian minister of state, was born December 16, 1745, at Hanover, where his father was Minister of War to the Elector, King George II. of England, and his grandfather had been minister. Thus marked out by birth for official life, he was educated, with the crown prince, afterwards King Frederick William II. of Prussia, and his brother, at Magdeburg, and afterwards studied jurisprudence at Halle. He was then, 1770, appointed referendarius in the chief court of justice at Berlin, and afterwards advanced to a judgeship. In 1773 he was sent with the grand chancellor to introduce the Prussian system of administration into the ceded province of Poland, now called West Prussia. In 1774 he was appointed chamberlain to Prince

Ferdinand, and the next year was nominated ambassador to the court of Saxony. Here he remained busily occupied in furthering the Prussian interest with the German courts till 1787, when he was sent to Paris to negotiate with France for the pacification of the United Provinces of the Netherlands. In 1788 he went as ambassador extraordinary to Holland, and in the same year was promoted to the like post in London, where he remained till 1790. On his return to Prussia, he was made Minister of War; in 1792, received the unusual distinction of the order of the black eagle; and in 1801 was created count. Alvensleben possessed the entire confidence of the king, and exerted an important influence on the policy of Prussia. He died at Berlin October 21, 1802. He published, but without his name, a chronological account of military events from the peace of Munster to that of Hubertsburg, 'Versuch eines tabellarischen Verzeichnisses der Kriegsbegebenheiten vom Münsterschen bis zum Hubertsburgischen Frieden,' 8vo, Berlin, 1792.

AMAT, FELIX, abbot of St. Ildefonso and archbishop of Palmyra, was born August 10, 1750, at Sabadell, in the diocese of Barcelona, of a family rather noble than wealthy. At the age of eleven he was sent to the episcopal seminary at Barcelona, where he distinguished himself for his proficiency in poetry, rhetoric, and mathematics. Resolving to enter the church, he received, in 1767, his first tonsure from Climent, Bishop of Barcelona, who had conceived a great admiration for his talents and industry. Amat's stature at this time was prodigious; at the age of seventeen he had attained the height of ten palms and three inches Spanish, or seven feet two inches English. In 1770 he took his doctor's degree at Granada, and returning to Barcelona, was named by his patron, Bishop Climent, professor of philosophy at the episcopal seminary, and by the king, at Climent's recommendation, librarian of the episcopal library. In the latter office he distinguished himself for his activity, intelligence, and powers of classification and arrangement, the fruits of which abide to this day. He occupied himself, also, at the suggestion of Climent, in writing 'Institutes of Philosophy;' and was engaged by Valladares, who succeeded to the bishopric of Barcelona on the resignation of Climent in 1775, to draw up a series of new regulations for the episcopal seminary, and to write a little book for the guidance of the institution, which was published under the title of 'El Seminarista.' Amat likewise accepted from the bishop the post of director of this establishment; but escaped from the too great mental and bodily fatigue incident to the office, when he became a successful candidate for the chief canonry of Tarragona. This preferment at once introduced him to the friendship of Don Francisco Armaña, Archbishop of Tarragona, with whom he co-operated in forming at Tarragona a society of "Amigos del Pais," or "Friends of the Country," a title which has rather a social and economical than a political significance. Of this society Amat drew up the regulations, and contributed numerous articles to its Transactions. In 1790, with the assistance of his brother, Don Antonio, who was perfectly acquainted with the English language, he prepared a compendium of Burke's 'Reflections on the French Revolution,' which was published without the name of the translator, or the date or place of printing. When the war with France broke out in 1794, the patriotism of Amat procured for him to be named one of the general junta for the rising in arms of Catalonia, but he found time in the midst of his warlike occupations to write a letter to Veyan, Bishop of Vich, on the method of teaching theology by the 'Sum of Theology' of St. Thomas Aquinas. In the next year, which restored peace to Spain, Amat was engaged in a controversy with Jovellanos on the 'Notice of the Royal Institute of Asturias;' and about the same time was freely contributing materials to his friend Don Josef Esteve for the Catalan dictionary, published in the year 1800. Amat was appointed, in 1801, royal visitor of the priory and college of Roncesvalles, and discharged his delicate duties with so much tact and success that he was named in 1803 by Charles IV. abbot of St. Ildefonso, the royal residence; in 1805, visitor of the royal monastery of the Escorial; and in 1806, confessor to the king. In 1803 he had been made, by the Pope, archbishop of Palmyra *in partibus*. On accepting the office of royal confessor, he stipulated that he should not be required to interfere in political affairs; but he entered with energy into the discussions on a plan for the general reform of the universities, and actively promoted the design of a new Spanish translation of the Bible, which was suggested by the king, and finally executed by Don Felix Torres Amat, the nephew of the confessor.

But the events of the years 1807 and 1808, were such as to force Amat from his position of political neutrality, which he

abandoned in such a way as to taint his hitherto unimpeached patriotism with the suspicion of sympathy with the French invaders of Spain. He was set down by his fellow countrymen as an "Afrancesado;" and was judged, not only by the Spaniards, but by the French themselves, as favourable to the cause of the latter. King Joseph Bonaparte appointed him to the bishopric of Osma, which Amat neither accepted nor declined, merely putting off taking possession till the arrival of the necessary bulls from Rome. At this time he wrote his work, 'Deberes del Cristiano hácia la Potestad Publica;' Duties of a Christian towards the Public Authority, or Principles of Guidance for Good Men in the Revolutions that agitate Empires. On the entry of Lord Wellington into Madrid, 12th August, 1812, and the restoration of the national government, Amat judged it prudent to retire from the capital; to which he returned, however, on its re-occupation by the French troops, when he endeavoured to play the part of a mediator with so much success as to leave it doubtful on which side were his sympathies. On the arrival of King Ferdinand VII., who, from having been a prisoner, showed every sign of developing into a despot, Amat was unsuccessful in his attempt to convince the sovereign of the rectitude of his political conduct during the French domination; and being, along with others, who had held certain offices under King Joseph, banished by royal decree from Madrid, retired July 13th, 1814, to Catalonia. In 1816 he obtained permission to resign the Abbey of St. Ildefonso; and in 1817 had the mortification of seeing his 'Ecclesiastical History' arbitrarily prohibited by the Inquisition, which had been re-established by King Ferdinand. Amat foresaw the agitations that impended over his native country, and in 1820, when commotions had broken out at Cadiz and elsewhere, published 'Observaciones pacíficas sobre la Potestad Ecclesiástica,' or Pacific Observations on Ecclesiastical Power, which satisfied neither party. The infirmities of advanced age, combining with the sorrow and apprehension with which Amat regarded the existing disasters and future prospects of Spain, put an end to his life on the 28th of September, 1824, at the age of seventy-four, at a convent of Franciscans near Sallent, where he had resided for several years.

Four principal works of Amat may be selected for mention out of the long list of his productions. His great work is his 'Tratado de la Iglesia de Jesu Cristo' (Treatise on the Church of Jesus Christ), generally known as his 'Ecclesiastical History,' which is the name given to it in the leaf before the title-page. It occupies twelve small Spanish quartos, which were published at intervals, the first four at Madrid in 1793, the fifth and sixth in the same city in 1798 and 1799; the seventh and eighth in 1799, at Barcelona; the ninth and tenth also at Barcelona in 1800 and 1802 respectively; and the two last in the same city in 1803. A second edition, in thirteen volumes, appeared at Madrid, in 1807. It is singular that this work, which in the warmest terms defends the Inquisition, should have been, at its first appearance, denounced to that tribunal, and several years after prohibited by it. Amat's next important works are his 'Observaciones sobre la Potestad Ecclesiástica' (Observations on Ecclesiastical Power), Barcelona, 1817-23, 3 vols. 4to; and his 'Seis Cartas à Irenico' (Six Letters to Irenicus), Barcelona, 1817. Both these works were published under the assumed name of Don Macario Padua Melato, Macario being the Greek equivalent of his Christian name of Felix, and Padua Melato an anagram of his appellation Amat de Palou. In the 'Letters to Irenicus' the author enunciates distinct ideas of the rights of man and of civil society, and that contract is refuted which is pretended to be the origin and necessary foundation of sovereignty, and makes it dependent on the consent of subjects. The mention of the principal works of Amat is completed with the 'Deberes del Cristiano en Tiempo de Revolucion,' Madrid, 1813, 8vo; but besides these, he left several small treatises in philosophy; occasional sermons; pastoral letters; and an unfinished reply to Volney's 'Ruins of Palmyra,' with which, as archbishop of Palmyra, Amat thought himself particularly concerned. (*Biog. Dict. of Soc. for Diff. of U. Knowledge.*)

AMELOTTE, DENYS, a French ecclesiastic of the 17th century, was born at Saintes, in Saintonge, in 1606. He was ordained priest in 1632, and some time after took the degree of doctor of divinity. He formed an intimacy with the priests of the Congregation of the Oratory, and subsequently—probably several years before, but certainly not later than, 1650—became a member of that body. In his 'Vie de Charles de Condren, second Supérieur Général de la Congregation de l'Oratoire de Jesus,' 4to, Paris, 1643, Amelotte, who had been a pupil of Condren, made some remarks on Du Verger de

Hauranne, abbot of St. Cyran, which gave great offence to the friends of that ecclesiastic, and to the Jansenists generally. Some years later Amelotte published the first part of a work on the Jansenist controversy—which should have been followed, but was not, by two other parts—with the title of 'Défense des Constitutions d'Innocent X., et d'Alexandre VII., et des Decrets de l'Assemblée du Clergé contre la Doctrine de Jansenius,' &c., 4to, Paris, 1660. This work drew upon its author the attack of the members of the Society of Port Royal, in a work written by Nicole and remarkable for its personalities, of which the title was 'Idée Générale de l'Esprit et du livre du Père Amelotte,' 4to, Paris, 1661. Amelotte retaliated in the dedication of his translation of the New Testament, addressed to Péréfixe, Archbishop of Paris, in which he described the Jansenists as "blind rebels," and charged them with "rage, imposture, and calumny." Further, Amelotte exerted his influence to procure the prohibition of the version of the New Testament, then in preparation by the members of Port Royal, of which they asserted Amelotte had surreptitiously obtained a copy, and availed himself of it in making or correcting his own version. The Port Royalists, being thus prevented, through the influence of Amelotte, from obtaining a licence to publish their version at Paris, brought it out at Mons, in Flanders. It is known as De Sacy's version.

Amelotte was Superior of the house of the Congregation of the Oratory, Rue St. Honoré, Paris, and assistant to the Superior General of the Congregation. He was the theological adviser of the Chancellor Seguier, whom he had prevailed on to withhold his licence from the Port Royal New Testament. But in the latter part of his life, he complained of the neglect of the great, whom he had obliged, and through whose influence he vainly expected a bishopric. Le Long, in a note to his 'Bibliothèque Historique de la France,' places the death of Amelotte in 1675; but the balance of probabilities is appreciably, if slightly, in favour of Nicéron, who states ('Mémoires,' &c.) that he died at Paris, 7th October, 1678, at the age of 72.

Amelotte's version of the New Testament is from the Clementine edition of the Vulgate, and bore as its title 'Le Nouveau Testament, traduit en François, avec des Notes sur les principales Difficultés,' &c., 3 vols. 8vo, Paris, 1666, 1667, and 1670. It was republished twice, if not three times, in the author's lifetime, but without the notes. It has been reprinted many times since. A second edition, with the notes, and with a new dedication to Harlay, successor of Péréfixe in the archbishopric of Paris, was published in two volumes, 4to, 1688. The other works of Amelotte are religious, and comprehend two Lives of Jesus Christ, one in Latin and one in French, harmonised from the four Gospels in the Latin version, and in his own French version. 'Le petit Office du Saint Enfant Jesus,' enumerated by Nicéron amongst the works of Amelotte, appears to have been written by Marguerite du Saint Sacrement, whose Life Amelotte wrote, and was merely edited by him.

AMICI, GIOVANNI BATTISTA, a distinguished Italian astronomer and optician, was born at Modena, in 1784. While studying mathematics at Bologna, he evinced a taste for the pursuits which afterwards brought him into note. He studied the principles of various optical instruments; introduced a new brilliant hard white alloy for the specula of telescopes; made large specula with his own hands; invented ellipsoid specula, to get rid of spherical aberration; greatly improved the achromatic microscope, with which he made valuable observations on infusoria, on the circulation of the sap in plants, and on vegetable functions; and contrived six kinds of camera lucida, for the use of designers and to facilitate microscopic observations. These labours were spread over the first forty years of the present century. After making telescope specula 11 inches in diameter, and one of larger size for Milan Observatory, he undertook to make a magnificent five-feet speculum, to be cast in the ducal gun-foundry at Pavia; but various circumstances led to the abandonment of the design. He contrived new forms of reflecting microscope, polariscope, and micrometer. Amici, who had been professor of mathematics in early life at the Lyceum of Pano, was in 1831 appointed Inspector General of Studies in the Duchy of Modena; and he afterwards succeeded Pons as director of the Florence Observatory. Besides papers on microscopic physiology, in the 'Memorie della Società Italiana,' he communicated to various scientific bodies articles on Double Stars, Jupiter's Satellites, the Angular Diameter of the Sun, &c. Amici died April 23rd, 1863.

AMIGONI, or AMICONI, GIACOMO, a celebrated Italian painter, was born at Venice in 1675. After studying in the schools of his native city, he went to Flanders, attracted by the

reputation of the Flemish painters, and from his study of their masterpieces, is said to have discovered the system of colour he had long sought in vain in Venice. He painted historical subjects and the then popular conversation pieces, adopting the small size of the Flemish cabinet painters as well as their mode of colour in preference to those of his countrymen. Having been appointed painter to the Elector of Bavaria, he stayed some time at Munich, painted the ceilings of the palace at Schleissheim; some altar-pieces for churches, and several cabinet pictures for private collections. From Munich he came in 1729 to England, where his manner was a novelty, and where, consequently, he was for some few years very popular. One of his first commissions was to paint a staircase at Lord Tankerville's in St. James's Square (already destroyed when Walpole wrote), and for which, on his declining to charge beyond the cost of the scaffolding, &c., Lord Tankerville gave him 200*l*. He was then employed to paint the staircase of Powis House, Great Ormond-street, with the story of Holofernes—the personages of which he clad in Roman dress. Other decorative works engaged his pencil, and among them was a 'Shakspeare and the Muses' over the proscenium of the new Theatre in Covent Garden; but the demand for this kind of decoration was slackening; his manner had lost its novelty; patrons would not buy his history or conversation pieces, and so he was driven to portraiture, on which he flourished for the next few years, contriving, besides living handsomely, to put by 5000*l*. Walpole records that for a whole length he was paid 60 guineas. Among the portraits he painted whilst here were Caroline, Queen of George II., and the three eldest princesses; Prince Frederick, eldest son of George II., the Poor Fed of the satirists, who is represented by the courtly painter as seated, with a volume of Homer in his hand, whilst a couple of Loves are hovering over him; the portrait is now in Windsor Castle. Amigoni left London in 1739 for Venice, where he painted several works, the most admired being a 'Visitation' for the monastery of S. Filippo. In 1747 he went to Spain, was made court painter to Ferdinand VI., and painted for him several pictures which met with much applause. He died at Madrid in 1773.

Amigoni was sufficiently praised in his own day and immediately after. Lanzi speaks of his fertile and animated genius, and grandeur and beauty of style; and Zanetti eulogises the clearness and charm of his colour; but in truth he was wholly wanting in genius, and in manner feeble and conventional. The only interest he now retains for us arises from his connection with English art during the early years of the reign of George II. He etched a few plates, but they are of little value. Heineken enumerates 127 engravings executed from his pictures, among them being many from his English portraits, some of which are prized by collectors.

AMLING, CARL GUSTAV, an eminent German engraver and designer, was born at Nürnberg in 1651. Having learnt to draw and engrave at home, he went to Munich, where he attracted the notice of the Elector, Maximilian II. of Bavaria, who sent him to Paris to complete his studies under F. de Poilly, one of the ablest engravers of the time. On his return to Munich he was made court engraver, and continued to reside in that city till his death in 1701. Amling enjoyed the reputation of being the best line-engraver in Germany. His style is, however, deficient in purity and vigour, and the drawing is frequently incorrect. The most important, and perhaps the best, of his historical prints, are 13 of the series of 22 from the tapestries designed by P. Candido, in the palace at Munich. But his historical plates are inferior to his portraits, some of which are highly prized: the best are those of the Electors; several are from drawings made from the life by himself. Heineken, who gives a full list of his engravings, says that he was a painter as well as an engraver.

AMORETTI, CARLO, a learned Italian, was born at Oneglia, in Genoa, March 13, 1741. The son of a merchant, he was intended for the priesthood, and at the age of 16 entered the order of St. Augustine. His progress in study was so satisfactory that while still young he was appointed professor of ecclesiastical law at the University of Parma; but a growing dislike to the clerical profession led him to petition the Pope for secularisation, which was granted in 1772, and having resigned his professorship, he was left free to apply himself to his favourite studies. At this time his bent was towards physical and natural science; he was united in close intimacy with Fortis, Soave, and Vanini, workers in the same field; and the post of tutor in the Cusani family at Milan enabled him to pursue his investigations under favourable circumstances. In 1775 Amoretti began, in conjunction with Padre Soave, a work that was intended to keep his countrymen acquainted with the progress of knowledge throughout the civi-

lized world by means of translations of memoirs and essays, either published or in MS., by distinguished writers, selected from the transactions of the chief learned societies. Of the 'Scelta di Opuscoli interessanti,' as it was called, 36 volumes were published in three years, when, fearing the accumulation of small volumes would be found inconvenient, the editors determined to change the form; and in its larger size, and under the title of 'Opusculi Scelti sulle Scienze e sulle Arti,' it was continued from 1778 to 1803, making 22 quarto vols. The work was of great value at the time of its publication, and may still be referred to with advantage.

Amoretti's first independent work was a translation, made at the suggestion of Fumagalli, of Winckelmann's History of Art, 'Storia delle Arti del Disegno presso gli Antichi,' 2 vols. 4to, 1779. It was received with great favour, and the credit he gained from it led Amoretti to write a life of Lionardo da Vinci, in the preparation of which he was able to make use of the MSS. of Lionardo preserved in the Ambrosian Library: "Memorie storiche sulla Vita gli Studi, e le Opere di Lionardo da Vinci," 8vo, Milan, 1784, and several times reprinted. In 1783 Amoretti was made secretary to the Società Patriotica di Milano, for the promotion of arts and agriculture, and he retained this office till the dissolution of the society in 1798. Before this happened, 1797, he was elected one of the "Dottori del Collegio Ambrosiano," or conservators of the Ambrosian Library, a position which greatly facilitated his researches. His attention had for some time been directed towards geography and the connected sciences, and in 1794 he published what has been generally considered the most valuable of his works, 'Viaggio di Milano ai tre Laghi.' The three lakes are of course Lago Maggiore, Lugano, and Como, and the book is an invaluable repository of information respecting the physical features of the district in which they are situated, as well as of the political and social condition of Milan. The work was several times reprinted, and Amoretti published in his 'Opusculi Scelti' some appendices to it, the results of subsequent journeys and investigations. In 1800 he published another important contribution to comparative geography, being an account of the first voyage round the world made by the fleet under the command of Magalhaens, from Pigafetta's MS. in the Ambrosian Library, 'Primo Viaggio intorno al Globo Terraqueo; ossia Ragguaglio della Navigazione alle Indie Orientale per la Via d'Occidente, fatta dal Cavaliere Antonio Pigafetta, Patricio Vicentino, sulla Squadra del Capitano Magaglianos negli Anni 1519-22; ora pubblicato per la prima Volta, tratto da un Codice MS. della Biblioteca Ambrosiana di Milano,' &c., 4to, Milan, 1800; with it was included an essay on navigation from a MS. bound up with Pigafetta's, and presumed by Amoretti to have been written by him. A French translation of the *Primo Viaggio*, by Amoretti, appeared the same year as the original. Amoretti also published both in Italian and French the voyage of Maldonado, the truth of which he stoutly maintained, but though convinced himself, he has convinced few besides. Two other works may be mentioned, 'Le Guide des Étrangers dans Milan, et aux Environs,' 2 vols. 12mo, Milan, 1805, a well arranged and useful guide, written by Amoretti in French; and a reprint of several papers on the use of the divining rod in searching for water and minerals, 'Della Raddomanzia ossia elettrometria animale ricerche fisiche e storiche,' 8vo, Milan, 1808. He also published later various papers on coal, lignite, animal electricity, &c., and took some part in a periodical commenced in 1808, under the title of the 'Giornale della Società d'Incoraggiamento delle Scienze e dell'Arti stabilita in Milano.' Amoretti was created a Knight of the Iron Crown in 1805; he was subsequently a member of the Council of Mines, and was elected member of the Institute of Italy. Beyond barren honours, his various and most useful labours met, however, with but little recompense, and he died, as he had lived, in comparative poverty, March 25, 1816.

AMPÈRE, JEAN-JACQUES-ANTOINE, a distinguished French writer, the son of the eminent mathematician and physicist, ANDRÉ-MARIE AMPÈRE [E. C. BROS. Div. vol. i. col. 195], was born at Lyon, August 12, 1800. He was educated at Paris under the supervision of his father; studied philosophy under Cousin; read diligently English and German literature, and evinced a decided inclination for a literary life, which his father fostered. The young Ampère ranged himself along with the brilliant band of literary men who united liberalism in politics with freedom in the forms of philosophy, poetry, and romance. He was one of the recognised circle at Madame Recamier's; was one of the staff of the 'Globe' under Guizot's editorship, and a welcome contributor to other liberal and literary journals. In the early part of 1830 he was invited to lecture on literature at

the Athenée of Marseille, and he published the introductory discourse under the title of 'L'Histoire de la Poésie,' 8vo, Marseille, 1830. The course itself laid the foundation of a work published three years later, 'De la Littérature française dans ses rapports avec les littératures étrangères au Moyen Age,' 8vo, Paris, 1833; but M. Ampère was recalled from Marseille to Paris by the events which followed the revolution, and acted at the Sorbonne as substitute for M. Villemain and M. Fauriel. In 1833 he was appointed professor of literature in the College of France, and his lectures were among the more attractive in that brilliant period of the Parisian professorships. The substance of the courses appeared in 'L'Histoire littéraire de la France avant le douzième siècle,' 3 vols. 8vo, 1839-40; and 'Sur la Formation de la Langue française,' 3 vols. 8vo, Paris, 1841.

But while filling the chair at the college, M. Ampère continued to be a frequent contributor to newspapers and periodicals. He also made several long journeys, of some of which he gave an account in the 'Revue des Deux Mondes,' republished in 2 vols. 8vo, 1834, under the title 'Littérature et Voyages (en Allemagne, en Scandinavie, &c.),' 3rd ed. 1863. Later M. Ampère published notes of his visits to Italy, Egypt, Nubia, &c. Among other fruits of these journeys and literary researches made whilst pursuing them, may be mentioned 'la Grèce, Rome et Dante, Études littéraires d'après Nature,' 12mo, Paris, 1848; the 'Promenade en Amérique,' of which a 3rd edition in 2 vols. 8vo appeared in 1868; and the most important of all his works, 'L'Histoire Romaine à Rome,' of which the greater part was first published in the 'Revue des Deux Mondes,' but which as a separate publication forms 4 vols. 8vo, 1856-64, the last two volumes being posthumous. This work, on which M. Ampère's fame will perhaps ultimately rest, exhibits extensive and varied erudition, keenness of perception and observation, much richness of illustration, and an attractive style; but there is a want of grasp and concentration which renders the book unsatisfactory and wearying as a whole, however charming and often brilliant may be separate parts. Much of this may, however, be attributed probably to the piecemeal way in which it was prepared for publication in the pages of the 'Revue des Deux Mondes.' Other publications of M. Ampère were his 'Heures de Poésies,' and 'César. Scènes historiques,' 8vo, 1859.

M. J. J. Ampère was elected member of the Académie des Inscriptions in 1842; succeeded M. A. Guiraud at the Académie Française in 1847; and was made officer of the Legion of Honour in 1846. He died on the 27th of March, 1864. His successor at the Institute was M. Prévost-Paradol.

AMSDORF, NICOLAUS VON, the son of noble parents, was born on the 3rd of December, 1483, at Zschepe, a village near Wurzen, in Saxony. He entered the University of Wittenberg in 1502—the year of its foundation by Frederic, Elector of Saxony—as a student of divinity, and was appointed professor in that faculty in 1511. He became a warm friend and partizan of Luther, whom he accompanied to the disputation of Leipzig in 1519, and in 1521 to the celebrated diet of Worms, on his return from which Luther was carried off with friendly violence to the castle of Wartburg. On the recommendation of Luther, who had reappeared at Wittenberg in the spring of 1522, Amsdorf was appointed in 1524 superintendent and minister at St. Ulrich, in Magdeburg, where he devoted himself with his usual zeal to the propagation of the Reformation. In 1531 he was employed in quelling the religious troubles that had broken out in the imperial town of Goslar; in 1534 he introduced the new religious doctrines into the principality of Calenberg; and in 1537 was one of the framers and signatories of the "Articles of Schmalkalden." On the 20th of January, 1542, Amsdorf was consecrated Bishop of Naumburg by Luther, in presence of the Elector and his brother, John Ernst, Duke of Saxony. This appointment was made on the condition that the sovereignty and temporal rights over Naumburg, which had hitherto belonged to the bishops, should be exercised by the Elector; whilst Amsdorf was to content himself with the discharge of the spiritual functions of the office. Such an arrangement was regarded by the Emperor and the Roman Catholic party as a breach of the constitution of the Empire; yet Amsdorf was maintained in his see by the Protestants till 1547, when the defeat and capture of the Elector, John Frederic, on the field of Mülberg, compelled him to retire to Magdeburg. Here he continued his activity in the interests of the Reformation, and was frequently involved in controversy with other theologians. Against Matthias Flacius he maintained that original sin was nothing substantial, but only a strong accident; and, in a dispute with George Major, he went so far as to maintain that good works, far from being necessary, were pre-

judicial to salvation. In 1552 Amsdorf was appointed superintendent and ecclesiastical counsellor at Erfurt, the residence of the sons of the Elector, John Frederic, who was still in captivity, and who was not restored to liberty till 1554, in which year he died, his last moments being soothed by the consolations of Amsdorf. Although he never recovered the see of Naumburg, Amsdorf continued to receive from his friends the title of bishop; and after having greatly contributed to the foundation of the University of Jena, which was solemnly established on the 2nd of February, 1558, he died at Eisenach on the 14th of May, 1565, in the 82nd year of his age. Amsdorf is the author of numerous theological pamphlets, which are now very rare. In some of these he treats of the doctrines of Christianity, and in others of matters of merely ephemeral interest and significance. The greater part of his productions have a controversial character. He took an active part in Luther's translation of the Bible, and was the editor of the second edition of Luther's works, to which he furnished a preface. The only work which, in addition, it is necessary to particularise as having been written by Amsdorf, is one of considerable historical interest, entitled 'Ein Kurzer Auszug aus der Chronica Nauderi, wie untreulich die Päpste mit den Römischen Kaisern gehandelt,' Magdeburg, 1534, 4to ('A Short Extract from the Chronicle of Nauclerus, to show how unfairly the Popes have acted towards the Roman Emperors').

AMYRAUT, MOYSE (Latinized, Amyraldus, Moses,) was a member of an ancient family, and born at Bourgueil in Touraine, in September, 1596. His father designed him for the legal profession; and reluctantly consented that he should enter upon a course of theological studies at Saumur. These being completed, Amyraut was settled as minister successively at St. Aignan and at Saumur, in the university of which city, soon after his settlement there, he was, in 1633, appointed professor of divinity. Having been deputed, in 1631, to represent the synod of Charenton in laying before the king their remonstrances against certain infractions of the edicts of pacification made in favour of the Protestants, Amyraut, by his firmness and tact, succeeded in placing the Protestant clergy on the same footing with the Roman Catholics, so far as permission to stand in the royal presence was concerned. Previously, the Protestants had been required to approach the king on their knees; and the address which Amyraut displayed in forcing the establishment of a better precedent, won for him the high consideration and permanent regard of Cardinal Richelieu. But Amyraut was the occasion of a protracted and virulent controversy amongst the Protestants themselves. In a work conceived and produced in the interests of peace, he endeavoured to reconcile the predestinarianism of Calvin with the doctrine of universal grace. To Du Moulin and other Calvinistic divines, the work seemed to impugn the decrees of the council of Dort, and to promulgate the heresy of Arminius; so that the question of the writer's deposition was agitated before the synod of Alençon. After an able defence Amyraut was honourably acquitted; but he was enjoined for the future to be silent on the matter in controversy. With this condition his sense of the justice of his cause did not allow him to comply; and when his contumacy was brought to the notice of the national synod of Charenton, that body procured an amicable compromise, or "holy amnesty," which left Amyraut at liberty to defend his position against the attacks of foreign adversaries. The first use he made of this concession was to publish an answer to the attack of Spanheim, in his work, in three volumes, on universal grace. On the same side had enlisted also Rivet, Des Marets, and other writers, whilst Amyraut was supported by the talents of Daillé, Mestrezat, Blondel, and Claude. In the long run the opinions advanced by Amyraut gained the ascendancy, and were so generally adopted in France as to be publicly received by the universities of the Huguenots, with whose dispersion, after the revocation of the edict of Nantes, they rapidly spread through Holland and other countries of Protestant refuge. Amyraut forfeited nothing of personal respect by the part which he took in this controversy. His Protestant opponents esteemed and venerated the intrepid advocate of a creed they repudiated; whilst from the highest dignitaries of the Roman Catholic church, including Richelieu and Mazarin, he received substantial marks of friendship and confidence. The favour of the latter may have been due in great part to the emphasis with which Amyraut publicly maintained the doctrine of implicit obedience to the sovereign authority. To these views he gave prominence in his 'Apology for the Protestants,' published in 1647; and in 1650, in a work on the sovereignty of kings, occasioned by the execution of Charles I.

BIOG. DIV.—SUP.

of England, as well as in the preface to his Latin version of the Psalms, dedicated to Charles the Second. Yet upon occasions when conscience compelled him to opposition, Amyraut could boldly and successfully withstand the orders of the government. He died in July, 1664, leaving behind him an enviable reputation for learning, judgment, amiability, candour, and conciliation; and for a charity which found expression in constant and liberal benefactions to the poor, without distinction of creed. He was a voluminous author; and wrote with equal facility in Latin and French. The principal of his writings not already mentioned are the following:—'A Treatise on Religion,' 1631; 'On the Nature, Extent, &c., of the Gospel,' 1636; 'The Exaltation of Truth and the Abasement of Reason,' 1641; 'On Separation from the Church of Rome' (Latin), 1647; 'Irenicon, designed to promote the Re-union of the Calvinists and Lutherans,' 1648; 'Christian Morality,' 6 vols. 8vo, a work of singular merit, composed with great care; 'A Treatise on the Millennium'; 'A Treatise on Dreams' ('Discours sur les Songes divins, dont il est parlé dans l'Ecriture,' Saumur, 1659); and a Poem entitled 'Apology of St. Stephen for his Judges.'

ANCHIETA, JOSEPH DE, Jesuit missionary, called the Apostle of Brazil, was born at Laguna in Teneriffe, in 1533. Having studied at the University of Coimbra, he entered the Society of Jesus at the age of seventeen. In 1553 he went with six other Jesuits to Brazil, where he acted as schoolmaster in a small mission colony called San Paolo. They suffered many hardships, but succeeded in converting many of the natives. Anchieta studied the language of those around him, and wrote a grammar and vocabulary of the Tupinamban tongue. Having no books, he wrote out all the lessons for his pupils; converted popular songs and ballads into hymns; prepared forms for confession and catechism; and at the same time acted as physician and general adviser. In 1562 he succeeded in establishing a mission, and strengthening the Portuguese authority, at Espiritu Santo. On returning to San Paolo, in 1564, he wrote a poem to the Virgin, consisting of 5000 Latin verses. He was appointed provincial in 1578, was unceasing in his labours for the conversion of the natives, among whom he continued to reside till his death, which occurred on June the 9th, 1597, at the village of Reritiba, near Espiritu Santo. Anchieta left behind him a reputation among the natives and converts for powers little less than miraculous. Out of ten works attributed to Anchieta, only two have been published separately,—a grammar of the Tupi language; and the poem on the Virgin. A Latin memoir by him on the natural products of Brazil has been printed by the Academy of Sciences.

ANDERSON, REV. JOHN, was born in 1671, and educated at St. Andrews, where he took the degree of M.A. This is nearly all that is known of his early life, for twenty-five years of which he states, in one of his works, he had resided in Edinburgh. He was preceptor to John Campbell, second duke of Argyll; and, from a satirical expression of "Curst Calder," one of his literary opponents, who calls him "an old pedantic dominie," it is probable that he had been at one time a schoolmaster. In 1704, he was appointed minister of Dumbarton; and about the commencement of the year 1717, received an invitation from the people of Glasgow to become one of their ministers. But the ministers of Glasgow, upon whom he had reflected in a letter addressed to Walter Stewart of Pardovan, withstood his appointment, which, after being canvassed in the synod, was at length carried into effect in 1720, by his translation to the North-west or Ram's Horn Church, in Glasgow. Almost immediately after the confirmation of his appointment, he died, leaving a reputation, to use the words inscribed on the monument erected by his grandson, of "a pious minister and an eloquent preacher, a defender of civil and religious liberty, and a man of wit and learning," who "lived in the reigns of Charles II., James II., William III., Anne, and George I." His literary activity was almost entirely controversial, and he appears as the advocate of Presbytery against Episcopacy, and labours to establish the Genevan, and not the English, origin of the liturgy which was used in Scotland for some years after the establishment of the Presbyterian discipline. The principal work of Anderson, and that by which he is at present chiefly known, is 'A Defence of the Church Government, Faith, Worship, and Spirit of the Presbyterians, in answer to a Book entitled "An Apology for Mr. Thomas Rhind,"' 4to, 1714.

ANDERSON, LARS. [ANDRÆ, LAURENTIUS, E. C. S.]

ANDERSON, ROBERT, a provincial poet of considerable celebrity, was born at Carlisle, February 1, 1770. Of poor parents and the youngest of nine children, he was educated in

a charity school till, at ten years of age, he was set to work with his brother a calico-printer. Having shown some talent for drawing he was apprenticed to a pattern drawer, but seems to have been harshly treated, especially during the last years of his term, which were spent in London. It was whilst here that he wrote his first verses, some ballads, which were purchased by the proprietors of Vauxhall Gardens. In 1796 he returned to Carlisle and shortly after published a volume of poems, which, however, attracted no notice. His first real success was with a ballad in the Cumberland dialect called 'Betty Brown,' which became very popular, and was followed by others of a similar description, until enough had accumulated to form a volume, 'Ballads in the Cumberland Dialect, by Robert Anderson, with Notes and a Glossary by Thomas Sanderson,' 8vo, 1805. The work passed through several editions, but from this Anderson, having sold the copyright, derived no advantage. He now took a situation at Belfast, where he remained several years. Returning to Carlisle he was persuaded to collect and publish his scattered verses, which accordingly appeared in 1820, in two volumes, accompanied by an autobiography of the poet, and an 'Essay on the Characters and Manners of the Peasantry of Cumberland,' by the author's friend Mr. T. Sanderson. During his last years the friends and admirers of the humble poet raised a subscription by means of which a monthly payment was made him sufficient for his support. He died at Carlisle, September 27, 1833, and was buried in the cathedral cemetery. The ballads and poems of Anderson afford clever, humorous descriptions of local manners and customs, told in the purest and raciest local idiom, and have consequently maintained their local popularity; but they have little originality, depth of feeling, or inherent power, and are not calculated to win renown on a wider stage.

ANDRADA, JACINTO FREIRE DE, a Portuguese writer, was born at Beja in Alemtejo in 1597. While abbot of the monastery of Santa Maria de Chaus, he aided in establishing John of Braganza as King of Portugal in 1640, and was a man of much social and political influence until his death, which took place at Lisbon, May 13, 1657. Andrada was a polished and witty writer of verses, in which he ridiculed the stilted style of the Portuguese poets of those times. His best work is a life of Dom João de Castro, viceroy of Portuguese India, 'Vida de Dom João de Castro, Quarto Visorey da India,' fol. Lisbon, 1651. This was the best biographical work in the language at the time it was written, and is still regarded as a model in Portuguese composition. It was translated into English by Sir Peter Wyche, folio, London, 1664.

ANDRADA E SILVA, JOSÉ BONIFACIO, a Brazilian politician, was born at Santos in Brazil in 1762. Having taken degrees in jurisprudence and natural philosophy at Coimbra University, he was sent at the government expense in 1790 to travel in Europe, in order to extend his knowledge in chemistry, mineralogy, and metallurgy. He was away ten years, during which time he visited France, Holland, Scandinavia, Germany, and Italy, and became acquainted with Fourcroy, Duhamel, Justeiu, Brongniart, and Werner. On his return to Portugal he was appointed general superintendent of mines, professor at Coimbra, and secretary of the Academy of Sciences at Lisbon. Returning to Brazil in 1819 he exchanged science for politics, and with his two younger brothers, Antonio Carlos and Martin Francisco, became mixed up in the proceedings connected with the establishment of Brazil as an empire independent of Portugal. As the principal author of the measures which led to this result, José was entrusted by the Emperor Pedro with the general direction of affairs; but the Andrada ministry did not long retain popularity or power. His ministry was dissolved in July, 1823, but in a few months the brothers were again restored. This time their measures led to a collision with the assembly. The military were called out, but the emperor intervened; the Andrades were all three arrested, placed on board a vessel of war, and carried to France, where they remained about five years. They returned to Brazil, were arrested on landing, but allowed to retire to their estates. A reconciliation soon, however, took place with the emperor, and Don Pedro, before his abdication in 1831, nominated José Andrada guardian of his children, including his infant son and successor. He remained regent till September, 1834, when, in deference to the popular demands, he resigned and retired into private life. He died at Rio, April 6, 1838. José Andrada wrote a few papers, in French and Portuguese, on the mines and mineralogy of Brazil, and some on economical subjects printed in the 'Annales de Chimie,' and 'Transactions of the Lisbon Academy,' as well as one or two political pamphlets.

*ANDRAL, GABRIEL, an eminent French physician, was born at Paris on the 6th of November, 1797. His father, Guillaume Andral, was a member of the Académie de Médecine, and had seen much active service as a surgeon in the French army. Gabriel Andral, being thus early accustomed to medical studies, became a doctor of medicine in 1821, and at the age of 25 was elected member of the Académie de Médecine, as well as assistant professor to the Faculté de Paris. Before the age of 30 he succeeded Bertin as professor of hygiene; an office which he exchanged in 1830 for that of professor of internal pathology. In 1839 he succeeded Broussais in the chair of general therapeutics and pathology. He was elected a member of the Institute in 1843; and in 1858 was made Commander of the Legion of Honour. Besides his acknowledged skill as a teacher of the medical sciences, Dr. Andral has written many professional works of great value. One is 'Clinique Médicale,' Paris, 1823-26; of which the fourth edition, in 5 vols. 8vo, appeared in 1840. Others are 'Précis d'Anatomie Pathologique,' Paris and Montpellier, 3 vols. 8vo, 1829; 'Cours de Pathologie interne, professé à la Faculté de Médecine, recueilli et rédigé par M. Amédée Latour,' Paris, 3 vols. 8vo, 1836; of which a second edition appeared in 1848. He has also published a valuable work, written in conjunction with Meriadec Laennec, 'Notes et Additions au Traité de l'Auscultation médiate de Laennec,' Paris, 8vo, 1837, and many memoirs in the medical journals, including an important series of investigations 'Sur les modifications de proportions de quelques principes du Sang.'

ANDREA PISANO. [PISANO, E. C. vol. iv. col. 843.]

ANDRÉE, ABRAHAM, an ecclesiastic who took an active part in the introduction of the Reformation into Sweden, was born in Angermannland, and after some foreign travel was appointed in 1576 rector of the School at Stockholm. Having resolutely opposed the attempt of King John, son of Gustavus Vasa, to re-introduce Roman Catholicism, Andrée, who had married the daughter of the first Protestant archbishop of Upsal, was dismissed from his rectorship. Andrée retired to the island of Aland, where he wrote and published a pamphlet exhorting the clergy to remain firm in the Protestant faith. The king ordered his arrest upon a charge of sedition; but he escaped into Germany, where he was supported for thirteen years by Swedish Protestants. In 1593 King John was succeeded by Sigismund, an avowed Romanist. The clergy of Sweden assembled at Upsal and took the bold step of unanimously electing Andrée to be their archbishop; and so strong was the national feeling that Sigismund was compelled to confirm the election. On the 19th of February, 1594, Andrée was consecrated as archbishop, and then he crowned the king. Later the regent, Duke Charles, having conceived an enmity towards Andrée, accused him in 1599, before the States, of complicity in seditious schemes; the archbishop was sentenced to deprivation, subject to reconciliation on the part of the duke, who however caused him to be imprisoned in the castle of Gripsholm, where he remained till his death in 1607. Archbishop Andrée published four works in Latin, on theological and controversial subjects; of which the one relating most closely to the events of his own life was 'Apologia pro Fugâ ex Regno Sueciæ,' Hamburg, 8vo, 1588. He also published a translation of a commentary on Daniel by Draconitis, and various Latin and Swedish writings of his father-in-law, Archbishop Laurentius Petri of Nereke.

ANDRÉE, GIOVANNI, a learned Italian canonist, was born at Mugello, near Florence, about the year 1272. After receiving rudimentary instruction at Bologna under his father, who kept a grammar school there, he studied canon law under Ægidius and Blaisio; and then Roman law under Syllimani and Malumbra. He was professor of the decretals at Bologna in 1302, and at Padua in 1307. Throughout the long period from 1309 to 1348, he occupied the post of professor of canon law at Bologna, where he was greatly respected, and his judgment much relied on. In 1326 he was arbiter in some internal national disputes; in 1328, and again in 1331, he went on an embassy to the Pope at Avignon; in 1334 he accompanied the papal legate to Florence; in 1337 he was sent on special embassies to Padua and Venice; and in 1340 he assisted Bologna with his advice in a time of distress. He was much valued by the authorities at Rome; for he tried to establish the papal temporal power in Bologna, and interceded with the magistrates to permit a Carthusian monastery to be established. He died in 1348. Of a family of four sons and four daughters, the youngest daughter, Novella, occasionally officiated for her father in lecturing when he was ill; and on these occasions a curtain is said to have been drawn before her, lest her beauty should

distract the attention of the students. Andræ lived almost an ascetic life, but was liberal to the church and to the poor.

Andræ was the greatest authority of the age on the subject of the decretals. He wrote several works, which are still valued for their learning, but more for the notices they contain of his legal contemporaries and predecessors. Among them were (1) 'Glossa in Sextum,' 2nd ed. Strasburg, 1742; a commentary on the sixth book of the decretals. (2) 'Novella in Decretales,' a commentary on the first five books of the decretals, folio, Rome, 1476; Venice, 1489; Pavia, 1504 and 1505; and Venice, 1581, &c. (3) 'Novella in Sextum,' Venice, folio, 1499, 1581, &c. (4) 'Questiones Mercuriales,' Venice, folio, 1499, 1581, &c. (5) 'Additiones ad Durantis Speculum,' a work valuable on account of the biographical notices of canonists and writers on forms of court, contained in the Proœmium. It was written about 1346. His minor writings are very numerous.

ANDRÆ, or ANDRESSON, GUDMUND, an Icelandic pastor and writer, was born about 1630 in the district of Midfjord. After keeping a school at Holum, he became deacon of Reinestad; and it was while holding this post that he wrote a book which greatly influenced his life. It was a defence of polygamy and concubinage—censuring laws which had been passed against those usages in 1564, called the 'Stora Dóm' (Great Doom of Judgment). MS. copies of the book were distributed, and it became very popular. Expelled from his deaconship by the Bishop of Holum, he returned home, and fell into great poverty. Here he wrote a work with the Greek title 'ἑαυτοῦ γινώσκω' (Know thyself). In 1649 Bielke, the newly-appointed governor, arrived in Iceland from Denmark. At the instigation of the bishop, the governor caused Andræ's case to be investigated by the Althing, or General National Assembly. Puzzled how to decide, the Althing remitted the matter to Copenhagen, whither the accused was taken. While under imprisonment, Andræ, who had been allowed a certain freedom of movement, accidentally fell out of a window, and, being unable to find the prison door, wandered into the royal nursery, which was close at hand. Speaking no Danish, and the domestics no Icelandic, he was unable to make himself understood, but was eventually conveyed back to prison. The king, hearing of Andræ's case through this singular adventure, appointed an ecclesiastical commission to report on the offending book. For this purpose it had to be translated from Icelandic into Latin; and it has been conjectured that the translation softened down some of the more offensive passages. At any rate, the report was so far moderate that, on admission of his fault and pleading penitence, he was pardoned on condition of never returning to Iceland. He accordingly remained in Copenhagen, was the next year (1650) admitted into the University of Copenhagen as royal bursar, and rose into favour at court. He died at Copenhagen of the plague in 1654. Andræ wrote many works, of which the chief is 'Philosophia Antiquissima Norvego-Danica dicta Voluspa, alias Edda Sæmundi,' a Latin translation of portions of the Voluspa, or the Edda of Sæmund, published under the care of P. J. Resenius, 4to, 1673. Resenius also published an Icelandic-Latin Dictionary, left in MS. by Andræ, Copenhagen, 4to, 1683, a work never of much value, and long superseded by better dictionaries.

ANDRÆ, JAKOB, an eminent Protestant theologian, was born at Waiblingen, Würtemberg, on the 25th of March, 1528. He was apprenticed to a carpenter; but manifesting superior intellectual qualities, he was sent to study theology at Tübingen under Sneppius. In 1546 he was ordained deacon at Stuttgart. Almost the whole remainder of his life was spent in theological controversy, either going to various places to take part in discussions between Catholics and Protestants, and Lutherans and Calvinists, or in writing on the points in dispute. Some of these proceedings lost him his deaconship at Stuttgart. He died at Tübingen on the 7th January, 1590. Andræ's chief work was in aiding other theologians to write the 'Liber,' or 'Formula Concordiæ,' a summary of articles of faith for the Lutheran Church. He travelled thousands of miles to procure the assent of influential persons—princes, prelates, clergy, nobles, and corporate bodies—to this summary. This work effected a permanent breach between the Lutherans and Calvinists. Andræ's writings, both in Latin and German, are now seldom consulted. The list in Heindreich ('Pandectæ Brandenburgicæ,' pp. 172-176) fills six folio columns. Jakob Andræ's grandson, Johann Valentinus Andræ, published a life of him, in Latin hexameters, Lüneburg, 1649, 18mo.

ANDRÆ, LAURENTIUS, or LARS ANDERSON, a Swedish theologian, who aided largely in the introduction of the Reforma-

tion into Sweden, was born in the latter part of the fifteenth century, according to some authorities in 1480. He studied at Rome, was ordained priest, and in 1522 was archdeacon of Strengnäs, when he was converted from Catholicism to Protestantism by Olof Petri and Laurentius Phase, two Swedes who had visited Luther. His advocacy of the new doctrine attracting general attention, he was in 1623 sent for by the king, Gustavus Vasa, whose favour he secured, and who made him his chancellor. From this time he became the king's chief adviser as to the best mode of introducing the Reformation into Sweden. In conjunction with Olof Petri, Andræ published the first Swedish translation of the New Testament in 1526; the Roman Catholics also published a translation; and each party inveighed bitterly against the errors in the work of the other. Gustavus Vasa having decided in favour of the Protestant version, a fierce struggle ensued between the contending theologians; but the peasantry at length sided with the king and the Reformation. In 1529, Andræ took the post of president of an assembly of the clergy at Örebro, convened to settle a new code of doctrine by compromise. In 1531 he was a candidate for the first Protestant Archbishopric of Upsal; but Laurentius Petri was elected. Some years after this, Andræ fell into disgrace for concealing his knowledge of a plot designed for assassinating the king: his reticence being due to the sacredness of the confessional. His life was spared, but his property was confiscated, and he lived twelve years in poverty and obscurity. He died at Strengnäs in 1552. Besides his share in the translation of the New Testament, Andræ wrote 'En kort Underviisning om Troona och godha Geringar;' Stockholm, 8vo, 1528 (A Short Instruction respecting Faith and Good Works), chiefly a compilation from the writings of Luther.

ANDREANI ANDREA, called MANTUANO, a celebrated Italian engraver, was born at Mantua about 1540. He engraved on copper, but his celebrity depends on his wood engravings in chiaroscuro in the manner of Ugo da Carpi. His finest work is the series of nine prints after the cartoons of the Triumph of Julius Cæsar by Andrea Mantegna, now at Hampton Court, with a tenth containing the portrait of Vincenzo Gonzaga, Duke of Mantua. The drawings were made on the wood by Bernardo Malpizzi; and the work is a masterpiece in its kind, but a fine and uniform set is very rare. Another great work is 'The Triumph of Christianity,' in eight plates after Titian. His other more important prints include 'The Pavement of the Cathedral of Siena,' designed by Beccafumi, in eight plates (also extremely rare in a perfect state and highly prized); 'The Deluge,' and 'Pharaoh overthrown in the Red Sea,' both after Titian, and both large prints in four sheets each; 'Christ before Pilate,' in two large plates, from a bas-relief by Giovanni de Bologna; and 'The Adoration of the Magi,' after Parmigiano, &c. Besides a block for the outline and deep shadows, Andreani used two or three for the middle tints and lights, and thus produced at times a wonderfully rich as well as powerful and painter-like effect. He has been charged by many writers with effacing the signatures on blocks by other engravers and substituting his own; but though Bartsch and others have pointed out blocks which have been so treated, no evidence has been adduced to prove that Andreani was the culprit. As Mr. Wornum has observed, "it is quite as possible that the imposition is the work of some printseller, as of Andreani." Indeed the prints being inferior, it is more likely that an unscrupulous dealer would seek to profit by the popularity of Andreani's name, than that he should imperil alike his fame as an artist and his credit as a man. Andreani died at Rome in 1623.

ANDREOLI, GIORGIO, called GIORGIO DA GUBBIO, or MAESTRO GIORGIO, was by profession a sculptor, but is now chiefly famous as the maker of that variety of Majolica earthenware known as Gubbio ware. Andreoli was a native of Pavia; attained a good position as a sculptor; executed several retables, or carved altar-pieces, for churches and chapels in Pavia and its neighbourhood; modelled some figures in the manner of Della Robbia; and painted some earthenware of the then popular kind now familiar as Majolica. In 1519 he settled in Gubbio, and established there a manufactory for artistic earthenware, in the preparation of which he was assisted by his brothers Salimbene and Giovanni. Andreoli's ware must have found appreciative purchasers. Every public collection in Europe contains examples, and the specimens in private hands appear to be inexhaustible. Andreoli himself was a prosperous man. He was placed in the first rank of citizens, and was made gonfalonier. The date of his death is unknown: he was alive in 1552. Commonly the manufactory is stated to have been carried on by

Maestro Giorgio, from 1519 to 1537; but specimens of Gubbio ware are extant with his mark and the date 1541. If we may judge by the dated specimens, there must have been great fluctuations in the production, those of particular years being very numerous, while for other years they are just as scarce, and for some years not a specimen is known. Giorgio's pottery differs from the ordinary majolica in possessing a brilliant iridescent lustre, produced by the use of a stanniferous glaze, which, if not exclusively his, was of a better kind, and used with a happier effect than by any other maker. The articles are similar to those of the ordinary majolica, alike in shape and in the subjects painted on them. Andreoli's ware is, however, as a rule, better in form than the average, and the painting is generally good of its kind, and characteristic. Some of the female heads, portraits executed for admirers, as love gifts or bridal presents, are executed with rare spirit. Very fine specimens obtain extremely high prices, from 100 to 150 guineas having been given for a plate, and 20 to 25 guineas being an ordinary price. But the Gubbio ware has met the fate of ordinary majolica. Ingenious Italian fabricators copy the old ware with such accuracy, and imitate the marks of age and accident with so much skill, that even experienced dealers and experts have been frequently deceived by their productions, and credulous collectors have been victimised wholesale. The South Kensington Museum possesses a good many specimens with Maestro Giorgio's mark. Andreoli had a son, VINCENZIO, who followed his father's calling: he is sometimes referred to as Maestro Cencio, but little is known respecting him.

ANDRES, JUAN, a learned Spanish Jesuit, was born at Planes, in Valencia, February 15, 1740, the eldest of eleven sons, of a noble family. After studying at the College of Valencia, he entered the Society of Jesuits as a novitiate, at Tarragona, in 1764; and prosecuted his further studies in philosophy under the Jesuit José Bosch at Gerona; and in theology, Greek, Hebrew, Italian, and French, at the Theological College of Valencia. He became professor of rhetoric and poetry in the University of Gandia, Valencia. Thus passed the first twenty-seven years of his life. In 1767, the Jesuits were expelled from Spain; they took refuge in Corsica, where they underwent many privations. Andres opened an academy at St. Bonifazio; and in 1768 removed to Ferrara, where for some years he taught philosophy in an academy. In 1773 appeared his first treatise: 'Prospectus Philosophiæ universæ Disputationi propositæ in Templo Ferrariensi,' which was highly valued for its arrangement, perspicuity, and variety of theses. After acting as tutor to the son of the Marquis Bianchi, at Mantua, he learned English, German, and Arabic, and visited the principal libraries of Italy and Germany to collect materials for his great work, a history of science and literature. In 1786 the first volume appeared, and brought him not only fame, but four pensions from sovereigns and princes. Being obliged to withdraw from Mantua during the siege, in 1796, he resided successively at Colorno, Pavia, Parma, and Naples. Between that date and his death, at Naples, on 12th January, 1817, he filled at different times the posts of director of studies at the University of Pavia, superintendent of education at Parma, preacher and teacher at the re-established College of Jesuits at Naples, prefect of the Royal Neapolitan Library, head of the educational establishments of that kingdom, and perpetual secretary of the Accademia Ercolanese de Archeologia.

Juan Andres published numerous works of more or less importance; chief among them was 'Dell' Origine, de' Progressi, e dello Stato attuale d'ogni Letteratura,' 9 vols. 4to., Parma, 1782, &c., an examination into the history of all branches of human knowledge. Of this work, on which he bestowed a vast amount of erudite labour, there have been seven Italian editions, one Spanish, one German, and one (first volume only) French. Sismondi gives it credit rather for a vast amount of accumulated knowledge than for critical acumen; and it involved the author in a controversy with Tiraboschi. Among other works by Andres were:—'An Essay on Galileo's Philosophy'; 'A Defence of Galileo's demonstration of the descent of falling bodies'; and other essays on the causes of the slow progress of science at the time in which he wrote; on the Music of the Arabs; on the origin and changes in the Art of Teaching the Deaf and Dumb to Speak; and on the state of Spanish Literature. Nearly twenty other works by Andres are known to exist, though unpublished: many of them pointing out the value of ancient MSS. with which he was acquainted.

ANDRES DE UZTARROZ, JUAN FRANCISCO, a voluminous Spanish writer of the 17th century, was born at Saragossa about 1606. Very little is known of the personal events of his life. After studying in the university of his native

city, he in 1638 took the degree of doctor of laws, and in 1647 was appointed chronicler of the kingdom of Aragon. He was employed until his death at Madrid, 18th August, 1653, in arranging, classifying, and indexing the national archives. This official duty, however, left him sufficient time to write nearly a hundred works, mostly relating to historical and antiquarian subjects. Only a minority of these were published. The most important were:—'Annales de la Corona y Reyno de Aragon,' and 'Progresos de la Historia en el Reyno de Aragon.' At his suggestion, a collection was formed of writers in Aragonese history; to aid which he visited all the libraries and collections in the kingdom, adding books to the royal collection, and obtaining extracts from others. Andres was distinguished as an historian, antiquary, philosopher, jurist, and poet, but chiefly in the first two capacities.

ANDROS, SIR EDMUND, governor of New England, was born in London, 6th December, 1637; his father being marshal of the ceremonies to Charles I. Young Andros shared the exile of the royal family; fought under Prince Henry of Nassau in Holland, and held many courtly and military appointments between 1660 and 1674. In this last named year he was appointed governor of New York, recently acquired from the Dutch. His administration was active and vigorous. He got into disputes with the leading merchants, and was summoned to England; but his policy was approved, and he received the honour of knighthood. He was successful in defending the colony from the attacks of Indians. In 1686 he was appointed by James II. governor of Massachusetts, New Hampshire, Maine, New Plymouth, Rhode Island, and Connecticut, under the collective name of New England. He gradually became unpopular by his haughty and arbitrary manner; by levying taxes in the king's name alone; enforcing church of England ceremonies and services; and discountenancing charters previously given to the colonies. On the reception of the news of the abdication of James II., and the landing of William of Orange, Andros was seized and imprisoned by the Boston men. After being kept for some time under arrest, he was sent to England in February, 1690; but the charges made against him were allowed to drop. In 1691 he published a vindication of his conduct. Between 1692 and 1698 he was governor of Virginia, where he effected much benefit by encouraging the cultivation of cotton, and promoting manufactures. In 1704 he was made lieutenant-governor and bailiff of Guernsey. He died at Westminster, 24th February, 1713.

(W. H. Whitmore, *Memoir of Sir Edmund Andros, Knt., Governor of New England, New York, and Virginia*. Prefixed to the *Andros Tracts* of the Prince Society of Boston, N.E., 4to, 1868. Allen; Beverley; Bancroft, &c.)

ANDROUET DU CERCEAU, JACQUES, an eminent French architect, and the author of several important works on architecture, flourished during the second half of the 16th century; but the year of his birth, and that of his death, are alike unknown. A recent biographical dictionary that boasts much and blunders often in its dates, gives 1592 as the year of Androuet's death, but he was alive in 1596. He is believed to have been born at Orleans, though La Croix du Maine says he was a Parisian. D'Argenville says he was one of those French architects who by the favour of Cardinal D'Armagnac were enabled to visit Italy in order to complete their education by the study of the beautiful remains of antiquity; that he was most impressed by the vestiges of the triumphal arch at Pola, in Istria, and that the coupled columns on each side of the arch served him as models alike in his designs, his writings, and his buildings. Coupled Corinthian columns on each side of a large arched opening recur frequently in Androuet's designs, as they do in those of many other architects of that and later periods, but it is too fanciful to speak of this as his fundamental principle of design, or to suppose that of all the works of antiquity which he saw and studied in Italy, this alone produced any fruitful impression.

We can find few dates to assist us in following Androuet du Cerceau's career as an architect: as an author, the materials are somewhat fuller. He appears to have found many excellent patrons, his books probably contributing to extend his credit as a learned architect, as well as an accomplished designer, at a time when a thorough acquaintance with the works of ancient Rome was regarded as the first essential in an architect. For private patrons Androuet erected the Hôtel des Fermes; the Hôtel de Sully; the Hôtel de Bretonvilliers; the Hôtel de Mayenne; and a part of that of Carnavalet. Appointed architect to the king, he commenced in May, 1578, by order of Henry III., the Pont Neuf, a work of great richness and importance; but the civil war

caused its discontinuance, and it was not finished till 1604, under the direction of Guillaume Marchand. By Henry IV. he was charged with the enlargement of the Louvre; and he designed and commenced, if he did not complete, the two grand pavilions of a single order. In 1596 he made the designs for the gallery of the Louvre, and its erection was confided to him. But religious troubles now intervened, as civil troubles had when he was at work on the Pont Neuf. Androuet was a Protestant: he would not abandon his creed; and he was obliged to quit France. He died in a foreign country; but where, and when, are now unknown.

Androuet du Cerceau was one of the leaders in that style of classic renaissance which has become so thoroughly the dominant style in Paris as to be generally considered the representative style of French architecture. Many of his buildings have been destroyed; others altered; but enough by his hand remains to show that—without commanding genius—he was an excellent architect, and that he knew how to impart to a palace a grandiose and palatial aspect.

The first of his numerous publications appears to have been that entered in the catalogue of Callet as 'Premières Etudes de Temples,' 8vo, with 50 plates, and without date, but published at Orleans before 1549. This was followed by 'Exemplaria Templorum Antiquo more constructorum,' folio, 40 plates, Orleans, 1549. 'Quinque et Viginti exempla arcuum partim ab Androuet du Cerceau inventa, partim ex veterum sumpta monumentis,' small folio, Orleans, 1549. 'Duodecim fragmenta structurae veteris,' 4to, 13 plates, Orleans, 1550. 'Liber de eo picturae genere quod Grottesche vocant Itali,' sm. folio, Orleans, 1550; this work met with great success; an augmented edition was published in two series, the first of 60 plates, in 1562, the other of 36 large plates, at Paris, in 1566, under the title 'Livre de Grotesques.' Vivenel says that at least five series are known of the small grotesques designed by Androuet; one series of 30 plates was engraved by Hans Siebmacher of Nürnberg, possibly after Androuet quitted France. 'Vetustissimæ Optices quam perspectivant nominant, xx. figuræ,' &c., sm. folio, Orleans, 1551. 'Livre d'Architecture contenant les Plans et Dessains de cinquante Bastiments tous différens: pour instruire ceux qui désirent bastir, soient de petit, moyen, ou grand estat,' folio, 50 plates, Paris, 1559: another issue appeared the same year, with the title, &c. in Latin; and, in 1611, an augmented edition, with 69 plates. 'Second Livre d'Architecture, contenant plusieurs et diverses ordonnances de cheminées, lucarnes, portes, fontaines, puis, et pavillons, pour enrichir tant le dedans que le dehors de tous édifices,' folio, 68 plates, Paris, 1561: a Latin issue being published the same year. These volumes, of considerable value when they appeared, and now of interest in connection with the history of French renaissance architecture, were followed several years later by a third 'Livre d'Architecture, auquel sont contenues diverses ordonnances de plans et élévations de Bastiments pour seigneurs, gentilshommes et austres qui voudront bastir aux champs; mesme en aucuns d'iceux sont desseignez les basse-courts, avec leurs commoditez particulières, aussi les jardinages et vergiers,' folio, 68 plates, (many copies, however, contain only 38 plates), Paris, 1582. In 1576 appeared the most important of all Androuet's publications, 'Des Plus Excellens Bastiments de France, auquel sont designez les plans de quinze [this in the first volume, as many more in the second] Bastiments et de leur contenu, ensemble les élévations et singularitez d'un chacun,' 2 vols. folio, with 130 plates, Paris, 1576–79. This work is now very rarely met with in good condition, with the plates perfect; and when so found commands a high price, as much as 650 francs having been paid for it at a sale. A second edition was published at Paris in 1607, but in this the plates are greatly worn, and some are mutilated; a third edition, dated Paris, 1648, is in all respects worse. The work is one that cannot be overlooked in an historical examination of French architecture, but the plates are poor in drawing, and the information sadly meagre and unsatisfactory. 'Leçons de Perspective positive,' folio, Paris, 1576: like the greater work just described, dedicated to "La très vertueuse Princesse," Catherine de Medici. 'Petit Traite des Cinq Ordres de Colonnnes,' sm. folio, 12 plates, Paris, 1583.

The plates in Androuet du Cerceau's various architectural publications were usually engraved as well as drawn by himself. But it has not until lately been noticed that he designed and engraved many other prints which were published by him, either separately or in series, and also engraved many from the designs of other artists. Of those drawn by himself, the first place may be assigned to a collection of 'Vases,' which appeared at Turin in 1587, and of which Vivenel enumerates 68 plates. About the

same time also appeared at Turin a series of 'Meubles' (buffets, tables, bedsteads, &c.), in 43 undated prints. From other designers, he engraved 'Les Divinités,' after Caraglio, in 20 plates, and the 'Histoire de Psyche,' after Raffaele, in 32 plates, &c. In all, M. Le Blanc attributes 485 plates to him. M. Callet made a collection of prints by him in 16 vols. folio, which at his sale was secured for the Bibliothèque Impériale at the price of 3700 francs (148l.).

(D'Argenville, *Vies de Fameux Architectes*; Callet, *Notice Historique sur la Vie Artistique et ouvrages de quelques Architectes Français du XVI. siècle*; Vivenel, *Catalogues des Livres, &c.*; Brunet, *Manuel du Libraire*.)

ANEURIN, a Welsh poet of the sixth century, sometimes termed "the Monarch of the Bards," is believed to have been born about 510, and to have been a son of Caw ab Geraint, a chieftain of the northern Britons of that part of Strath Clyde now called Cumberland. It has been suggested that Aneurin and Gildas the historian were the same person; but the opinion has now no adherent. Who Aneurin was is, however, very difficult to determine. According to the semi-mythological narrative, he was one of four Gododin chieftains who, at the defeat of the Britons by the Saxons at Cattraeth, escaped with life, all the other chiefs, 360 in number, being slain, with their leader and the bulk of the army. Aneurin was made prisoner, but released after a time by the son of a brother bard, Llywarch Hen, and took refuge at the court of King Arthur, in South Wales. Afterwards he joined the college of Cadog, formed a friendship with Taliesin the Bard, wrote his poems, and died about 560 or 570, as would seem, from a blow on the head by Eidyn. The poems ascribed to Aneurin were first printed in the 'Myvyrian Archaeology.' Their authenticity was impugned by Pinkerton, and defended by Sharon Turner. Later authors have written on each side, without having settled the question. Many, perhaps most, of the poems attributed to Aneurin are now admitted to be spurious; but that entitled 'Gododin' appears to be authentic. (See the article WELSH LANGUAGE AND LITERATURE, E. C., ARTS AND SCI. DIV., vol. viii., col. 855, &c., where the question is treated at length.) The earliest copy of Aneurin's poems occurs in the MS. called the 'Black Book of Carmarthen,' which is considered to have been written in the 12th century, whilst the diction is certainly of an earlier period. 'Gododin' is generally understood to be a lament over the defeat of the Britons at Cattraeth, and the chieftains slain there, but some Welsh writers conceive it to refer to an altogether different affair, one well-known author, the Rev. Edward Davies, even insisting that it relates to the massacre of the Welsh chieftains by Hengist at Stonehenge. Gray's translation of a portion of 'Gododin,' 'The Death of Hoel,' is well known. A translation of the whole was published by the Rev. E. Davies in his 'Mythology and Rites of the British Druids,' another version was published in 1820 by Mr. Probert; and neither of these being satisfactory, a third was issued in 1858 by the Rev. John Williams ap Ithel.

ANFOSSI, PASQUALE, an Italian dramatic composer, was born at Naples in 1729; but Fétis gives the date 1736. Having entered the Conservatorio at Naples, he first studied the violin, and then composition, under Sacchini and Piccini. His first opera, 'Cajo Mario,' was produced at Venice in 1769; his second, 'I Visionari,' at Rome in 1771; but he had no success until his opera, 'L'Incognita Perseguitata,' was produced in 1773. This work, besides possessing a certain degree of merit, was benefited in its success by the musical war then raging between the Gluckists and the Piccinists. The Gluckists hailed Anfossi as a rival to Piccini, and Anfossi himself appears to have behaved somewhat ungenerously to his old master. From this time he produced in rapid succession, at various Italian theatres, 'Olimpiade,' 'La Finta Giardiniera,' 'Il Geloso in Cimento,' and other operas. He conducted operas in Paris in 1781, and in London in 1782, but unsuccessfully. He produced his 'Il Trionfo d'Arianna' and 'Il Cavaliere per Amore' in Germany in 1783. Operas continued to pour from his pen, until the number reached nearly 50, all now forgotten. Being appointed Maestro di Capella at St. John Lateran, he composed many masses and motets, of which the best known are 'Laudate Pueri' and 'Laudate Jerusalem,' for a full orchestra. He also composed an oratorio, 'L'Assalone.' Anfossi died in 1797.

ANGELIS, PIERRE, French landscape painter, was born at Dunkerque in 1685; studied in Flanders, and afterwards at Düsseldorf, where was then the famous gallery of pictures, since removed to Munich. He came to England in 1712, and soon became a favourite. In 1728 he went to Rome, where he remained three years. He then left for England, but taking Rennes

in his way, was so well received that he decided to stay there; and there he died, in 1734. Angelis painted conversation pictures and landscapes with small figures. Walpole describes his manner as "a mixture of Teniers and Watteau, with more grace than the former, more nature than the latter;" and the description is true of his earlier works; his later productions were more ambitious and less pleasing. He copied many of Rubens' paintings, and aimed at reproducing his colour. He is now chiefly interesting from his residence in this country at a time when almost the only painters were foreigners, who were, however, preparing the way for a native school, and doubtless to a certain extent influenced its early character.

ANGHIERA, PIETRO MARTIRE DE, Italian writer, was born in 1455, at Arona, on Lago Maggiore. He went to Rome in 1477, where he lived ten years, under some sort of patronage from Cardinal Antonio Sforza and the Archbishop of Milan, but without filling any definite post. Removing to Spain in 1488, he lectured at Salamanca on Juvenal. Having gained favour at court, he in 1492 took orders, and was appointed instructor to the royal pages, and so continued for nine years. In 1501 he was sent on missions to Venice and to Cairo, on the return from which he wrote an account of Lower Egypt, '*Legationis Babylonicae, libri tres*,' printed with the Decade noticed below. Between 1502 and 1505 he was appointed member of the Council of India, apostolic protonotary for the pope, and prior of the cathedral church at Granada. He died at Granada in 1526. Anghiera is chiefly known for two works—(1) a collection of letters, extending from 1488 to 1525, published four years after his death; the letters are valuable for their personal details concerning eminent men of the period. (2) '*De Rebus Oceanicis et Orbe novo Decades*' (folio, Alcalá, 1530)—Decades of the Ocean, a history of the progress of American discovery from the first voyage of Columbus to 1525, a work that has been translated into French, German, and English. Anghiera's connection with the Spanish Court enabled him to treat this subject with effect and value.

ANGUIER, FRANÇOIS, a distinguished French sculptor, was born in 1604, at Eu, in Normandy. The son of a joiner, he early showed so much skill in carving in wood, that he was sent to Paris, and received into the atelier of the sculptor, Simon Guillain. He afterwards came to England, where he earned sufficient to enable him to proceed to Rome. There he studied a couple of years, and formed a close friendship with Du Fresnoy, Poussin, and Mignard. On his return to France he acquired the favour of the King, Louis XIII., who gave him apartments in the Louvre, and made him keeper of his cabinet of antiquities. He found ample employment, being regarded as one of the first sculptors of the day. Many of his works have been destroyed, but those which remain, though marked by the conceits of the time, justify the opinion of his contemporaries. His most celebrated work was the costly monument of Henri, last Duc de Montmorency, beheaded at Toulouse in 1632. It was erected in 1658, at the cost of the widow of Montmorency, in the Church of the Religieuses de Ste. Marie, at Moulins, of which it is still the most cherished ornament. It comprises a recumbent statue of the duke, armed; the duchess in mourning habiliments at his feet, seated statues of Valour and Liberty, while four columns support a semi-classical shrine, on which are a central cinerary urn, statues of Nobility and Piety, angels, &c. Other important works were the marble monument of the Cardinal de Bérulle, in the Oratoire, Rue St. Honoré; those of Henry Chabot, Duc de Rohan, and of the Duc de Longueville, in the Church of the Celestines, at Paris; the statues of J. A. de Thou and his wife, at St. André-des-Arcs; and the tomb of Jacques Souvré, Grand Prieur de France, at St. Jean-de-Latran. A marble statue of the Virgin, executed for the high-altar of the last-named church, was also greatly admired. François Anguier died at Paris, August the 8th, 1669.

ANGUIER, MICHEL, younger brother of the preceding, born at Eu in 1612, like him learnt to carve in wood at home, and studied sculpture under Guillain at Paris. He followed his brother to Rome in 1641, trusting to his industry for a maintenance. He found employment under Algardi, then in the height of his renown, and filled all his spare time in the study of the masterpieces of ancient art. In 1651 he returned to Paris, to assist his brother in the execution of the Montmorency monument and other works. The first independent production of Michel Anguier which secured attention was the model for a statue of Louis XIII., heroic size, which he was commissioned to cast in bronze for the city of Narbonne. Somewhat later he had the good fortune to be patronised by the Queen, Anne of

Austria, whose apartments in the Louvre were superbly decorated by him with statues, reliefs, garlands, carved framing for paintings, &c. He also executed for her, among other things, a Nativity, for the altar of the Church of Val-de-Grace, one of his finest works; a Pietà; the Attributes of the Virgin, &c. A marble crucifix for the Church of the Sorbonne, and 'Our Lord appearing to St. Denis and his companions,' the altar-piece for St. Denis-de-la-Châtre, are by some regarded as the best of his religious, and the sculptures on the Porte St. Denis (commenced in 1674) the most successful of his secular, designs.

Michel Anguier was elected member of the Academy in 1668, and at the same time appointed assistant professor; somewhat later professor, and in 1671 rector of the Academy. He died on the 11th of July, 1686, and was interred by his brother in the Church of St. Roch.

ANSALDI, INNOCENZIO, Italian painter and writer on art, was born in 1734, at Pescia, in Tuscany, and received an excellent education at the College of Florence. He had been intended for a learned profession, but his inclination for painting was so decided, that his parents yielded, and sent him to Rome, where he studied for some years. Returning to Florence, he executed many pictures for the churches of that city and elsewhere, and numerous easel pictures, some of which have found a place in the public collections. But though a graceful and accomplished artist, his works display little original power, and are now not much valued. His principal literary productions are—'*Descrizione delle Pitture, Sculture, ed Architetture delle Città e Subborghi di Pescia nella Toscana*,' 8vo, Bologna, 1772; '*Cataloga delle migliori Pitture, &c., della Valdinievole*,' printed in the '*Istoria di Pescia*;' a translation in verse of Du Fresnoy's Art of Painting, '*Il Pittore Instruito*,' published, with a memoir of Ansaldo by Canon Moreri, Bologna, 1820. He died in 1816.

ANSALDO, ANDREA, an eminent Italian painter, was born in 1584, at Voltri, in the Genoese territory. He was a scholar of Orazio Cambiaso, of Genoa, but by frequent copying of the works of Paolo Veronese, of whom he was a devoted admirer, he soon surpassed not only his master, but most of the other painters in Genoa. On leaving Cambiaso he returned to Voltri, and painted the Decollation of St. John the Baptist for the church of San Rocco, and two others for the Church of SS. Niccolò ed Erasmo, which were greatly admired, and produced numerous commissions. He painted both in fresco and oil, and is especially commended by Lanzi for "his great talent in the decoration of the vaultings of churches, which may be regarded as the highest grade of the art of painting;" Ansaldo, he adds, "is one of the few masters who have painted both much and well." His most celebrated works in this class are—'*San Carlo Borromeo Staying the Plague at Milan*,' in the church of SS. Niccolò ed Erasmo; '*St. Ambrose Absolving the Emperor Theodosius*,' for the oratory of S. Ambrogio; '*The Martyrdom of S. Sebastian*,' an altar-piece for the cathedral of Cadiz; '*The Last Supper*,' for the oratory of S. Antonio Abate, at Genoa, which was regarded as uniting the splendour of Venetian colour with the detail and finish of the Dutch masters. His frescoes of '*The Assumption of the Virgin*,' in the cupola of the Nunziata, were also greatly esteemed, but having become injured by damp, they were repainted in 1700 by Gregorio de' Ferrari. His best works in a different class are some frescoes in the Spinola Palace, representing the exploits of the Marquis Federigo Spinola in Flanders. Ansaldo's success excited the jealousy of rival artists. He was wounded by Giulio Benso, previously the leading artist of the school, who had painted some frescoes in the choir of the Nunziata, which those painted by Ansaldo in the adjoining cupola were supposed to have eclipsed; but the rivals became afterwards fast friends. Some time later Ansaldo received a more serious wound, from an unknown hand. During his confinement from this wound he wrote a comedy. He died at Genoa in 1638.

ANSELME, or ANSEL, of LAON (Latinized, Anselmus Laudunensis), and generally known as Scholasticus, was born before the middle of the 11th century, at Laon, a town of France, which was then the capital of the Pays Laonnais. His parents were agricultural labourers. He is supposed to have been sent to the abbey of Bec to study under St. Anselm, who was then prior of that abbey. About the year 1076 Anselme began to teach publicly in Paris; and to him has been attributed the revival of literature and of the study of theology which now began to distinguish that capital. He may therefore be considered one of the founders of the University of Paris, for he was the earliest teacher of the "school of Paris," from which sprang the university. Before the commencement of the 12th century, Anselme returned to his native town of Laon, to superintend the schools

connected with the cathedral church there, of which he had been elected chancellor, or scholasticus, and which, under his direction, presently became the most celebrated in Europe. The teaching of Anselme was aimed first and especially at the heart; and his theology consisted of a simple exposition of the Holy Scriptures, supported by the authority of the Fathers, whom he studied all his life. His brother Raoul, or Radulphe, who taught the *Literæ Humaniores* and Dialectic, seconded him in his system of teaching. Students thronged to Laon from Italy, Spain, Germany, England, and the extremities of the north. Men already advanced in years, and who had long been teachers,—as professors or bishops—were fain to repair to Laon and there to become pupils of the illustrious brothers. “The school of Laon was almost as celebrated in its age under Anselme, as the school of Alexandria, under Origen.”

Anselme died on the 15th of July, 1117, and was buried in the abbey of St. Vincent; and an epitaph was placed on his tomb, which has been erroneously supposed by some to be an epitaph upon Anselm of Canterbury. The works of Anselme have all been attributed to various authors, particularly to Anselm, the Archbishop of Canterbury; but the authority of manuscripts, which date up to the time of Anselme of Laon, proves that he was the author of the following works:—An interlinear gloss upon all the Old and New Testament, in which the text of Scripture is explained by short notes, drawn chiefly from the Fathers, a work which furnished abundant material to subsequent expositors of scripture; A Commentary on the Song of Songs, and on the Apocalypse; Commentaries on St. Matthew; on the Psalms; and on St. John.

ANSELME DE SAINTE-MARIE, commonly called *Le Père ANSELME*, a learned writer on genealogy, was born at Paris in 1625. His original name was Pierre de Guibours, but he adopted the name by which he is known on entering the order of Barefooted Augustines, in 1644. His life was the most uneventful possible. It was spent in his convent, and he conformed to all the observances and austerities of his order, but he was relieved from monastic duties in order that he might pass his days in the undisturbed pursuit of his researches. He died at Paris, January 17, 1694. His great work is the *Histoire généalogique et chronologique de la Maison royale de France, et des grands officiers de la couronne*, Paris, 2 vols. 4to, 1674. Father Anselme for the remainder of his life laboured at the revision of the history, and after his death his friend Du Fourny, and later the Augustine Fathers, Ange de Ste. Rosalie and Simplicien (Raffard and P. Lucas), and after the death of Simplicien, the Father Alexis (Pierre Caquet) continued the task. The result of their labours was the publication of a greatly enlarged and improved edition, in 9 vols. folio, Paris, 1726-33. This is the best edition; other editions appeared in Paris (2 vols. folio, 1712) and at Amsterdam (folio, 1713), but they are very inferior. The value of the work was shown by the great use made of it by Moreri and Bayle. It is in truth difficult, as the last editor observes, to estimate the toil and drudgery this good father must have voluntarily undergone in collecting and verifying so many names, marriages, births, and dates of all kinds as he has here brought together. It is not exempt from faults, but then, as that capital compiler Dom Chaudon naively asks, what compilation is? Every student of French history has need to be grateful to the humble Augustine. The purpose of *Père Anselme's* other works is sufficiently explained by their titles—*‘Le Palais d’Honneur, contenant les généalogies historiques des illustres Maisons de Lorraine et de Savoye, et de plusieurs nobles familles de France, ensemble l’origine et l’explication des armes, devises et tournois, l’institution des ordres militaires, les cérémonies des sacres des Roys et Reyne de France, leurs entrées solennelles, baptêmes,’* Paris, 2 vols. 4to, 1663-64. The second volume, which forms in effect a distinct work, has for its title—*‘Le Palais de la Gloire, contenant les généalogies historiques des illustres Maisons de France, et de plusieurs nobles familles de l’Europe.’* Like the preceding, this is a work of immense research; but, unlike it, has not been benefited by revision and extension after the first publication. *‘Le Science Heraldique,’* 4to, 1675, is but little esteemed.

ANSLAY, or ANNESLEY, BRIAN, of whom all that is known is that he is the author of a curious volume called *‘The Citie of Dames,’* printed, in 1521, by Henry Pepwell, who in some rhymes prefixed states that—

“Of late came into my custody
This forseyde book, by Brian Anslay,
Yeoman of the seller with the eight King Henry.”

The book appears to be a translation of the *‘Trésor de la Cité des Dames,’* of Christine de Pisan. Warton, *‘Hist. of Eng. Poetry,’* vol. iii. p. 79 (Park’s ed.), says that Anslay “translated a popular French poem into English rhymes, at the exhortation of the *gentle earl of Kent.*” But the book is in prose, not rhyme. It is printed throughout in black letter, and ornamented with curious woodcuts. Its value is mainly bibliographical.

ANSTER, PROF. JOHN, LL.D., was born in 1793 at Charleville, co. Cork, Ireland. He was educated at Trinity College, Dublin, where he obtained a scholarship in 1814, and in 1825 took the degree of LL.D. In 1825 he was called to the Irish bar; for several years went the Munster circuit; in 1837 was appointed registrar of the Admiralty Court, Ireland, and in 1849 was nominated Regius Professor of Civil Law in Dublin University. He died June 9, 1867. Without attaining high rank, Dr. Anster was favourably known as a writer. In 1819 he obtained the prize offered by Trinity College for a poem on the death of the Princess Charlotte, and he published it with other poems in the same year. In 1820 he published translations of portions of Göthe’s *‘Faust,’* and fifteen years later a complete translation of the First Part, to which in 1864 he added a version of the Second Part. Though never popular here, it has been much admired and has been two or three times reprinted in Germany. *‘Xeniola,’* published in 1837, comprises translations from Schiller and others. Dr. Anster was a frequent contributor to *‘Blackwood’s Magazine,’* the *‘Dublin University Magazine,’* the *‘North British Review,’* and other periodicals; and in 1849 published his *‘Introductory Lecture on the Study of Civil Law.’*

ANSTIS, JOHN, a learned herald and antiquary, was born at St. Neot’s, Cornwall, September 28, 1669; was educated at Exeter College, Oxford; entered of the Middle Temple in 1688; and elected member of parliament for St. Germain’s in 1702. In 1703 he was appointed deputy-general to the auditors of the imprest, and the following year one of the chief commissioners of prizes. In 1711 he was elected M.P. for St. Maw’s, and in 1714 for Launceston. But while thus seemingly fully occupied with departmental and parliamentary life, his real devotion was for heraldry and genealogy, and his acquirements in that line having been brought under the notice of Queen Anne (and along with them no doubt his constant support of the government), she, in April, 1714, granted him a reversionary patent for the office of garter-king-at-arms. But Anne died, and Anstis, who was a thorough-going Tory, fell under suspicion of being a partizan of the Pretender, and, on the death in 1715 of Sir Henry St. George, garter-king-at-arms, though Anstis claimed his office in virtue of his patent, the appointment was given to Vanbrugh, the dramatist-architect, who had for some time served as *clerc d’armes*. Anstis prosecuted his claim in the law-courts, where ultimately judgment was given in his favour, and he was instituted garter-king-at-arms in April, 1718. From the first he applied himself with the greatest zeal to the duties of the office, and, as he had the good fortune to wear down the prejudice of the court, he, June 8, 1727, obtained a fresh patent, not merely securing to him the post of garter-king for life, but the reversion to his eldest son. Anstis died at his residence, Mortlake, on the 4th of March, 1744. An enthusiast in his special departments, and a good general antiquary, having access to a great body of inedited archives, and of unwearied industry, Anstis was able to prepare several works, which, from their learning and accuracy, are of great value to the historical student. His chief work is *‘The Register of the Most Noble Order of the Garter, from its Cover in Black Velvet usually called the Black Book; with Notes placed at the Bottom of the Pages, and an Introduction prefixed by the Editor,’* London, 2 vols. fol. 1724. *‘The Form of the Installation of the Garter,’* appeared in 4to in 1720. *‘Observations Introductory to an Historical Essay on the Knight-hood of the Bath,’* London, 4to, 1725: in itself little more than a compilation of authorities, by bringing together in conjunction and methodical order all that could be collected on the subject, it supplies the materials for a complete history of the order. *‘Letters to a Peer concerning the Honour of Earl Marshal,’* 8vo, 1706, contains only the first letter of the intended series. *‘Curia Militaris; or, a Treatise of the Court of Chivalry; in three books,’* is said to have been printed, but it was never published, and only a few sheets are now known to exist. He also wrote a great many treatises on detached subjects, which were printed in various publications of the time, and left several MSS. either complete or nearly so, on heraldic and genealogical matters, and one or two on Cornish parochial antiquities. Among his collections were several folio volumes on the history of heralds, which

passed into the possession of Sir George Naylor, garter-king-at-arms, and were made use of by Noble in preparing his 'History of the College of Arms.' A pretty full account of his unpublished MSS., as well as of his printed works, is given in the Biographical Dictionary of the Society for the Diffusion of Useful Knowledge, article, Anstia.

*ANTHON, CHARLES, LL.D., was born in the city of New York, in the year 1797. He was the fourth of six sons; and after receiving a good preparatory education, entered in 1811 as a student of Columbia College, New York, where he graduated in 1815. He now entered the law office of his brother, Mr. John Anthon, who is favourably known in America for his 'American Precedents,' 'Nisi Prius,' 'The Law Student,' and other works belonging to his profession. In 1819, Charles Anthon was admitted to the bar of the Supreme Court of the State of New York. Whilst a student of law, he had applied himself assiduously to the study of classical authors, and especially of the Greek; his proficiency in which procured for him, in 1820, the appointment of Adjunct Professor of Languages in Columbia College. This office he held till the year 1835, when, upon the resignation of Professor Moore, Anthon was elected to the vacant chair. In 1830 he had been appointed Rector of the College Grammar School; and in 1831 had received from his *Alma Mater* the degree of LL.D. The publications of Dr. Anthon are numerous. Soon after his appointment to the adjunct professorship, he compiled a new edition of 'Lempriere's Classical Dictionary,' which was very favourably received, and immediately republished in England. In 1830, he brought out his larger edition of Horace, with various readings and a copious Commentary; a smaller edition of which appeared in 1833. In 1835, Professor Anthon, whose life-long effort has been to promote the improvement of the character of classical scholarship in America, projected, in conjunction with the publishing house of Messrs. Harper, a classical series which should comprise as well the text-books used in academies and schools preparatory to college, as those usually read in colleges and universities. This series includes some of the most important Greek and Latin authors—Homer, Xenophon, Cæsar, Virgil, Horace, Juvenal, &c. Dr. Anthon's classical series has proved one of the most successful enterprises of the kind in America, and has met with a wide reception and approval in this country. He has also published important works in Ancient Geography; Greek and Roman Antiquities, in connection with which it may be mentioned that the first American edition of Potter's 'Archæologia Græca,' or the Antiquities of Greece, appeared at New York, 1825, 8vo, "with additions and corrections by Charles Anthon." He has further largely illustrated the classical mythology and literature generally, so that his various works amount in the aggregate to about fifty volumes.

ANTIQUUS, JOHANNES, a distinguished Dutch painter, was born at Groningen, October 11, 1702; learned glass painting under Gerard Vander Veen; afterwards studied history and portrait painting under Benheimen and Wassenberg; in 1725 went to Amsterdam, and thence to France and Italy. At Florence he entered the service of the Grand Duke, acquired some reputation by his paintings, and was elected a member of the Academy, to which body he presented the sketch for his large picture of the 'Fall of the Giants.' He stayed in all six years in Florence; visited Rome, where he was much noticed by Pope Benedict XII.; Venice, where he found a patron in General Schulembourg; and Naples, where he made the acquaintance of Solimena. On the death of the Grand Duke he returned to Holland with a great reputation as an artist. At the invitation of the Prince of Orange, he settled in 1741 at Breda as court painter, and died there in 1750. His most celebrated pictures are 'Mars disarmed by the Graces,' and some other classical pieces in the palace at Loo. Antiquus designed learnedly and correctly, and painted with much refinement, but in an artificial manner. His portraits are much praised.

ANTOINE, JACQUES-DENYS, an eminent French architect, was born at Paris the 6th of August, 1733. The son of a cabinet maker, and himself a working mason, he owed his great success entirely to his own energy and ability. By some authorities he is said to have lived for some years in Switzerland, and to have erected several buildings there. In Paris he appears to have established himself in the first instance as a builder and contractor. He made himself known by the skilful construction of the galleries over the Salle des Pas Perdus of the Palais de Justice. In the Hospice de Charité, he introduced a Grecian Doric order of unusual purity, and adapted the body of the building to it with marked propriety. But the structure that

secured his fame was the Hôtel des Monnaies, Paris, an edifice of large size and imposing dignity, begun in 1768, and completed in 1775. In this the central feature is an open vestibule, with six Ionic columns and an attic. It is said that Antoine was compelled greatly to retrench his original design in consequence of a portion of the sum allotted for the building having been diverted by the minister D'Angivilliers to the erection of an hotel for himself. Antoine designed the Salle des Archives Nationales, and several other buildings at Paris, at Nancy, at Berne, and at Madrid. He died of apoplexy, August 24, 1801.

ANTOLINI, IL CAVALIERE GIOVANNI, professor of architecture at Milan, was born in 1755. He was for over ten years, 1780-90, in Rome, closely engaged in studying its ancient architectural remains. Little more is known of his life, and he does not appear to have had the opportunity of applying practically his extensive knowledge. For Napoleon I. he prepared the designs for a Forum, which the emperor proposed to erect at Milan, but which the march of events left unaccomplished. Antolini published his designs in 25 large folio plates, with the title, 'Opera d'Architettura, ossia Progetto del Foro che doveva eseguirsi in Milano,' 1814. From this it appears that the Foro Bonaparte, as it was to have been named, would have comprised a vast amphitheatre 1,771 feet in diameter, surrounded with a complete series of public buildings, united by Grecian Doric colonnades, and having a grand central edifice about 200 feet square. Judging from the plates, however, the Foro would have been more remarkable for magnitude than beauty. Antolini published several works, some of them of value: 'Il Tempio di Minerva in Assisi, confrontato colle Tavole di Palladio,' Milan, folio, 1803; 'Idée Elementari d'Architettura civile per le Scuole del Disegno,' Bologna, folio, 24 plates, 1813; 'Le Rovine di Vileia, misurate e disegnate da G. A.,' Milan, large folio, 1819-22, a careful exposition of the remains of the ancient city of Villeja; 'Il Tempio di Ercole in Corsi, e quello di Minerva in Assisi,' Milan, folio, 1828. He also edited, with notes and original observations, Milizia's 'Principles of Civil Architecture,' Milan, 1832. He died at Milan in December, 1841.

*ANTONELLI, GIACOMO, cardinal-deacon of S. Agata alla Suburra, was born on the 2nd of April, 1806, at Sonnino, a village near Terracina, which enjoys a double reputation for the brigandage of its men, and the picturesque costume of its women. His father, who is stated to have belonged to an ancient and respectable family, but personally to have been a woodcutter, sent him to be educated at the Grand Seminary of Rome; to be a student of which, in a state where the clergy were almost the only high functionaries, was a necessary step to every aspirant for political employment. Of this institution he became known as one of the most remarkable pupils. He succeeded in gaining the favour of Pope Gregory XVI., who named him a *prokato*, appointed him an assessor of the superior criminal tribunal, and delegated him successively to Orvieto, Viterbo, and Macerata. In 1841 Antonelli became Under-Secretary of State to the Ministry of the Interior; in 1844, Second Treasurer; and in the year following, Grand Treasurer of the two Apostolic Chambers (finance minister), in the place of Tosti. He was raised to the dignity of a cardinal-deacon on the 12th of June, 1847, by Pius IX., to whose liberal disposition he recommended himself by something like enthusiasm in the same direction. In March, 1848, Cardinal Antonelli was President and Minister of Foreign Affairs, in a liberal cabinet composed of nine members, only three of whom were ecclesiastics. To this cabinet it was that the Roman people owed the framing of the famous "Statuto," or Constitution, which had been almost wrung from the Pope, and which was proclaimed on the 14th of March, 1848, but of which the principal articles were very soon violated or eluded. For a moment Antonelli was extremely popular; but the liberalism of the national party was too advanced and rapid to keep pace with the measured step of a prince of the Church; and on the 1st of May he resigned the presidency of the cabinet into the hands of Count Mamiani. Nevertheless, Cardinal Antonelli continued to control the Pope, to whom he acted as confidential adviser in all questions of home and foreign politics. Through his influence Mamiani was superseded by an able but unpopular minister, Pellegrino Rossi, who had formerly been a peer of France, and French ambassador to Rome. Count Rossi was assassinated November 15, 1848; and on the 24th of the same month the Pope, whose palace of the Quirinal had been assaulted by the populace, retired to Gaeta, in the Neapolitan territory. His flight hither was advised and directed by Cardinal Antonelli, who, presently rejoining him there, protested in his own name and that of his sovereign against the Provisional Government of

Rome, and appointed a commission for the administration of the Papal States. He was afterwards named secretary of state of the court of Gaeta. On the 18th of February, 1849, he addressed collectively to the representatives of Austria, France, Spain, and Naples, a circular in which he appealed to all Christendom to effect the re-establishment of his spiritual sovereign on the throne of St. Peter. Meanwhile he continued to profess his respect for the "Statuto" of the 14th of March, 1848. On the 9th of April, 1849, when already the French troops had landed at Civita Vecchia, he was named president of a special commission charged with the reforms of the church. After the capitulation of Rome, Antonelli counselled the Pope to use a great reserve with the French, and not to precipitate his return to Rome. When Pius IX. consented to re-enter Rome, April 12th, 1850, he named his faithful servant secretary of state for foreign affairs, an office which he still continues to hold, conjoined with the presidency of the council of ministers, and the prefecture of the Sacred Apostolic Palaces.

The measures of Cardinal Antonelli were now recognised as repressive and reactionary; and were such as occasionally to call forth the opposition of members of the Sacred College, and the remonstrances of foreign governments. During the last war in Italy, and since its termination, the report of the resignation of Cardinal Antonelli has been frequently spread; but the Pope has honoured him with renewed marks of confidence. Several circulars of Antonelli have attracted attention; especially those relative to the coldness which arose between the Court of Rome and the Cabinet of the Tuileries, and to the difficulties and conflicts resulting from the presence of French troops in the midst of the Roman people. It was Cardinal Antonelli who answered the interpellations of the Russian Ambassador on the subject of the allocution of the Pope in favour of Poland (1864). Antonelli, indeed, is a master of the art of palliation; and no one understands better than he how to apologise for pontifical politics. His language on the subject of the Encyclical of 1864 was full of a spirit of moderation which it was somewhat difficult to conciliate with the text of that famous document. In the Ecumenical Council, which began its sittings in December, 1869, Cardinal Antonelli has already found a worthy field for his tact and ability in rescuing the more impulsive pontiff from the effects of his zeal and impetuosity.

ANTONIDES VAN DER GOES, JOHANNES, an eminent Dutch poet, was born on the 3rd of May, 1647, at Goes, in Zealand, but taken by his parents when four years old to Amsterdam, where he learned Greek and Latin under Cocceius. His poetic exercises at school being much praised, he essayed translations of the Latin poets, which were so greatly admired by Vondel, that he was induced to undertake a long and elaborate poem in his native tongue on the river Y. When the 'Ijstom,' as it is entitled, was published in 1671, it met with an enthusiastic reception; and, though its descriptions now appear overwrought and conventional, it is still regarded as one of the great national poems. Antonides began another long poem, an epic on the subject of St. Paul; but his circumstances were narrow, he was depressed in spirit, and of feeble health, and he did not live to complete it, dying from the breaking of a blood-vessel, on the 18th of September, 1684, at the early age of 37. A collected edition of his works was published by his father in 1685; and several later editions have appeared: that of 1714 has an excellent portrait, engraved by P. Van Gunst from the original by Bakhuizen.

ANTONINUS, SAINT, Archbishop of Florence, was the son of a Florentine notary, whose name varies with different authorities as Niccolò di Pierozzo and Niccolò di Forciglioni. He was born at Florence in 1389. His Christian name was Antonio, for which the diminutive Antonius, or, in Latin, Antoninus, was substituted on account of the smallness of his stature. In early youth he became a Dominican friar, and entered the convent of Fiesole, which had just been founded. His learning was various, and, considering the age in which he lived, profound. He was well versed in casuistry, in canon law, and in ecclesiastical history; and occupied himself also with public affairs with singular tact and vigour of understanding. His choice of a political party was a prudent one; he attached himself zealously to Cosmo de' Medici, of whom Machiavelli has spoken ('History of Florence') in terms of such rare panegyric. Antoninus became successively prior of more than one convent, auditor of the Roman rota, and vicar-general of his order for Tuscany, and afterwards for Naples. In 1445 he was nominated to the then vacant archbishopric of Florence by Pope Eugenius IV.; but did not overcome until the following year the reluctance he

BIOG. DIV.—SUP.

felt to enter upon that high office. He held the see for about 14 years, during which he distinguished himself, as he had done in all his previous offices, by his zeal in practical reform, and in asserting for the clergy, whom it was his object to elevate in character and influence, their claims to jurisdiction and immunities. More than once he acted as ambassador of the Florentines to the Court of Rome. He died in the year 1459, and was buried in the church of St. Mark, the principal Florentine convent of his order; in which may still be seen a splendid chapel dedicated to his memory, erected in 1588 from a design by Gian Bologna, and containing a bronze statue of him by that artist. He was canonised in 1523 by Pope Adrian VI.: the day assigned to him in the Roman calendar is the 10th of May.

The principal works of Antoninus that have been printed are the three following:—'Defecerunt' [the first word of the book], 'sive Summa Confessionalis,' first printed at Rome in 1472, 4to, and reprinted about twenty times, in Italy and elsewhere, before the end of the 16th century. There is also an Italian translation of it, 'Istruzione de' Sacerdoti, ovvero Somma Antonina composta volgarmente,' Bologna, 4to, 1472, and in several subsequent editions. 'Summa Summarum, sive Summa Theologica, in Quatuor Partes distributa,' Nürnberg, 1478, 4 vols. fol., black-letter. This work, which had been previously printed, in successive volumes, at Venice, was afterwards reprinted about twenty times, the latest and best edition being that of Verona, 1740, 4 vols. folio. Many of the treatises of which this work is composed have had a frequent separate publication; and the whole is intended as a systematic summary of Roman Catholic morality, and is generally acknowledged to have been the earliest work in which an attempt was made to carry the treatment of such topics beyond the scholastic limits. As a digest of doctrines and authorities, the 'Summa' long held a venerated place amongst the standards of the Roman Catholic Church. One other published work of St. Antoninus remains to be mentioned—'Summa Historialis, sive Chronica, Tribus Partibus distincta, ab Orbe condito ad Annum 1459.' Mazzuchelli names an edition of 1480, Venice, 3 vols. fol., the existence of which recent bibliographers pronounce doubtful. The oldest certain edition is that of Nürnberg, 1484, 3 vols. fol., black-letter. Other editions (all in folio) are those of Basel, 1491; Strasburg, 1496; Paris, 1512; Lyon, 1517, 1525, 1543, 1585; and one or two later ones, which are said to contain interpolations. In the plan of this Chronicle there are two features particularly deserving of notice. The one is its comprehensiveness: it aims at delivering a history of intellect as well as of politics and religion. The other is its steady attempt at philosophical exactness of sub-division: each department of human thought or action is treated in a separate section. A revised edition containing all the works of St. Antoninus, under the title 'Antonini Archiepiscopi Florentini Opera omnia, ad Autographorum Fidem nunc primum exacta, Vitâ Auctoris variisque Dissertationibus et Annotationibus aucta, Curâ et Studio Th. Mar. Mamachi et Dion. Remedii,' was to have been published in 8 vols. folio, Florence, 1741, &c., but only two volumes (each divided into two parts), and containing the Summa, were issued, sufficient subscribers not having been found for the complete collection.

ANTONIO VENEZIANO [VENEZIANO, ANTONIO, E. C. vol. vi. col. 314].

APRÈS DE MANNEVILLETTE, JEAN BAPTISTE NICOLAS DENIS D', a distinguished French hydrographer, was born at Havre, 11th February, 1707. His father, in the service of the French East India Company, educated him for the maritime profession, and took him out on a voyage to India in 1719—21. Appointed fourth officer to a vessel, he was wrecked on a voyage to Senegal in 1727. The experience gained on this voyage of the imperfection of the existing charts of the Atlantic had much influence on his later exertions. In 1730 he went as second officer to India. In 1732 he married Marie Madeleine Jaquette de Binard. While engaged on various voyages between 1733 and 1742, he was the first to use Halley's Sextant in determining longitudes by lunar distances; he also made a vast number of soundings in the seas which he traversed. His 'Neptune Oriental,' published in 1743 at the expense of the Company, after approval by the Académie des Sciences, gave correct charts and sailing directions for various parts of the India and China Seas. He then obtained leave to make hydrographical explorations, as a means of adding to the value of his charts, &c. In 1750 he set out in the 'Glorieux,' and visited Rio Janeiro, the Cape of Good Hope, the Isle of Bourbon, the Isle of France, and Madagascar, collecting materials for new and valuable charts. In 1762 the Company appointed him Inspector of Charts, &c., at the dépôt at Brest. By the year 1766 he

H

prepared complete sailing directions from France to India, for which he was decorated by the King. A second edition of the 'Neptune Oriental' (1775) was greatly improved by the assistance of D'Anville and La Caille. D'Après died on the 1st of March, 1780, while preparing a supplement to this work. The King purchased all his charts, plans, and drawings, and placed them in the Dépôt de la Marine.

APROSIO, LUIGI, on entering the order of St. Augustine, ANGELICO, but commonly known in his own day as 'IL PADRE VINTIMIGLIA,' a learned Italian writer and bibliographer, was born on the 19th of October, 1610, at Vintimiglia, in Liguria. At the age of 15 he was received into the order of the Eremitani di S. Agostino della Congregazione di Genova; passed in succession through the convents of Genoa, Siena, Monte S. Savino, Pisa, Trevigi, Feltre, Losina, Venice, Murano, and Rapalla; settling ultimately in that of Vintimiglia, when he was appointed Vicar-General of the Congregation of S. Maria della Consolazione. Aprosio mixed much in society; was intimate with the men of learning and celebrity in all the cities in which he had resided; and was a member of a great many of the academies for which Italy was then renowned. From childhood he had a passion for books, which in manhood he took every opportunity of gratifying, and he had the reputation of being the best bibliographer of his time. When established in his native city, he resolved to found there a good library. He commenced it in 1648, and in 1678, writing to J. Fiorelli, he states that he had then collected upwards of 7000 volumes. This library, which became celebrated as the Biblioteca Aprosiana, still exists, but has lost most of its rare books and choice MSS., and contains now, it is said, less than 5000 volumes. Aprosio wrote a catalogue raisonné, which was published to the end of the letter C, under the title 'La Biblioteca Aprosiana, Passatempo autunnale di Cornelio Aspasio Antivigilmi,' Bologna, 12mo. 1673, pp. 666. In this curious volume Aprosio gives many particulars of his own life, and accounts of the friends from whom he received the volumes he describes. Sixty years after it was printed, J. C. Wolff published a Latin translation of it (Hamburg, 8vo, 1734). Brunet states that the continuation of the 'Biblioteca,' in 4 vols. 4to, entirely in the handwriting of the author, is preserved at Genoa. Aprosio died February 23rd, 1681. He wrote and printed a great number of short pieces both in prose and verse, but all under fictitious names. Thus under the pseudonym *Galistoni* he wrote some criticisms—'Il Vaglio' (the Sieve), 'Il Buratto, (the Boulter), &c.—on Stigliani's poem 'Il Mondo Nuovo,' and in defence of the 'Adone' of his friend Marini, which Stigliani had somewhat rudely assailed; and retorted on Stigliani's reply, 'L'Occhiale' (the Spy-glass), by 'L'Occhiale Stritolato' (the Spy-glass broken), under the assumed name of Scipio Glareano. Aprosio's other publications include 'La Visiera Alzata,' Parma, 12mo, 1689, now extremely rare, and prized for its information on literary and bibliographical matters; 'Le Vigilie del Capricorno,' Venice, 12mo, 1667 and 1678; and several more, generally trifling, and not always clerical in character. His verses, both Latin and Italian, are given more or less fully in the collections.

APTHORP, EAST, D.D., was born in 1733 at Boston, in New England. His father, a merchant, sent him to England to complete his education at Jesus College, Cambridge. In 1755 he won the Chancellor's Medal, and in the following year the Members' Latin prize; graduated in 1757, and in 1758 took his M.A. degree, and was elected fellow of his college. In 1761 he was sent by the Society for the Propagation of the Gospel in Foreign Parts as missionary to Cambridge in Massachusetts; but having become involved in controversy with the Congregationalists of Boston, he returned to England about 1764. He was now employed by Archbishop Secker to defend the sending of bishops to America, and in reward was presented by the archbishop with the vicarage of Croydon. About this time he issued a prospectus of an edition of the Latin historians, but the scheme was abandoned. In 1778 he published the work by which he stands the best chance of being remembered: 'Letters on the Prevalence of Christianity before its civil Establishment; with Observations on a late [Gibbon's] History of the Decline of the Roman Empire.' It was received with great favour, and Gibbon himself praised it in his semi-sarcastic way. "If I am not mistaken," he writes ('Vindication of some Passages in Chapters of the Decline and Fall of the Roman Empire,' p. 92), "Mr. Apthorp was the first who announced to the public his intention of examining the interesting subject which I had treated in the two last chapters of my History. The multitude of collateral and accessory ideas which presented themselves to the author,

insensibly swelled the bulk of his papers to the size of a large volume in octavo. . . . When Mr. Apthorp's Letters appeared, I was surprised to find that I had scarcely any interest or concern in their contents. They are filled with general observations on the study of history, with a large and useful catalogue of historians, and with a variety of reflections, moral and religious, all preparatory to the direct and formal consideration of my two last chapters, which Mr. Apthorp seems to reserve for the subject of a second volume. I sincerely respect the learning, the piety, and the candour of this gentleman, and must consider it as a mark of his esteem, that he has thought proper to begin his approaches at so great a distance from the fortifications which he designed to attack." The second volume never appeared, and Gibbon's Chapters remained uncorrected as far as Mr. Apthorp was concerned. But the book brought its author copious reward. The Archbishop of Canterbury (Cornwallis) bestowed on him the lucrative rectory of St. Mary-le-Bow, and the annexed rectories of St. Pancras, Soper-lane, and All-Hallows, Honey-lane (all in the city of London); appointed him to preach the Warburton Lecture, and conferred on him the degree of D.D. For these preferments Gibbon laughingly claims the credit. "I enjoyed the pleasure," he says ('Memoirs of my Life and Writings,' p. 29) "of giving a royal pension to Mr. Davis, and of collating Dr. Apthorp to an archiepiscopal living." Dr. Apthorp published his Lectures in 1786 in 2 vols. 8vo, under the title of 'Discoveries on Prophecy; read in the Chapel of Lincoln's Inn, at the Lecture founded by Wm. Warburton, late Lord Bishop of Gloucester;' but though marked by learning and moderation, they possess no distinctive value. In 1790 Dr. Apthorp was made a prebend of St. Paul's, and shortly after offered the bishopric of Killaloe, but this he declined on the ground of failing health. He soon after became blind, but he probably found some compensation in the good will of his old Croydon parishioners, who, in testimony of their esteem and sympathy, made him a present of nearly 2000*l.* In 1793, Dr. Porteus, Bishop of London, collated him to the rich prebend of Finsbury, but to retain it he was compelled by the archbishop to resign his other preferments. He now retired to Cambridge, where he died in 1816. Besides the works already noticed, Dr. Apthorp published several Sermons, a volume of 'Select Devotions for Families,' and three or four pamphlets.

AQUILA, CASPAR (German KASPAR ADLER), one of the most distinguished Protestant divines of the Reformation period, was born on the 7th of August, 1488, at Augsburg, of which place his father, Leonard Adler, was syndic. On leaving the Academy of Augsburg, he went to Ulm and thence to Bologna to complete his education. In 1514 he was appointed preacher in Bern, but after a brief sojourn left for the University of Leipzig, whence, in 1516, he joined Franz von Sickingen, who appointed him his field preacher, or military chaplain. The following year he was chosen preacher at Jengen, near Augsburg. Here he devoted himself to a closer study of theology, and soon adopted the views of Luther, which he set forth in his sermons. For this he was arrested by order of Christoph von Stadion, Bishop of Augsburg, and confined in an unwholesome dungeon at Dillingen during the winter of 1519—20, and then only released through the intervention of Queen Isabella of Denmark, sister of the Emperor Charles V. He now joined Luther at Wittenberg, and thence proceeded to the Castle of Ebernburg to teach the children of Franz von Sickingen. Whilst here he narrowly escaped a strange death. The soldiers of the castle wished him to baptize a cannon, and on his refusal, forced him into the mouth of a huge mortar with the intention of blowing him from the castle wall. Their efforts to ignite the powder failed, however, and at length an officer succeeded in rescuing him. From 1524 he resided at Wittenberg as preacher and teacher of Hebrew, at the same time rendering Luther valuable assistance in translating the Bible and in advancing the doctrines of the Reformation. By Luther's recommendation he, in 1527, was appointed to the office of pastor at Saalfeld, where in the following year he was made ecclesiastical superintendent. When the Interim was put forth, Aquila vehemently opposed it both by his personal influence and in two publications, 'Christlich Bedenken auf das Interim' (1548, reprinted in 1549), and 'Das Interim illuminirt' (Augsburg, 1548). His opposition so incensed the Emperor Charles V., that he declared Aquila an outlaw, and offered a reward of 5000 florins for his head. Aquila was obliged to fly from Saalfeld, taking with him only a Hebrew psalter. But the Countess of Schwarzburg gave him an asylum in her castle of Rudolstadt, where he remained till the excitement about the Interim had calmed down, when she obtained

for him (1550) the deanery of Schmalkalden. In 1552, after the Treaty of Passau, he was restored to his office at Saalfeld, and there he quietly pursued his religious duties till his death on the 12th of November, 1560. Besides the works above cited, and several sermons, Aquila published 'Christliche Erklärung des Kleinen Katechismus,' Augsburg, 1538; and 'Fragstücke der Ganzen christlichen Lehre,' Augsburg, 1547.

(J. G. Hillinger, *Lebensbeschreibung Casparis Aquila*, Jena, 8vo, 1731; C. Schlegel, *Bericht vom Leben und Tode C. A.*, Leipzig, 4to, 1737; J. Avenarius, *Kurze Lebensbeschreibung, C. A.*, Meiningen, 4to, 1718.)

AQUILANO, or DELL' AQUILA, SERAFINO, one of the most popular Italian poets of the 15th century, was born in 1466 at Aquila, in the Abruzzo, whence the name by which he is known—his family name is conjectured by Mazzuchelli to have been Cimino. While very young he was placed in the court of the Count of Potenza, where he learned music under G. Flamand. He is said to have next spent three years in the study of Dante and Petrarch, after which he went to Rome in the suite of Cardinal Ascanio Sforza, with whom he stayed for about six years. He had now acquired great skill in improvisation and in accompanying his verses on the lute, and his performances in this way were eagerly sought after. In 1491 he was invited to the court of the Duke of Calabria, afterwards Ferdinand II. of Naples, with whom he stayed three years; then visited in succession the courts of Guidobaldo, Duke of Urbino, Francisco Gonzago, Marquis of Mantua, and Lodovico Sforza, Duke of Milan, from which last he was driven by the occupation of the territory of Milan by the French. At Rome he was cordially received by the Cardinal Borgia, and afterwards by Cesare Borgia, Duke Valentino, who obtained for him, in 1499, the appointment of Knight of Jerusalem, and the post of commander with a handsome income. He did not, however, long enjoy his good fortune, dying of fever on the 10th of August, 1500, in his 34th year.

A reader of Aquilano's poetry would find it difficult to account for the extraordinary popularity it enjoyed, unless he was acquainted with the circumstances under which it was produced. The language was still but imperfectly formed, and Aquilano was the first since Petrarch to mould it with perfect ease and harmony. His poetry was always animated, full of fancy, not altogether devoid of imagination and feeling: it was exactly in accord with the tone of sentiment of the best society of the day, and it was recited in turn at the chief courts of Italy by the author himself, with all the charm of an accomplished actor and musician. The number of editions of his collected poems was remarkable. The first appears to have been that of Francisco Flavis—'Opera del facundissimo Seraphino Aquilano,' Rome, 4to, November 29, 1502, of which an 8vo edition was issued on December 24, 1502, and which was reprinted at Bologna, in 8vo, 1503. 'Opera dello elegante poeta S. A., finite et emendate, con la loro Apologia (di Angelo Colocci a Silvio Piccolomini) e la vita de esso poeta,' (di Vincenzio Calmeta), Rome, 4to, 1503. Other editions appeared at Fano, 8vo, 1505; Venice, 1505; Milan, 1516; Florence, 8vo, 1516, by F. di Giunta, esteemed the best of the old editions; Florence, 8vo, 1517, by B. Zuchetta; Venice, 4to, 1519, reprinted 1526; Milan, small 8vo, 1523; Venice, 1529—1530, corrected edition by Marco Guazzo; an edition, 'Opere dello elegatissimo Poeta S. A. cō molte cose aggiunte di nouo,' Venice, 8vo, 1538, contains on the title page the announcement that the poems are divided into 165 sonetti, 3 egloghe, 7 epistole, 20 capitoli, 3 disperate, 27 strambotti, and 19 barzelette. Several other editions are given by Mazzuchelli and Brunet; the latest is that of A. de Bondoni, 1550; there are also separate editions of his strambotti.

ARAGONA, TULLIA D', a celebrated Italian poetess, born in the early part of the 16th century. She was the illegitimate daughter of Tagliavia, Archbishop of Palermo, and afterwards Cardinal, who gave her so good an education that while yet a child she was proficient in Latin, and became the most accomplished woman in Italy in music and singing. Very beautiful, and possessed of a liberal income, her house became the favourite resort of the most eminent wits and scholars, with whom she used to exchange sonnets, and who were unbounded in their admiration of her loveliness and genius. Arrighi declares that her beauty is overpowering as that of the sun; Nardi that she is fitly named Tullia, as inheriting the eloquence of Cicero (Tullius). Unfortunately she was not so preeminent in other virtues; but she married, and after the death of her husband, retired to Florence, where she died about 1560. Her works are: (1) 'Rime della Signora Tullia di Aragona e di diversi a lei,' Venice, 12mo, 1547 (reprinted 1549 and 1560), in which are

printed the sonnets addressed to her by Cardinal Ippolito de' Medici, Francesco Molza, Ercole Bentivoglio, Filippo Strozzi, Benedetto Varchi, Pietro Manelli, Lattanzio Benucci, and the most ardent of all her admirers, Girolamo Muzio, with the lady's answers. (2) 'Dialogo della Infinità di Amore,' Venice, 12mo, 1547; the lady in this again sustaining one part only of the performance, and her praises being the main subject of the other two speakers. (3) 'Il Meschino,' Venice, 4to, 1560 and 1594, a sort of epic in 36 cantos of ottava rima. Tullia professes to have taken the story from a Spanish romance, but it is really a versification of the popular Italian romance of Guerino Meschino. Tullia's poem was greatly admired at the time of publication, and Crescimbeni compares it to the Odyssey; but no one since his time has probably found resolution enough to read half way through it.

ARBRISSEL, or ARBRISSELLES, ROBERT D', derived his name from the place of his birth, Arbrissel, now called Arbresec, a village near La Guerche, in the diocese of Rennes. His parents were of the middle class; and from the time of his birth, about 1047, gave him such an education as their neighbourhood afforded. In 1074 Robert went to Paris, and was soon after admitted to priests' orders. From 1085 to 1089 he acted as arch-priester and vicar-general to Silvestre de la Guerche, Bishop of Rennes, a man of no learning himself, but a patron of the learned. For four years Arbrissel carried on a crusade against the crying abuses of the time, whether amongst the clergy or the laity, and made himself so obnoxious by the opposition he had given to prevalent vices, that when he lost the support of the bishop, by the death of the latter in 1089, he found it necessary to quit the diocese of Rennes. He repaired to Angers, and taught theology there for the space of two years; when, conceiving a despair of the world, and of himself as dwelling in the world, he went with one companion and buried himself in the forest of Craon, which was towards the confines of Anjou and Bretagne. Here he soon acquired a reputation for his extreme mortification, and at length found himself at the head of a small community. In 1096 Arbrissel was invited by Urban II. to preach the sermon at the dedication of the church of St. Nicolas at Angers, and acquitted himself so much to the satisfaction of the Pope, who assisted in person at the dedication, as to be named by him "apostolic preacher," with a commission to exercise his priestly office throughout the whole world. And on the day after the sermon, Reginald, the lord of Craon, made over to him a portion of the forest of Craon, that he might found an abbey in it. Such is the origin of the abbey of La Roë (de Rota). After discharging the duties of prior of La Roë for two years, Robert, conceiving that his commission from the Pope not only permitted but necessitated his itinerancy, set out upon an evangelistic tour in company with two other preachers, and their joint labours resulted in the conversion of numbers of men and women of all shades of immorality. Robert founded several monasteries for his converts, of which the most celebrated was the abbey of Fontevrault, in the diocese of Poitiers, on the confines of Touraine and Anjou. The site of this abbey was a valley covered with thorns and brambles, which was called Fontevraud, or Fontevaux. The natives called it Frontevaux, and its correct Latin title is Fons Ebraidi. Here Robert at first constructed some huts, but in a short time the abbey contained within one enclosure monasteries for men and women. They were, however, separate buildings; and the three monasteries for females were devoted respectively to virgins, widows, and reformed magdalens. The order of Fontevrault adopted the rule of St. Benedict; but Robert introduced a novelty, the wisdom of which has been much questioned, the government, namely, of all the monasteries, male and female, by one abbess. He vindicated the subjection of men to women, a point on which he strictly and solemnly insisted, by the example of Christ, who recommended St. John to the Virgin Mary, and ordered that beloved disciple to be obedient unto her as to his own mother. The date of the foundation of the abbey of Fontevrault is probably the year 1101. The institution was confirmed by a bull of Pascal II., dated March 26th, 1106; and again by a bull of Pope Callistus II., dated September 15th, 1119. Not long after the death of Robert the number of the religious of both sexes amounted to nearly 5000. Fontevrault became at last the most magnificent of all the female monasteries of France. The order was suppressed at the French Revolution.

In 1104 Robert resigned the direction of the monastery into the hands of a noble widow named Hersinde or Hersende de Champagne, or de Clairvaux. The title of abbess, however, was given first to Petronille, who succeeded Hersinde on the 28th of October, 1115. Having thus provided for the administration of

the abbey, Robert resumed his missionary activity, preaching against the vices of the day, and from time to time visiting Fontevrault, where it is remarkable that he claimed a peculiar exemption from the authority of the superioress. He died at Orsan, a monastery of his order in Berri, on the 25th of February, 1117. Here his heart was left, the rest of his body being transported, according to his request, to Fontevrault. In 1633, Louise de Bourbon, abbess of Fontevrault, placed his remains in a magnificent marble tomb, on which was inscribed the epitaph which Hildebert, Bishop of Mans, wrote in honour of Robert.

ARBUCKLE, JAMES, was born in Glasgow, about 1700. Nothing certain is known of his life. In 1719 he published a mock-heroic poem, entitled 'Snuff,' which, though of little value, was of greater promise as a juvenile poem than his subsequent works fulfilled. It was followed by an occasional poem on the Death of Addison, and in 1721 by 'Glotta,' an extravagant description of the Clyde. Some miscellaneous verses appeared at intervals, but he does not appear to have ventured on any further sustained flight. The last work ascribed to him is 'The Letters of Hibernicus, published in the Dublin Journal,' London, 1729. He died in 1734.

ARCHDALL, REV. MERVYN, learned Irish antiquary, was born at Dublin in 1723. Having gone through the usual course of study and taken orders, he was appointed domestic chaplain to Pococke, Bishop of Meath and Ossory. Devoting his attention to antiquarian subjects, he had to regret the want of a work for Ireland corresponding to Dugdale's 'Monasticon Anglicanum,' and, encouraged by Bishop Pococke, set himself to supply the deficiency. The collection and preparation of the materials cost him several years of close application, but in 1786 appeared in a 4to volume of 840 pages, the 'Monasticon Hibernicum; or an History of the Abbies, Priors, and other Religious Houses in Ireland.' The necessity for confining it to a single volume compelled Mr. Archdall, sorely against his inclination, to abridge or epitomise the original documents, but he has done this with scrupulous good faith, and the arrangement of the whole is very convenient. Mr. Archdall's only other separate work is a revised edition of Lodge's 'Peerage of Ireland,' 7 vols. 8vo, 1789. He died rector of Slane, August the 6th, 1791.

ARCHDEKIN, JOSEPH (or as it is sometimes printed in his titlepages, Arsedekin), a learned Irish Jesuit, was born at Kilkenny, about 1619. In 1642 he entered the society of Jesuits at Mechlin, and in 1662 was made professor of moral and scriptural theology at Louvain. His first publication was a treatise, 'Of Miracles, and the New Miracles done by the Relicks of St. Francis Xavier, in the Jesuits' College at Mechlin,' Louvain, 8vo, 1667. It is printed in English and Irish, being as is believed the first book printed in the two languages, and is now extremely scarce. But a work that excited much more attention was his 'Præcipue Controversiæ Fidei ad facilem methodum redactæ,' Louvain, 8vo, 1671. With it is usually bound up, though sometimes it is met with separately, a life of St. Patrick, 'Vitæ et Miraculorum Sancti Patricii, Hiberniæ Apostoli Epitome: cum brevi Notitia Hiberniæ, et Prophetiâ S. Malachiæ,' also printed at Louvain in 1671. The success of the 'Controversiæ Fidei,' which is a summary of the doctrines of the Church, was wonderful. New editions were rapidly required; it was reprinted without the knowledge of the author, and manuscript copies were made for the use of the students at the University of Prague. The editions issued by the author were corrected and extended till what in the original was a modest 8vo volume of 500 pages, in the eighth edition, Antwerp, 1686, had swelled to three bulky quartos, while the title was changed to 'Theologia Tripartita Universa.' This enlarged edition was dedicated to James II., and contains much additional matter respecting Irish Church history, and memoirs of Peter Talbot, Roman Catholic Archbishop of Dublin, who died in prison in Dublin in 1680, and of Oliver Plunket, Roman Catholic Archbishop of Armagh, executed in London in 1681. But though so popular with his co-religionists, the book failed to give satisfaction at Rome, and in 1700 it was prohibited till corrections should be made in it by the Congregation of the Index. An edition with these corrections, the 13th of the work, was published at Antwerp in 1718, and none has since appeared. Archdekin was made professor of classics at Antwerp in 1670, and of philosophy in 1671. He died at Antwerp, August the 3rd, 1693.

ARCHER, THOMAS, an English architect of the first half of the 18th century, who is chiefly remarkable for the extreme alternations in the criticisms bestowed upon him. Of his life little is told. Where he learnt architecture, or whether he ever had any regular instruction in it, is as uncertain as in the case

of Vanbrugh. That Archer was a follower, if he was not a scholar of Vanbrugh, we, however, know. Vanbrugh has indeed been credited, perhaps untruly, with assisting him in his designs. Like Vanbrugh, he seems to have had something besides architecture to depend upon. Walpole, writing of Vanbrugh's immediate successors, says, "There was a Mr. Archer, the groom-porter, who built Hethrop, and a temple at Wrest." When and how long Archer was groom-porter is not stated. In a note Walpole is even more contemptuous:—"St. Philip's Church at Birmingham, Cliefden House, and a house at Roehampton (which as a specimen of his wretched taste may be seen in the 'Vitruvius Britannicus') were other works of the same person; but the chief d'œuvre of his absurdity was the Church of St. John, with four belfries, in Westminster."—('Anecdotes,' vol. iv. p. 85.) Vanbrugh was the butt of two or three generations of wits, and the chief d'œuvre of his most successful disciple, which they said was so preposterous that it must have been designed by the master and borrowed or stolen by the scholar, was not likely to be left unassailed. Its unusual form, "with four belfries" at the angles, afforded a ready topic for ridicule. By some it was likened to a parlour-table with the legs uppermost; by others to an elephant sprawling on its back with its legs in the air. The scoffers prevailed, and for long St. John's, Westminster, was never referred to, except in mockery. At last came the reaction; Vanbrugh and his Italian were accepted as at once poetical and picturesque, and even St. John's found not only defenders, but admirers. Probably it would have found admirers still, but that the mediæval current set in, and in ecclesiastical architecture bore all before it. Yet apart from preconceptions, it is hard not to feel that there is something of character and individuality in the exterior of St. John's Church, though some central or predominant feature is sorely needed, and objections occur at every turn to the details. St. Philip's, Birmingham, the earlier of the two churches, is likewise the more conformable to the approved type; but it has a tower, surmounted by a cupola of somewhat original and decidedly effective outline. Like St. John's, it is placed in the midst of a square—the Birmingham square, however, having much the larger area—and it consequently fairly shows itself on all sides. The Birmingham interior is far the better of the two, St. John's being very poor. St. Philip's Church was commenced in 1711, consecrated in 1715, and completed in 1719. St. John's was begun in 1721, and consecrated in 1728, but not finished till some years later. It is only fair to add that many alterations were made in St. John's during the progress of the works, and in opposition to the wish of the architect: Archer's original design will be found in the Crowle Pennant in the Print Room of the British Museum. Archer's contemporaries had sufficient confidence in his ability. He had numerous commissions, and when he died, April 23, 1743, he left a fortune of over 100,000*l.* "to his youngest nephew, H. Archer, Esq., member for Warwick."

ARCKENHOLTZ, JOHANN, celebrated Swedish writer, was born in Finland in 1695. In 1730 he accompanied a Swedish nobleman named Hildebrand in a tour through Europe, and whilst in Paris he wrote some remarks on the connection between France and Sweden, in the course of which he reflected somewhat severely on Cardinal Fleury, then prime minister of France. Though the cause of much trouble, this served to bring Arckenholtz conspicuously into notice. Eight years after his return to Sweden, Arckenholtz's MS., through the indiscretion of a friend, fell into the hands of Count Gyllenborg, the leader of the French party, who transmitted it through the French ambassador to Cardinal Fleury. The cardinal demanded satisfaction of the Swedish government, and the king, after vainly attempting to remove his anger, was reluctantly forced to dismiss Arckenholtz (1738) from the post he held in the Swiss chancery. Arckenholtz found it convenient to travel abroad. King Frederick, as elector of Hesse-Cassel, gave him, 1746, the post of court librarian at Cassel, which he held for 20 years, when he was recalled to Stockholm (1766), and appointed historiographer, the States granting him a pension of 1200 dollars on condition of his writing the life of his patron, King Frederick, a duty he never fulfilled. His last years seem to have been mostly taken up with speculations and visions of the spirit world, after the example of Emmanuel Swedenborg. He died on the 14th of July, 1777.

Cardinal Fleury's excessive anger at Arckenholtz's remarks gained him credit for extraordinary literary skill, but his writings by no means satisfied the expectations which had been raised. His most important work was 'Memoires concernant Christine, Reine de Suède,' four large volumes 4to, Amsterdam, 1751-60. The book

when it appeared excited prodigious interest, but it was soon ruthlessly attacked by d'Alembert and Voltaire, and with less wit but equal vigour by the Danish historian, Baron Holberg. At the end of a century it retains its character as an invaluable collection of materials, but French critics are as much disturbed as ever by its harsh and lumbering style. Arckenholtz replied to his assailants in a 'Réponse à la Lettre de M. le Baron de Holberg,' 8vo, 1753, and a 'Lettre à M. G[essner] à l'occasion des Reflexions sur Christine par M. d'Alembert,' 8vo, 1754; and in some respects he had the better of the fight. But in a literary sense the attack was so damaging that he (or his publisher) deemed it prudent to place the materials he had collected for a companion work, the 'Life of Gustavus Adolphus,' in the hands of Mauvillon, who wrought them into his 'Histoire de Gustave-Adolphe.' Arckenholtz afterwards published, 'Recueil des Sentimens et des Propos de Gustave-Adolphe,' Stockholm, 12mo, 1769; 'Lettres sur les Lapons et les Finnois,' Frankfurt, 8vo, 1756; 'Memoires de Rusdorf,' Frankfurt, 1762; an historical sketch of Frederick of Hesse-Cassel; an attempt at a Pragmatical History of Conventions and Treaties of a Free State with Neighbouring Powers; and one or two other essays, all of them written in French.

ARESON, JON, the last Roman Catholic bishop of Iceland, was born at Grita, Eyafjord, in 1484. Although poor, and scantily educated, he had high notions of genealogy, and he (or his friends for him) claimed to be eighty-fifth in direct descent from Adam. He entered the church at the age of twenty, as priest of Helgastad. Under instructions from Bishop Gottskalk of Holum, he undertook two missions to Norway, which brought him much reputation. After filling the posts of Dispensator and Officialis, he was appointed Bishop of Holum in 1522; but Ogmund, Bishop of Skalholt, claiming the right of nomination, sent an armed force against Areson, and drove him out of Iceland. An appeal to Archbishop Olaus at Drontheim resulted in Areson's reinstatement and consecration in 1524. After the lapse of many years, circumstances made Areson as violent in his conduct as Ogmund had been. Frederick III. of Denmark, having accepted the Reformation, sent orders in 1540 to prepare for it in Iceland. Nearly all the clergy yielded assent except Areson, who not only defied the king and the Althing, or annual assembly of Iceland, for years together, but began in 1549 a bitter persecution of the Protestant Bishop of Skalholt. Areson had taken a mistress while a priest, and had sons by her, who intermarried with the best families in Iceland; and when he was outlawed by the king for contumacy in 1549, two of his sons joined him in a fierce war against the Protestants. All three were captured, and beheaded, November 7th, 1550. The Reformation was quietly completed after this tragic episode.

Areson was the best Icelandic poet of his time. He introduced printing into Iceland in 1530 with the aid of John Matthiæ from Sweden. His published works are 'Manuale Pastorum,' 'Pinslargátr,' or a Lamentation for the Passion; a Paraphrase on the 51st Psalm, and Miscellaneous Poems.

ARETINO, D'AREZZO, or DE ARRETINUS, is an addition of frequent occurrence to the Christian names of distinguished Italians. It implies that they are citizens of Arezzo in Tuscany, or connected with the place by birth or residence. PIETRO ARETINO [E. C. vol. i. col. 300], and SPINELLO ARETINO [ib. col. 302] are examples. The following may be noticed in this Supplement.

ARETINO, ANGELO, a distinguished jurist of the 15th century, was of a family named Gambiglionni, and took his doctor's degree at Bologna in 1422; was assessor at Perugia, and afterwards held judicial offices in Rome, Città di Castello, and Nescia, where he was imprisoned for a year on an unjust charge of misconduct. On his release he was appointed to lecture on the Institutes at Ferrara; afterwards, 1438, at Bologna; and then again, 1445, at Ferrara, where he continued with the highest reputation till his death, which probably occurred shortly after 1450. He wrote several works which were long regarded as authorities, and one 'Tractatus de Maleficiis,' fol. 1472, and many times reprinted, which is still found in good law libraries.

ARETINO, BONAGUIDA, a celebrated jurist and glossator of the 13th century, was born at Arezzo, taught the canon law in that town, and practised as an advocate during the pontificate of Innocent IV. (1243-54). His writings refer to forms of process as well as to the principles of canon law. Savigny gives a full account of his writings as well as those of Angelo Aretino.

ARETINO, CARLO, one of the most distinguished scholars of the court of Cosmo de' Medici, was the son of Gregorio Marsuppini, at one time governor of Genoa, and was born at Arezzo

about 1399. He learnt Latin under John of Ravenna, Greek under Manual Chrysoloras; early secured the favour of Cosmo de' Medici; for some time lectured in Florence on the classic writers; in 1441 was appointed to the honorary office of apostolic secretary; and in 1444 to the important post of chancellor to the republic, which he filled with so much credit that on his death in April, 1453, he was decreed a splendid public funeral in the nave of Santa Croce. Carlo Aretino was regarded as one of the greatest Greek and Latin scholars and orators of his age, though few specimens of his literary ability have been printed. A selection of his Latin poems is given in vol. vi. of the 'Carmina Illustrum Poetarum Italorum,' Florence, 1720; and a translation of the 'Batrachomyomachia' into Latin hexameters was published at Parma, 4to, 1492, and reprinted with the original and an Italian version by the Abbé Lavagnoli, Venice, 4to, 1744.

ARETINO, FRANCESCO. [ACCOLTI, FRANCESCO, E. C. S. col. 15.]

ARETINO, LEONARDO. [BRUNI, LEONARDO, E. C. vol. i. col. 978.]

ARETIUS, BENEDICT, learned Swiss botanist and divine, was born at Bern about 1505; studied in his native city; was in 1548 appointed professor of logic at Marburg, but in the following year returned to Bern as principal of the gymnasium; was nominated professor of languages in 1563, and later professor of theology; and died April 22nd, 1574. Aretius was a laborious scholar, and in theology a devoted, or as he has been styled, fanatical disciple of Calvin, going the length of writing a treatise in defence of the execution of Valentinus Gentilis for holding Arian views—a treatise that was translated into English. His spare time was given to botanising in the country around Bern, carrying out his investigations at home, or in correspondence with men of science and learning. Conrad Gessner makes frequent reference to Aretius in his works, and gave his name to an Alpine plant which he was the first to describe (*Aretia helvetica*). The reputation of Aretius as a botanist rests on a description of the flora of the Niesen and Stockhorn mountains, 'Descriptio Stocchorni et Nessi montium in Bernatium Helveticorum ditione et nascentium in eis stirpium,' printed in a folio edition of the works of Valerius Cordus and in Gessner's 'Hortus Germaniæ.' Sprengel states that about 40 plants were for the first time described in it. Aretius also published a work on the history and nature of comets, 'Brevis Cometarum Explicatio,' 4to, Bern, 1556; and edited an old medical treatise 'Opus Physicum et Medicum de gradibus et compositionibus medicamentorum,' 8vo, Zurich, 1572. Of his numerous theological publications the following are perhaps the most important:—'Censura Conclusionum quod Baptismus non successerit circumcissioni contra Pædo-baptistas,' Geneva, 1567; 'Examen Theologicum, brevi et perspicua methodo conscriptum,' 1572; 'Problemata Theologica, folio, Lausanne, in three parts, of which the first and second' appeared in 1574, and the third (posthumous) in 1576. His lectures on the Lord's Supper, 'Lectiones vii. de Cena Domini,' Lausanne, 1578, passed through several editions, as did also his (posthumous) commentary on the New Testament, 'Commentarii in Libros Novi Testamenti,' fol. 1580; 'Commentarii Breves in Mosis Pentateuchum,' Bern, 8vo, 1602. To these should be added his commentaries on Pindar, 'Commentarii absolutissimi in Pyndari, Olympia, Pythia, Nemea, Isthmia,' Geneva, 4to, 1589.

ARETUSI, CESARE, called also CESARE MODENESE, was born at Modena about the middle of the 16th century; studied the works of Raminghi and Correggio; acquired reputation as a portrait painter; and was admitted a citizen of Bologna, but on the invitation of Duke Ranuccio he removed to Parma, where he died in 1612. Aretusi belonged to a stage in Italian art when facility of execution and skill in imitating the manner of the masters of the preceding period were sufficient to secure fame. Both these faculties he possessed, and he was far above the average as a colourist. He was accordingly employed to make a copy for the cathedral of San Giovanni, at Parma, of Correggio's famous picture of the Notti now at Dresden, and he executed his commission with so much ability that probably Mengs was not singular in believing that the possession of the copy would compensate the loss of the original. At any rate the authorities were so well satisfied, that having decided to erect a new tribune to the cathedral, they directed Aretusi to make copies from the frescoes by Correggio which adorned the old tribune, and these being made, the old pictures were destroyed with the walls on which they had been painted. Aretusi's dexterity in assimilating Correggio's manner seems to have been exercised on easel as well as mural paintings; and as it was evidently appreciated by his contemporaries, it is not unlikely that

many 'duplicates' and some 'originals' ascribed to the great painter are due to the pencil of his copyist. Aretusi had little inventive or original power. Some of his best so-called original works were produced in conjunction with Gio. Battista Fiorini, an artist of whom little is known beyond his co-partnership with Aretusi.

ARGENTRÉ, BERTRAND D', a learned French jurist and historian, was born at Vitré, in Brittany, in 1519. He at first applied himself to the study of history and general literature, and wrote a Latin history of Brittany; but it was never printed, and the MS. is in the Bibliothèque Impériale. D'Argentré, in 1547, succeeded his father as Sénéchal of Rennes. He had deeply studied jurisprudence, and became the acknowledged leading authority on the customary law of Brittany. He was in 1579 appointed one of the commissioners for the reformation of that law. In the performance of this task he took high ground in maintaining the feudal and seignorial privileges, and would have strengthened the position of the lord as against the vassal had he not been checked by the more liberal views of his coadjutors. On the completion of the commission, the States of Brittany invited D'Argentré to write a history of that province, which, by the aid of some memoirs prepared by his great-uncle, Pierre le Baud, he completed in three years. The work was published at Rennes, in 1582, but proved to be little more than a dry detail of facts. By the Parliament of Paris it was, however suppressed, on account of the freedom with which he had spoken of the ancient rights and independence of Brittany. D'Argentré revised, modified, and republished his history in 1588. It became his duty to act against the League in 1589; and this duty occasioned him so much pain, harass, and vexation, that he died 13th February, 1590. D'Argentré wrote a great number of works on the customary law of Breton, and on the feudal rights, privileges, and prescriptions. Several of these works were printed in his lifetime, and all were collected and published by his son in 1608 under the title, 'Commentarii in Patrias Britonum Leges, in lucem editi cura et studio Caroli d'Argentré.' A life of D'Argentré, by Mionec de Kirdanet, was published at Rennes in 1820.

ARGENTRÉ, CHARLES DU PLESSIS D', Bishop of Tulle, was born at Du Plessis, near Vitré, the 16th of May, 1673. After studying philosophy at the college of Beauvais, and theology at the Sorbonne, he joined the order of Friars Minors; was admitted into the Society of the Sorbonne in 1698, and received a doctor's degree in 1700. In the same year he was nominated to the Augustine abbey of Sainte-Croix de Guingamp. In 1702 he obtained the deanery of Laval. He was elected, in 1705, one of the deputies of the second order to represent Tours at the General Assembly of the Clergy of France. In 1707 he became vicar-general to the Bishop of Tréguier; in 1709, almoner to the King; and in 1725, Bishop of Tulle. For some years after this he was one of the deputies of the first order representing the province of Bourges at the General Assembly of the Clergy. He continued diligently in the discharge of his diocesan duties until his death, which took place October 27th, 1740. D'Argentré published fourteen works between 1698 and 1734 on theological subjects. Many were controversial, directed against the writings of Jurieu, Fénelon, and Holden. His principal works were 'Analyse de la Foi, avec un traité de l'essence et des marques qui distinguent la véritable Église de Jésus-Christ,' two vols. 12mo, Lyon, 1698; 'Elementa Theologica,' &c., 4to, Paris, 1702; 'Lexicon Philosophicum,' La Haye, 4to, 1706; 'De Supernaturalitate,' &c., Paris, 4to. He also published a large number of sermons, funeral orations, pastoral letters, &c.

ARINGHI, PAOLO, an Italian antiquary of the 17th century, was born at Rome, entered at an early age the Congregation of the Oratory, and remained in it till his death in 1676. As an investigator of the ancient remains of his native city, he did good service to the study of Christian antiquities by his 'Roma Subterranea,' two vols. folio, Rome, 1651; Cologne, 1659; Paris, 1659. Substantially a Latin version of Ant. Bosio's 'Roma Sotterranea,' though much extended and improved, Aringhi's book is practically superseded by the later and more elaborate works of Bottari, Louis Perret, and Rossi, but no original investigator can afford to leave Aringhi unreferred to. His other works are 'Monumenta Infelicitas, sive Mortes Peccatorum pessimæ,' 2 vols. fol., Rome, 1664; 'Triumphus Poenitentia,' fol., Rome, 1670.

ARLER, PETER VON, German mediæval architect, was born about 1333 at Bologna, where his father, Heinrich von Gemünd, in Suabia, had recently settled. Peter von Arler was,

in 1356, already in Germany, and though so young, must have acquired some reputation, since in that year was entrusted to him the completion of the cathedral of St. Vitus, in the Hradschin, or royal quarter, Prague. This magnificent structure, in many respects one of the finest examples of German Gothic architecture extant, was commenced by Mathieu d'Arras in 1343; Von Arler continued the works for thirty years, till they were interrupted by his death in 1386, and unhappily they were left incomplete, only the choir and one of the towers having been erected. The tower, the highest in Europe, being 506 feet high, was reduced after a great fire in 1541 to its present height of 314 feet. The original design, still preserved in the Schatzkammer (treasury) of the cathedral, was probably by d'Arras, but its present aspect, and particularly the exceeding richness of the decoration, is no doubt due to Von Arler. The Allerhelighi Kirche, in the same city, was also erected by Von Arler, and the famous bridge over the Moldau, between the Altstadt and the Kleinseite, with its fifty-six statues of saints, was commenced by him, though not completed till a century and a quarter after his death. The only other work of importance attributed to Von Arler is the church of Kolin on the Elbe.

ARLINCOURT, CHARLES VICTOR PRÉVOT, VICOMTE D', French writer, was born at the château de Mérantrais, near Versailles, September 28, 1789. His father, of an old family of Artois, was one of the royalist victims of 1793, and the boy was taken by his mother into Picardie, where he was educated under an abbé. At ten years of age he is said to have written a poem of many thousand lines on the effect of the passions, but happily it was consigned to the flames. The young count was noticed by Napoleon I., who appointed him successively to posts in the establishment of Madame Mère; in the diplomatic service in Spain; and as auditor of the council of state. On the fall of Napoleon I., M. d'Arlincourt transferred his services to Louis XVIII., who made him maître des requêtes; but he was dazzled by the reappearance of the Emperor, and after the Hundred Days he was superseded by Louis; nor, though his Bourbonism went on increasing in fervour, did he succeed in regaining the confidence of the family till after the events of 1830. His first literary venture was in a fragment of an epic poem, published in 1810, under the title of 'Une Matinée de Charlemagne,' in which some incense was skilfully administered to the living Charlemagne; but when the completed epic was published in 1818 as 'Le Caroléide,' Charlemagne had fallen, and the tone was sensibly modified. However, it had a certain amount of popularity, and a third edition was published in 1824. But though he continued occasionally to write verse, it was to his prose romances that he owed his exceptional celebrity. Of these the most popular was 'Le Solitaire' (1825), which passed through numerous editions, was transferred to the stage in most European capitals, and was made the subject of a successful opera-comique. 'L'Étrangère,' 'Le Renégat,' and 'L'Ipaiobé,' were very similar in character and conduct, all glancing at current events, and satirizing present manners under old names and times. The ejection of Charles X. from the throne of France turned his pen to political satire, and from this time he poured forth a stream of romances which, under historic pseudonyms, are filled with extravagant laudation of the Bourbons, and denunciations of their successors, and of all who fail to appreciate their high qualities: the titles of a few will serve as examples, 'Les Rebelles sous Charles V.' (1832); 'Bannissement et retour de Charles VII.' 'Le Brasseur Roi' (1833); 'Les Trois Châteaux'; 'Les Pèlerins'; 'Les Trois Royaumes' (1845); 'La Tache de Sang,' and so forth. The revolution of 1848 strongly excited him, and he issued a violent political pamphlet, 'Dieu le veut!' (1848), which led to a prosecution, and of which a 60th edition appeared in 1849. This was followed by a second brochure, 'L'Italie Rouge,' which went through seven editions. The enemies of M. d'Arlincourt, who, as may be supposed, were pretty numerous, attributed the apparent success of his numerous works to the means he took to ensure their circulation, but much of it may be accounted for by his position, his trenchant language, and thorough-going partizanship. None of his productions are likely to live. He made a couple of dramatic attempts; first with a tragedy, 'Le Siège de Paris' (1826), then with a less regular play, 'La Peste Noir,' in 1845; but both were unsuccessful. M. d'Arlincourt died January 22, 1856.

ARMANI, or ARMANNI, GIOVANNI BATTISTA, one of the most distinguished of the modern extemporaneous poets of Italy, was born at Venice 14th March, 1768. After serving for two years as a military cadet with the Venetian expedition

to Africa, and studying for a time at the University of Pavia, he began, at the age of twenty, to support himself by travelling about Italy as an improvisatore. When the stirring times of the Napoleonic wars began, Armani was appointed in 1797 Vice Secretary of the Committee of Public Safety at Venice. For eighteen years after this appointment his fortunes fluctuated with the changing political events in Italy. He died June 15th, 1815, while filling the post of Chancellor of Taxes, at Adria. Many of Armani's extemporaneous effusions were collected and published by the Abate Segalini in 1814, under the title 'Squarcio di Versi estemporanei di G. B. Armani.' His verses are curious rather than admirable; often rhymes to fit certain endings presented to him of eight lines. One, on the Death of a Cricket, had to bring in three lines from Petrarch. Another, a sonnet, had not only the endings to fit to prescribed rhymes, but the fourteen lines to begin with the letters of 'Amor vince tutto.' Two dramas by him, 'Mehamet III.' and 'Sofia,' were acted without success. Several translations from his pen were printed, but are forgotten. He also made collections for a History of Extemporaneous Poetry in Italy, but the work was never written, and the materials are lost.

ARMATI, SALVINO, the reputed inventor of spectacles, was born at Florence in the latter half of the 13th century, and died in 1317. The credit awarded to him is based on several slight facts. Roger Bacon in 1292, Vanni del Busca in 1299, and G. del Rivolto in 1305, all allude to spectacles in a way that points to the probable invention about 1280 or 1290. Other testimony supports the claim of Armati rather than that of Alessandro Spina, of Pisa, who has also been credited as the inventor.

ARMENGAUD, JEAN GERMAIN DESIRÉ, French writer on art, was born at Castres, department of Tarn, in 1797, and educated at Lavaur and Toulouse. Against his will he was placed in a commercial establishment, but he was after a time enabled to devote himself to the more congenial pursuit of art. After spending some time in the museums of France, he visited the principal galleries of Europe, and thus prepared, commenced the publication of a work of importance, the 'Histoire des Peintres du toutes les Écoles depuis la Renaissance jusqu'à nos Jours,' 4to, with engravings, 1849; the completion of the book was, however, left for M. Ch. Blanc. M. Armengaud's next publication was even more ambitious in character than his first—'Les Galeries Publiques de l'Europe,' of which the first volume, large 4to, devoted to Rome, appeared in 1856, and was reprinted in small folio in 1859. This, in its wood engravings, paper, and printing, is one of the handsomest and best got up volumes which have ever issued from the Parisian press; it was patronised by the Pope, who, as a mark of his appreciation, bestowed on M. Armengaud the Order of St. Gregory the Great; and it was largely subscribed for; but the text was not satisfactory, and several years elapsed before another volume was issued, and with that the series seems to have come to an end. M. Armengaud's other works are—'Chefs-d'œuvre de l'Art Chrétien,' Imp. 8vo, 1858; 'Les Trésors de l'Art,' 1859, with 47 engravings on steel; 'Les Chefs-d'œuvre de Rubens à la Cathédrale d'Anvers,' 1859; and 'Le Parthénon de l'Histoire,' 1863—64,—like some of the preceding, more remarkable for the brilliancy of the illustrations than for the value of the text. M. Armengaud died in March, 1869. His brother, JULES EDOUARD ARMENGAUD, is an able designer, and, partly in conjunction with a still younger brother, Charles, has published several important works on the mechanical and industrial arts, including 'Publication industrielle des Machines, Outils et Appareils les plus perfectionnés et les plus récents, employés dans les différentes branches de l'Industrie Française et Étrangère,' 11 vols. 8vo, with folio plates, 1840—58; 'Nouveau Cours raisonné de Dessin industriel appliqué,' 8vo, with folio plates, 1848—50; 'Cours élémentaires de Dessin industriel à l'usage des Écoles primaires,' 4to, with plates, 1850; 'Le Génie Industriel,' 4to, 1851—56, &c.

*ARMITAGE, EDWARD, A.R.A., was born in London, May the 20th, 1817. His artistic education was acquired in Paris, where during 1836—38 he studied in the atelier of Delaroche, obtaining that precision of drawing and firmness of handling which have ever since characterised his productions, and which induced the great French painter to select him as his assistant in executing the Hemicycle in the École des Beaux-arts. Mr. Armitage, we believe, exhibited his first picture, 'Prometheus,' at the Salon in 1842. In 1843 he obtained by his 'Landing of Julius Cæsar in Britain' one of the first-class prizes at the cartoon competition in Westminster Hall; in 1845 he won a 200l. prize for his 'Spirit of Religion,' and in 1847 a 500l. prize for the 'Battle of Meane,' the last of which he received a com-

mission to paint in oil for the Queen. Mr. Armitage now spent two or three years in Italy, with great benefit, especially in colour, in which he had previously been somewhat deficient. This was apparent in his 'Mother of Thomas à Becket seeking Gilbert,' exhibited at the Royal Academy in 1849, but still more in his 'Aholibah,' 1850, and 'Samson,' 1851, the first of the scriptural pictures in which he gave evidence of distinctive style combined with careful study. From this time Mr. Armitage has continued to paint subjects of an elevated class, and always in a serious and conscientious spirit. Of those contributed to the annual exhibitions of the Royal Academy the following may be specified:—'Hagar,' 1852; 'The City of Refuge,' 1853; 'The Lotos Eaters,' 1854; 'The Mother of Moses hiding after having exposed her Child on the river's brink,' 1860; 'Pharaoh's Daughter,' 1861; 'The Burial of a Christian Martyr in the time of Nero,' 1863; 'Ahab and Jezebel,' 1864; 'Esther's Banquet,' 1865; 'The Remorse of Judas,' and 'The Parents of Christ seeking Him,' 1866; 'Christ Healing the Sick,' 1867; 'Herod's Birthday Feast,' a very fine work, 1868; 'Hero lighting the beacon to guide Leander across the Hellespont,' a production of rare grace and beauty; and 'Christ calling James and John, the sons of Zebedee,' 1869. With the multitude of visitors these have not perhaps been popular pictures, but it may be doubted if any have during these years done more to sustain the credit of the English school of painting. We are not called upon here to enter upon their merits, but we are bound to record the earnestness of purpose and thorough study on the part of the artist which each in succession has displayed. Besides these, Mr. Armitage has painted some frescoes in the Houses of Parliament; a life-size series in the Roman Catholic church of St. John, Duncan-terrace, Islington, and a large commemorative picture of 'Henry Crabb Robinson surrounded by his Friends,' on the wall of University Hall, Gordon-square, London. In 1855 Mr. Armitage visited the Crimea, and afterwards painted some of the incidents of the war there; and in 1867 he was elected Associate of the Royal Academy.

*ARMSTRONG, SIR WILLIAM GEORGE, a distinguished civil and mechanical engineer, was born at Newcastle-on-Tyne in 1810. His father was a merchant, and, in one year, mayor of that town; his mother was a daughter of Mr. Potter, of Walbottle Hall, Northumberland. From a child he evinced a liking for mechanical pursuits. When not more than six years old, he planned a method of setting a number of old spinning-wheels in motion by means of weights descending on strings from top to bottom of his father's house; and the wheels, thus set spinning, were made to act upon imitative water-pumps, corn-mills, &c. Young Armstrong, at a proper age, was articled to Mr. Donkin, a solicitor at Newcastle; and he afterwards studied special pleading in London with his brother-in-law, Mr. (the late Baron) Watson, with a view to the adoption of the legal profession. His interest in mechanical and scientific pursuits continued, however, to be the leading feature in his character. This bias became more decided in 1835, when his attention was riveted by observing the great waste of power in some of the Yorkshire cascades and rapids. He felt that something better might be done than merely work a few water-wheels with the descensive force, by bringing down the water in a closed instead of an open channel, and thus preventing the waste of nineteen-twentieths of the power. This was the germ of important works in later years. In 1840 he made another observation fruitful in results. He found that steam, escaping through cement round the safety-valve of a boiler, was in an electric state. This suggested a course of experiments which led to the construction of his hydro-electric machine, the most powerful apparatus known for producing frictional electricity. This invention, induced by a discovery, led to Mr. Armstrong's election as a Fellow of the Royal Society. It was not, however, until 1847 that he abandoned the law as a profession. Shortly before this date he had acted as chief promoter of, and solicitor to, a scheme for providing Newcastle with water; and then, when an act was obtained for the purpose, he brought his love for hydraulic science into immediate usefulness. His plan was adopted of applying water-pressure, by descent through the pipes of the Whittle Dean Waterworks, to various mechanical purposes in the town, especially that of working hydraulic cranes on the quay. The success was so complete, that Mr. Armstrong resolved to establish himself as a mechanical engineer. He and a small circle of friends founded the Elswick Engine Works near Newcastle. About the same time he was elected a member of the Institution of Civil Engineers, and was warmly encouraged by the late Mr. Rendel. Mr. Hartley, Engineer of the Liverpool Docks, introduced the hydraulic

cranes there; and ever since that time the Elswick Works have been busy in the construction of similar machines. Mr. Armstrong's 'Accumulator' has greatly increased the efficiency of his hydraulic machinery. Where a head of water cannot be obtained by mere altitude, water is forced up by steam-power into an artificial head, or accumulator, which is constantly available as a moving power for lifting weights, opening and closing ponderous dock-gates, working swing-bridges, pumping water, shipping coal, hauling and lifting waggons, docking ships, crushing ore, working lifts at hotels and lofty buildings, working capstans and turntables, and numerous other purposes. The Armstrong hydraulic machinery has become very extensively employed in these several ways in or on railways, canals, mines, docks, and other engineering works.

Mr. Armstrong's inventions relating to artillery commenced in 1854. Meditating on the difficulty with which guns had been brought into position at the battle of Inkermann, he conceived that ordnance of equal effect might be made of much smaller weight. He received encouragement from the Duke of Newcastle (Secretary for War) to make an experimental gun, which was completed in April, 1855; but he made a very long course of experiments before submitting it for final approval. Adopting wrought iron instead of cast, and a rifled instead of a smooth-bore, he had nevertheless many other points to determine,—such as the mode of building up the gun of coiled slabs or bars of iron, the number of rifle-grooves, their sharpness of twist, the kind of shell and shot to employ, the best kind of fuze, and the relative advantages of breech-loading and muzzle-loading. After numerous experiments, Armstrong submitted a 3-pounder gun to the War Office in 1856, then a 5-pounder, and then an 18-pounder in 1857. In 1858, when General Peel was Secretary for War, a contract was made for a large number of the new guns. Mr. Armstrong ceded all his patents in ordnance matters to the Government; the guns were to be made by the Elswick Company, under certain stringent conditions, in a distinct establishment, to be called the Elswick Ordnance Works. Mr. Armstrong was knighted and made a C.B., and was appointed Engineer of Rifled Ordnance, with a salary of 2000*l.* a year. The guns first made under this contract were breech-loaders, mostly 12, 20, and 40-pounders, but guns of much larger calibre were afterwards made as muzzle-loaders for naval use as well as for land service. Between the years 1858 and 1870 the Armstrong gun and the position of Sir W. G. Armstrong in reference to the Government underwent many changes; but the leading feature of the gun, whether rifled or smooth, muzzle-loading or breech-loading, is in the coiling of one wrought-iron tube over another until a sufficient thickness is built up. His ordnance, of various kinds, has ranged from a 1-pounder up to a 600-pounder (the latter familiarly named in 1863 "Big Will"). The Armstrong gun has been largely adopted by the Austrian, Italian, Turkish, Spanish, Danish, Dutch, Norwegian, Greek, Egyptian, Chilian, and Peruvian Governments.

Sir W. G. Armstrong, when president of the British Association in 1863, drew attention to the gradual lessening of our supply of coal, and the probability of actual exhaustion at some future time. The discussion suggested by this important address led to the appointment of a Royal Commission to inquire into all the circumstances connected with our national coal supply, and he was nominated a member of this commission. Sir William strongly opposes the patent laws in their present form; his opinions thereon are embodied in evidence given before a Royal Commission, which has been published in the parliamentary papers. Sir W. G. Armstrong is president of the Institution of Mechanical Engineers, and also of the Newcastle Literary and Philosophical Society. The University of Cambridge has conferred upon him the degree of LL.D.

ARNALDUS, or ARNOLDUS, DE VILLÀ NOVÀ is said to have been born at Villeneuve, in Provence, about 1240, and to have been educated at Barcelona under John Casamila, a celebrated professor of medicine. He had to quit the place suddenly, in consequence of having predicted the death of Peter of Aragon. After travelling through Italy, he visited Paris, and became a teacher in the University of Montpellier. He became famous as a physician, and as such, was sent for by several sovereigns, and even by the Pope. He was skilled in the science of his time, and also in the Hebrew, Greek, and Arabic languages. As an astrologer he calculated the age of the world, and predicted that it would come to an end in 1335. (Brande, 'Hist. Chim.' says 1376.) For this, and several other of his opinions, he was condemned as a heretic, but he was protected by the Pope, although compelled to leave France. He died in 1313, while proceeding to visit

Pope Clement V., who was ill, at Avignon; some say he was shipwrecked on the coast of Genoa. His works, 21 in number, were published in a folio volume at Venice in 1505. There were seven later editions, the last of which was published at Strasburg in 1613. His *Rosarium* ('*Rosarius Philosophorum*') is a compendium of alchemy in theory and practice; the latter part, subdivided into 32 chapters, contains minute directions for making the philosopher's stone. Dr. Thomson ('*Hist. Chim.*') read it carefully, but found it in many parts quite unintelligible.

Arnold, in common with other alchemists, regarded mercury as a constituent of the metals. He admits some reservations in his account of the philosopher's stone. His favourite medicines were gold and gold-water, but he also used mercury and bismuth (naming the latter *marcasite*). He distilled oil of turpentine, oil of rosemary, and spirit of rosemary, which afterwards became famous as *Hungary water*.

Arnold is one of the worthies included in the once celebrated apology of Mundæus, a learned Frenchman of the 17th century, entitled, 'An Apology for all the Wise Men who have been unjustly reputed Magicians from the Creation to the Present Age.' Arnold did not fail to suffer from the tendency of the middle ages to denounce superior knowledge as magic, and magic as a criminal pursuit.

ARNAUD DE MARVEIL, a Provençal troubadour, was born at Marvelh, in Perigord. The dates of his birth and death are not known, but both were in the 12th century. He entered the service of Roger II. Viscount of Bézières, to whose wife, in accordance with the fashion of the troubadours in those days, but under various fanciful names, he addressed passionate songs of praise and love. He appears to have received handsome gifts in return for these effusions. Alfonso, King of Castile, also an admirer of the countess, brought about the removal of Arnaud, who had to find an asylum with the lord of Montpellier. There is a great variety of metres in his love songs, some of which have been printed in various collections. One poem by him, in 400 verses, breathes a tone of disappointment at the morals and conduct of the world. Raynouard, Sismondi (who gives several specimens of his verse), and other recent writers on the poetry of the troubadours, place Arnaud de Marveil at the head of the amorous poets of his age and country; but Petrarch, who styles him "the lesser Arnaud," is much less favourable in his estimate.

(Millot, *Hist. Lit. des Troubadours*, vol. i. pp. 69—84.)

ARNDT, ERNST MORITZ [E. C. vol. i. col. 350]. Notwithstanding his great age, Herr Arndt continued active in mind and body; writing or translating poetry, taking pleasure in the cultivation of his garden, in walking, visiting his friends, still more in receiving those who came with feelings akin to reverence to pay their respects to the venerable patriot. Mr. Crabb Robinson, who saw him at Bonn in 1856, notes that he found him "the same as ever. . . . His flow of talk or declamation was in quantity equalled only by Coleridge; the tone different—Arndt having a sharp, loud, laughing voice; his topics always recurring—the difference of race and the science of ethnology." So the old man lived on, over his 91st birthday, which was celebrated as a festival, till he passed away on the 29th of January, 1860. A fine bronze statue of him, by Afinger, was erected by the subscription of "the German people."

ARNGRIMSSON, EYSTEIN, the author of the most famous religious poem in the Icelandic language, was a monk of the 14th century, who having for repeated acts of insubordination been excommunicated in 1358 by Bishop Girdar, of Skalholt, in proof of his penitence composed a poem in honour of the Virgin Mary. The bishop was so much delighted with the poem that he not only removed the ban, but received the author into his friendship, and made him his official. Arngrimsson died in 1361, shortly after his arrival at Drontheim from a voyage in which he had been shipwrecked. 'The Lily,' the poem above referred to, is the only composition of Arngrimsson's which has come down to us. It comprises a hundred stanzas of eight lines each, and is written in a strain of elevated devotion to the Virgin. When the country became Protestant 'The Lily' ceased to be a household poem, but it has never ceased to be reckoned the finest specimen of Icelandic verse. It has been often printed, the first time, in Icelandic only, being at the press of Holum in 1612, but somewhat altered in its religious tone by its editor, Arngrim Jonsson (Jones): perhaps the best edition is that of Finn Magnusson, 1818, who has accompanied it with a Danish translation.

ARNHEIM, or ARNIM, GEORG BARON VON, a distinguished soldier and statesman of the time of the Thirty Years'

War, was born about 1586 at Boitzenburg, in Brandenburg. Although belonging to a noble family, he presented a characteristic example of the soldier of fortune, one who takes up arms as a profession without much regard to patriotism or international politics. He entered early the Swedish army, in the service of Gustavus Adolphus; but Wallenstein induced him to change masters, and join the Imperial forces. In the command of a regiment Arnheim shared in the victories of the Imperialists at Domitz, &c., in 1626. Wallenstein then employed him on a mission to Gustavus Adolphus, to induce the latter to join in an attack on Christian IV.: Sweden to have Norway, and the emperor Denmark, as a partition of the spoil. Instead of succeeding in this mission, Arnheim discovered that Gustavus had a scheme for appropriating all the provinces on the south shore of the Baltic, assuming to himself the title of "Protector of the Protestant Faith in Germany." Wallenstein changed his plan accordingly, with a view to frustrate intrigue by counter-intrigue. In his projects he estimated very highly the aid of Arnheim, who by astute negotiations gained over Mecklenburg and Pomerania to the Imperial side. Arnheim conducted the siege of Stralsund in 1628, and then went to aid Sigismund of Poland against the Swedes. When, in 1630, Wallenstein was dismissed by the Emperor, Arnheim quitted the Imperial service. He next became field-marshal and commander-in-chief of the Elector of Saxony's forces, which he led against the Swedes. Wallenstein, restored to favour in 1632, marched against his old friend and supporter, Arnheim, with (it is believed) some kind of secret understanding between them. New intrigues arose after the death of Wallenstein in 1634, which led to Arnheim fighting once more against the Imperialists, whom he defeated at Liegnitz. After the signing of the peace of Prague in 1635, Arnheim retired to his castle of Boitzenburg; here he was surprised and seized by the Swedish general Wrangell, and taken to Stockholm in 1637. He escaped, and, while planning a scheme of revenge, died suddenly, June 29, 1641. Cardinal Richelieu characterised Arnheim as the ablest Protestant whom the Pope could have trusted and honoured.

ARNIM, LUDWIG ACHIM VON, an eminent Prussian poet, was born at Berlin, January 26, 1781. After studying medicine and the natural sciences at Göttingen, he took the degree of M.D., though he never practised as a physician. He wrote several works, some poetical and some scientific, and then went to travel in Germany, the romantic scenery of which strengthened his natural love for the primitive simplicity of popular legends and poems. In conjunction with Clemens Brentano, he published at Heidelberg, in 1803, a collection of popular songs, under the title 'Das Knaben Wunderhorn.' After marrying Brentano's sister, (Goethe's correspondent Bettina, see the next article), he resided quietly in and near Berlin until his death, which took place January 21, 1831. Arnim's writings were only appreciated gradually: his romantic, imaginative, gentle tone seeming to have little to do with the actual world around him. His most popular work is the collection above-mentioned. His best original work is the novel, 'Armuth, Reichthum, Schuld und Busse der Gräfin Dolores' (1810), in which all his peculiarities are distinctly marked. He also published 'Halle und Jerusalem, Studentspiel und Pilgerabenteuer,' and ten or a dozen other poems and novels, besides many pieces in verse and prose contributed to periodicals, all of which have been published in a collected form, 'Sämmtlichen Werke,' 19 vols. Berlin, 1839—46.

ARNIM, ELIZABETH VON, better known as BETTINA, wife of Ludwig Achim von Arnim, and sister of the poet Clemens Brentano, was born April 4, 1785, at Frankfurt, and educated partly in a convent, partly under the direction of her aunt, the celebrated Sophie Laroche. She was early known in a wide circle for her talents, her fondness for poetry, and her wayward manners, but she made her name and peculiarities familiar throughout Germany, and soon throughout Europe, by the publication of 'Goethe's Briefwechsel mit einem Kinde,' 2 vols., Berlin, 1835, which she translated into English under the title of 'Goethe's Correspondence with a Child.' The first volume is devoted to the correspondence of the poet, the second to that of his mother, and the third (Tagebuch) to the diary of the Child. Its publication was perhaps indiscreet, but it preserved many fine passages from the aged poet's pen—when the correspondence commenced he was over 60, and 'the child' Bettina already on the wrong side of 20—many pleasant passages in his life and character, and many amusing ones in her own. It was followed by 'Die Gündertode,' 2 vols. Grunberg and Berlin, 1840, a sentimental sketch, with the correspondence, of Mademoiselle

Gündertode, who had acquired notoriety from having committed suicide, in consequence of an unrequited attachment for Creuzer, the distinguished scholar. Bettina now turned to social politics, took an active part in efforts that were making to ameliorate the condition of the working classes of Berlin, and wrote on the subject and dedicated to the King a work, 'Dies Buch gehört dem Könige' (This Book appertains to the King), 2 vols. Berlin, 1843, that would perhaps have called forth a severe rebuke if it had come from any other than one now recognised as a sort of petted, wilful, clever woman. A few years later she published 'Ilius Pamphilus und die Ambrosia,' 2 vols. Berlin, 1848, the substance of a correspondence on industrial and philanthropic subjects with the manufacturer Nathusius. Her latest works were 'Gespräche mit Dämonen,' and a sketch of her brother Clemens Brentano, with passages from his inedited poems. She died at Berlin on the 20th of January, 1859.

* ARNOLD, MATTHEW, eldest son of Dr. Thomas Arnold, of Rugby [E. C. vol. i. col. 354], was born at Laleham, Middlesex, December 24, 1822. He was educated at Winchester; under his father at Rugby; and at Balliol College, Oxford, where he was elected scholar in 1840. At Oxford he won the Newdigate Prize in 1843 by his poem 'Cromwell'; graduated second class in Literis Humanioribus, Michaelmas, 1844; was elected fellow of Oriel the following year, and in due course proceeded M.A. In 1847 Mr. Arnold was appointed secretary to the Marquis of Lansdowne, an office he retained till his appointment in 1851 to a government inspectorship of schools. This post he has retained (advancing in grade) till the present time, having while holding it acted as commissioner to visit the schools of France and Germany, his reports on which have been printed and much valued. To bring his opinions on education more distinctly before the public, Mr. Arnold published the essay he prefixed to his first report under the title of 'The Popular Education of France, with Notices of that of Holland and Switzerland,' 8vo, 1861: the leading idea, which he enforces at much length, being the benefit of the direct control of the state in all educational matters; that alone, as he seems to think, being sufficient "to prevent the English people from becoming with the growth of democracy Americanized." This view he further developed, but at the same time somewhat modified, in a second work, 'A French Eton; or, Middle-Class Education and the State,' 8vo, 1864, in which, while admitting that "our actual middle class" is "traversed by a strong intellectual ferment," and has "real mental ardour, real curiosity, . . . is the great reader," he denies that it has "the fine culture or the living intelligence which quickened great bodies of men" in better times, and proposes as the only remedy the establishment for their especial behoof of public schools by the State and under State control: the model of such schools being the French Lyceum. In a further report, published in 1868, under the title of 'Schools and Universities of the Continent,' Mr. Arnold gives a sketch of the Prussian and Italian as well as the French and Swiss systems of education, employing it still further to enforce his favourite idea of the necessity of bringing all middle-class schools under direct "State action and State control," which he would extend to the books used, as well as to the systems of instruction adopted in the schools.

But though he has written so much and so earnestly on education, it is as a poet and essayist that Mr. Arnold is chiefly known to the public. A slight volume of original verse, 'The Strayed Reveller, and other Poems, by A.,' appeared from his pen in 1848, and though it did not attract general attention, was regarded as a work of promise. 'Empedocles on Etna, and other Poems,' appeared in 1853. The following year he published a volume of 'Poems,' the first volume to which his name was attached, and containing a selection from the poems previously published with several new pieces, together with a preface, in which he enunciated his preference for a finished and classic style over a freer manner, and for a narrower but cultivated audience, rather than a wide public and popular sympathy. In 1867 Mr. Arnold published a volume of 'New Poems,' including 'Thyrsis,' a number of sonnets and short pieces, and the 'Empedocles,' which he had withdrawn, but now reproduced at the suggestion or request of Mr. Browning. In 1869 he collected as many of his verses as he wished to be preserved, with some new ones, classifying them as (1) 'Narrative and Elegiac Poems,' and (2) 'Dramatic and Lyric Poems,' in 2 vols., bearing the general title of 'Poems, by Matthew Arnold.' This may be regarded as his definite utterance in poetry, and affords a sufficient gauge of his rank as a poet. His verse is elegant, elaborate in construction, highly finished, but deficient in breadth and

spontaneity, and that passionate element which Milton regards as a constituent of all genuine poetry. The best of his longer poems, and that which shows the truest fancy, perhaps, is 'Tristram and Isult.' In 1857 Mr. Arnold was appointed Regius Professor of Poetry in Oxford University, and as he broke away from the customary practice of reading his lectures in Latin, he had a favourable opportunity of setting forth his views on poetry and poetic criticism, whilst the issue of 'Merope, a Tragedy,' served as a practical illustration of his theory. Mr. Arnold's lectures were well attended, excited much interest, and his principles had warm admirers within the university. Outside he met with many opponents when his teaching found its way into print. The 'Three Lectures on Translating Homer,' 1861, gave rise to a rather personal controversy with Professor Newman, whose version he criticised, and who in turn dealt roughly with the hexameters which Mr. Arnold printed as illustrations of the way in which he thought Homer should be translated.

As an essayist, besides occasional papers in magazines, many of which, however, have been reprinted in his volumes, Mr. Arnold has published 'Essays on Criticism,' 8vo, 1865, 2nd edition, 1869; 'On the Study of Celtic Literature,' 8vo, 1867; and 'Culture and Anarchy, an Essay in Political and Social Criticism,' 8vo, 1869. In all these, whatever be the subject, the burden is the deadly evil of 'Philistinism': of the middle-class predilection for what is practical, the absence of culture, of "sweetness and light;" and the superiority of a regulated propriety over unlicensed liberty of speech. Graceful and agreeable in expression and subtle in thought as the essays almost always are, the reader misses in them, as in the author's poems, the breadth of view, firmness of grasp, and straightforward manliness of style, which he would expect to be the natural heritage of the son of Thomas Arnold.

ARNOLD, or ARNOLDE, RICHARD, London chronicler, appears to have been born near the middle of the 15th century. He was a London merchant; a member of the Company of Haberdashers; lived in the parish of St. Magnus, London Bridge, and traded to Flanders, at least occasionally. On one occasion he was imprisoned in the Castle of Sluys, in Flanders, on suspicion of being a spy, but speedily liberated; on another, as we learn from his chronicle, he was suspected of treasonable practices by his own Government. Nothing further is known of him, except the publication of what is commonly but inaccurately called 'The Chronicle of London,' or 'Arnold's Chronicle.' This work was first printed at Antwerp, by John Doesborowe, about the year 1502, but without place, date, or printer's name, under the title, 'The Names of the Balyfs, Custos, Mayres, and Sherefs of ye Cite of London, from the Tyme of Kyng Richard the First, called Cure de Lyon, which was crowned ye iii day of Septēbre y^e yere of our Lorde God xi^e LXXXIX.' A second edition, also without date, place, or printer's name, was issued in folio from the press of Peter Treveris, London, about 1521. Somewhat later another black-letter edition (described at length in Herbert's *Ames*, vol. iii. 1746—51) was published; and it was not again reprinted till 1811, when Francis Douce edited an edition in 4to, under the title of 'The Customs of London, otherwise called Arnold's Chronicle,' &c. The book is a strange farrago, seemingly the common-place book of a citizen of an antiquarian turn, with a particular curiosity about the rights, customs, and dignitaries of the city, and all a Londoner's interest in the preparation of viands. All sorts of information on these several matters is mingled with the lists of mayors, sheriffs, &c., mentioned in the title-page, and as Warton long ago remarked, "between an estimate of some subsidies paid into the Exchequer and directions for buying goods in Flanders," is smuggled in a copy of the fine old English ballad of the 'Nut-Brown Maid.'

ARNOLFO DI LAPO [LAPO, ARNOLFO DI, E.C. vol. iii. col. 805.]

ARRAS, MATHIEU D', French mediæval architect, was born near the close of the 13th century. Nothing appears to be known of his early years. The inscription on his tomb in the cathedral of St. Vitus, at Prague, states that he was a native of Arras; that he was the master builder or architect of this church, which was commenced by order of the Emperor Charles IV. in 1344, and that he carried on the works from its foundation until his death in 1352. The continuance of the works and the character of the building are noticed in the memoir of his successor, ARLER, PETER VON, E. C. S. The designs of Mathieu d'Arras were not carried out in their integrity, but the connection of French ideas with German Gothic architecture of

this time is worth noting. Mathieu d'Arras also began for Charles IV., in 1348, the royal castle of Karlstein, the richest and most remarkable feudal castle in Bohemia, now only preserved with difficulty from ruin.

ARREBOE, ANDERS, a distinguished Danish writer, was born in 1587, at Ærrøe's Kjöbing, in the island of Ærrøe. He studied at the university of Copenhagen, took the degree of M.A. in 1610, and was appointed preacher in the royal palace. In 1618 he was elected Bishop of Drontheim; but three years later he was deposed from his bishopric for several acts of levity and licentiousness, and, in particular, for having sung improper songs and danced improper dances. He lived in misery and poverty for five years. The King then pardoned him, in consideration of his penitence and his having written some excellent psalms, and made him pastor of Vordingborg, which post he held till his death in 1637. Arreboe is ranked by his countrymen as the most distinguished of the early Danish poets; but his writings, though full of poetic imagery and feeling, are expressed in language which has now become almost unreadable by Danes. Among his works were (1) 'Complimentary Poem on a Victory gained by the King of Denmark over the Swedes,' Copenhagen, 1611; (2) 'Poem on the Death of the Queen, Anna Catharina,' Copenhagen, 1612, 4to; (3) 'Hexæmeron,' Copenhagen, 1641, a paraphrase of the French work under the same name, written by Du Bartas. This, which is regarded as Arreboe's masterpiece, opens with a fine invocation to the Deity. The Hexæmeron celebrates the work of the first six days of the first week. Besides numerous psalms Arreboe published a series of fifteen sermons on Christ's Passion, and a similar series on the Vision of the Prophet Ezekiel.

ARRHENIUS, CLAUS or CLAUDIUS, a celebrated Swedish historian, was born at Linköping in 1627. After studying at Upsal University, he was engaged, in 1657, as tutor to Count Gabriel Oxenstierna. On returning from his travels with that nobleman, he was appointed Professor of Logic and Metaphysics at Upsal, in 1667; Professor of History in 1668; and Assessor of the Swedish Collection of Antiquities, in the following year. In 1678 he received the appointment of royal historiographer; and in 1684 was ennobled. His later appointments were—librarian to the University in 1687 (after resigning his professorship), censor of books in 1689, and one of the royal secretaries in 1693. He died at Stockholm in 1695. Arrhenius wrote many historical works; but his fame rests on his 'Historiæ Svecorum Gothorumque Ecclesiasticæ, Libri IV. priores,' Stockholm, 4to, 1689. This work was to have been extended to greater length, but he only completed four books or parts, bringing down the ecclesiastical history of Sweden to the end of the 12th century. Arrhenius contributed some of the text to Dahlberg's splendidly illustrated work, 'Svecia Antiqua et Hodierna.' He also prepared a collection, in eleven volumes, of all the papal bulls and letters relating to Sweden.

ARWIDSSON, ADOLF IVAR, Swedish writer, was born August 7, 1791, at Padasjoki, in Finland, where his father was provost. Having completed his studies at the university of Åbo, he was in 1817 admitted lecturer on history. In 1821 he founded, with some friends, a literary and political periodical, the 'Åbo Morgonblad,' which met with a good share of success, but the freedom of its political articles being objected to by the Russian Government, its publication was stopped. He continued, however, to write in the 'Mnemosyne,' but again gave offence, and in September, 1822, was dismissed from the university, and ordered to quit Finland. He now settled in Sweden, and was employed in arranging the books of the Royal Library, Stockholm, of which, after a while, he was appointed librarian. From this time, abandoning politics, he devoted himself to the duties of his office, and to the study of early Swedish literature. His first publication was an edition of Calenius, 'Opera Omnia,' 3 vols. 8vo, 1830—33. His next was a valuable collection of old Swedish ballads with their proper tunes—'Svenska Fornsänger,' 3 vols. 8vo, Stockholm, 1834—42, a sort of supplement to the work of Azelius and Geijer. Besides some occasional papers, he published an edition of the Frithiof-saga, Stockholm, 1841; a 'Catalogue of MSS. in the Royal Library, Stockholm;' and as secretary of the Stockholm Typographical Society, he contributed to their Repertory many interesting bibliographical and biographical notices. He died when on a visit to his native place, at Wiborg, on the 21st of June, 1858.

ASHPITEL, ARTHUR, F.S.A., architect, was born December 15, 1806, at Clapton, near London; received a good general education under Dr. Burnett; and learnt architecture

in the office of his father, who was in partnership with Mr. Savage. While at school, at about the age of 12, he had a severe fall by which his hip-joint was injured, he was rendered a cripple for life, and his constitution was enfeebled; but, thus cut off from out-door sports and occupations requiring the exercise of physical activity, he was led to the adoption of studious habits, and to a wider range of literary culture than is perhaps usual among architects. Having served several years in his father's office, he in 1842 commenced practice on his own account in Crown-court, Old Broad-street. The earliest building of a public character erected by him was the church of St. Barnabas, Homerton, 1845, since much enlarged in size and somewhat modified in character. Other works were the extension of the London Orphan Asylum, Clapton; the Hutchison Markets; the Wellington Memorial, London Bridge, since removed; and several large private houses and offices. In 1850 he entered into partnership with Mr. J. Whichcord, of Maidstone, and removed to Carlton Chambers, Regent-street. Here, retaining his city connection, he by means of his partner's Kentish ties, greatly extended his general practice, and though the execution of no great public work fell to his lot, he had a busy and prosperous professional career. Among the works erected by him as joint architect were churches at Blackheath (St. John's), Platt, Postling, Godmersham, and three or four other places in Kent; schools at Bexley, Milton, Rainham, &c., and the Kent Ophthalmic Hospital; the Kentish Chronic Lunatic Asylum; the Kent Infirmary; the Cranbrook Union Workhouse; baths and wash-houses at Maidstone, Lambeth, Bilston, Kidderminster, and Tynemouth; and several mansions and villas. When at Poets' Corner, Westminster, he again worked alone, he erected a new church among the ruins of St. Dogmael's Abbey, near Cardigan; others at Vernham Dean, Hampshire; at Ripple, near Deal, Kent (a somewhat heavy Norman structure); at Aldborough Hatch, Essex (a smaller but graceful and well-finished early First Pointed building); restored the churches of Sutton, Kent, Great Ilford, Essex, and some others; built schools, model dwellings for artisans, some London offices, and several villas. But during his later years Mr. Ashpitel was perhaps better known by his personal influence, both in the profession and in general society, than by his buildings. He was vice-president and a leading member of the council of the Institute of British Architects, one of the examiners at its voluntary architectural examinations, 1863-66, and a valued contributor to its Sessional Papers and Architectural Dictionary. He was one of the most zealous supporters of the Architectural Exhibition, and during many years was its treasurer and guarantee for its continuance. He was also a member of the Society of Antiquaries, and of the Royal Asiatic Society, in the proceedings of both of which he occasionally took part; he prepared for the Annual Congresses of the Archaeological Association architectural and antiquarian discourses on the cathedral, or the principal church or monastery in the town or locality in which the meeting was held; he wrote several architectural articles in the *Encyclopædia Britannica*, and one or two in the *Fine Arts Quarterly Review*; was, under the well-known signature A. A., a frequent correspondent of 'Notes and Queries'; wrote occasional verses and translations from the Greek anthology, in the 'Owl' and other periodicals, and altogether had come to be regarded as the literary representative of the English school of architecture, much as Professor Donaldson is regarded as representing its learning. About 1854, having been advised to visit Italy for the benefit of his health, he made a prolonged tour in company with Mr. D. Roberts, R.A., and stayed some time in Rome. As one of the results of his residence in this city he in 1858 exhibited at the Royal Academy 'A Restoration of Ancient Rome,' a large and elaborate drawing, which attracted much attention, and was followed next year by a companion drawing, 'Rome as it is.' The two drawings were subsequently reproduced under his direction in chromo-lithography, and he wrote in 1866 a descriptive pamphlet to accompany the prints. On his way home from Italy he was attacked with intermittent fever at Airolo, in Piedmont, and never wholly regained his former vigour. He died at his residence, Poets' Corner, on the 18th of January, 1869. The drawings of Ancient and Modern Rome, mentioned above, he bequeathed to the South Kensington Museum; his more valuable books and collection of Etruscan vases to the Society of Antiquaries, and a sum of money to the Institute of British Architects in order to found a prize.

(Mémorial by Mr. Wyatt Papworth in the *Architect; Builder; Register; Notes and Queries*, Jan. 1860.)

ASIOLI, BONIFAZIO, an Italian musical composer, was born at Correggio, 30th April, 1769. He was one of those pre-

cious children so frequently met with in connection with music. Before he was eight years old he had composed three masses and twenty other church compositions; besides pieces for the violin and harpsichord. At twelve years of age he displayed some remarkable extempore fugue playing at Venice. While still a boy he officiated as Maestro di Capella at Correggio. By the age of eighteen there had flowed from his pen five masses, an oratorio, twenty-four other church compositions, several overtures, choruses, cantatas, and instrumental pieces, and three operas, viz., 'La Volubile,' 'La Contadina,' and 'La Discordia Teatrale.' In 1787 he went to Turin, where he produced an opera and two lyrical dramas. After a visit to Venice in 1796, he received the appointments of Maestro di Capella and Director of the Conservatorio at Milan. In 1813 he returned to his native town of Correggio, where he remained till his death, which occurred May 26th, 1832. Asioli's best music is in the form of cantatas, nocturnes, and airs and duets with pianoforte accompaniments. His larger compositions are very little known.

ASSELYN, JAN, a distinguished Dutch landscape painter, was born in 1610 at Diepen, near Amsterdam. He was a pupil of Esaias Vandevelde and Jan Miel. In 1630 he went to France and thence to Italy, where he remained several years. He visited Venice, Florence, and other cities; but made Rome his principal place of abode and there formed a close acquaintance with Pieter Laer, and modified his style by the study of the works of Claude Lorraine. Here he was admitted a member of the Netherlands brotherhood of painters, the Roomsche Bent, and received the cognomen of the Crab (Krabbetje) from the fingers of one of his hands being crooked. On leaving Rome he stayed some time at Lyon, where he married in 1645 the daughter of Houwaart Koonman, a merchant of Antwerp, and soon after returned to Amsterdam, where he lived in good reputation till his death, in 1660. The works of Jan Asselyn were much admired and eagerly purchased during his lifetime, but have since scarcely sustained their celebrity. Our own National Gallery possesses no work from his pencil, but four landscapes by him in the Louvre show that he was a very able artist. Struck by the charm of Claude's pictures Asselyn sought to adapt his manner to Dutch landscape. In the attempt he lost much of the distinctive freshness and simplicity of the earlier native painters, but his pictures display true poetic feeling, clear transparent colour, and a light and spirited touch. His figures of shepherds, peasants, and animals are skilfully introduced, but have a somewhat artificial air. Many of his pictures have been engraved. In 1654 Asselyn published an account of the Roomsche Schelder-Bent under the title 'De Broederschap de Schilderkonst.' His portrait has been etched by Rembrandt and by J. Houbraken.

(Houbraken, *de Grootte Schouburgh der Nederlantsche Konstschilders*, vol. iii. p. 64 &c., D'Argenville, Waagen, &c.)

ASSHETON, JOHN, a priest of the 16th century, is remarkable as having been probably the first Englishman to be called to account by the ecclesiastical authorities of his country, for inculcating Unitarian opinions. In the course of his preaching, he denied the Trinity, and the deity of the Holy Spirit; asserted the simple and proper humanity of Jesus Christ, and taught that the only benefit which men receive through Christ consists in their being brought to the true knowledge of God.

On the 28th December, 1648, Assheton was summoned to Lambeth, to appear there, as Strype informs us ('*Memorials of Archbishop Cranmer*,' book ii. ch. 8), before Archbishop Cranmer, "where John Whitwell, the Archbishop's almoner, and Thomas Langley, both priests, and his Grace's chaplains, exhibited a schedule of divers heresies and damned opinions against the said Assheton; which are recited in the abjuration which he made, the tenor whereof is as followeth:—'In the name of God, Amen. Before you, most learned father in God, Thomas, Archbishop, Primate, and Metropolitan of all England, Commissary of our most dread lord and excellent prince, Edward VI., by the grace of God, &c. I, John Assheton, priest, of my pure heart, free will, voluntary and sincere knowledge, confess and openly recognise, that in times past, I thought, believed, said, heard, and affirmed these errors, heresies, and damnable opinions following; that is to say, (1) That the Trinity of Persons was established by the confession of Athanasius, declared by a psalm, *Quicumque vult*, &c., and that the Holy Ghost is not God, but only a certain power of the Father. (2) That Jesus Christ, that was conceived of the Virgin Mary, was a holy prophet, and especially beloved of God the Father; but that he was not the true and living God; forasmuch as he was seen, and lived, hungered, and thirsted. (3) That this only is the fruit of

Jesus Christ's passion; that whereas we were strangers from God, and had no knowledge of his Testament, it pleased God by Christ to bring us to the acknowledging of his holy power by the Testament. Wherefore I, the said John Assheton, detesting and abhorring all and every my said errors, heresies, and damned opinions, willingly, and with all my power, affecting hereafter firmly to believe in the true and perfect faith of Christ and his holy Church, purposing to follow the true and sincere doctrine of Holy Church with a pure and free heart, voluntarily mind, will, and intend utterly to forsake, relinquish, renounce, and despise the said detestable errors, heresies, and abominable opinions: granting and confessing now," &c. Assheton then goes on in his abjuration to confess in detail the orthodox antitheses of the heresies just enumerated; which when he had done, he "subscribed his hand to this confession before the Archbishop, exhibiting it for his act; and lifting up his hand, beseeched his Grace to deal mercifully and graciously to him; and touching the Gospel, gave his faith that he would faithfully and humbly obey the commands of the Holy Mother-Church, and whatsoever penance the said most reverend Father should lay upon him." The sympathisers with the opinions of Assheton express doubts of the sincerity of his recantation; and inveigh, not unreasonably, against the persecution which forced men into violating their consciences in order to preserve the security of their persons.

ASSHETON, WILLIAM, remarkable as the deviser of a peculiar annuity scheme, was a clergyman of the 17th century. Born at Middleton in Lancashire, in 1641, he entered Braenose College, Oxford, in 1658, and having taken his B.A. degree, was elected a fellow of his college in 1663, and went into orders. He was made chaplain to the Duke of Ormond, Chancellor of Oxford University, in 1673, D.D., and prebend of Knaresborough. After this he obtained the living of St. Antholin, Watling Street, and in 1676 was presented to the rectory of Beckenham, in Kent. He was more than once proctor for the diocese of Rochester. Dr. Assheton died at Beckenham in September, 1711. This divine, so fortunate in his preferences, was the author of many polemical and devotional works. He wrote honestly but bitterly against Roman Catholics, Dissenters, Anabaptists, Socinians, and all who differed from the Church of England: indeed he inveighed against any toleration either in religion or politics. Of the twenty-five works which he published between 1662 and 1710, most were of this controversial character. William and Mary caused to be published at two pence each, for extensive diffusion, three tracts written by Assheton against Blasphemy, Drunkenness, and Swearing. In 1706 he published a work in a different strain of thought, 'The Possibility of Apparitions.' But Dr. Assheton is best known by his singular annuity scheme, a scheme that failed because devised by a man of sanguine temperament upon insufficient data. It was a plan for providing for the widows of clergymen and others. As it was necessary to have some substantial body to give guarantees of security, he succeeded after some difficulty in making an arrangement with the Mercers' Company. The company and the trustees signed an agreement 4th October, 1699, which was enrolled in Chancery; and in the same year was published 'A full Account of the Rise, Progress, and Advantages of Dr. Assheton's Proposal (as improved and managed by the Company of Mercers) for the benefit of Widows of Clergymen and others, by Settled Jointures and Annuities at the rate of 30 per cent.' The agreement set forth "That the company would take in subscriptions at any time till the sum of 100,000*l.* should be subscribed, but not more. That all married men at the age of 30 years or under might subscribe any sum not exceeding 1000*l.* That all men not exceeding 40 years might subscribe any sum not exceeding 500*l.* That all married men not exceeding the age of 60 years might subscribe any sum not exceeding 300*l.* That their widows should receive the benefit of 30*l.* per cent. according to the proposal. That no seafaring man should subscribe." The last-named clause was probably suggested by the greater precariousness of seafaring life. It is now well known that so high an annuity as 30 per cent., especially with but little regard to the age of the annuitant, must necessarily fail. The company gradually reduced the rate for new applicants to 18 per cent., but nevertheless lost so heavily as to be obliged to apply to parliament for permission to establish a lottery in 1764, as a means of extricating it from its difficulties. It was not till 1801 that the company was clear of the final engagement.

ASTARLOA Y AGUIRRE, DON PABLO PEDRO DE, a learned Spanish philologist, was born at Durango, June 29, 1762. He studied philosophy and theology in the seminary of

Larrasoro, and was appointed to a benefice in his native town. His uneventful life was spent in the study of languages, of which he is said to have mastered 60; but he also acquired a considerable store of general learning, and he possessed a warm imagination as well as originality and breadth of view. His one great work—the first, as William Humboldt remarked, in which the Basque language was examined in a really searching spirit,—is entitled, 'Apologia de la lengua Bascongada, ó ensayo crítico-filosofico de su perfeccion sobre todas las que se conocen: en respuesta a los reparos propuestos en diccionario geográfico-histórico de España; tomo segundo, palabra Nabarra,' Madrid, 1803. As the title indicates, it was written in order to refute an article in the Dictionary of the Academy of Madrid, by Don Joaquim de Tragia, in which that writer, with a great show of learning, controverts the antiquity usually assigned to the Basque tongue. Astarloa, on the other hand, with equal erudition and greater acumen, establishes the essential identity of the modern Basque with the ancient Iberian language, and proves as a consequence the direct descent of the Basque people from the ancient Iberi. The most learned of the subsequent investigators in the same field of inquiry have acknowledged the value of his researches, and accepted his main deduction, though they have not gone so far in enthusiastic admiration of the language itself, and have very generally rejected his etymologies. The book is written with a warmth and charm of style very uncommon in a philological dissertation. Astarloa died at Madrid on the 3rd of June, 1806. He left a grammar of the Basque language and various MS. collections in the hands of his friend Don Juan B. de Erro y Aspiroz, who is believed to have made use of them in preparing his own publications.

ASTLEY, JOHN, a portrait painter of some notoriety, was born in the early part of the 18th century at Wem, in Shropshire, and was a scholar of Hudson, whose manner he adopted. Reynolds was his fellow pupil, and after leaving Hudson both, as artists were then expected to do, visited Rome. Reynolds gave his time to the study of the great masters; Astley spent most of his in dissipation. He enjoyed, however, the patronage of Sir Horace Mann, the English minister, and found in consequence some employment in painting portraits and in making copies for tourists. As may be supposed, he was often in difficulties. Northcote relates ('Life of Sir Joshua Reynolds,' vol. i. p. 44) that one summer afternoon the English painters having met for a little holiday excursion outside Rome, "the season being particularly hot, the whole company threw off their coats as being an incumbrance to them, except poor Astley, who alone showed great reluctance to follow this general example; this seemed very unaccountable to his companions, when some jokes made on his singularity at last obliged him to take his coat off also. The mystery was then immediately explained, for it appeared that the hinder part of his waistcoat was made, by way of thriftiness, out of one of his own pictures, and thus displayed a tremendous waterfall on his back, to the great diversion of the spectators." Reynolds described him as so illiterate a man that "he would rather run three miles to deliver his message by word of mouth than venture to write a note." On his return from Italy, Astley removed to Dublin, where for three years he practised with much success, when he resolved to push his fortune in London. On his way he stayed for a while in his native place. Here he made a considerable figure; kept his coach, and lived in style. He was tall, well-formed, and of dashing manners, and he caught the eye of the wealthy widow of Sir Thomas Duckenfield Daniell, of Duckenfield. The lady requested him to paint her portrait, and in the course of executing his commission he was emboldened to sue for her hand. She lived but a short time after their marriage, but left him all her property, with the reversion at her daughter's death (which happened a few years later) of the Duckenfield estate, worth 5000*l.* a year. Astley now gave himself up to a life of pleasure. He altered and enlarged Duckenfield Lodge, Cheshire; had a villa at Barnes, Surrey, which he fitted up in a most fantastic manner, and purchased the Duke of Schomberg's house in Pall Mall, which, says Pennant, "he divided into three, and most whimsically fitted up the centre for his own use:" it was afterwards the residence of Gainsborough. He died at his seat, Duckenfield Lodge, on the 14th of November, 1787. He is said to have wasted not less than 150,000*l.* of the fortune he received from Lady Daniell, and yet to have left a large property to his family by a second marriage. Astley's portraits are occasionally met with in private collections. To us they seem an improvement on Hudson's, though they will not bear comparison with those of Reynolds or Gainsborough. He had evidently con-

siderable skill in seizing a likeness, and possessed some power of characterization, but drew carelessly, and was a poor colourist.

ATHELARD, or ADELARD, of BATH, distinguished as "Philosophus Anglorum," one of the earliest and most eminent cultivators of natural philosophy in England, was born probably in the latter part of the 11th century. From the addition "Bathoniensis" to his name in most MSS., it has been supposed that he was a native of Bath, but it is as likely to have signified his place of residence as of birth. Of his personal history little is known beyond what is gathered from his writings. He studied at Tours and Lyon, and at the latter place lectured, one of his scholars being a nephew who is a colloquist in one of his dialogues. Dissatisfied with the state of learning in France, Athelard crossed the Alps to Salerno, and thence went in quest of knowledge to Germany, Spain, Egypt, and Arabia, though some writers think the references to his Arabic studies do not of necessity imply that he visited the country, but rather that he acquired his knowledge of Arabian philosophy in Spain. Before returning to England he seems to have taught Arabian science in Normandy. Altogether he was seven years absent from England. When he came back, Henry I., he writes, occupied the throne. Mr. Wright ('Biog. Brit. Lit.' vol. ii. p. 95) concludes from one of his earliest books written after his arrival being dedicated to William, Bishop of Syracuse, that he must have returned to England before 1116, the date of that prelate's death. Mr. Hunter, in his edition of the Pipe Roll of Henry I., pointed out under the 31st year of that monarch's reign, a gift of 4s. 6d. to Adelard de Bada from the profits of the county of Wilts, and if he is right in supposing that the donation was made to Athelard, the philosopher, by the King in his known character as a patron of learning, it is a proof that Athelard was alive in 1130. Beyond this nothing is known. The time of his death has escaped record. His original writings comprise a treatise or allegory, in the form of a dialogue, on the pursuit of philosophy, 'De eodem et diverso,' in which he defends the Arabic philosophy which Athelard was the first to introduce into England, and which he complains was almost unknown to the scholars of Western Europe. This subject he pursues at greater length in his more popular work, the 'Quæstiones Naturales,' in which he develops the system of natural philosophy he is endeavouring to introduce. Other works, some of them mere tracts, are—'Regulæ Abaci,' a treatise on the Astrolabe, of which there is a MS. in the British Museum, and others on the seven liberal arts, on the compotus, &c., which are named by Tanner and others, but appear to be lost. The Life of St. Dunstan, which Tanner attributed to him, is known not to be his. Another class of writings is of at least equal importance with his original works. These are his translations from the Arabic, but especially his translation of the Fifteen Books of Euclid, by which, indeed, Euclid was first made known in Western Europe, and which there is every reason to believe was the Euclid of the middle ages, and the text of the Latin edition of Campanus (Venice, 1482) the first edition of Euclid printed. His other translations included the Kharismian Tables; the 'Præstigia Astronomica Thebædis'; the 'Isagoge minor Japharis mathematici in Astronomiam,' &c. Very few of Athelard's works have been printed. His 'Quæstiones Naturales,' about 1474, was the earliest, and was several times reprinted; portions of 'De eodem et diverso' are given in Jourdain's 'Recherches Critiques sur l'âge et l'origine des traductions Latines d'Aristote,' 1819. The influence of Athelard was very great upon his contemporaries and immediate successors, and during the next century he was regarded with reverence as the most eminent of English philosophers. He was the forerunner of Roger Bacon, and in some respects little inferior to him.

'ATTÂR FERÎD-UD-DÏN, a Persian poet of great celebrity, but chiefly admired for his profound knowledge of the Sufi doctrines, with which his writings abound, and according to which this world and its affairs are nothing, and spirituality everything. He was born about the year 1119, at the village of Karkan, or Karakdan, one of the suburbs of Nishapur, in Khorâsân. His father, Ibrahim 'Attâr Karkani, seems to have made a considerable fortune in the city of Nishapur as a dealer in perfumes, in which occupation he was assisted, and ultimately succeeded, by the poet. About 1148 the father and son removed to Shâdyâkh, one of the most select suburbs of the city, where the governor and the most distinguished families resided. During his father's life 'Attâr seems to have been left to pursue his mystic studies at his own leisure. He was known to, and in correspondence with, numerous learned men and illustrious sheikhs of that period.

He had also collected a library, consisting of 114 volumes, the works of the most distinguished masters on spiritual matters. After his father's death 'Attâr succeeded to his fortune, and for some time carried on his business, whilst the style of his living and establishment was rather that of a prince than a merchant. The remonstrances of one of his Sufi friends, who had assumed the garb of a darwesh mendicant, aroused 'Attâr to the hollowness of all mundane glory and prosperity. The mirror of his mind became illumined with the rays of spiritual light. He renounced the world, and abandoned his possessions to be appropriated by any one who felt the inclination. After a few years spent in seclusion, divine contemplation, and the severest mortification, in the monastery of the distinguished Shaikh Rukn-ud-dîn Asaf, 'Attâr, when about the age of 40, made the pilgrimage to Mecca; in the course of which he became acquainted with a great number of men illustrious for their learning and sanctity. On his return to Nishapur, he devoted the remainder of his long life to the practice of piety, and the composition of his numerous works in prose and verse. Of the former kind is his 'Tazkirat-ul-awliâ,' or Lives of the Saints—that is, those of his own sect. His writings in verse are numerous and extensive, amounting in all to upwards of a hundred thousand couplets, forming forty different pieces or works, of which the following twelve were favourites in the time of Daulatshâh, the biographer of 'Attâr:—(1) 'The Asrâr-nâma'; (2) 'The Ilâhî-nâma'; (3) 'The Masîbat-nâma'; (4) 'The Ushtur-nâma'; (5) 'The Wasiyat-i Mukhtâr-nâma'; (6) 'Jawâhir-ul-lazzât'; (7) 'Mantik ul-tair'; (8) 'Bulbul-nâma'; (9) 'Gul o Hormuz'; (10) 'Pand-nâma'; (11) 'Haidar-nâma'; (12) 'Siyâh-nâma.'

'Attâr was murdered in the year 1221, in the hundred and second year of his age, by one of the ruthless horde of barbarians who, under Chingiz Khân, desolated the city of Nishapur, at that time the capital of Khorâsân. The city was levelled with the ground, in such a manner that horses might run over it without stumbling, and a few years afterwards its very ruins were obliterated by an earthquake. Its name and shadow only remain.

ATTERBOM, PETER DANIEL AMADEUS, a Swedish poet and historian, was born at Åsbo in East Gothland, 19th January, 1790. Having studied at the gymnasium of Linköping, he went in 1805 to Upsal, where he paid great attention to German literature. In 1807, in conjunction with several friends, he established a poetico-critical society, the Aurora Union, with the main object of purifying Swedish literature, especially poetry, by freeing it from French and other disfigurements. Between 1810 and 1813 they published a journal, 'Phosphorus,' which acquired for them the appellation of 'Phosphorists,' and which contained much bitter and cutting writing. Between 1812 and 1822 Atterbom edited the 'Poetiskkalender'; wrote a drama, 'Rimmerbandet'; and a fragment of a dramatised version of Märchen. After two years' travel in Germany and Italy, he became in 1819 tutor in the German language and literature to the Crown Prince Oscar. In 1821 he became docent of history at Stockholm, in 1822 adjunct professor of philosophy at Upsal, and in 1828 professor of logic and metaphysics at the same university. The last-named professorship he exchanged in 1835 for that of aesthetics. In 1839 he was admitted to the Academy of Stockholm, a step which healed a bitter feud which had existed between the Phosphorists and the Academicians. He died 21st July, 1855, at Upsal. Among other works by Atterbom were 'Lycksalighetens Ö' ('The fortunate Island'), 1824; 'Skrifter,' 1835; 'Samlade Dikter,' 1841; 'Svenska siare och Skaldar,' 6 vols. 8vo., Stockholm, 1841—55 (a literary-historical work of great value). As a poet, Atterbom was reflective in tone and polished in language. As a philosopher, he was a theosophist, combining Christianity with much mystical speculation.

AUDIGUIER, VITAL D', Sieur de la Ménor, a celebrated French writer, was born of a noble but poor family near Villefranche, Guienne, about the year 1569. After a somewhat wild and quarrelsome youth, he made some progress in the study of jurisprudence at college; in 1590 succeeded his father as a magistrate; resigned in the following year; joined the army of Henri IV., and gained much credit during the wars of the League. After the peace he went to Paris, led a dissipated life, and was addicted to gambling. Nevertheless he was a very active writer; for between 1604 and 1624 he produced poems, novels, translations, and miscellaneous essays in rapid succession, and is ranked among those who assisted in refining and polishing the French language. His writings are mostly of a trivial character, but they are full of life and spirit: in 1638 the French Academy placed all his prose writings among the celebrated works in the

language. Several of his prose essays, &c., are included in La Serré's 'Bouquet des plus belles Fleurs.' D'Audiguier was killed in a duel in a Paris gambling-house in 1624.

AUDOUIN, PIERRE, a distinguished French line engraver, was born at Paris in 1768, and learnt engraving under Beauvarlet. He engraved in a clear, firm, and intelligent manner, but without the fine feeling of the greatest masters of the burin. His fame rests on the engravings he made from paintings in the Louvre for the celebrated 'Musée de Laurent, such as 'La Belle Jardinière,' after Raffaele; the 'Portraits of two Men,' called 'Raffaele and his Fencing Master' (No. 386 according to the present arrangements of the Louvre); 'Jupiter and Antiope,' after Correggio; 'The Entombment,' after Caravaggio; 'Charity,' after Andrea del Sarto; three or four after Terburg, and others after Le Sueur and Mieris. He also engraved the portrait of Louis XVIII. after Le Gros, and various other single plates. Audouin held the appointment of engraver in ordinary to the king; and in 1819 received the medal for engraving. He died at Paris in 1822.

* AUERBACH, BERTHOLD, popular German author, was born of Jewish parents, February the 28th, 1812, at Nordstetten, in the Würtemberg Black Forest; studied Jewish theology at Hechingen and Karlsruhe; and then the classics, philosophy, and literature in the gymnasium of Stuttgart and in the universities of Tübingen, Munich, and Heidelberg, completing his academical course in 1835. His independent study was directed in the first instance to the literature of his race, and he published in 1836 a treatise on its recent character and direction, 'Das Judenthum und die neueste Literatur,' this was followed by 'Das Ghetto,' and at a short interval by 'Spinoza,' (2 vols. Stuttgart, 1837; 2nd edition, 1854); and this by 'Dichter und Kaufmann,' 2 vols. Stuttgart, 1839. His study of Spinoza led him to publish a translation of the entire works of the great Jewish philosopher, together with a critical memoir of his life and writings, 'Spinoza's sämtlichen Werken,' 5 vols. 8vo, Stuttgart, 1841. His next work, on the education of the middle classes, was of a kind that addressed itself to a wider audience, and attracted much notice, 'Der gebildete Bürger, Büch für den denkenden Mittelstand,' (Karlsruhe, 1842). He continued to take an earnest interest in education and all questions of social politics, but his next important publication was in a different field, being a series of sketches or novelets depicting village life in the Black Forest—'Schwarzwälder Dorfgeschichten,' (2 vols. Mannheim, 1843). In some respects this work may be compared with Miss Mitford's 'Our Village,' presenting the same bright clear pictures of villages and villagers and of rustic scenery, life, and wants, but with wider knowledge and deeper insight, though without the indescribable charm of manner and freshness and simplicity of style of the English authoress. It was very successful, was translated into English (under the title of 'Tales from the Black Forest'), Dutch, Swedish, and part into French, and several times reprinted in German. Other series have since appeared, and the whole were republished together in 4 vols. in 1853—54, and, under the title of 'Volksausgabe,' in 6 vols. Stuttgart, 1861—62. During 1845—48 Herr Auerbach edited an almanac 'Der Gevattersmann,' in which he sought to popularize and apply his views on social matters and popular literature, views which he set forth more systematically in 'Schrift und Volk: Grundzüge der Volksthümlichen Literatur, angeschlossen an eine Charakteristik J. P. Hebel's,' Leipzig, 1846 (The Press and the People: Sketch of a National Literature in reference to a characteristic of J. P. Hebel). The events of 1848, in which he was deeply interested, led to the publication in 1849 of his 'Tagebuch aus Wien von Latour bis auf Windischgrätz' (Vienna Diary from Latour to Windischgrätz), Breslau, 1849. Since then, though his social and educational views have more or less coloured all his writings, he has for the most part avoided politics. His later writings have been 'Hofer,' a tragedy, 1850; a series of old German tales, 'Deutsche Abende,' (Mannheim, 1850; 2nd edition, 1853); 'Dorfgeschichten' (a village story), and a popular drama, 'Der Wahrspruch' (Leipzig, 1856); 'Joseph in Schnee' (Stuttgart, 1860); 'Edelsweiss,' and a pleasantly written essay, 'Goethe und die Erzählungskunst' (Goethe and Narrative Art), Stuttgart, 1861. His collected works were published in 20 vols. Stuttgart, 1857—59, and in 22 vols. 1863 and following years. Since then his most important publication has been 'Das Landhaus am Rhein, (the Villa on the Rhine), in 3 vols., 1869, which appears to be less popular than his shorter tales, but is a work of much power, displaying alike keenness of observation and depth of reflection. Taken altogether, Auerbach must be regarded as the greatest living novelist of

Germany. Auerbach's frequent change of abode may be pretty well traced in the places of publication of his successive works given above. For some years past he has resided at Stuttgart, previous to which he was for awhile at Berlin.

AUGUSTIN, JEAN-BAPTISTE-JACQUES, a celebrated French miniature painter, was born at Saint-Dié, department of Vosges, on the 15th of August, 1759. Poor and without friends, he acquired the knowledge and practice of his art by his own unassisted efforts; yet when he established himself in Paris, in 1781, the novelty, vigour, and truth of his works produced, as has been said, an entire revolution in the public taste. In truth the elegance of the 'style Pompadour,' as it was called, had been imitated till it had sunk into mere feeble affectation, and the world of fashion, to which the miniaturist primarily addresses himself, is always ready to run from one excess to another. For over a quarter of a century Augustin was supreme in his department, and sovereigns, nobles, and the most distinguished men and loveliest women sought to convey their features to posterity by the aid of his pencil. Napoleon, Josephine, Hortense, Louis XVIII., and Louis Philippe, the Queen of Naples, and the Duchesse d'Angoulême, Lord William Bentinck, and M. Denon, are some among his celebrated portraits. But Augustin lived to experience the ebb of the tide, and in his latter days was without a sitter. He died of cholera at Paris on the 13th of April, 1832.

AURIA, VICENZO, a learned and industrious Sicilian antiquary, was born at Palermo, August 5, 1625. His father, Federigo Auria, who held a high judicial office and was known as the author of some esteemed works on jurisprudence, died while Vincenzo was yet an infant; but his brother, also a judicial functionary of rank and a man of learning and ability, undertook to direct the education of his nephew. Vincenzo's progress as a boy, and afterwards at the Jesuit's College, Palermo, was of uncommon promise, and it was decided that he should adopt the law as a profession. He accordingly applied himself diligently to the study of the civil and canon law; took the degree of doctor of laws in the University of Catania; and commenced the practice of his profession with unusual prospects of success. But along with the jurists and casuists he had been studying the Italian poets and historians with at least equal zeal. He had written Italian and Latin verse, which had already procured for him the appellation of the Sicilian Petrarch; his 'Canzone Siciliane' had found a place in the 'Muse Siciliane,' and he had been elected a member of the Accademia de' Raccensai. His literary pursuits became more and more absorbing, and after a comparatively brief struggle he decided to abandon his prospects at the bar and to devote his life to the elucidation of the history of his native place, with the certainty of never rising above comparative poverty. This resolution he steadily carried out, and the long series of works he wrote, if not very brilliant in character or of any wide interest, are of great value as the foundation of a clear knowledge of Sicilian history and antiquities, and at the same time furnishing much that is of value to the student of general history. Auria was appointed by the viceroy keeper of the national archives in 1679, and in the following year commissioned by him to write a biographical history of his predecessors from the year 1409. On the foundation of the Sicilian Academy, Auria was made a member, and appointed superintendent of the department of precious stones. He died after a long illness, and very poor, Dec. the 6th, 1710. The senate of Palermo decreed him the funeral honours due only to the most illustrious citizens. Auria's published works are very numerous, but referring almost exclusively to Sicilian history, antiquities, poetry, and hagiography, it is unnecessary to give their titles. The following, as among the more important, will be sufficient:—'Dell' origine ed antichità di Cefalù,' Palermo, 1656, of which Havercamp published a Latin translation in vol. xiv. of the 'Thesaurus Siciliae'; 'La Giostra, discorso sopra l'origine della Giostra, in varie parte dell' Europa,' 1690; 'Historia cronologica dell' Signori Vicerè di Sicilia, dall' anno 1409 al 1697,' fol. Palermo, 1697; 'La Sicilia Inventrice, ovvero le invenzioni lodevoli nate in Sicilia,' Palermo, 4to, 1704. Mongitore gives a complete list of Auria's published and unpublished works (which last are rather numerous) in his 'Bibliotheca Sicula,' vol. ii. p. 274; and in Crescimbeni's 'Vite d' Arcadi Illustri,' part iii. pp. 109-28, is an ample memoir of Auria by Mongitore.

AURIFABER, JOHANN, whose vernacular name was Goldschmid, was born in the year 1519, in the county of Mansfeld. He became a student of divinity at Wittenberg, and was successively tutor of the sons of the Count of Mansfeld, and field-preacher in the French war in 1544. In 1545 he returned to Wittenberg for the purpose of teaching divinity, and it is said

that Luther employed him as his "familiar" or private secretary, and that he was present at Luther's death, at Eisleben, in 1546. In 1547 he remained for six months a partner in the captivity of the Elector, John Frederick of Saxony, to which that prince was condemned after being beaten by the Emperor Charles V. at the battle of Mühlberg. In 1551, Aurifaber was appointed Court preacher at Weimar, but was dismissed from his office in the following year. Through the liberality of the Count of Mansfeld, he was enabled to devote four years exclusively to the preparation of a collection of such of Luther's works as were not contained in the Jena edition, in the publication of which he had likewise been active. Besides the Eisleben collection of some of Luther's works and the Jena edition, of which, as just stated, he was co-editor, Aurifaber edited 'Letters of Luther,' in two volumes, and his 'Tischreden,' or Table-Talk, folio, Eisleben, 1566. The 'Tischreden' was reprinted twice in 1567, and a fourth time in 1568. The last reprint is prefaced by some pages from the pen of the editor, who complains of one Dr. Kugling as having, in a rival edition, made material alterations of the text. This rival edition, however, would appear never to have got beyond the manuscript form; at all events, it is unknown to bibliographers. The four editions already specified are exact reproductions, the one of the other, infinite typographical blunders included. In 1569 appeared a new edition (Frankfurt, folio), with an appendix "of prophecies which the venerable man of God, just before his holy death, delivered unto divers learned theologians and ecclesiastics, with many consolatory letters, opinions, narratives, replies, &c., never before made public." The dedication, "to the Council of Rauschemberg," dated March 24, 1568, intimates that the editor, Johann Fink, had derived his new materials from various books and writings of Martin Luther. The Prophecies, it is added, were due to the research of George Walther, preacher at Halle. Fabricius ('Centifolium Lutherianum,' p. 301) mentions two other editions in folio, Eisleben, 1569 and 1577, but no copies of these editions are at present known. Since that period the editors of the 'Tischreden' have been many, and the forms of its issue have been various. The contents of the work were originally gathered from the mouth of Luther by his friends and disciples, and chiefly by Antony Lauterbach, and Johann Aurifaber, who were very much with the great reformer towards the close of his life. They consist of notes of his discourses, of his opinions, his cursory observations, in the freedom of private friendship, in his walks, during the performance of his clerical duties, and at table.

In 1566, Aurifaber was appointed minister of the principal Lutheran church at Erfurt, became senior preacher in 1572, and died there on the 18th of November, 1575. The latter part of his life was embittered by quarrels with his colleagues, which were probably of the same description as those that prevailed among the different editors of the works of Luther, and led to many fanatical charges of heresy and Crypto-Calvinism. Adelung mentions 17 letters of Aurifaber to King Christian III. of Denmark, which were first published by Andreas Schumacher, in 'Briefe gelehrter Männer an die Könige von Dänemark,' 8vo, Copenhagen, 1758.

AURIGNY, GILLES D', a French jurist and poet, was born at Beauvais towards the end of the 15th century, and died in 1553. Very little is known of his life, except that after studying law in his native city, he removed to Paris, where he practised as an advocate. The following are his principal works:—(1) 'Les Constitutions et Ordonnances faites pour le bien et utilité des Agricoles de France par Charles VII., Louis XI., Charles VIII., Louis XII., François I., &c.' Paris, 1527, 8vo; (2) 'Le cinquante-deuxième Arrêt d'Amour, avec les Ordonnances sur le fait des masques,' Paris, 1528, 8vo; (3) 'Le Livre de la Police Humaine, extrait des grands et amples volumes de François Patrice, par M. Gilles d'Aurigny, et traduit en François par Jehan Leblond,' Paris, 1544, 8vo; (4) 'La Peinture de Cupidon,' Poitiers, 1545; (5) 'La Généalogie des Dieux poétiques, nouvellement composée,' Poitiers, 1545, 16mo; (6) 'Le Tuteur d'Amour, auquel est comprise la fortune de l'Innocent en Amour,' Paris, 1546, 8vo, reprinted with additions seven years later; (7) 'Contemplation sur la Mort de Jésus Christ,' Paris, 1547, 8vo; (8) 'Psalmes de David.' D'Aurigny's 'Tuteur d'Amour,' imaginative in subject and elegant in language, but not original in matter or thought, is regarded by some critics as the best French poem of the 16th century.

AURISPA, GIOVANNI, one of the restorers of learning in Italy, was born at Noto in Sicily about the year 1369. Visiting Constantinople about 1418, he brought home from thence many

valuable Greek MSS. Being very poor, he was obliged to pledge these MSS. for bread, but Lorenzo de' Medici redeemed them. Aurispa for a time taught Greek at Bologna and at Florence. Removing to Ferrara, he obtained for several years the patronage of the Este family. He taught the classics, took orders, and filled some ecclesiastical offices. In 1438 he became personally known to the Pope, Eugenius IV., which led to his appointment as apostolic secretary in 1441. Nicolas V. gave him two abbacies. He returned to Ferrara in 1450, and remained there till his death in 1459. Some of Aurispa's epistles and translations from Greek into Latin have been published; but his best services to literature were as a collector of ancient MSS. He brought to Italy MSS. of the poets Pindar, Callimachus, Oppian, and the Orphic verses; the historians Dion Cassius, Diodorus Siculus, and Arrian; and the philosophers Plato, Xenophon, Plotinus, and Proclus; many of the works having been until then unknown in Europe. He also collected many MSS. of the Greek fathers.

AUSTIN, JOHN, was born on the 3rd of March, 1790, and was the eldest of a family remarkable for intellectual powers of a peculiar order. At the age of 16 he entered the army, and served in it for five years, several months of which he passed with his regiment, which formed part of Lord William Bentinck's corps, in Sicily. Acting upon the advice of appreciative friends, he quitted the army, and, becoming a member of the Inner Temple, was called to the bar in 1814. His fellow-students, and the eminent lawyers under whom he studied, had marked the force and clearness of his mind, his retentive memory, and the vigour and precision of his language; and they confidently foretold for him a high place in the profession. In 1819, after an attachment of five years, he married Miss Sarah Taylor, of Norwich, a member of a distinguished family [AUSTIN, SARAH]. The prospects of professional success were, however, clouded by the failure of his health, and the delicacy and sensitiveness of his mental constitution. He was intolerant of imperfection in his work; and such a temper could not readily accommodate itself to the demands of business. After a vain struggle, in which his health and spirits suffered severely, he gave up practice in the year 1825. Fortunately, the foundation of the London University, in 1826, occasioned the opening of a school of jurisprudence, of which Mr. Austin was chosen to be the professor; and he resolved to spend the interval between his appointment and the commencement of his lectures in Germany, where the study of the science could be pursued with advantage in the society of the most eminent Roman jurists. In the autumn of 1827, after visiting Heidelberg, he established himself, with his wife and only daughter, at Bonn, which was then the residence of Niebuhr, Brandis, Schlegel, Arndt, Welcker, Mackeldey, Heffter, and other eminent men, from whose society he received equal pleasure and instruction. He left Bonn after a stay of about six months, in the spring of 1828, master of the German language and of a number of the greatest works which it contains. His lectures opened with a class which exceeded his expectations; and which included several of the men afterwards eminent in law, politics, or philosophy, among whom may be mentioned Lord Romilly, Master of the Rolls, Lord Clarendon, Mr. C. F. Villiers, Sir G. C. Lewis, and Lord Belper. He now appeared to have attained to a position above all others the best suited to him. His peculiar tastes and talents fitted him for the business of a teacher; and he felt with a sort of awe the responsibility attaching to his office. His power of methodising and expounding is said to have been matchless; and he had a natural and powerful eloquence (when he allowed himself to give way to it), which was calculated to rivet the attention and to fix itself on the memory. But in spite of the brilliant commencement of his career as a professor, it soon became evident that this country would not afford such a succession of students of jurisprudence as would suffice to maintain a chair, which, under the circumstances, its holder found himself compelled to resign. This resignation was the real calamity of his life, the blow for which there was no remedy, and from which he never recovered. His failure at the bar was nothing, for that was not his vocation; but there was no one to do the work he could have done as an expounder of the philosophy of law. In June, 1832, he gave his last lecture; and in the same year published a volume entitled 'The Province of Jurisprudence Determined,' having in the previous year published 'An Outline of a Course of Lectures on General Jurisprudence, or the Philosophy of Positive Law.' The reception given to the work was not at first encouraging, and it was left gradually to make its way by its own merits, which, by slow degrees, began to be appreciated.

It is now, to use the words of Marvin's 'Legal Bibliography,' Philadelphia, 1847, "acknowledged to be one of the most valuable contributions to the philosophy of law and legislation that has been produced in modern times, and entitles the author to rank with Hooker and Montesquieu." In the year 1833, Mr. Austin was appointed by Lord Brougham, at that time Lord Chancellor, a member of the Criminal Law Commission. But it appeared to his colleagues that his views were too abstract and too thorough to be reduced to practice; and Mr. Austin, finding himself unable to discharge the duties of his office, according to his own estimate of them, resigned his place. In 1834 he was engaged to deliver a course of Lectures on Jurisprudence at the Inner Temple, a study which Mr. Bickersteth, afterwards Lord Langdale, and others, thought it advisable to foster. But here, as before at University College, it was found that the demand for anything like scientific legal education had to be created; and the lecturer soon saw the inutility of struggling against such obstacles as he had to oppose. He resolved, therefore, to abandon a conflict in which he had met with nothing but defeat, and to seek an obscure but tranquil retreat on the Continent, where he might live upon the very small means at his disposal. Accordingly he retired to Boulogne, where he had been settled about a year and a half, when a proposal was made to him, in 1837, by the Colonial Office, through his friend Sir James Stephen, to go to Malta as Royal Commissioner, to inquire into the nature and extent of the grievances of which the natives of that island complained. Aided by Mr. (afterwards Sir) George Cornewall Lewis, he rendered services to the island which are still remembered there with affectionate gratitude; and he had the satisfaction of seeing every measure he recommended adopted by the Colonial Office. After his return from Malta, in 1838, he was so much worse in health than usual, that in 1840 his medical friends exhorted him to try the waters of Carlsbad, from which he derived much benefit, and to which he returned in the summers of 1841—43. The intervening winters were spent at Dresden and Berlin; at the former of which cities it was that he wrote for the 'Edinburgh Review' his answer to Dr. List's violent attack on the doctrine of free trade. In 1844 he removed to Paris, and was, shortly after, elected by the Institute a corresponding member of the moral and political class. In the same year an appeal was made to him to publish a second edition of 'The Province of Jurisprudence,' but his fastidious taste and scrupulous conscience shrank from the idea of a mere reprint; and his response to the appeal was the drawing up of a prospectus of a work on 'The Principles and Relations of Jurisprudence and Ethics,' in which, as he wrote to his friend Sir William Erle, it was his intention to "show the relations of positive morality and law (*mos* and *jus*), and of both to their common standard or test; to show that there are principles and distinctions common to all systems of law (or that law is the subject of an abstract science); to show the possibility and conditions of codification; to exhibit a short scheme of a body of law arranged in a natural order; and to show that the English law, in spite of its great peculiarities, might be made to conform to that order much more closely than is imagined." Mr. Austin had finally established himself in Paris, when the Revolution of 1848 "once more uprooted him." He remained, however, in Paris for some months, watching the course of events; and the result of his observations was to confirm him in his opinion of the difficulty, if not the impossibility, of reconstructing a society which has once been completely shattered. This opinion, together with his ardent patriotism, found utterance in a pamphlet which he published in 1859, under the title of 'A Plea for the Constitution,' and which was originally intended for a quarterly journal, as a review of Lord Grey's work on Reform. Mr. Austin returned to England in the autumn of 1848. He spent the last ten years of his life at Weybridge, in Surrey, and this decade was the "happiest period of his life." He alternated his studies and literary avocations with a glad and contented communing with nature, and a close scrutiny of the course of political events. He died in December, 1859; at which time only one part of his Lectures had been published. No one seemed so well fitted as Mrs. Austin to prepare such portions of her husband's writings as were left by him in a finished or nearly finished state; and the result of her labours was seen in 1861 in her editing of a new issue of 'The Province of Jurisprudence Determined,' which was followed in 1863 by two other volumes of her husband's 'Lectures on Jurisprudence, or the Philosophy of Positive Law.' A third edition of the whole, revised and edited by Mr. Robert Campbell, appeared in 1869, 2 vols. 8vo, London. The pursuit of truth was ever Mr. Austin's first

object; the diffusion of a knowledge of it, his second. He was frequently reckoned a disciple of Bentham, for whom, indeed, he had a profound admiration, but whom he did not blindly worship or follow slavishly. On certain points he differed from him, and especially on the supposed fitness of the people for the exercise of political power. He always thought that Bentham's secluded habits, and his acute sense of the misgovernment occasioned by what he called sinister interests, blinded him to the no less dangerous evils arising from ignorance.

AUSTIN, SARAH, descended from the Taylors of Norwich, a family which in several generations produced men and women distinguished by literary and scientific ability, was born in 1793, and received in her father's house an education of unusual range and solidity. On her marriage, in 1820, with Mr. Austin, then a barrister on the Norfolk circuit, she came to reside next door to Mr. Jeremy Bentham and Mr. James Mill, in Queen-square, Westminster. Here her house soon collected within its walls the deepest thinkers and most refined men of letters of the time—Bentham; James and John Stuart Mill; the Grotes; the rising lawyers of that day, Bickersteth, Erle, Romilly, and Senior; Charles Buller, Jeffrey, Sydney Smith, and Lord Lansdowne. Much of Mrs. Austin's life was spent abroad. She accompanied her husband during his residences severally at Heidelberg, Bonn, Boulogne, Malta, Carlsbad, Berlin, Dresden, and Paris. In the last-named city her small *salon* had an intellectual stamp and charm not inferior to that of her London circle. During her stay abroad at different periods she contributed valuable "travelling letters" to the 'Athenæum,' and both then, and after her return to England, in 1848, frequently supplied critical and obituary notices to that journal; and in addition, contributed more extended articles to the Reviews. Mr. Austin died in December, 1859, and his widow, whose own death took place on the 8th of August, 1867, occupied half that interval in the responsible duty of arranging for publication those 'Lectures on Jurisprudence,' 3 vols. 8vo, 1861—63, which form the noblest monument that could be raised to the memory of her husband.

Mrs. Austin did not often aspire to original literary composition; and she is chiefly known for singularly able translations of several of the choicest specimens of German literature. Her principal works of this kind were 'The Travels of a German Prince,' London, 1832; 'Characteristics of Goethe, with notes original and translated,' 3 vols. 12mo, 1833, from the German work of J. D. Falk, 'Goethe aus näherem persönlichen Umgange dargestellt'; 'History of the Reformation in Germany,' and the 'History of the Popes,' from the German of Leopold Ranke, to the latter of which the late Dean Milman contributed a preface; 'Collection of Fragments from the German Prose Writers, translated with Notes,' 12mo, 1841; and the 'Story without an End,' which has gone through so many and so varied editions, from the German of F. W. Carové, 'Das Märchen ohne Ende.' Mrs. Austin translated, from the French of Victor Cousin, his 'Report on the State of Public Instruction in Prussia,' and from Guizot, a Discourse designed as an introduction to the History of the Reign of Charles the First, 'On the Causes of the Success of the English Revolution of 1640—1688.' We owe, further, to her pen a work entitled 'Germany, from 1760 to 1814; or Sketches of German Life,' &c.; another 'On National Education,' 8vo, 1839; and 'Two Letters on Girls' Schools, and on the Training of Working Women,' of which the second edition, "with additions," was published in 1857, 8vo. Finally, it should be stated that Mrs. Austin edited Lady Holland's 'Memoir of the Rev. Sydney Smith,' with a Selection from his Letters, 4th edition, 1855, 8vo; and also the charming work of her (Mrs. Austin's) daughter, the late Lady Duff Gordon, entitled 'Letters from Egypt, 1863—65.'

AUVERGNE, GUILLAUME D', or GULIELMUS ALVERNUS or ARVERNUS, bishop of Paris, was born at Aurillac in the second half of the 12th century. After studying at Paris theology, philosophy, and mathematics, he became doctor and professor of theology at the Sorbonne. He was appointed Bishop of Paris in 1228. In 1225 he established the Maison des Filles de Dieu for reclaimed women; in 1229 he founded the priory of St. Catherine, and in 1234 a baptismal church at Crène. But holding strong views on ecclesiastical rights, he was brought into collision with the University of Paris, and excommunicated some of the masters and scholars. In 1230 he was employed in counteracting the treasonable designs of the Duke of Brittany, and succeeded in reclaiming the Bretons back to their loyalty to the king. Next he undertook to suppress the plurality of benefices. He presided over the religious ceremonies

connected with the recovery of the Holy Crown of thorns (1238); baptized the eldest son of Louis IX. in 1244; attended the king in his interview with Pope Innocent IV. in 1245; and subscribed to a solemn condemnation of the Talmud in 1248. He died on the 30th of March, 1249. Bishop D'Auvergne was a good classical scholar, but made that and every other kind of learning subservient to the interests of the church. He opposed all kinds of heresy. As a writer, he was less dry and diffuse than most controversialists of that age. His writings, which were very numerous, were for the most part collected and published at Orleans in 1674, 2 vols. 4to. They comprise controversial, devotional and philosophical treatises. A less perfect edition was published in folio at Venice in 1591. His '*Rhetorica Divina*,' Ghent, 1483, 4to, was the first book known to have been produced in that town with a date, and was the first of his works printed. He wrote an immense number of discourses, but his most important work was '*De Universo*,' a treatise on the authority, origin, nature, and duration of the universe, and of good and evil spirits. It is a work of considerable originality and power, and is of importance in the history of philosophy in the middle ages.

AUVERGNE, MARTIAL D', a distinguished French lawyer, wit, and poet, was born at Paris in 1440. Nearly all that is known of his personal history is told in two epitaphs, one in Latin prose and one in French verse, given in the additions by Joly to Loiseau's '*Offices de France*.' These epitaphs represent him to have been beloved for his virtues, a good Christian, a learned lawyer who was fifty years in the profession, and was the friend and adviser of the poor. According to a narrative in Denis Godefroy's edition of the '*Chronique de Louis XI.*,' Martial d'Auvergne, in the month of June, 1486, threw himself from his chamber into the street, in a fit of frenzy, whereby he broke his thigh and bruised his body all over. He died on the 13th of May, 1508. Martial d'Auvergne was one of the best writers of his time, manifesting both wit and judgment in his several works. His chief work was '*Les Arrests d'Amour*,' an account of fifty (supposititious) decisions pronounced at the Courts of Love by judicial tribunals of ladies, to whom were referred all points of dispute relating to love and gallantry. The arrests or decisions given in the book are satirical, but fair imitations of the questions usually discussed in the Courts d'Amour. They are in prose, with a poetical introduction and conclusion. After two or three undated editions, the first dated edition of this work was published in Paris, 1525, 4to. Numerous later editions have appeared, of which that of 1541 bore the curious title, '*Droits nouveaulx et Arrestz d'Amours, publiez par Messieurs les Senateurs du Parlement de Cupido, sur l'estat et police d'Amour, pour avoir entendu le différent de plusieurs amoureux et amoureuses*.' A second work by him was '*L'Amant rendu Cordelier à l'Observation d'Amour*,' a love-poem of 234 strophes, each containing eight verses. It was first published at Paris, 1490, 4to. A third work was '*Dévoties Louanges à la Vierge Marie*,' Paris, 1482, 8vo. But Martial d'Auvergne's reputation chiefly rests on his '*Vigilles de la Mort du feu roy Charles VII.*,' Paris, 1492, 4to; this consists of between six and seven thousand verses, giving a chronological and very circumstantial account of the misfortunes and exploits of Charles VII., with the principal events of his reign.

AVAUX, CLAUDE DE MESMES, COMTE D', an eminent French diplomatist, son of J. J. de Mesmes, first Comte d'Avaux, was born in 1595. In comparatively early life he obtained responsible appointments: he was successively master of requests and superintendent of finances. In 1623 he became a councillor of state. In 1627 he was nominated ambassador at the court of Venice, and afterwards at the courts of Rome, Mantua, Florence, and Turin. Richelieu, by whom he was highly valued, entrusted him to represent France in the negotiations at the end of the Thirty Years' War; and in this capacity he aided to bring about the peace of Westphalia in 1648. But the envious machinations of his colleague, Servien, led to the recall of d'Avaux by Mazarin (Richelieu's successor) just before the end of the negotiations. He retired to his estates in disgrace, but was re-appointed by Mazarin to diplomatic duties, and died at Paris 19th November, 1650. D'Avaux was a generous and enlightened friend to literary men. The following works by him are of value to the historical student:—1. '*Exemplum Literarum ad Daniam Regem scriptarum*,' Paris, fol. 1642. 2. '*Lettres de D'Avaux et de Servien*,' 8vo, 1650. 3. '*Mémoires touchant les Négociations du Traité de Paix fait à Münster en 1648*,' Cologne, 12mo, 1674; Grenoble, 1674.

AVELLONI, FRANCESCO, a voluminous Italian dramatist, son of Casimiro Avelloni, was born at Venice in 1756, and studied

at the Jesuit College in that city until its suppression in 1773. He then removed to Naples, where, left destitute by the death of his father, and disappointed in hopes of assistance from relatives, he carved out a career for himself. After some vicissitudes, he found a friend in Bianchi, manager of a theatre, and wrote in little more than a fortnight a five-act play for him. When on the road from Venice to Naples, Avelloni had been waylaid and robbed by brigands, and the events which he saw and heard during a temporary captivity among them suggested to him a plot for his play, which he called '*Giulio Assassino*.' It had great success, being performed twenty successive evenings to crowded audiences. Avelloni at once decided to adopt play-writing as a means of living. He wrote forty dramas on stories or plots suggested by the Prince of Sangro, who brought them out under his own name; the prince received whatever honour accrued, while Avelloni received a sum equal to about thirty shillings, together with a ham, for each drama. Having married an actress, Avelloni tried his fortune both as a manager and as an actor, but unsuccessfully, and at last took to private teaching. He wrote the enormous number of six hundred plays, some in verse and others in prose. Most of them have passed into oblivion, but many are still acted, and the collections of dramas usually contain a few of them. They were generally sentimental in style, somewhat after the fashion of Goethe's '*Werter*,' and Kotzebue's '*Stranger*,' easy in dialogue, but strained and improbable in incident. He had some success in the writing of allegorical dramas, of which the best were '*Lucerna di Epitteto*,' '*Le Vertigini del Secolo*,' and '*Il Sogno d'Aristo*.' Avelloni, who, on account of his diminutive stature, was known among his friends as *Il Poetino*, died at Rome in 1837.

AVERANI, the surname of three brothers distinguished among Italian writers for their learning.

BENEDETTO AVERANI, the eldest brother, was born at Florence July 19, 1645. After greatly distinguishing himself in his early studies, he obtained in 1676 the professorship of Greek at the University of Pisa. This he subsequently exchanged for the chair of humanity, which he held till his death, December 28, 1707. He was buried in the Campo Santo of Pisa. Averani passed his life in study and teaching, to which he was strongly attached. He was eminent as a teacher of the Greek and Latin languages and antiquities; he was the leading professor at Pisa; his lectures at the university being extempore and lively, were very attractive; and by them and by his writings he contributed to the revival of the study of the Greek language and literature. His printed lectures comprise 86 on the Greek anthology, 58 on Thucydides, 26 on Euripides, 31 on Livy, 45 on Virgil, and 98 on Cicero. They were much studied in his day, and their merit is still recognised. Some of his Latin works were published by him in 1688, and some by his brother Giuseppe in 1709; but the whole were collected and edited some years later by his brothers Giuseppe and Niccolò, under the title '*Benedicti Averani Florentini Dissertationes habitæ in Pisanâ Academiâ, &c. Accesserunt ejusdem Orationes et Carmina, omnia iterum edita; necnon Epistolæ, quæ nunc primum in lucem prodeunt*,' 3 vols. folio, Florence, 1716—17.

GIUSEPPE AVERANI, the youngest and most distinguished of the brothers, was born at Florence in 1662. In 1684 he became professor of law in the University of Pisa. He acquired great fame as a lecturer, first on the Institutions of Justinian, and then on the Pandects. While advancing in reputation as a jurist and lecturer, he was also prosecuting science. He made experiments on burning-glasses, on light, on electricity, on odours, and on the propagation of sound. The Royal Society of London elected him as one of its fellows. Refusing good offers from Bologna, Turin, and Florence, Averani remained at Pisa till his death, on August 24, 1738, after 14 years of abstinence from lecturing on account of feeble health. Besides jurisprudence and science, he had studied theology, archæology, and the language of his native country; his learning on the last-named subject caused his services as censor of the academy Della Crusca to be greatly valued. Of 12 works written by him the most valued are:—(1) '*Interpretationum Juris Libri Duo*,' published at Leyden by Van der Aa in 1716, and '*Interpretationum Juris Libri Tres posteriores*,' Leyden, 1746; (2) '*Lezioni Toscane*,' 3 vols. Florence, 1744—46—61; containing lectures on philosophy, antiquities, and theology, and papers describing his scientific experiments; (3) '*Monumenta Latina Posthuma J. A.*,' Florence, 1768.

NICCOLÒ AVERANI, the second brother, was born about the middle of the 17th century. He was an advocate by profession, but a mathematician by inclination, and dwelt at Florence till his death, August 4, 1727. The works by which he is remembered,

besides the edition of his brother's Latin lectures (mentioned above), were his edition of the works of Gassendi, 6 vols. folio, Florence, 1726; and 'De Mensibus Egyptiorum, nunc primum edita, Dissertatio,' published ten years after his death by Gori and Cardinal Noris.

AVILA, GIL GONZALES DE, or DAVILA (De Avila being printed on his earlier, Davila on his later title-pages), a Spanish biographer and antiquary, was born at Avila about 1577. His boyhood and youth were spent in Rome, where he received his early education in the household of Cardinal Deza. When about 20 he returned to Spain, and was made deacon and minor canon in the cathedral of Salamanca. He soon after commenced author by the publication of an attempt to explain the purpose of the so-called Bull of Salamanca, a stone effigy which then stood in the *medio puente*, a sort of shrine in the centre of the old bridge of that city, and of similar effigies in other parts of Castile—'Declaracion del Toro de Piedra de Salamanca, y de otros que se hallen en otras partes de Castilla,' Salamanca, 4to, 1597. More important, however, was his next work, 'Historia de las Antiquedades de la Ciudad de Salamanca, Vidas de sus Obispos, y cosas sucedidas en su tiempo' (History of the Antiquities of the City of Salamanca, with the Lives of her Bishops, and the events which happened in their time), Salamanca, 4to, 1606. In this work Avila displayed his predilection for biography, the city and its antiquities occupying less than a twelfth of the volume, the rest being given to the lives of the bishops. A life of Alfonso, Bishop of Avila, 'Vida y Hechos del M. Don Alfonso Tostado de Madrigal, Obispo de Avila,' appeared in a quarto volume in 1611. The following year he was called to Madrid to fill the office of Historiographer Royal to the Two Castiles. In the fulfilment of the duties of this office, in research among the national archives, patient biographical and bibliographical study, and the writing and publication of his books, his days passed quietly till he had numbered his three score years and ten, when his faculties gradually decayed, and his last days were passed in second childishness. He died at Avila, May 1, 1658. Besides the works already named, and some of merely local and temporary interest, he wrote the following:—'Historia del Origen del Santo Christo de las Batallas' (History of the Origin of the Most Holy Christ of Battles), 4to, 1615. 'Teatro Ecclesiastico de las Ciudades y Iglesias Catedrales de España,' vol. i. 1618, was to have been continued, but he subsequently revised his plan, and recast his materials; the matured work appearing eventually under the title of 'Teatro Ecclesiastico de las Iglesias Metropolitanas y Catedrales de los Reynos de las dos Castillas, Vidas de sus Arzobispos y Obispos y cosas memorables de sus Sedes,' in which, as in his former work, the lives of the archbishops and bishops occupy a far larger space than the accounts of their churches. Of this work the first volume was published in 1645, the second in 1647, the third in 1650, and the fourth before 1655; a fifth was to have been added, but does not appear to have been prepared. It is a work of much value for the mass of historical and biographical materials it contains. A brief general account of Madrid, with full biographies of its illustrious natives, appeared at Madrid in 1623 in a handsome folio volume, under the title, 'Teatro de las Grandezas de Madrid, corte de los Reyes Catolicos de España.' In 1638 he published a life of Henry III. of Castile, and biographies of the founders of the two fraternities of the Holy Trinity, 'Historia de la Vida y Hechos del Rey Don Henrique III. de Castilla,' fol. Madrid; and 'Compendio de las Vidas de los gloriosos San Juan de Mata y Felix de Valois,' 4to, Madrid. On the death of Tomayo in 1641, Avila was appointed to succeed him as Historiographer of the Indies, in which capacity he published his 'Teatro Ecclesiastico de la primitiva Iglesia de las Indias Occidentales,' 2 vols. Madrid, 1649—55, in which the churches and ecclesiastics of North and South America are treated in a manner corresponding to that of his great Teatro of the churches and bishops of Castile, to which this was intended as a supplement. He left in MS. a life of Philip III., written by command of Philip IV., which does not appear to have been printed.

AVILA Y ZUNIGA, DON LUIS DE, Spanish historian, born towards the end of the 15th century, is believed to have been a native of Placentia. He appears to have been of humble origin, but he acquired wealth and station by marriage with an heiress of the Zuniga family, whose name he added to his own. He won the favour of the Emperor Charles V., who appointed him grand-commander of the order of Alcantara, and sent him during the papacies of Paul IV. and Pius IV. as ambassador to Rome where he contributed to the resumption of the Council of

Trent. He accompanied Charles V. in his German campaign, and commanded the cavalry at the siege of Metz in 1552. After the abdication of Charles, Avila retired to his mansion at Placentia, and amused his leisure by filling his house with rarities, and by directing the decoration of the walls with paintings of the campaign in Germany. He was a frequent, and always welcome visitor of the ex-emperor at Yuste, and was present at his funeral in 1558. This is the last that is recorded of Avila, the date of whose decease is not known. Avila is the author of a history of the war in which he took part, 'Comentarios de la Guerra de Alemaña, hecha de Carlos V. en el año de MDXLVI. y MDXLVII.' Venice, 1548, and reprinted at Granada and at Antwerp the following year, and at Antwerp and Saragossa in 1550. In 1560 an English translation, by John Wilkinson, was published with the following noteworthy title, 'The Comentarios of Don Lewes de Auela and Suniga, great master of Acanter, which treateth of the great wars in Germany, made by Charles the fifth Maximo, Emperoure of Rome, King of Spain, against John Fredericke, Duke of Saxon, and Philip the Lantgraue of Hesson, with other gret princes and cities of the Lutherans, wherin you may see how god hath preserved this worthy and victorious Emperour in al his affayres against his enemies, translated out of Spanish into English, An. Do. 1555, Londini, in ædibus Richardi Totteli.' An Italian translation was published at Venice in 1548, probably in connection with the issue of the original; a Latin version by William Mallinæus appeared at Antwerp in 1550; one in Dutch, the same year and place; and three in French, by Mathieu Vaulcher, Antwerp, 1550; by Gilles Boilleau de Buillon, Paris, 1551; and an anonymous version, 1672. Avila's is a valuable and well-written book, but its originality no less than its fairness has been questioned.

AVILER, AUGUSTIN CHARLES D', French architect and author, was born at Paris in 1653. His taste for architecture was developed early, and at the age of 20 he gained the first prize for architecture given by the French Academy, which entitled the winner to a royal pension, in order that he might pursue his studies at Rome. Aviler embarked at Marseille along with Desgodets, the architect, and Vaillant, the antiquary, but the felucca was taken by an Algerian pirate, and Aviler and his friends carried to Tunis. Notwithstanding his captivity, Aviler prosecuted his studies, and he was employed to erect a superb mosque in the chief street of the city, the success of which, as much as the representations of Louis XIV., procured him his liberty in 1676. He repaired at once to Rome, where he remained five years occupied in studying the construction and ornamental principles and details of the ancient buildings. On his return to Paris he was employed as assistant to Mansard, then busy on his great works in the capital. Tiring, however, of a subordinate position, he determined to try his fortune in the provinces. He was engaged to erect the triumphal arch in honour of Louis XIV. at Montpellier, known as La Porte de Péron. This excited so much admiration that he received a commission to erect a palace for the archbishop at Toulouse, and several fine buildings at Carcassonne, Nîmes, and Béziers, his satisfactory completion of which obtained for him from the Etats de Languedoc the appointment, in 1693, of architect of Provence. He now settled in Montpellier, married, and was fairly launched on a prosperous career; but he fell into a bad state of health, and he died in 1700, at the early age of 47. Notwithstanding his close occupation as an architect, Aviler found time to write several works of great value in their day. These are (1) 'Cours d'Architecture,' 2 vols. 4to, 1691, which was held in much esteem, but is mainly a commentary on Vignola; it was more than once reprinted; the best editions are those by Mariette, with additional designs and a life of the author, 1750 and 1755. (2) 'Dictionnaire de tous les termes de l'Architecture Civile et Hydraulique,' an exceedingly useful book at the time of its publication, and one which has served as the basis of subsequent dictionaries, Aviler's definitions having been in the main adopted by his successors. Avila is also the author of a translation of Scamozzi's treatise on Architecture with original notes, published at Paris, folio, 1685, and reprinted at Leyden in 1713.

AVRIGNY, HYACINTHE ROBILLARD D', a learned French Jesuit, was born at Caen in 1675. He entered a Jesuit seminary at the age of 16, and gradually rose to the position of professor of humanities in one of the colleges of the order. But being in feeble health, he changed his office for that of procurator. D'Avrigny's favourite subjects of study were ecclesiastical and civil history. He wrote—(1) 'Mémoires Chronologiques et Dogmatiques, pour servir à l'Histoire Ecclésiastique depuis 1600 jusqu'en 1716,' 4 vols. 12mo, 1790; (2) 'Mémoires

pour servir à l'Histoire universelle de l'Europe, depuis 1600 jusqu'en 1716,' 4 vols. 12mo, Paris, 1725 and 1731, reprinted in 1767 in 5 vols. with additions by le Père Griffet. These works, especially the first, brought him into trouble. He was too fearless in investigation and too independent in judgment to suit his superiors; and the mortification produced by the reproof administered by them, and the retrenchment exercised before they permitted the volumes to be published, is said by, Dom Chaudon to have hastened D'Avrigny's death, which occurred April 24, 1719. Both works are useful, even in the mutilated form which they presented when published after his death.

AYLESBURY, or AILESBUURY, SIR THOMAS, born in London in 1576, was educated at Westminster School, and entered as a student of Christ Church, Oxford, in 1598. Here he distinguished himself as a mathematician; took the degrees of B.A. in 1602, and M.A. in 1605. On leaving Oxford he received the appointment of secretary to the Earl of Nottingham, Lord High Admiral, and then served the Duke of Buckingham in a similar capacity. His next offices were as one of the Masters of Requests and Master of the Mint. In 1627 he was created a baronet. On the breaking out of the civil war, he was deprived of his appointments. In 1649, after the execution of Charles I., Aylesbury went to the Netherlands, and lived in a quiet and frugal way at Breda until his death in 1657. His daughter Frances became Countess of Clarendon, mother to the queen of James II., and grandmother to Queens Mary and Anne. Sir Thomas Aylesbury was an excellent scholar, a good mathematician, and an enlightened man, liberal and generous to men of genius and letters.

AYLESBURY, WILLIAM, son of Sir Thomas, was born at Westminster about 1612; entered Christ Church, Oxford, as a gentleman-commoner in 1628; and became B.A. in 1631. On leaving college he was appointed by Charles I. tutor and guardian to the orphan sons of the first Villiers, Duke of Buckingham. While travelling with them on the Continent he was shot in the thigh by a brigand. On his return to England he was commanded by the King to translate D'Avila's 'History of the Civil Wars of France'—a work, however, in which the chief part of the translation was, according to Ant. Wood, done by Aylesbury's coadjutor, Sir Charles Cotterel. Like his father, Sir William Aylesbury was straitened in his circumstances by the events which followed the execution of Charles I.: but, unlike his father, he took office under the Protector, and went out as secretary to the Governor of Jamaica, in which colony he died in 1657.

AYLETT, or AYLET, ROBERT, was born about 1583; educated at Trinity College, Cambridge; took his M.A. degree; in 1608 was incorporated of Oxford University; obtained in 1614 the degree of LL.D. at Cambridge, and, according to Wood, succeeded Sir Charles Cæsar as master of the faculties, on the death of Sir Charles in December 1642. But long before this he had become known as a candidate for the poet's bays. In 1622 was published an 8vo. volume by him, comprising four poems:—'Peace, with her four Garders: Thrift's Equipage: Susanna: Joseph, or Pharaoh's Favorite.' One at least of these pieces, 'Susanna,' is met with separately, but of the same date, and it was perhaps issued first in order to test the reception the volume would be likely to meet with. No other work appears to have been published by Dr. Aylett until he put forth a rhyming argument of 26 pages for and against marriage, 'A Wife not ready made but bespoken, by Dicus the Batchelor, and made up for him by his fellow-shepherd Tityrus: in four pastoral eclogues. The second edition, wherein are some things added, but nothing amended,' Lond. 1653: the first edition has escaped notice. The following years appeared his 'Divine and Moral Speculations, in Metrical Numbers, upon various subjects,' in which the 'Wife not ready made' and the 'Susanna' mentioned above, are included. Another rhyming pamphlet of 15 pages, consisting of a series of brief devotional exercises, issued in 1654, with a portrait by T. Cross, and entitled 'Devotions: viz. 1. A Good Woman's Prayer. 2. The Humble Man's Prayer,' concludes, as far as we know, the list of Dr. Aylett's poetic publications. They are in request among bibliographers, but are forgotten by every one else, and are not worth resuscitating. The year of his death is not mentioned.

AYRES, JOHN, celebrated for his skill as a penman in the latter part of the 17th and the beginning of the 18th centuries, was of humble birth, having served for some time as footman to Sir William Ashurst, a merchant of London. Whilst in this capacity his master taught him writing and arithmetic, and he then opened a school in St. Paul's Churchyard, which seems to

have been a successful enterprise. In 1683 (the first date clearly recorded concerning him), he published 'The Accomplished Clerk,' a book illustrated with engraved specimens of penmanship, which was republished with his portrait in 1700. In 1696 appeared 'A Tutor to Penmanship, or the Writing Master,' comprising a brief history of the art of writing, with 48 folio plates of examples, engraved like the former by John Sturt, who, in an address to the purchaser, refers to several other works executed by him conjointly with Ayres. About the same time was published 'Arithmetic made Easy, for the use of Tradesmen.' The year of Ayres's birth is not known; his death is supposed to have occurred suddenly about 1705.

AYRES, PHILIP, a miscellaneous writer of the second half of the 17th century, of whose personal history nothing appears to be known. His works comprise—1. 'The Fortunate Fool: written in Spanish by Don Alonzo Geronimo de Salas Barbadillo of Madrid,' 12mo. London, 1670. 2. 'The Count of Gabalis; or the Extravagant Mysteries of the Cabalists, exposed in five pleasant discourses on the Secret Sciences,' 16mo. 1680, a translation (with some original 'animadversions' at the end) from the French of the Abbé Pierre Villiers. 3. 'Emblems of Love, in four Languages [Latin, English, Italian, and French]. Dedicated to the Ladies,' 8vo. 1683. This is a very curious work; it comprises a series of 44 poetical emblems, each adorned with a pictorial design, the whole being engraved upon copper plates. 4. 'Lyric Poems, made in imitation of the Italians. Of which many are Translations from other Languages,' 8vo. London, 1687. 5. 'Pax Redux, or the Christian Reconciler. A Project for Reuniting all Christians into One Sole Community. Translated from the French,' sm. 4to. 1688—but said in the preface to have been first published 15 years before. 6. 'Three Centuries of Æsopian Fables,' 8vo. 1689.

AYRTON, EDMUND, a composer of church music, was born in 1734 at Ripon, in the grammar-school of which town he was educated. By his father he was intended for the church; but evincing a preference for music, he was placed under the tuition of Dr. Nares, organist of York Cathedral. At a comparatively early age he became organist, auditor, and chorus master of the collegiate church of Southwell, Nottinghamshire. Here he remained many years, marrying into a good family, and bringing up a large number of sons and daughters. In 1764 he was appointed one of the gentlemen of the Chapel Royal, and soon afterwards vicar-choral of St. Paul's, and one of the lay clerks of Westminster Abbey. In 1780 he became 'Master of the Children of his Majesty's Chapels,' and in 1784 was created Mus. Doc. of Cambridge. When the general thanksgiving was held at St. Paul's on the 29th of July, 1784, for "the termination of the American war," a grand anthem by Ayrton was performed, 'Begin unto my God with timbrels,' with full orchestral accompaniments. This composition was much admired. In the same year he became assistant director of the Festival for the commemoration of Handel at Westminster Abbey; he filled the same post at the similar festivals which were continued annually until the breaking out of the French Revolution, when the minds of men were untuned for music. Dr. Ayrton died in 1808, and was buried in Westminster Abbey. Among his musical compositions were a complete morning and evening service in C; another (shorter) in E flat; two verse anthems, 'I will Sing a New Song,' and 'The King thy Judgments'; two full anthems with verses, 'Thy Righteousness, Oh God, is very high,' and 'Bow down thine ear, Oh Lord'; also several fugues. All his music presents good examples of the English church style, learned in treatment, and yet simple.

AYRTON, WILLIAM, youngest son of Dr. Ayrton, and an eminent musical editor and critic, was born 22nd February, 1777. He married the daughter of Dr. Samuel Arnold, the composer, in 1803. Deriving from his father a general and accurate acquaintance with musical subjects, he became musical and literary critic to the 'Morning Chronicle' when under Mr. Perry. This position he held from 1813 to 1826. In 1817 Mr. Waters, becoming proprietor of the King's Theatre or Opera House, entrusted the management to Mr. Ayrton, who entered upon the task with a determination to raise the standard of public taste in regard to opera, by introducing to the English boards high-class German music. He engaged as his chief singers Mesdames Pasta, Camporese, and Fodor, with Signori Crivelli, Ambrogetti, and Naldi. To Mr. Ayrton belongs the credit of introducing to the English public Mozart's chef d'œuvre, 'Il Don Giovanni,' an opera which had brilliant success. This encouraged him to introduce in succession the same composer's 'Figaro' and 'Clemenza di Tito,' Cimarosa's 'Penelope,' Paer's

'Agnese' and 'Griselda,' and Paesello's 'Molinara.' But he was thwarted by a cabal of singers and dancers, who opposed his plans, and led him to give up the management at the end of the one single season in disgust. Among the 'Letters of Charles Lamb' is a droll rhymed epistle of his to Mr. Ayrton, asking for gallery orders of admission to see 'Il Don Giovanni;' and Talfourd, in his 'Final Memorials of Charles Lamb,' speaks of Ayrton being "mildly radiant at the continued triumph" of that opera, when assembling with other choice friends at Lamb's 'Wednesday Nights.' In 1821, Mr. Ebers having taken the Opera House, sought the aid of Mr. Ayrton as manager. Again was the manager baffled, this time by a committee of subscribers, who insisted on that which Ayrton would not yield—the right of apportioning the operatic characters among the performers. He abandoned the enterprise in a few months. From 1823 to 1833 Mr. Ayrton edited the 'Harmonicon,' in which his literary and critical articles were of a far higher character than had up to that time been customary in musical periodicals. Between 1833 and 1844 he contributed musical articles and biographies to the 'Penny Cyclopædia;' and in 1834–36, he edited 'Sacred Minstrelsy' and the 'Musical Library,' the earliest works in which high-class music was published collectively at a cheap price. He also wrote musical notices for Mr. Knight's 'Pictorial Shakspeare.' Mr. Ayrton was elected F.R.S. and F.S.A., and was one of the original members of the Royal Institution. At the time of his death, which took place 8th May, 1858, he had accumulated a large amount of materials for a 'Philosophical History of Music' and a 'Dictionary of Music.'

AYSCOUGH, REV. FRANCIS, the records of whose early life are nearly entirely summed up in a statement in the 'London Magazine' for October, 1766, that he might with propriety have been called the child of good fortune, was admitted of Corpus Christi College, Oxford, on the 28th of March, 1717. In 1723 he took his M.A. degree, and was subsequently admitted first to deacon's and then to priest's orders; and on the 16th of January, 1727, became a scholar or probationary fellow of his college. On the expiration of his second year of probation, he became a candidate for an actual fellowship. On the day for considering the claim, January 15, 1730, the president and a majority of the fellows voted against his admission, but without assigning any reason. Ayscough hereupon appealed to the Bishop of Winchester, the visitor of the college, who, after a hearing and consideration of the case, decided in favour of Ayscough, and sent an injunction commanding the college to admit him, and requiring those fellows who had excluded him to defray the costs of both parties. Ayscough was admitted accordingly, and he took the degree of D.D. in 1735. From the titles of Sermons which he published, Ayscough is known to have been chaplain to His Royal Highness the Prince of Wales in 1736, and to have become, in or before the year 1752, rector of North Church, Hertfordshire. He also held the office of preceptor to George III. before his accession to the throne, and to his brother Edward, Duke of York; and it was probably owing to his connection with the royal family, and to the influence of George, Lord Lyttelton, whose sister he had married, that he at length received the appointment of Dean of Bristol. He died in 1766.

AYSCOUGH, GEORGE EDWARD, the only son of the Rev. Francis Ayscough, D.D., by Anne, one of the sisters of George, Lord Lyttelton, was a lieutenant in the 1st Regiment of Foot Guards. The time of his birth and the particulars of his early history are unknown, excepting that he was honoured by having George III. and his brother, the Duke of York, for his godfathers. In 1774 he edited, with a dedication to his cousin, the second Lord Lyttelton, 'The Works of George, Lord Lyttelton, formerly printed separately, and now first collected together; with some other pieces never before printed.' This work went through several editions, of which the third, enlarged considerably from its first issue, was published in three volumes, octavo, in 1776. In the last-named year Ayscough published 'Sémiramis, a Tragedy; as it is acted at the Theatre Royal in Drury Lane,' 8vo. This play has an epilogue by Richard Brinsley Sheridan. In the following year Ayscough sought to recover on the Continent the health he had forfeited by dissipation at home, and on his return in 1778, produced, as the literary results of his journey, 'Letters from an Officer in the Guards to his Friend in England, containing some Accounts of France and Italy.' His sojourn abroad appears to have produced no lasting benefit to his ruined health, for he died, after a lingering illness, on the 14th (or, according to the 'Gentleman's Magazine,' the 19th) of October, 1779; leaving behind him the character of an abandoned man, and of a soldier "who gave up his commission to

avoid doing his duty when called upon by his sovereign to fight in America." (Nichols, *Literary Anecdotes of the 18th century.*)

AYSCOUGH, SAMUEL, the son of George Ayscough, and grandson of William Ayscough, both eminent printers at Nottingham, was born in that town in 1745, where he was educated under Mr. Richard Johnson, the author of 'Noctes Nottinghamiæ.' Injudicious speculations on the part of his father brought Samuel to the necessity of working as a labouring miller, from which employment he was rescued by the care of a gentleman who had been his school-fellow, and who now sent for him to London and procured for him the situation of over-looker to some street-paviours. Presently, however, he obtained employment successively in the shop of Mr. Rivington, the bookseller in St. Paul's Churchyard, and at the British Museum as an assistant under the principal librarian. The salary which his skill commanded at this institution, augmented by sums received for occasional employment in the libraries of private gentlemen, was shared by his father, whom he had, with some assistance from his early friend, sent for to London, and whom he maintained in comfort until his death on the 18th of November, 1783.

After having been employed in a subordinate capacity in the British Museum for 15 years, Ayscough was, about 1785, appointed assistant-librarian upon the establishment. In or before the year 1782 he was ordained to the curacy of Normanton-upon-the-Soar, in Nottinghamshire; and he also became assistant-curate of St. Giles-in-the-Fields, London. In 1790 he was chosen to preach the annual Fairchild lecture, at Shoreditch Church, before the Royal Society; which he continued to do until the completion of his series of 15 discourses on Whit-Tuesday, 1804. About a year before his death he was presented, by the Lord Chancellor Eldon, to the living of Cudham, in Kent, about 17 miles from London, where he regularly performed duty, though he continued to reside at the British Museum, where he died, of dropsy on the chest, on the 30th of October, 1804, in his 60th year. He was buried in the cemetery of St. George's, Bloomsbury, behind the Foundling Hospital.

Ayscough's labours, especially in connection with the library of the British Museum, were of exceeding value, but commonly of a kind in which it would be difficult to distinguish what is his from that which is by his colleagues. The following works, however, appear to have been wholly by him, and most of them were published with his name:—(1) 'A Catalogue of the Manuscripts preserved in the British Museum, hitherto undescribed, consisting of five thousand volumes; including the collections of Sir Hans Sloane, Bart., the Rev. Thomas Birch, D.D., and about five hundred volumes bequeathed, presented, or purchased at various times,' 2 vols. 4to, 1782. (2) 'Remarks on the Letters of an American Farmer; or, a Detection of the Errors of Mr. J. Hector St. John, pointing out the pernicious tendency of those Letters to Great Britain,' 8vo, 1783. (3) 'A General Index to the Annual Register,' from 1758 to 1780, both inclusive. (4) 'A General Index to the Monthly Review, from its commencement to the end of the seventieth volume,' 2 vols. 8vo, 1786. (5) 'A General Index to the first fifty-six volumes of the Gentleman's Magazine, from its commencement in the year 1731 to the end of 1786,' 2 vols. 8vo, 1789. (6) 'An Index to the remarkable Passages and Words made use of by Shakspeare, calculated to point out the different meanings to which the words are applied,' 8vo, 1790. (7) 'A General Index to the first twenty volumes of the British Critic,' 8vo, 1804; a continuation of which Index was subsequently compiled by Dr. Blagdon. And in addition Ayscough either compiled, or assisted largely in compiling, various Museum catalogues, the principal of which, the catalogue of printed books, 'Librorum Impressorum qui in Museo Britannico adservantur Catalogus,' 2 vols. fol. 1787, was compiled in about equal proportions, by Ayscough, Dr. Maty, and Mr. Harper.

AYTOUN, WILLIAM EDMONSTONE [E. C. vol. vi. col. 967]. In 1858 Professor Aytoun edited the 'Ballads of Scotland,' 2 vols. 8vo, Edinburgh and London; and in the following year published, conjointly with Mr. Theodore Martin, a Translation of some of the Poems and Ballads of Goethe. In 1861 he made a not very successful attempt after fame as a novelist, by publishing 'Norman Sinclair,' 3 vols.; and in 1863 gave utterance to his loyalty in a 'Nuptial Ode on the Marriage of the Prince of Wales.' Professor Aytoun was son-in-law to Professor Wilson (Christopher North), and was proud of his

wife as her father's daughter. He died August 4th, 1865, in Morayshire, at his country residence of Blackills, near Elgin.

AZEGLIO, MASSIMO, MARQUIS D', an eminent Italian statesman, artist, and author, and one of the chief agents in bringing about Italian union and freedom. He was the youngest son of CESARE TAPARELLI, MARQUIS D'AZEGLIO (b. February 10, 1763, d. Nov. 29, 1831), the representative of an ancient Piedmontese family, who served with credit against the French, was made prisoner in 1795, and kept in captivity till the peace of 1796; removed to Florence when the French annexed Piedmont; was sent in 1814 as minister from King Charles to congratulate the Pope on his return to Rome; then, with the rank of general, quietly returned to the management of his private affairs and to literary studies, during his last years being the director of a widely circulated journal, 'l'Amico d'Italia.'

Massimo d'Azeglio was born at Turin on the 24th of October 1798. His early education was directed by his father, a devout Catholic, and a strict, almost stern, disciplinarian. In due time he proceeded to college, but at the age of 16 entered the Urban Guard, when his regular academic instruction ceased. In 1814 he accompanied his father to Rome as a member of the diplomatic staff, and availed himself of the opportunity to take lessons in music and drawing. On his return to Turin he was appointed to a cornetcy in the royal guard, which he exchanged after a time for a higher rank in an infantry regiment. Becoming tired and ashamed of the idle and dissolute life he was now leading, he made a resolution (1817) to give up his wild associates, and set about learning to paint in oil, but after "six months of furiously hard work" he fell ill. On his recovery he was allowed to revisit Rome. Here he continued to study painting, selecting as his instructor one Marten Verstappen, of Antwerp, a clever but boorish left-handed landscape painter, under whom he learnt to paint directly from nature. But along with painting he read and even wrote poetry, among his compositions being a tragedy, the early scenes of a comedy, and some "frantic odes and sonnets about Italy." Miss Cornelia Knight, then resident at Rome, taught him English, and introduced him to other English families. It was a pleasant life, but Azeglio felt that it was an unsatisfactory one. He was dependent on his father, whose property had been wasted whilst his country had been held by the foreigner. His drawings had been admired, and he believed he could support himself by his pencil. That he might remove the objections which he knew his parents would feel to such a scheme, he went to Turin. His proposal was a serious blow to their notions of the obligations of nobility, and was especially repugnant to his father's family pride. But he prevailed, and with a trifling allowance (about 70*l.* a year) he returned to Rome, free to follow his inclinations, and to support himself by his own exertions.

He at once renounced all his fashionable acquaintances, dropped his title, and set hard to work. Socially, as he remarks, "it was a very perceptible fall. From having two or three horses and a servant, I was about to find myself minus horses and lodging—everything changed for the worse." But he never regretted the change: he was convinced, as he wrote just before his death, that "if every young man started in life with only 150 francs a month, the world would be more worthily peopled than it is." But though painting was now the business of his life, he did not limit his thoughts to the study of art. One of his first engagements was to rise two hours before dawn to take lessons in history of a professor named Garello. So he worked on, making steady progress till he was able to submit his pictures to public exhibition. One, 'Leonidas at Thermopylæ,' was sent to Turin, and his father offered it to King Charles Felix, who sent the artist a diamond snuff-box, which he, "as is the custom, hastened to sell for the sake of his memory." In 1825 he ventured on a more ambitious subject, 'The Death of Montmorency,' which he painted on a large scale, and which proved a decided success when exhibited at Rome, whilst "at Turin it was looked upon as quite a marvel." He was satisfied now that he had mastered his tools, and that it was time to quit Rome. He had stayed six years, sketched all the surrounding country, and visited Naples, Venice, Florence, and Switzerland, travelling over much of the ground "with his traps at his back," and he now determined to settle as a painter in Milan. The death of his father made some increase in his means, but he continued to work steadily at his profession, and during the fourteen years he remained at Milan (1831–45) he took a high position as an artist, and painted several pictures which hold honourable rank among the best productions of recent Italian art. The first pictures he exhibited at the Brera

(the Milanese Academy), 'The Challenge of Barletta,' 'The Interior of a Birch-wood,' and 'The Battle of Legnano,' took the Milan art-public by surprise—the thoroughly Italian subjects and the novelty and beauty of their execution contributing equally to the pleasure of the spectators—and they were at once purchased, 'The Birch-wood' by the Viceroy, the others by Italian noblemen. Nor did his paintings ever after lack purchasers, they mostly, indeed, when not commissioned, being bought whilst in his studio: "in one winter," he writes, "I painted twenty-four pictures, nearly every one of which was commissioned beforehand." The titles of a few of the pictures (there were 61 in all, about a-third being landscapes) exhibited by him at the Brera from 1833 to 1843, will sufficiently indicate their general character: 'Encounter between Diego Garcia de Paredes and a number of Frenchmen on the bridge of boats over the Garigliano;' 'Revenge,' (given to the church of San Fidele); 'The Ghost of Argalia;' 'Bradamante fighting the magician Atlante, to deliver Ruggero from the enchanted Castle;' 'Funeral of Duke Amadeo VI. of Savoy;' 'Ippolita, the messenger of Bradamante to Ruggero;' 'Defence of Nice against Barbarossa and the French' (commissioned by King Carlo Alberto); 'The Battle of Turin;' 'The Battle of Col d'Assietta;' 'Giacomuzzo Attendolo Sforza throwing his axe at a tree, to decide whether or not to turn soldier.'

But now commenced a new and most important phase in his career, and one of no small influence in the recent history of Italy. While at Rome, as now at Milan, he had not only resolutely avoided "dissipation and idleness, the curse of the young Italian gentry," but as resolutely held himself aloof from the *Giovine Italia* and secret societies generally, then rife throughout the country, yet as earnestly as the most enthusiastic he longed for the advent of a United Italy, while he believed that it was only by the cultivation of the national character, and thus forming a national mind, that Italy could be made one nation. In the hope of thus "acting on the public spirit by means of a national literature," he devised the plan of a novel 'Ettore Fieramosca,' but wrote only a small portion of it. At Milan he formed a close friendship with Manzoni, and married his daughter. The connexion stimulated his patriotic feelings. He finished his novel and submitted it to Manzoni and Grossi, who gave their hearty approval; the book was printed; by a little dexterous management secured the licence of the Austrian censor (who however was dismissed from his office for his want of perception); published (1833), and quickly ran all over Italy—"it passed from the masculine to the feminine half of society; found its way to the studios and the stage; became the *vade-mecum* of every prima-donna and tenor, and the hidden treat of the school-girl; and even penetrated between the pillow and the mattress of college boys, and of the military cadet." The purpose of the book, to rouse Italians against the foreigner, was clear, and its acceptance determined Azeglio to follow up the impression by another historical novel, 'Niccolò de' Lappi,' on which however he devoted a great deal more attention and study with a view to historical accuracy. Thus written amid the intervals of his professional labours its progress was necessarily slow, but it was at length finished, passed safely the ordeal of the censorship, and was published in April, 1841, with as prosperous an issue as its predecessor.

Azeglio's residence at Turin and professional career were brought to an unexpected close. He had made a journey to Rome at the instance of a friend, and whilst staying there he had become intimate with several of the leading Roman liberals. One of these told Azeglio one day that it was indispensable he should have a serious conversation with him. At their meeting he explained to Azeglio that the Romagna was in an excited state, and that in case of the anticipated death of Pope Gregory an outbreak was inevitable, that affairs amongst the nationalists themselves, owing to the measures of the Mazzinists, &c., were complicated and every movement hazardous, and that, in order to be prepared against evils that would inevitably arise, many of the most influential patriots considered it to be advisable to have a new man, one who had not been mixed up in the proceedings of the societies, and could inspire confidence, to assume the direction of the liberal party, and that they had decided that Azeglio was that man, and now called upon him to accept the dangerous responsibility. After brief consideration he undertook the charge on the understanding that he should be free to advise the relinquishing of secret societies, the abandonment of any premature outbreak, and the acceptance of Charles Albert as the head of the union. With this understanding he made a tour of propagandism, under the guise of an artistic journey,

through a great part of Italy, town by town, and with few exceptions secured the assent of the leading patriots to his views. Having thus satisfied himself of the general good-will, he proceeded to Turin and was admitted to an audience with Charles Albert, to whom he related the whole of his proceedings, and asked whether he approved of them or not. The king heard his statement in silence, and then replied—"Tell those gentlemen to remain quiet and avoid a rising, as nothing can be done at present; but let them be certain that when the time comes, my life, the lives of my sons, my sword, my exchequer, my army, shall all be expended for the Italian cause." It was the definite moment that led to the liberation of Italy, though not immediately. Azeglio could not quite shake off the distrust which the previous conduct of the king had implanted. The more impetuous entirely disbelieved the man and rejected his advice. But the king was true to his promise, and though he perilled his all on the cast and lost, the freedom of Italy was assured.

Azeglio, though successful in deferring a general rising, could not prevent a partial and necessarily disastrous outbreak. But he had now resolved on a policy of what he termed conspiracy in broad daylight: to make no attempt at revolution, but to prepare for the battle on the field of opinion and publicity. Balbo, with whom he was now in the closest connection, agreed with him that for this it was first of all necessary to write a book. The affair at Rimini afforded a topic, and in a month Azeglio had ready his 'Gli ultimi Casi di Romagna.' Permission to publish it was refused at Turin, but he was successful at Leghorn; and in a few days after its appearance in the beginning of 1846, it had been conveyed by hand from one end of Italy to the other. Its effect was decisive. It stimulated the Italian people, but it brought them to understand that the true policy was to wait the course of events. Azeglio was banished from Tuscany and forbidden to enter the Austrian dominions in Italy.

The election of Pope Pius IX. followed by his promulgation of a general amnesty, the adoption of liberal measures, and the expression of warm sympathy with the Italian cause, roused throughout the peninsula a wild passionate enthusiasm for the new pontiff, and Azeglio shared in the general illusion. He repaired to Rome and supported by his voice and influence the popular excitement, his belief, like that of Gioberti and Balbo, being that the Pope was the true leader of the Italian people, and that the right course for liberated Italy would be to assume the shape of "a confederation of free states with its centre at Rome, and the Pope for its president:" a fearful mistake, as he lived to feel, and, being adopted by Napoleon III., the source of endless complication and trouble. Azeglio's views were set forth in a series of pamphlets called the 'Programma per le Formazione di un' Opinione nazionale.'

Azeglio was now at Rome watching the course of events. He saw that the eruption was at hand, and as a call to readiness he published 'I Lutti di Lombardia,' a passionate narration of the Austrian tyranny in Lombardy and Venice, and one of the most effective of his writings. The Parisian outbreak of February, 1848, was immediately followed by the rising of Milan against the Austrians, and by the march of Charles Albert into Lombardy at the head of his army. Azeglio called on the people of Rome to join their countrymen; a small but enthusiastic army was, with the Pope's active support, quickly organised, and Azeglio accompanied it into Venetia as staff-adjutant to the commander, General Durando. Attacked by Radetski with an overwhelming force, the pontifical army was defeated (June, 1848) after a desperate resistance, and Azeglio fell dangerously wounded in the thickest of the fight. The armistice which Charles Albert was driven to conclude with the Austrians, closed for a time the prospect of Italian freedom. But Azeglio did not despair. He removed to Piedmont, and busied himself in counteracting the machinations of the extreme republican party.

Victor Emanuel, on his accession to the throne of Sardinia, turned at once to Azeglio to guide him in relieving the country from the state of depression and anarchy into which it had sunk. As minister, Azeglio imperilled not merely his popularity in Sardinia, but his influence with the Italian people, by entering into negotiations for a peace with the Austrian government, and notwithstanding the most violent clamour and reproaches, he persisted till he brought it to an honourable conclusion. Twice he dissolved the parliament on the question of its acceptance, but the same deputies were returned; when he issued a royal proclamation, signed by the king and countersigned by himself, setting forth the absolute necessity for peace in order to save the monarchy and the country. The proclamation of Moncalieri

produced its effect, and, as before, time was gained for Italy to repair her losses and watch for her opportunity. As Sardinian minister Azeglio directed his attention in the first instance to the financial and administrative reorganisation of the kingdom, amounting in many departments to a complete reconstruction, and with the most beneficial results. Another important measure was the abolition of ecclesiastical jurisdiction in civil matters, which led to collision with the papal government, though he still clung to his trust in Pius personally. He introduced Cavour into his ministry, but the men were too differently constituted to work well together, and the younger and stronger man prevailed. Azeglio resigned in May, 1852, but was induced by the king to resume office, Cavour being excluded from the new administration. But the difficulty of the position was not removed, and in October of the same year he resigned definitively. When, however, Cavour, by proffering the adhesion of Sardinia to the alliance against Russia, and proposing to send a contingent to the Crimea, placed Piedmont alongside the great European powers, Azeglio saw its immense value to Italy and announced his warm support of his rival's policy. On the conclusion of the Crimean war, Azeglio along with Cavour accompanied Victor Emanuel to Paris and London; and he drew up, at Cavour's request, the memorandum of Italian grievances which was laid before the Congress of 1856. In 1859 he heartily supported Cavour in every step that led to the war with Austria, and though in feeble health proceeded as envoy to Rome and to London, and, after the war had broken out, to Bologna. At the close of the campaign he became governor of Milan, but resigned the post on Cavour's avowal of complicity with Garibaldi's expedition into Sicily—a measure that revolted Azeglio's more fastidious sense of honesty and fair dealing.

He now withdrew wholly into private life. He had accepted the appointment of Director of the Royal Picture Gallery, Turin, and the time not required for the discharge of its duties, he spent mostly in the country. Still suffering from the effects of his wound, he was precluded from active physical exertion, but he painted, wrote, or received the visits of friends. In the hope of strengthening the Emperor Napoleon in the policy of non-intervention, D'Azeglio wrote in French and published 'La Politique et le Droit chrétien au point de vue de la question Italienne.' Somewhat later he published his 'Questioni Urgenti,' in which he again and with much earnestness urged the advantages of confederation as the solution of the Italian question, and implored his countrymen to abandon their passionate cry for Rome as the Italian capital. He also during these last years wrote the valuable and very interesting *Recollections of his life*, which were published the year after his death by his only daughter the Marchioness Ricci, and translated into English by Count Maffei (2 vols. 8vo); and which have supplied most of the materials for this memoir. But, though he continued writing till attacked by his fatal illness, he only lived to bring the work down to the publication of 'I Casi di Romagna.' The struggle, the defeat, and the ultimate triumph, were left for other pens to record. In December, 1865, while at his favourite villa on the Lago Maggiore, he was attacked by fever; the acute malady was overcome, but the chronic affection of the lungs under which he had long suffered assumed dangerous proportions, and he died on the evening of the 15th of January, 1866. Massimo d'Azeglio, taken altogether, was one of the most remarkable men that Italy has of late years produced. Not the greatest perhaps, but amongst the noblest and worthiest; one who has done most to make Italy what she is; one whose memory all true-hearted Italians will cherish; and one whose example her youth would do well before all to set before them as their model.

AZO, also named AZZO or AZOLINUS, one of the greatest jurists of the middle ages, was born at Bologna about the middle of the 13th century. His name is sometimes found, but in no good authority, with the prefix of Dominicus; sometimes with the surname of Ramenghis, or with that of Porcius or Porcius, which has several old testimonies in its favour; at other times, according to the custom of the age, it is coupled with that of his father Soldanus. He professed jurisprudence in the University of Bologna, and in no other; although it is sometimes wrongly stated that he taught at Modena or Montpellier. AZO was a pupil of Johannes Bassianus, but he far surpassed his master's fame and success; and in his time the University of Bologna numbered 10,000 students. He was frequently employed in state affairs by the city of Bologna; and his character was remarkable for a certain independence, which was apt to assume the form of harshness towards his adversaries. He is

too critically said to have known little of the liberal arts and of the canon law; and is even asserted by some authors to have become a canonist in his latter years, and to have entered holy orders. This last statement, however, results from confounding him with two later canonists, Azo Lambertaccius and Azo de Ramenghis. The year and manner of his death are alike uncertain. As to the first, authorities range between A.D. 1200 and 1230; and they who favour the latter date, appear to be the better informed. A frequent version of the manner of his death is, that having in a fit of passion killed one of his colleagues, he was publicly beheaded. But the idea of an ignominious death is scarcely reconcilable with the honours which were paid to his memory. Yet the mistake is probably founded on some real event, such as that of the execution of his son, in 1243; or perhaps that of another jurist, Azo Porchus, in 1247. Odofredus, the nearest of all authorities in point of time, mentions that Azo's devotion to his duties was so unremitting that he never felt ill except in vacation time, and actually died in the Autumn vacation; and that as a mark of respect to his memory, the beginning of the scholastic year, which had till then opened on St. Luke's Day, was deferred to that of All Saints. Azo had five sons, and his posterity can be traced at Bologna down to the close of the 14th century; but they never attained to eminence.

The works of Azo are six. (1.) His 'Glosses,' manuscript, remarkable as being the earliest which have often sufficient sequence to form a continuous commentary. (2.) His 'Readings on the Code,' known under the title of 'Azonis ad Singulas L.L. xii. libr. Cod. Just. Commentarius et magnus Apparatus.' The last three books of the Code, which Savigny reckons as the most valuable of all the works of the Glossators, as best exhibiting their method of teaching, were not by Azo, but by Hugolinus. The whole were collected by one of Azo's scholars, Alexander à S. Egidio, otherwise unknown, and were twice published, the first time by Contius, Paris, 1577, and again, with new title-pages, in 1581 and 1611; the second time at Lyon, 4to. 1596. (3.) The 'Summa Codicis,' and (4.) 'Summa Institutionum,' the ground-works of his fame. These Sums of Azo, which, it should be remembered, had been preceded by the less esteemed Sums of Rogerius, Placentinus, and Johannes Bassianus, received subsequent additions from Hugolinus and Odofredus; and there gradually arose a collection of Sums, or Commentaries, on the whole Corpus Juris, usually included in one volume, and comprising those of the Code and Institutes by Azo; that of the three Digests, attributed to Johannes, but in reality by Hugolinus; that of the Tres Libri, begun by Placentinus, continued by Pillius and never completed; and lastly, that of the Novels, by Pillius. The whole collection was frequently attributed to Azo, and hence the inextricable confusion in which Diplovataccio and other later authors have involved their accounts of the lives and writings of Azo, Johannes, Placentinus, and Pillius. The editions of the Sums are thirty in number, from that of Spire, fol. 1482, to that of Venice, fol. 1610, which may be distributed as follows, according to the places of publication: one at Spire, one at Milan, one at Geneva, two at Pavia, two at Basel, six at Venice, and no less than seventeen at Lyon, all either in fol. or 4to. (5.) The 'Brocarda,' consisting of short maxims of law, for which authorities are quoted, and to which a jurist of the name of Cacciavillano made some additions. The 'Brocarda' were published with the Sums in the editions of 1566 and 1581, Venice, fol.; Lyon, fol. 1593; and Venice, fol. 1610; and also separately at Basel, 8vo. 1567. (6.) The last extant work of Azo is the 'Questiones Sabbathine,' in manuscript. His 'Definitiones' and 'Distinctiones' are lost. Various other works have been attributed to Azo; some by a confusion of name between him and Azo Lambertaccius and Azo de Ramenghis. The reputation which Azo's Sums acquired and long retained was almost unbounded. Gravina speaks of the work as indispensable to every jurist. Azo was called the "fountain of law," the "trump of truth" (*veritatis tuba*), and even in his epitaph "the god of jurists" (*jureconsultorum numini*.)

AZPILCUETA, MARTIN, a famous doctor of the canon law, born in 1491 or 1493, at Varasoyñ, a town near Panpelpuna, in the then independent state of Navarre, from which circumstance he is often called "the Navarrese." He became, when young, a canon regular of Roncesvalles, and commenced his studies at the University of Alcalá. In 1512, when Jean d'Albret, the King of Navarre, retired to France from the invasion of Ferdinand the Catholic, King of Aragon, he was followed by Francisco Navarra, one of the principal Church dignitaries, and it is supposed that Martin, who was patronised by Francisco, and who went to France about the same time, went in his company, and

from the same motives. Azpilcueta remained 14 years in France, and taught canon law at Toulouse and Cahors; after which he returned to Spain, and taught at the University of Salamanca. He lectured first on the Decretals, and then on canon law in general; the study of which he revived with such effect as to achieve a reputation throughout Europe. He taught at Salamanca for 14 years, at the end of which time he accepted, by permission of the Emperor Charles V., the brilliant proposals made to him by John III. of Portugal, to teach in the University of Coimbra. Here he continued for 16 years; and then, retiring on a pension, repaired to the Court of Spain, where for 12 years he acted as confessor to some of the princesses of the royal family. In his 80th year he was called upon by the affection which he bore to his friend Bartholomé de Carranza, Archbishop of Toledo, to support the latter against the charge of heresy, first before the tribunal of the Inquisition at Valladolid, and then within the Pope's own jurisdiction at Rome. The investigation lasted some years, during which nothing could be proved against Carranza, who was finally ordered to dissolve all suspicion of heresy by a public abjuration of obnoxious doctrines, soon after which he died at Rome, in the monastery of Santa Maria sopra Minerva, on the 2nd of May, 1576. His advocate was treated with such distinguished honour, that he appears to have lost all wish to return home. Pius V. named him assessor to Cardinal Francesco Alciati, the vice-penitentiary; and Gregory XIII., the successor of Pius, manifested an extraordinary regard for him. Throughout Rome his name became so famous, that every one who excelled in an art or profession was called its "Navarro." His disposition was liberal and beneficent; and it is related that the mule on which he rode through Rome always stopped, when he came to a beggar, and did not move on till his master had bestowed the customary donation. He had practised charity from an early age; when a professor at Toulouse and Salamanca he was frequently seen in the morning delivering his lectures on the law, and in the afternoon acting as a servant in the hospital. Though of a weak constitution, he never, at the most advanced age, omitted the prescribed fasts, and he was always ready to give gratuitous legal advice to all who applied, till within five days of his death, which took place on the 21st of June, 1586. He was at this time, according to the date of his birth favoured by Nicéron, 95 years of age, 93 according to Antonio; and according to an erroneous statement in his funeral oration by Correa, upwards of a century.

There are, according to Clement, four editions of Azpilcueta's works:—(1.) 'Opera Omnia,' Rome, 1590, 3 vols. folio; (2.) Lyon, 1595—97, 3 vols. folio, the title of which, according to the Bodleian Catalogue, is 'Pleraque Opera'; (3.) At Venice, 1602, 6 vols. 4to, the first four of which contain all, and more than all, that is given in the two preceding editions, while the last two are occupied by 'Consilia et Responsa'; (4.) At Cologne, 1616, 2 vols. folio. An abridgment of the whole of his works was published by Castellanus, in 1 vol. 4to, at Venice, in 1598. The separate works, and the editions of them, are so numerous, that for a list of the whole we must refer to the second volume of Nicolas Antonio, or the fifth of Nicéron. The most remarkable are:—(1.) 'Manuale sive Enchiridion Confessoriorum et Penitentium,' a manual for confessors and penitents, into which, as Azpilcueta told Roscius Hortinus, one of his biographers, he had introduced all he knew; (2.) 'De rebus Ecclesiasticis,' a treatise on benefices, translated by Azpilcueta himself from a Spanish treatise of his own, 'Tratado de las rentas de los beneficios eclesiasticos para saber en que se han de gastar,' Valladolid, 1566. In this treatise Azpilcueta maintains that the holders of ecclesiastical benefices are bound to expend on their own wants no more than is strictly necessary, and to distribute all the remainder to the poor—a doctrine which met with some opposition. His remaining works are:—'On the Canonical Hours'; 'On Silence during Divine Service'; 'On the Year of Jubilee, and on Indulgences in general'; 'On the Ends of Human Actions,' &c. To the last is appended an 'Apologetic Letter to the Duke of Albuquerque,' in which, whilst refuting a report which was prevalent at Rome, that he had fallen into disgrace with Philip II., who with his ministers had been against Bartholomé de Carranza, Azpilcueta is led to give some particulars of his own life, from which subsequent biographers have drawn most of their information. There is also a biography of him by Simon Magnus Ramlotæus, prefixed to his edition of the 'Manuale,' at Rome, in 1575, and consequently published during Azpilcueta's lifetime—a proceeding at which he openly testified his displeasure. (*Biog. Dict. of U. K. Soc.*)

B

BAAN, JAN DE, an eminent Dutch portrait painter, was born at Haarlem, February 20, 1633; learnt the rudiments of art from an uncle named Piemans, and was then placed under J. de Bakker of Amsterdam, but formed his style on an attentive study of the works of Vandyck. He settled at the Hague, but came to England by invitation of Charles II., and painted the king and queen and several of the nobility, but he was dissatisfied with his treatment here and returned to the Hague. In 1672 he was invited to visit France in order to paint the portrait of Louis XIV., but he refused to paint a monarch who was at war with his country, and his answer was not resented. Besides princes and nobles, De Baan painted many of the more remarkable men of his time and country. Among them were the unfortunate Count Horn, and the still more unfortunate De Witts. When the populace had murdered the brothers, they insisted on De Baan giving up the portraits he had painted of them, but he had previously taken the precaution to remove them from his house. At Dordrecht, however, the crowd tore down and destroyed the portrait of J. De Witt, which was hung in the Town Hall,—a very elaborate composition, and held to be De Baan's masterpiece. Houbraken and others relate some remarkable escapes from the violence of those who envied his success, but some of the stories have rather a legendary character. He died at the Hague in 1702. His son, **JAKOBUS DE BAAN**, born in 1673, studied under his father; at the age of 18 was regarded as a good portrait painter; came to England, was patronized by William III., and painted a portrait of the Duke of Gloucester, which was much praised; went to Florence, where he was honoured with the notice of the Grand Duke, then proceeded to Rome in order to study the works of the great masters there; and on his return died at Vienna, in 1700, at the early age of 27. Some conversation pieces by him are much admired.

BABBARD, RALPH, an English mechanician, or mechanical inventor, who lived in the latter half of the 16th century, but nothing is known of his personal history. Mr. Halliwell, in his *Rara Mathematica*, has drawn attention to a manuscript in the Lansdowne Collection (MSS. Lansd. No. 125), containing "a speciall breife remembrance of some pleassante serviceable and rare inventions as I have by longe studie and chargeable practice found out," addressed by Babbard to Queen Elizabeth. One of the inventions was "the rarest Engyne that ever was invented for sea service;" and it is described as being "a vessell in manner of a Tally or Talliote [probably galley or galliot] to passe upon the seas and ryvers without oars or sayle against wynde and tyde, swifter than any that ever hath bynne seene, of wonderful effect bothe for intelligence, and many other Exployles almost beyonde the expectation of man." Some persons have imagined that this was a foreshadowing of the steamboat; but probably Babbard, like the Marquis of Worcester in his *Century of Inventions*, formed crude schemes which he never tested even by a model, or delineated in a diagram.

* **BABINET, JACQUES**, a French physicist, was born at Lusignan, March 5, 1794. He was destined for the bar; but a course of studies in the Lycée Napoléon at Paris, and the Ecole d'Application at Metz, gave him a strong love for science. He was for some time attached to the 5th Regiment of Artillery, which he quitted to become professor of physics at the College of St. Louis. Between 1825 and 1828 he gave courses of lectures on meteorology at the Athénée; in 1838 succeeded Savary at the College of France; and in 1840 succeeded Dulong in the section of general physics at the Académie des Sciences. In 1854 he became assistant astronomer at the Paris Observatory for Meteorology. He frequently lectured at the public meetings of the Institute, and before the Société Philotechnique. Babinet has written largely on scientific subjects. Among his works are the following:—*Resumé complet de la physique des corps impondérables, contenant, outre l'acoustique, un essai sur leur nature, la théorie de leurs vibrations, leurs applications à tous les phénomènes de l'électricité et du magnétisme, de la lumière et de la chaleur*, Paris, 1825, 32mo; and a companion work, in the same year, on *ponderable bodies*. *Expériences pour vérifier celles de M. Trevelyan sur la vibration des métaux chauffés*, Paris, 1835. Papers in the *Mémoires de la Société Philomathiques* on the measure of chemical forces; on the mass of the planet Mercury;

on the determination of terrestrial magnetism; on the retardation of light in refractive media, &c. Besides numerous memoirs in the *Comptes Rendus* and in the *Annales de Physique*, M. Babinet has written papers in the *Revue des Deux Mondes*, on the plurality of worlds; on precious stones; on the condition of the earth before geological epochs; and on earthquakes. *Études et Lectures sur les Sciences d'Observation, et sur leurs applications pratiques*, 1855—63, 7 vols. 16mo. *Calculs appliqués aux Sciences d'Observation* (in conjunction with M. Housel), 1857, 8vo. *Notice sur l'Eclipse de Soleil de 15 Mars*, 1858, 8vo. *Sur la Sécheresse, les irrigations, et les reboisements*, 1858, 4to. *Nouvelle Cours de Géographie physique et politique*, 1859, 12mo. *De la Télégraphie Électrique*, 1861, 8vo. *Notes sur quelques actualités scientifiques*, 1861, 4to. *La Période Glacière*, 1867, 8vo. He also wrote introductions to Nadar's work on aërostation, and to Liail's *Espece Celeste et la Nature tropicale*. Babinet contrived an aërostatic machine, which he called a *helix*, and introduced a new projection for maps known as the *homolographique* projection.

* **BABINGTON, CHARLES CARDALE**, was born in 1806 at Ludlow, in Shropshire; and received his early education in and near Bath, with which place he was closely connected for many years. His later education was carried on at St. John's College, Cambridge, where he took his B.A. degree in 1830, and his M.A. degree in 1833. He has written many papers (more than one hundred in number), chiefly relating to the entomology and botany of the British Isles. His first original work was the *Flora of Bath*; but he is best known by his *Manual of British Botany*, which has passed through several editions. This Manual manifests a quality which is prominent in many other of Professor Babington's writings, viz., a strong analytical tendency. He is remarkably quick in detecting the differential points of plants, and the result is that he recognises a far larger number of species in a group than do most of his contemporaries. This is well shown in his treatment of the genus *Rubus*, or Brambles. He succeeded Henslow as professor of botany in the university of Cambridge in 1861. He is a Fellow of the Royal and other learned Societies; and an editor of the *Annals of Natural History*.

BABINGTON, GERVASE, an English scholar and prelate, was born about 1550, according to Fuller (*Abel Redivivus*), in the county of Nottingham, but according to Prince (*Worthies of Devon*), in Devonshire; in either case being a member of the same ancient Nottinghamshire family as Anthony Babington, the conspirator. He was educated at Trinity College, Cambridge, at a time when Dr. Whitgift was the master, and became a fellow of that society. In 1578 he was admitted M.A. of the University of Oxford by incorporation. Having devoted himself to the study of divinity, he presently became celebrated as a preacher in the university. Upon taking his doctor's degree, he was appointed chaplain to Henry, Earl of Pembroke, who married "Sidney's sister," through whose favour he obtained in 1588 the prebend of Wellington in the cathedral church of Hereford, a stall which he held until his promotion to Worcester in 1597. He was collated to the office of treasurer of the diocese of Llandaff, January 28, 1590, to the episcopal oversight of which he was consecrated at Croydon, on the 29th of August, 1591. In 1595 he was translated "for his singular piety and learning" to the see of Exeter, and was enthroned there on the 22nd of March. He is charged with having inflicted irreparable injury on the revenues of this diocese, by alienating from it the rich manor of Crediton. In 1597 he was translated to Worcester, the temporalities of which were restored to him on the 15th of October. He was incumbent of the diocese of Worcester for about 13 years, and was one of the Queen's Council for the Marches of Wales. He died May 17, 1610, of a hectic fever, and was buried in his cathedral with great sorrow and solemnity. Fuller says of Babington that "in the midst of all his preferments he was neither tainted with idleness, nor pride, nor covetousness, but was not only diligent in preaching, but in writing books, for the understanding of God's word." Most of the books thus alluded to were published separately—some of them in more than one edition—between the years 1583 and 1604; and in 1615 they appeared collectively under the editorial care of Thomas

Chard, and with a dedication to the Earls of Pembroke and Montgomerie, in a large folio volume, entitled 'The Workes of the Right Reverend Father in God, Gervase Babington, late Bishop of Worcester. Containing comfortable notes upon the five Books of Moses, viz., Genesis, Exodus, Leviticus, Numbers, and Deuteronomie (the last two not before published); and also an Exposition upon the Creed (not before published), the Commandments, the Lord's Prayer, with a Conference betwixt Man's Frailtie and Faith; and Three Sermons. With Alphabetically Tables of the principall matters to each severall Worke.'

BACCIARELLI, MARCELLINO, Italian painter, born at Rome, February 16, 1731, was a pupil of Benefial. In 1753 he was taken to Dresden by Augustus III., Elector of Saxony and King of Poland, to make drawings for the engravings from the Dresden Gallery, and in 1756 he accompanied the King to Warsaw, where, with the exception of a visit to Vienna in 1761, to paint the portraits of the imperial family of Austria, he remained the rest of his life. Bacciarelli retained the favour of Augustus III. till the death of that monarch in 1763, and he was equally fortunate with his successor, Stanislaus-Augustus, who employed him in decorating the royal palaces, and made him director of the fine arts and of the crown buildings, his studio being converted into a sort of academy. On the foundation of the Warsaw University he was nominated dean of the faculty of the fine arts. He was held in the highest respect, and if the affairs of Poland had been in a less miserable condition, he would probably have founded a national school of painting. As it was, his labours died with him. He was a facile painter, with more elegance than vigour of style, and from the absence of healthy rivalry his manner deteriorated. His chief works were the series of six large paintings of events in Polish history, and portraits of the Kings of Poland from Bólaslas to Stanislaus-Augustus, for the palace at Warsaw. He painted numerous other large historical pieces for the royal family and nobility of Poland, and several scriptural subjects for the churches of Warsaw and other towns, besides a large number of portraits of the chief personages of the country. He died at Warsaw on the 5th of January, 1818, and was interred in the cathedral, where a handsome monument was erected to his memory. Bacciarelli was a member of the Academy of St. Luke at Rome, and of the academies of Bologna, Venice, Berlin, Dresden, &c.

BACCIO DA MONTE LUPO, whose real name was **BARTOLOMEO LUPI**, a distinguished Florentine architect and sculptor, was born about 1445. After a youth spent in idleness, he applied himself diligently to study, and executed an escutcheon of Pope Leo X. for the garden of the Pucci family at Florence, which was greatly admired, and brought him numerous commissions. The finest productions of his chisel were a statue of Hercules, executed for Francesco de' Medici, and a bronze statue of St. John the Evangelist for the Guild of Porta Santa Maria, which still occupies its original site at the corner of San Michele in Orto. He also executed a large number of crucifixes, the figures life size, of which Vasari enumerates several, and others, he says, may be found in various parts of Italy. As an architect, Baccio's most famous work was the finely proportioned church of San Paolino at Lucca, erected by him in 1522. It consists of a nave, choir, and transepts, being in the form of a Latin cross, and has columns of the Doric order. Baccio died at Lucca about 1534, and was interred with due honour in his church of San Paolino. He left several children, one of whom, **RAFFAELLE DA MONTE LUPO**, who died in 1588, attained to considerable reputation as a sculptor. According to his contemporary Vasari, Raffaele far surpassed his father Baccio, but this opinion was doubtless arrived at owing to his imitating the manner of Michelangelo, whom Vasari worshipped. He carved a Prophet and a Sibyl on the tomb of Julius II. from the models of Michelangelo; the angel on the Castle of St. Angelo; and the statue of Leo X. on his tomb in the church of the Minerva, as well as several other works in Rome, and a great many in other towns. In his later years he held the post of inspector and architect of the cathedral of Santa Maria in Orvieto.

BACHAUMONT, LOUIS PETIT DE, French memoir writer, was born about the close of the 17th century at Paris, where he died on the 28th of April, 1771. Bachaumont wrote 'Lettres Critiques sur le Louvre, l'Opéra, la Place Louis XV., et les Salles des Spectacle,' 8vo., 1752; an 'Essai sur la Peinture, la Sculpture, et l'Architecture,' 8vo., 1752, and some other things; but he is only remembered now for his 'Mémoires Secrets,' which were published after his death in 6 volumes, 8vo., 1777, and afterwards augmented by a series of 30 additional volumes, collected by Pidansat de Mairobert, and

BIOG. DIV.—SUP.

others. Bachaumont's memoirs, which extend from the 1st of January, 1767, to his death, relate to current events, social doings, gossip and scandal, and contain a sufficient store of piquant anecdotes respecting the notable people of the time, picked up for the most part, as was reported, in the salon of Madame Doublet, but some say, writes Dom Chaudon, "that his valet de chambre supplied him with many of them: so it is that historical collections are compiled." Several abridgments of the 'Mémoires' have been published: but the student of the manners and history of the 18th century should consult the original; and it should be added that Bachaumont's 'Mémoires' are of far greater value than the continuation.

BACHE, ALEXANDER DALLAS, an eminent geodetist and nautical surveyor, who for many years occupied a conspicuous place amongst American scientific men. Born July 19, 1806, in Philadelphia, he was educated at the Military Academy at West Point, where he graduated in 1825, and immediately afterwards was appointed assistant-professor of engineering in the Academy, a post which he held for some months. In 1827 he accepted the professorship of natural philosophy and chemistry in the University of Pennsylvania.

In 1836 he was made president of the Girard College, and as such he made elaborate inquiries into the state and method of education in Europe, the result of which inquiry was issued in an instructive octavo volume. In 1843 he succeeded Professor Hassler as Superintendent of the United States Survey, and retained the situation till his death, February the 17th, 1867. In conducting the survey, which is probably the most gigantic that has ever been achieved under the direction of any one individual, he displayed remarkable foresight, practical wisdom, and administrative talent. The survey reports, which were published annually, were either written or supervised by him, and won for him a European reputation, and one of the medals of the Royal Geographical Society of London. These reports are ranked by the best authorities amongst the most accurate and exhaustive works in the whole range of geodetical literature. Bache was an active member of the American Association for the Advancement of Science, to which body he contributed several valuable memoirs. He also contributed papers to the 'American Journal of Science and Art,' and other scientific publications. A list of his writings for periodicals is given in the 'Royal Society's Catalogue of Scientific Papers,' and comprises 75 items. He was elected the first President of the National Academy of Science on its establishment in 1863, his tenure of which was to have been for six years.

(*American Journal of Science*, Second Series, vol. xlv. p. 282.)

BACONTHORP, BACONTHORPE, BACONDORP, or simply **BACON, JOHN**, was born in the latter part of the 13th century, at Baconthorp, a village in Norfolk. He was "bred a Carmelite in the convent of Blakeney," and afterwards studied successively at Oxford and Paris. Here he acquired great reputation for learning, and was esteemed the head of the followers of Averroes, the "Interpreter" or "Commentator" of Aristotle. Fuller says that Baconthorp was remarkable especially for three things:—(1) For the dwarfishness of his stature; (2) for his high spirits in his low body; (3) for his high title, 'Resolute Doctor.' This high title was conferred upon him on account of the facility and soundness of his answers to the questions proposed to him. Upon his return to England, he was chosen the twelfth provincial of the English Carmelites, in a general assembly of that order, held in London in 1320. The disciples of Averroes, equally with their master, would have much difficulty in making their philosophical opinions harmonize with any system of theology that was considered orthodox by the average Jew, Mohammedan, or Christian; and it has been said of Baconthorp that "he grasped after more light than he saw, saw more than he durst speak of, spoke of more than he was thanked for by those of his superstitious order, amongst whom (saith Bale) neither before, nor after, arose the like for learning and religion." The year of Baconthorp's death is ascertained to have been 1346, but accounts differ as to his place of burial, which is variously said to have been Blakeney, Norwich, and London. Leland, Bale, and Pitts have given a catalogue of Baconthorp's writings, of which the principal ones that have been published are 'Commentaria seu Quaestiones par quatuor Libros Sententiarum,' Milan, 1510, and five other editions; and 'Compendium Legis Christi, et quodlibeta,' Venice, 1527.

BADCOCK, SAMUEL, a critic and theologian, was born at South Molton, in Devonshire, in the year 1747, and was educated for the dissenting ministry, the functions of which he exercised successively at Bere Regis, Dorsetshire, at Barnstaple, and at his

native town of South Molton. In 1778 he commenced his career as a man of letters; and in 1781 produced a poem called 'The Hermitage.' He was, however, chiefly distinguished as a critic and reviewer; and in this capacity gained great credit for his review of Martin Madan's 'Thelyphthora, or a Treatise on Female Ruin, in its Causes, Effects, Consequences, Prevention, and Remedy, considered on the basis of the Divine Law,' 3 vols. 1780-81. In this work the author, whose perception of the evils he wished to combat was quickened by his official employment as chaplain of the Lock Hospital, Westminster, justified polygamy, on the notion that the first cohabitation with a woman is a virtual marriage. His purpose was to remove the causes of seduction, but his opinions were overruled. Badcock's review of Madan's work was an elaborate vindication of our present marriage economy.

Early in his career Badcock had been a friend and admirer of Dr. Priestley, with whose opinions he manifested considerable sympathy. But a deeper study of ecclesiastical history convinced him that Unitarianism was not of the early origin which Priestley claimed for it; and he attacked, in a manner which Priestley himself felt to be formidable, the latter's 'History of Early Opinions concerning Jesus Christ; compiled from original Writers, proving that the Christian Church was at first Unitarian,' 4 vols. 8vo, 1786. Dr. Priestley wrote an immediate Defence, after which both History and Defence were attacked by Badcock. In 1784 Dr. Joseph White, Laudian Professor of Arabic, and afterwards Regius Professor of Divinity, delivered his celebrated Bampton Lectures at Oxford, in which he was so much assisted by Badcock that the latter is accounted by many the real author of the volume. Dr. John Johnstone, the biographer of Dr. Parr, remarks that "whether the plan of the Bampton Lectures was solely White's may be doubted. Much of the execution lay between him and Badcock; but the whole was superintended and revised by Parr." Soon after, Badcock conformed; and in 1787, having about twelve months previously, September, 1786, resigned his function as a dissenting minister, was ordained to the curacy of Broad Clyst, by John Ross, Bishop of Exeter, who is said to have admitted him, without examination, to deacon's and priest's orders on two consecutive Sundays. Badcock did not live to give proof of his ministry in the established church, but died on the 19th of May, 1788, in London, at the early age of 41.

BADIUS, JODOCUS, or JOSSE, a celebrated scholar and printer, was born in 1462 at Asche, or Aasche, a town in the province of Brabant, six miles north-east of Brussels, from which circumstance he is sometimes surnamed Ascensius. He studied successively at Ghent in Flanders, and at Ferrara in Italy. He afterwards settled at Lyon as a professor of the Greek and Latin languages, and became corrector of the press to John Trechsel, a printer of Lyon, whose daughter Thelif he married in or before the year 1499. It was to Badius that Robert Gaguin, the 20th General of the Order of the Trinitarians, entrusted the production of his work 'De Origine et Gestis Francorum,' fol. 1497; and the result of this commission was that Badius repaired in 1499 to Paris, where he established himself as a teacher of Greek, and as a restorer of the art of printing. His press acquired great reputation under the name of Præsum Ascensianum, and from it he issued, with his own notes and commentaries, editions of many of the classics, especially of Horace, Virgil, Lucan, Juvenal, Sallust, Quintilian, Valerius Maximus, &c. He bestowed the same pains on some modern authors, as Petrarch, Politian, Laurentius Valla, and Baptista Mantuanus. Badius had a numerous family, and the care of their maintenance pressed him into voluminous authorship, so that he was at once famous as "the father of many children, and the writer of many books," and it was pleasantly said of him in an epitaph composed upon him by his grandson, but which does not seem ever to have adorned his tomb, that "his books were more numerous than his children, because he commenced author very early, father very late." He died in 1535, at the age of 73, and was buried in the Collegiate Church of St. Benedict at Paris.

In the list of the works of which Badius was the author occur his 'Psalterium Beatæ Mariæ Virginis,' 'Epigrammata,' 'De Grammatica,' 'De Conscribendis Epistolis,' 'Vita Thomæ à Kempis,' and 'Navicula Stultarum Mulierum,' a satire on the follies of women, in which he imitated the style of Sebastian Brandt, of whose work, 'The Ship of Fools,' he had written a Latin Paraphrase, with annotations, under the title of 'Navis Stultifera à Domino Sebastianò Brant primum edificata, et lepidissimis Teutonicæ Linguae Rithmis decorata, deinde ab Jacobo Lochero Philomuso Latinitate donata, et demum ab Jodoco Badio

Ascensio vario Carminum Genere, non sine eorundem familiari explanatione illustrata.'

* BAEHR, JOHANN CHRISTIAN FELIX, an eminent German scholar, was born at Darmstadt on the 13th of June, 1798. He became a student of the University of Heidelberg, in which, in the year 1826, he attained the position of professor of classical literature. In 1833 he was appointed chief librarian of the library of Heidelberg, which owes important additions and improvements to his activity and intelligence. He became director of the Lyceum in 1839, and in 1845 director of the philological seminary. The Grand Duke of Baden made him a member of his privy council, and conferred upon him the order of the Lion of Zahringen.

Baehr is the editor of annotated editions of several of the 'Lives' of Plutarch, as for instance of the 'Life of Alcibiades,' 1822, and the 'Lives of Philopemen, Flaminius, and Pyrrhus,' 1826; and in the last-named year he produced Fragments of Ctesias, selected and annotated. In 1828 appeared the first edition of his celebrated 'History of Roman Literature,' 'Geschichte der Römischen Literatur,' 8vo, Carlsruhe, of which the second edition was issued in 1832, and the third, in two volumes, in 1844-5. An Abridgment of this work, 'Abriss der,' &c., was published at Heidelberg in 1833, and was translated into French by Roulez (Louvain, 1838). To the 'Geschichte der Römischen Literatur' three supplementary volumes were added between the years 1836 and 1840, all of which were published at Carlsruhe. They were—(1) 'Die Christlichen Dichter und Geschichtsschreiber Roms,' 1836; (2) 'Die Christlich-Römische Theologie,' 1837; 'Geschichte der Römischen Literatur im Karolingischen Zeitalter,' 1840. A fourth Supplement is expected to treat of the History of the Roman Literature from the Carolingian epoch to the 13th century. The most laborious and profound of all Baehr's editorial engagements is his valuable edition of Herodotus in 4 volumes, with notes, maps, and illustrations; and he has in addition contributed other works in archaeology and philology, besides articles to various encyclopædias, and to the 'Annals of Heidelberg,' of which since 1847 he has been the sole editor.

* BAER, KARL ERNST VON, an eminent biologist, was born Feb. 28, 1792 (new style), on the family estate of Piep in Esthonia. He spent his infancy at the house of an uncle situated in another part of the same Russian government, but returned to his native place in 1799 in order to attend the school there. In his autobiography he mentions several events of his early childhood which indicate the tendency of his thoughts to natural history subjects. This tendency was fostered by his uncle. In his fifteenth year he had already acquired a considerable acquaintance with the plants of his native district, as is evidenced by the following circumstance:—In 1807 his father was visited by Baron von Ungern-Sternberg, a botanist, to whom young Baer was able to show several indigenous plants which had not previously been seen by the baron. In the same year he was transferred to the cathedral school of Revel, where he pursued his studies for three years. The following four years were spent at the University of Dorpat, and in 1814 he acquired the degree of doctor of medicine. His knowledge of medicine, however, was slight, and for the purpose of better qualifying himself he visited the principal German universities. First he proceeded to Vienna, and passed through a medical course under the instructions of Professors Hildenbrandt, Kern, and Boer. In 1815 he went to Würzburg in order to study comparative anatomy under Professor Döllinger. He introduced himself to the professor by delivering him a small package of mosses which Dr. Martius had given him for the purpose, knowing how much Döllinger would prize them. Baer explained the purport of his visit, but was rather taken aback on being curtly informed that no lectures on comparative anatomy were to be given in the session about to commence. When Döllinger had opened his parcel and examined its contents, he gazed at Baer for a time, and then told him "to bring some animal and dissect it here; and then another one." The next morning Baer appeared at the professor's house with a leech, which he dissected under superintendence. This was Baer's first step in a long and honourable anatomical career. In 1815 Döllinger was desirous of investigating the development of chickens, but not feeling disposed to undertake it himself, he determined to engage some one who could not only dissect but also draw and engrave on copper-plates. These latter requirements prevented Baer's acceptance of the post, which was occupied first by Pander, and subsequently by d'Alton. This research led to the discovery of many important facts connected with the structure and developmental changes of the egg. Baer was fully cognisant of all the steps

of the inquiry, which had a great influence on his own subsequent career. In September, 1816, he left Würzburg for Berlin, where he stayed for a few months. In 1817 he took a position as prosecutor at Königsburg. While holding this post he seized every opportunity of acquainting himself with the structure of animals. The museum belonging to the college supplied him with a species of *Holothuria* from India, portions of the skeleton of the Aurochs, a specimen of *Delphinus phocaena*, &c. The results of his investigation were communicated to a meeting of anatomists at Königsburg in a paper entitled "Bemerkungen aus meinem zootomischen Tagebuche." Shortly after his comparison of the skulls of the aurochs and common ox was incorporated in Professor Hagen's memoir on *Bos urus*. This led to his drawing up a report on the individuals of *Bos urus* still existing in the forests of Lithuania. His first production was the thesis on the diseases endemic among the Esthonians, written prior to his receiving his doctor's degree. In 1819 he married Auguste von Medem, and in the same year he was appointed an extraordinary professor of zoology at Königsburg. In 1834 he became librarian to the Academy of Science at St. Petersburg; and in 1864 the fiftieth year of his doctorate was celebrated by the Esthonian nobility, at whose expense a splendidly printed and bound volume was issued containing Baer's autobiography.

The writings of Baer are very numerous, a full list of his books, pamphlets, articles, and short notices comprising upwards of 300 items. His most important work is that entitled 'Ueber Entwicklungsgeschichte der Thiere,' of which the first volume was published in 1828 and the second in 1837. His researches into the embryology of animals, a branch of science of which he was the founder, led him to his greatest scientific achievement, namely, the discovery that all animals arise from eggs, and that all eggs are at first morphologically identical. Another grand principle which he established is that the development of animals proceeds upon four distinct plans, which was an important advance upon Cuvier's discovery that all animals are formed upon one or other of four general plans or types of structure, as indicated in his classification of the animal world into Radiates, Mollusks, Articulates, and Vertebrates. Baer had himself arrived by independent research at the same classificatory result, and his proposed method of classification appeared in the same year as Cuvier's. His groups were essentially the same as those adopted by Cuvier, but he employed different names. In his later years Baer has spent much time in travelling over most parts of Europe, but especially northern Russia, and has given much attention to craniology and anthropology.

The reader who wishes for full information respecting Baer's life and writings is referred to his autobiography above mentioned. It is entitled, 'Nachrichten über Lebens und Schriften des Herrn Geheimrathes Dr. Karl Ernst von Baer, mitgetheilt von ihm selbst, 1865.' It is a large quarto volume of 674 pages, and was printed for private circulation only.

BAGNACAVALLLO [RAMENGHI, BARTOLOMEO, E. C. vol. v. col. 21].

BAHRDT, KARL FRIEDRICH, was born on the 25th of August, 1741, at Bischofswerda, a town of Saxony, about 20 miles N.E. from Dresden, where his father, Johann Friedrich Bahrdt, who subsequently became professor of theology and superintendent at Leipzig, was at that time placed as a deacon. He was educated successively at the Nicholaschule, the Schulpforte, and the University, Leipzig. In 1762 he became a catechist, and soon afterwards was appointed as Adjunct to his father, and professor extraordinary of sacred philology. In 1763 he made his first essay in literature by the publication of a work on the 'True Christian in Solitude.' Bahrdt was a man of much talent and critical judgment, but infirm of purpose, bitter in controversy, and unstable in morals; so that in 1768 he was obliged to vacate the appointments he held at Leipzig. He migrated to Erfurt, where he was made professor of philosophy and biblical antiquities, but where his academical and doctrinal irregularities acquired for him the odium of his colleagues. He married in 1770, and in the same year published a system of moral theology, 'System der Moraltheologie,' founded on an earlier work by his father. He next undertook an edition of the Old Testament on the plan of Dr. Kennicott, employing those manuscripts which had been neglected by former editors; and further proposed to organise a society of theologians, who, taking his own published System, should write their several judgments upon it, and these remarks were to be printed in a collected form. This plan produced the Letters on Systematic Theology. 'Briefe über die Systematische Theologie,' 2 vols. Eisenach, 1770-1772. In 1771, at the re-

commendation of his friend Semler, Bahrdt left Erfurt, and became preacher and professor at Giessen. Here his pen was unusually productive, and, it may be added, unusually severe; so that by his numerous discussions in controversial matters he made many enemies, and brought upon himself the rebuke of the ecclesiastical authorities. Hereupon he tendered his resignation, which, somewhat to his chagrin, was accepted. From Giessen he proceeded, in 1775, to undertake the directorship of the educational institution of Von Salis, called the Philanthropin, at Marschlins, in Graubünden, or the Grisons, where his impracticability clave to him so closely that he anticipated a probably imminent dismissal by accepting, with a feigned reluctance, the post of minister of Dürkheim on the Hardt, and superintendent-general. Here for a time he showed so much moderation, and a conduct so opposite to his former course of life, that he became an especial favourite both with the people and his patron, the Count of Leiningen-Dachsburg. His genius for quarrelling, however, did not long slumber; and he found it expedient to take a journey to Holland and England in search of pupils for a school which he had founded at Heidesheim, on the model of the Philanthropin. He returned in 1779 with 13 pupils to find that in his absence an imperial decree had been obtained against him, by which he was suspended from all ecclesiastical functions, until he should publicly retract his errors. He preferred to retire to Halle, in Prussia, where he opened a school, the doctrines of which were subversive of nearly all existing belief. Here he supported himself by his writings and his lectures, until he was guilty of the indecency of opening a tavern at the gate of the city, over which a female servant presided who unwarrantably assumed all the honours of a wife. This tavern, which he kept for ten years, was thronged with students and others, who were attracted by the easy doctrines of Bahrdt and the faithful reproduction of them in the practice of his life. Having ridiculed some ordinances of the King of Prussia in a comedy called the 'Religious Edict,' 'Das Religions-edict,' and having become suspected of initiating and advocating a secret and dangerous society called 'Die Deutsche Union,' he was condemned to two years' imprisonment—a sentence which was commuted by the King to one year's imprisonment in the fortress of Magdeburg. This time he employed in writing 'Morality for the Citizens, and a History of his own Life, 'Geschichte seines Lebens, seiner Meinungen und seiner Schicksale,' 4 vols. Berlin, 1790, in which he deals as recklessly with the good name of others as with his own. After his enlargement he formally separated from his wife, and pursued the same indecent course of life as before. He died at Halle, after a severe and lingering illness, on the 23rd of April, 1792. A list of the numerous works of Bahrdt is given in Wilhelm Heinssius's 'Allgemeines Bücher-Lexikon.' The three which are at once the most learned and of the greatest present interest and importance are—'Hexaplorum Origenis quæ supersunt,' 2 vols. 8vo, Lubeck, 1769-70; 'Observationes Criticæ, circa Lectionem Codicum MSS. Hebraicorum,' Lipsiæ, 8vo, 1770; and 'Apparatus Criticus ad formandum Interpretem Veteris Testamenti congestus,' Lipsiæ, 8vo, 1775.

BAÏF, JEAN ANTOINE DE, a French poet, a natural son of the Abbé de Grenetiere, was born in 1532, at Venice, where his father was residing as French Ambassador. He studied under Daurat, and had for a fellow-pupil the youthful Ronsard, with whom he formed a friendship which influenced his subsequent writings. At the age of 25 De Baïf published a volume of poems, addressed to two beauties (real or imaginary) whom he called Méline and Francine. From that time he became a poet by profession, celebrating events and persons of divers kinds in verse. He was generally poor, for his poems brought him more fame than wealth. By French critics he is considered to have impaired rather than enriched the French language, by his bizarre mode of writing. He indulged in a stilted kind of measure, intended to imitate the Latin and Greek poets, which he called after his own name *Baïfus*. He printed his verse with an alphabet consisting of 10 vowels, 19 consonants, 11 diphthongs, and 3 triphthongs of his own contrivance, by which he hoped to express by the spelling the exact sound of the words: some idea of it may be gained from the titles of the books given below, but the novel diphthongs are not in modern printers' founts. In 1570 he obtained a patent from Charles IX. empowering him to establish an academy of poetry and music; but this enterprise, the first of the kind in France, had little success. He died in comparative poverty at Paris, September 19, 1589. The published works of De Baïf are numerous, the following being the most important:—'Œuvres

de J. Ant. de Baif, Secrétaire de la Chambre du roi, contenant 9 livres de poèmes, 7 livres des Amours, 5 livres de Jeux, 5 livres de passe-temps, Paris, 1571—73, 2 vols. 8vo; 'Etrénes de poésie Françoisse an vers meürés: au roç, &c. Les bezones é jörs d'Eziodé, les Vers dorés de Pitagoras, ansénemans de Faulkilides: ansénemans de Naumage aux files a marier; par Jean Antöéne de Baif, Segretaire de le Çambre du Roç, Paris, 1574, 4to. Some of the copies were printed on vellum. Brunet describes a copy, the vellum binding of which bears the arms of De Thou, as containing an additional sheet with an ode, whose title is worth quoting as a sample of Baif's phonetic spelling—'A tres Eureus Prinse Hanri de France roç de Pélone sur son voçiaje é son antrée en son roçiaime; 'Les Mimes, Enseignemens et Proverbes; en 2 livres, Paris, 1576, 12mo; 1597, 8vo; 1619, 8vo; 'Tombeau de la royne de Navarre Marguerite, ou Traduction de cent distiques Latins des trois sœurs, Anne, Marguerite, and Jeanne de Seymour, sur la trépas de la royne de Navarre, par Baif, du Bellay, et Denisot, Paris, 8vo, 1551; 'Antigone, Tragédie en vers de cinq piéds, traduit du Grec de Sophocle, Paris, 1573, 8vo; 'Le Brave, ou le Taille-Bras, a comedy in 5 acts, imitated from Plautus, in four-feet verse, Paris, 1567. Besides these and other poems, De Baif published some musical works, viz., 'Instruction pour toute Musique des huit divers tons, en tablature de luth; 'Instruction pour Apprendre la tablature de guiterne; 'Douze chansons spirituelles, paroles et musique; 'Premier et deuxième livres de chansons à quatre parties.'

BAILLET, ADRIEN, a learned bibliographer, was born at Neuville near Beauvais, June 13, 1649. He studied at the convent of the Cordeliers, and afterwards at the college of Beauvais; took orders, and became vicar of Lardières in 1676, and minister of Beaumont church in 1679. He next occupied the post of librarian to M. Lamoignon, and for 26 years lived almost entirely among books, never going out more than one day in the week. He compiled and wrote out a most elaborate catalogue of the library, in 35 folio volumes; it was a catalogue of subject-matters, indicating not merely the authors of distinct works, but also those who had given slight or passing notices. His habits were eccentric; he slept only five hours a day, often sleeping in his clothes; took only one meal a day; drank no wine, and seldom had a fire. He thought only of books, the close attention to which weakened his naturally feeble health. He died January 21, 1706. Baillet's writings are very numerous, comprising a Life of Descartes; a History of Holland; an Essay on the Worship of the Virgin; Lives of the Saints (4 vols. folio; 10 vols. 4to; 17 vols. 8vo); the Maxims of St. Etienne de Grammont, &c. But the works which brought him into note were:—(1) 'Jugemens des Savans sur les principaux ouvrages des Auteurs,' 1685—86, 9 vols. 8vo; the commencement of a vast work which he never finished, and the pungent criticisms in which brought him into many controversies. (2) 'Des Enfants devenus célèbres par leurs études et par leurs écrits,' 12mo. 1688. (3) 'Des Satires personnelles, traité historique et critique de celles qui portent le titre d'Anti,' 2 vols. 12mo, 1689—a sharp satire on satirists, and especially Ménage, who had criticised Baillet's 'Jugemens.' (4) 'Auteurs déguisés sous des noms étrangers, empruntés, supposés, faits à plaisir, chiffrés, renversés, retournés, ou changés d'une langue en une autre,' 12mo. 1690. This was the commencement of a large work, which he abandoned on finding that it would give offence to his contemporaries.

BAILY, EDWARD HODGES, R.A. [E. C. vol. i. col. 486]. Even before his acceptance of the position of Honorary Retired Academician in 1862, Mr. Baily had withdrawn from actual professional practice, and as his physical infirmities increased, he was more and more confined to his dwelling. He died May the 22nd, 1867, aged 78.

* BAIN, ALEXANDER, Professor of Logic in the University of Aberdeen, was born in that city in 1818. He matriculated at Marischal College, in 1836, and took his M.A. degree in 1840; and in the same year commenced his literary activity by contributing an article to the 'Westminster Review,' to which he has since furnished several others at various times. From 1841 to 1844 he acted as deputy-professor of Moral Philosophy in Marischal College; in 1844-5 he was deputy of the Professor of Natural Philosophy; and in 1845 was appointed to the Professorship of Natural Philosophy in the Andersonian University, Glasgow. In 1847 he was named assistant secretary to the Metropolitan Sanitary Commissioners; and in the following year was appointed assistant secretary to the General Board of Health, but resigned his office in 1850. During the years 1847 and 1848, he wrote various text-books in Natural Science for

Messrs. Chambers's school series, and contributed the articles on Language, Logic, the Human Mind, and Rhetoric, to their 'Information for the People.' In 1852 Mr. Bain published 'The Moral Philosophy of Paley; with additional dissertations and notes.' 'The Senses and the Intellect' appeared in 1855, and a second and third edition respectively in 1864 and 1868; and the work was followed, in order to complete a systematic exposition of the human mind, by 'The Emotions and the Will,' in 1859, which attained a second edition in 1865. From 1857 to 1862 he acted as examiner in logic and moral philosophy in the University of London; and was re-elected to this office, 1864—68. Mr. Bain has been a frequent examiner in moral science at the examination for the Indian Civil Service; and in 1860 he was appointed by the crown to the chair of logic at Aberdeen. Since that time his principal works have been, 'On the Study of Character, including an Estimate of Phrenology,' 1861; 'An English Grammar,' 1863; 'Manual of English Composition and Rhetoric,' 1866; and 'Mental and Moral Science: A Compendium of Psychology and Ethics,' 1868, which reached a second edition the same year.

BAINES, RIGHT HON. MATTHEW TALBOT [E. C. vol. vi. col. 969]. The correct date of Mr. Baines' birth was the 17th of February, 1799. He resigned office with the other members of Lord Palmerston's ministry in February, 1858. His health permitted him to take little part in public matters subsequently, and he died at his residence, Queen's-square, Westminster, on the 22nd of February, 1860.

* BAKER, SIR SAMUEL WHITE, one of the successful recent explorers of Central Africa, was born at Thorngrove in Worcestershire, in June, 1801. His education included a considerable range of civil engineering; but his love of adventure gave another bent to his life. A residence of several years in Ceylon gave origin to two of his books, 'The Rifle and the Hound in Ceylon,' 8vo, London, 1854 (2nd ed. 1857); and 'Eight Years' Wandering in Ceylon,' 8vo, London, 1855. As an engineer, he planned and carried out the railway in Bulgaria, across the Dobrudscha from Rassova to Kustendje: an important work for travellers to the Black Sea, avoiding the tedious navigation of the lower part of the Danube. In 1861 he commenced his researches as an African traveller. Accompanied by his wife (a Hungarian lady, to whom he had been married in the preceding year), he started from Cairo for the Upper Nile. While tracing the course of the Atbara and the Blue Nile, two of the chief affluents of the great river, he was fortunate enough to see the commencement of the annual inundation; in a few hours a nearly dried-up stream was converted into a rapid river twenty feet deep, by the pouring down of water from the Abyssinian mountains. Mr. and Mrs. Baker reached Khartoum in June, 1862; compared the Blue Nile with the White Nile at and near the point of junction; brought together a large number of men, beasts of burden, and boats; and proceeded up the Nile to Gondokoro, a trading centre for many of the African tribes. Here they met Captains Grant and Speke, who had reached the same spot from the south, had discovered Lake Victoria Nyanza, and had heard of another large lake which they believed to be a very remote source of the Nile. Mr. and Mrs. Baker, amid almost innumerable difficulties and privations, succeeded in discovering this lake, on the 14th of March, 1864, and Mr. Baker named it the Albert Nyanza. [E. C. S., GEOG. DIV. col. 1038—41.] These discoveries gained for him the patron's medal of the Geographical Society, and the honour of knighthood. In 1866 he published 'The Albert N'Yanza, Great Basin of the Nile, and Explorations of the Nile Sources,' 2 vols. 8vo; and in 1867 'The Nile Tributaries of Abyssinia, and the Sword Hunters of the Hamram Arabs,' 8vo,—works which give a lively description of the country through which he and his wife struggled. When attending the Prince and Princess of Wales in their visit to Egypt at the end of 1868 and the early part of 1869, Sir S. Baker was consulted by the Khedive or Viceroy of that country concerning the possibility of suppressing the slave trade, and encouraging agriculture and legitimate commerce, near the upper waters of the Nile, far into the interior of Africa. An expedition was organised on a large scale, comprising troops, Nile boats, and stores in vast quantity, with various appliances for scientific exploration and industrial development. Sir Samuel Baker was placed in command of the whole, and invested with great powers. Sir Samuel, having first received from the Viceroy the order of the Medjidie, left Cairo with his party on the 2nd of December, 1869, Lady Baker, as in his former journeys, accompanying him. On the 8th of January, 1870, Sir Samuel Baker wrote from Khartoum that so far all had proceeded well, and that he expected to pro-

ceed within a week, with 1,000 soldiers. A later letter announces his having left Khartoum, and his expectation of reaching Gondokoro before the setting in of the rainy season in April.

* **BALARD, ANTOINE JÉRÔME**, was born at Montpellier, September 30, 1802. He was educated as a pharmaceutical chemist, and held several appointments in connection therewith, in his native town. In 1826 he was so fortunate as to discover in the mother-liquor of the salt marshes of Montpellier, and afterwards in the mother-liquor of sea-water, after the less soluble salts had been removed by crystallisation, the non-metallic element bromine. France, who never forgets to reward her scientific men in ways most gratifying to their intellect, promoted him to the chair of chemistry, left vacant by the death of Thénard; gave him in 1844 a place in the Academy; made him officer of the Legion of Honour; and in 1851 raised him to the chair of chemistry in the College of France, previously occupied by Pérouze. He has written numerous papers bearing on industrial chemistry, among which may be mentioned the method of extracting sodic sulphate directly from sea-water.

BALDERIC, or **BAUDRY**, an early French chronicler, was born at Meun-sur-Loire about the middle of the 11th century; studied at Angers, and, adopting the monastic life, became Abbot of Bourgueil in 1079. His fondness for poetry and light literature led to a neglect of his abbey, and a relaxing of discipline and morals. He secured the good will of Queen Bertrade, and disbursed much money in bribes to obtain the bishopric of Orleans in 1097, but unsuccessfully. He however obtained the bishopric of Dol in 1107. He became more severe and religious in his habits of life, and often visited the better conducted monasteries of England and Normandy. He spent the later years of his life in instructing the peasantry, and died at an advanced age in 1129 or 1130. During his career he assisted at many councils held at Rome. His chief writings were (1) '*Historiæ Hierosolymitanæ libri quatuor*.' This was a history of the first crusade, extending from 1093 to 1099, based on the earlier history by Theudebode; it is printed in Duchesne's '*Historiens de France*,' with a learned preface by Besly; (2) '*Gesta Pontificum Dolensium*,' now known only by extracts printed in Lebaud's '*Histoire de Bretagne*'; (3) '*Vita beati Roberti de Arbrissello*, first printed in 1641, in Latin and in 1647 in French, being translated by the Jesuit P. Chevalier. There have also been attributed to Balderic—'*Acta S. Valeriani*,' printed in du Bouquet's '*Histoire Ecclesiastique de France*'; '*Vita S. Hugonis Rotomagensis*,' printed in Moustier's '*Neustria pia*'; a poem, '*De Conquistu Angliæ*,' a fragment existing in MS. in the Imperial Library; a '*Lettre Curieuse aux moines de Fécamp*, sur les mœurs des Bas-Bretons, et sur l'état des monastères d'Angleterre et de Normandie,' (the French title given to it in du Bouquet's '*Historiens de France*'); and an historical poem on the chief events in the reign of Philippe I.

BALDERIC LE ROUGE, sometimes confounded with the above, was, like him, a chronicler of the 11th century. He was bishop of Noyon and Tournay, and died in 1097. He wrote a chronicle of Cambrai and Arras, extending from the time of Clovis to 1090; it was published in Latin in 1615 and 1834, and in French in 1836. There is also attributed to him a chronicle of Morinie, of which nothing is now known.

BALDI, LAZZARO, an eminent painter of the Tuscan school, was born at Pistoia, on the 19th of April, 1623 (though some authorities say 1624). He was the scholar of Pietro da Cortona, and after his death was regarded as the chief of the school. The greater part of his life was spent at Rome, where he died in 1703. His first patron was Cardinal Rospigliosi, afterwards Clement IX. A great number of his pictures, both in oil and fresco, may still be seen in the churches in and around Rome, and show him to have been a man of considerable fertility of invention, a good colourist, and a skilful painter, but too prone to imitate the manner of his master. His oil paintings are considered to be superior to his frescoes. Among his chief works are a '*David and Goliath*,' in the Quirinal, painted for Pope Alexander VII.; '*The Martyrdom of San Lazzaro*,' in the Academy of St. Luke; '*The Virgin Mary and St. Catherine*,' at Santa Maria della Pace, Rome; '*St. Peter receiving the Pontifical Power*,' at St. Camerino; a '*Repose in Egypt*,' in the church of the Madonna della Umiltà, at Pistoia; and '*St. Peter of Alcantara and St. Theresa*,' in the church of the Ognissanti at Florence.

BALDINUCCI, FILIPPO, Italian writer on art, was born at Florence about 1624. His studies having made him conversant with art and artists, he conceived the design of writing a complete biographical history of painting in Italy, from Cimabue

downwards, and the liberality of Cardinal Leopold de' Medici and the Grand Duke Cosmo III., who took great interest in his project, enabled him to devote himself to the undertaking. In 1681 he published the first volume under the title '*Notizie de' Professori del Disegno, da Cimabue in quà* (dal 1260 sino al 1670),' 4to. Florence, bringing the lives down to 1300. A second volume, continuing the series down to 1400, appeared in 1686, and he had prepared a third volume, to 1540, but it was not published till after his death, which occurred on the 1st of January, 1696. The remainder of the work, compiled by his son from the notes of Filippo, was published in 3 volumes, 1702–28. The original edition is now seldom met with in a complete form, but it has been many times reprinted, and sometimes with notes and additions: perhaps the most convenient edition is that of Florence, edited by F. Ranalli, 5 volumes, 8vo. 1845–47. Baldinucci's work would, by itself, give at the present day but an imperfect view of the lives of the Italian painters or the condition of art in Italy during the period to which it relates, but it is invaluable to the student of the art-history of the period. He understood what he was writing about; knew the men and their methods of procedure; was painstaking and conscientious, and had access to sources of information closed to later compilers; and he wrote in a pleasing and unaffected style. Another valuable work from his pen is a companion account of Italian engraving and engravers—'*Cominciamento e progresso dell' arte di Intagliare in Rame, con le Vite de' molti piu eccellenti maestri della stessa professione*,' 4to. Florence, 1686; reprinted at Florence, 4to. 1767, with notes by Manni. Baldinucci also published a dictionary of the arts of design, '*Vocabolario toscano dell' Arte del Disegno*,' 4to. Florence, 1681; and a lecture delivered at the Della Crusca Academy, of which he was an active member, '*Lezione detta nel Accademia della Crusca*,' 4to. Florence, 1692. Two posthumous works from his pen have appeared separately, '*Vita di Filippo di ser Brunellesco*,' edited by Moreri, 8vo. Florence, 1812; and '*Lettera intorno al modo di dar proporzione alle figure in pittura, scultura, &c.*,' edited by Poggiali, 8vo. Leghorn, 1802. The entire works of Baldinucci were published in 14 volumes, Milan, 1808–12, as a part of the '*Classici Italiani*.'

BALDOCK, or **BAUDAKE**, RALPH DE, bishop of London and Lord Chancellor in the early part of the 14th century, is currently said to have been educated at Merton College, Oxford. But as that college was founded by Walter de Merton, bishop of Rochester, in 1273, scarcely three years before Baldock was made archdeacon of Middlesex, Mr. Foss ('*Judges of England*') conjectures that the place of his education was rather the convent of Merton, in Surrey. He became a prebendary of St. Paul's, and held the stalls of Holborn, Isledon or Islington, and Newington. In 1276 he was collated to the archdeaconry of Middlesex; from which office he was promoted on the 18th of October, 1294, to be dean of St. Paul's, and was summoned by this title to the parliament which met on the 13th of October, 1300. On the death of Richard de Gravesend, bishop of London, December 9, 1303, Baldock was chosen, February 24, 1304, by the unanimous voice of the chapter, to the vacant see; an election which obtained the royal assent on the 22nd of March, and the archbishop's confirmation on the 10th of May. The temporalities were restored on the 1st of June. The election, however, was controverted by three canons, who, having been lately deprived of their prebends by the archbishop, were excluded from the election, and who now, in an appeal to the Pope, called its validity into question. Baldock found it expedient, therefore, to repair to Rome, where his mission was so successful, that, by command of Pope Clement V., he at length, January 30, 1306, received consecration at Lyon, at the hands of Petrus Hispanus, cardinal of Alba. On his return to England, he made profession of canonical obedience to the archbishop in Canterbury Cathedral, March 29, 1306; and on the 17th of July following, was enthroned in St. Paul's. In the same year he was appointed by the Pope to be one of the commissioners for examining the articles alleged against the Knights Templars. As bishop of London he gained great fame by the splendid repair of St. Paul's Cathedral at his cost, and it was on this occasion that the large collection of ox skulls was dug up, which was considered to fortify the tradition that here had stood a great temple to Diana. On the 21st of April, 1307, the day after the death of William de Hamilton, the Lord Chancellor, then in attendance on the king near the Scottish border, the Great Seal was conferred upon Ralph de Baldock, and its formal delivery to him took place on the vigil of the Ascension next following. The new chancellor did not repair to the king, but devoted himself to his official

duties, till the news of Edward's death reached London. This event took place at Burgh-on-the-Sands, on the 7th of July, 1307; and there is a curious entry on the Fine Roll, showing that Ralph de Baldock, being then in London and ignorant of the demise of the king, continued to send writs of course till the 25th of July. On the following Saturday he received the commands of Edward II. to send him the Great Seal, which was accordingly delivered to him at Carlisle on the 2nd of August. Being freed from the cares of office, Baldock spent the remainder of his days in the pursuit of literature, and the services of religion; only varying these by acting as one of the ordinaries for the management of the affairs of government and the king's household. He died at Stepney, July 24, 1313; and was buried under a flat marble in the Lady Chapel, on the east-side of his cathedral, to which both in his life and at his death, he was a munificent benefactor.

Baldock was an amiable and accomplished man, and reputed a master of all the learning of his time. He wrote in Latin a 'History or Chronicle of British Affairs' down to his own time, which, although now lost, was much valued by the author's contemporaries, and was known in the days of Leland, who saw it in London; he also compiled a 'Collection of the Statutes and Constitutions of the Church of St. Paul,' which was extant in the library of that church in 1559.

BALDUCCI, FRANCESCO, a celebrated Italian poet, was born at Palermo towards the end of the 16th century. An irregularly spent youth having brought him into pecuniary straits, he enlisted in the army sent by Pope Clement VIII. into Germany; and on his return, finding dependence on the great unsatisfactory and precarious, he took ecclesiastical orders, and was appointed chaplain of the hospital of San Sisto. Having acquired celebrity by his verses, he was invited to take up his residence in the house of Prince Gallicano. Here he was attacked by a fever, and at his own request was carried to the hospital of San Giovanni Laterano, where, after lingering about three weeks, he died in a state of delirium, 1642. Balducci's most celebrated poems are his 'Rime Siciliane,' 12mo. Rome, 1645 and 1647; reprinted at Venice, 12mo. 1663. The 'Rime' are praised by critics acquainted with the Sicilian dialect, for their purity of language, simplicity, and truth. His light anacreontic poems are also greatly admired for their airiness of manner, which ranks them among the best Italian verse of their class. Crescimbeni accords to Balducci the credit of having invented *cantatas*, or sacred poems for music, comprising recitativo and aria.

BALDUCCI, GIOVANNI, a distinguished early Italian sculptor and architect, was a native of Pisa, and flourished during the second quarter of the 14th century. His great patrons were Castuccio, lord of Lucca, and Azzone Visconti, duke of Milan. His masterpiece as a sculptor was the much-admired monument of San Pietro Martire in the church of S. Eustorgio, one of the best works of the period. As an architect his fame rests on the façade of the church of Bera, also in Milan, erected by him in 1347, as is inscribed over the entrance.

BALDUCCI, GIOVANNI, called COSCI, an eminent Italian painter of the latter part of the 16th century, was a native of Florence, where he was brought up by an uncle named Cosci, whence his designation. He was a pupil, and for some years an assistant, to Battista Naldini, whose mannerism he was charged with imitating, though himself an artist of more imagination and ability than his master. For some time he painted at Florence, then went to Rome with his patron, Cardinal Alessandro de' Medici (afterwards Pope Leo XI.), and spent his last years at Naples, where he died in or about 1600. Balducci's most celebrated works at Florence are the 'Last Supper' in the cathedral; a series of subjects from the New Testament, and another from the legend of St. Antonino, Bishop of Florence, in the cloister of Santa Maria Novella; and the entire decoration of the church of Gesù pellegrino, including frescoes of the Twelve Apostles, the 'Calling of the Sons of Zebedee,' and a Christ in Majesty. The cathedral of Volterra he ornamented with three subjects from the New Testament, and several figures of saints. At Sta. Prassede, Rome, he painted 'Christ Praying in the Garden,' and eight figures of angels, with the 'Resurrection of Lazarus,' in the Cloisters. At Naples his best work is a 'Holy Family' in the church of San Giovannello.

BALES, PETER, famed as a caligraphist, was born in 1547. His skill in writing in excessively small characters was accounted little short of marvellous. Holinshed describes his masterpiece, "a rare piece of work, and almost incredible" as containing "within the compass of a penny, in Latin, the Lord's

Prayer, the Creed, the Ten Commandments, a prayer to God, a prayer for the Queen, his poesy, his name, the day of the month, the year of Our Lord, and the reign of the Queen." He finished it on the 5th of August, 1575, and a week later presented it to Queen Elizabeth, at Hampton Court, "set in the head of a ring of gold covered with crystal." With it he presented "an excellent spectacle (lens) by him devised for the easier reading thereof, wherewith her majesty read all that was written therein with great admiration, and commended the same to the Lords of the Council and the ambassadors; and did wear the same many times upon her finger." But Bales is also memorable for a book on his art entitled 'The Writing Schoolmaster,' 4to, London, 1590. He divides his work into three parts—1, "Brachygraphie, that is, to write as fast as a man speaketh, treatably, writing but one letter for a word;" 2, Orthography; and 3, Caligraphy. On the strength of this book Bales is often spoken of as the first to introduce short-hand writing into England; but he was anticipated by two years by Dr. Timothy Bright, who in 1588 published a system of stenography, with a dedication to the Queen, under the title of 'Characterie, or the Art of Short, Swift, and Secret Writing.' Both systems consist of arbitrary characters, each standing for a word, instead of a combination of elementary signs as in the systems now in use. Bales' caligraphic and brachygraphic powers are said to have been called into requisition by Walsingham for diplomatic purposes. He died in 1610.

BALLANCHE, PIERRE SIMON, a philosopher and man of letters, was born at Lyon, in 1776. He is known for his efforts after the reconstruction of society, and for his enthusiastic anticipations of the same. He held and proclaimed that his epoch was one of transition to a new order of things; and generalising from the idea developed by Charles Bonnet, the "Brahmin of Natural History," of the palingenesis of the individual man, Ballanche conceived a palingenesis of the human race, and of all its relations, national, social, and political. Thus he was for a time one of the oracles of the professional reconstructors of society. His first work, "fait au sortir de l'enfance," was one which was never published, and which no longer exists even in manuscript. In it, he tells us in the "Preface Générale" to his 'Œuvres,' 4 vols. 8vo, Paris and Geneva, 1830, he sought to reproduce in a kind of epic narrative the terrors of the Revolution, in the midst of which he had passed his youth, and especially all the disastrous circumstances which attended or followed the Lyonnaise insurrection of 1793. He imagined a traveller from the continent of America, himself by that time the representative of a decaying civilisation, visiting about the year 3300, the ruins, and deserts, and sheep-walks which will then stand for the busiest centres of the life of to-day. The first published work of Ballanche was one entitled 'Du Sentiment considéré dans la littérature et dans les arts,' 1801. After having constructed in the feigned future the history of the present age, he proceeded to reconstruct the past in his 'Antigone,' a prose poem in six books, of which the last was finished at Rome in 1813, the entire work being ready for publication in 1814. The 'Antigone' was the result of many years of leisurely composition; and it reached a second edition in 1819, in which year appeared a small volume consisting of nine 'Fragments.' In 1818 Ballanche published his 'Essai sur les Institutions Sociales dans leur Rapport avec les Idées Nouvelles,' intended primarily as the Preface to the "épopée cyclique" which, composed chiefly of the 'Orphée,' 'Ville des Expiations,' and 'Elegie,' was to be known under the collective title of 'Palingénésie Sociale.' Of this work all that have been brought before the world in the 'Œuvres' of Ballanche are the 'Prolégomènes' in three parts, and the 'Orphée,' which refers to the state of prehistoric man, and is divided into nine books named after the Muses. It was intended to publish nine volumes of the 'Œuvres,' but the plan has not been prosecuted beyond the fourth. An edition, covering the same ground, was published in 6 vols. 18mo, in 1833. In 1819 appeared the first edition of 'Le Vieillard et le Jeune Homme,' a series of seven conversations, in which the ideas of the 'Institutions Sociales' are further elaborated. An edition of a hundred copies of 'L'Homme sans nom' was produced in 1820, and a second edition in 1828. 'L'Homme sans nom' is a regicide who is stricken by remorse, and who makes a life-long expiation, the end of which is soothed and elevated by religious consolation. The latest of the works of M. Ballanche is his 'Vision d'Hébal, chef d'un clan écossais,' the hero of which takes advantage of his gift of second sight to review the entire fortunes of the human race. The 'Vision d'Hébal' is at once a panorama of universal history, and a kind

of summary of the social philosophy of the author. It is tinged with a mystic colour through which its meaning is frequently hard to be defined, but Chateaubriand, a friend of M. Ballanche, regarded it as the most sublime and profound of his productions. Ballanche closed his life in repose and retirement on the 12th of June, 1847.

BALSAMON, THEODOROS, a Greek prelate, renowned as the ablest canonist of the Eastern Church, was born about the middle of the 12th century, at Constantinople, where he became chancellor and librarian of the cathedral church of St. Sophia. In 1186 he was nominated to the patriarchate of Antioch. He was flattered by the Emperor Isaac Comnenus with the hope of being made patriarch of Constantinople, but he never obtained that jurisdiction. His learning, which was rather technical than profound, exhibited itself in works that relate chiefly to canonical matters, and that are full of animosity against the Latin communion. He died in the year 1204. His commentary on the Canons of the Apostles and the Seven Ecumenical Councils, '*Commentarius in Canones SS. Apostolorum Conciliorum Patrium Epistolas Canonicas*,' was published in Greek and Latin, at Paris, in 1620; but the best edition is that of William Beveridge, afterwards Bishop of St. Asaph, in his *Pandects of Canons*, '*Συνοδικον, sive Pandectas Canonum*,' &c., folio, Oxford, 1672. The other works of Balsamon are '*Commentarius in Photii Nomocanonem*,' 4to., Paris, 1615; '*Collectio Ecclesiasticarum Constitutionum*,' printed in Justelli '*Bibliotheca Juris Canon.*' Vol. ii. Lat. cum notis Leunclavii, Franc. 8vo, 1593; '*Responsa ad varias Questiones Jus Canonicum Spectantes*'; and other tracts which have been published in different collections.

BALSHAM, HUGH DE, or DE BEDESALE, or BELESALE, was most probably born at Balsham, a village in Cambridgeshire, about the beginning of the 13th century. He was bred a monk; and became sub-prior of the Benedictine monastery at Ely. When the bishopric of Ely was left vacant by the decease of William de Kilkenny, who died, September 21, 1256, whilst absent on an embassy in Spain, King Henry III. issued a mandate to the prior and convent of Ely that they should elect Henry de Wingham, chancellor of England, to the vacant office. Notwithstanding the king's recommendation, they made choice, in a chapter held on the 13th of November following, of their sub-prior, Hugh de Balsham. The king had wished to entrust to a man skilled in public affairs, and not to one whose administration had been limited to a monastery, a place so politically important; and, incensed at the thwarting of his desires, he commissioned John Waleran, the keeper of the temporals of the see, to cut down the woods, to spoil the fish-ponds, to lay waste the manors, and to "make havoc of all things." The king had the case brought before Boniface, Archbishop of Canterbury, who, though he could discover no valid objection against Balsham, yet in order to gratify the king, declared the election of Balsham void, May 10, 1257. The latter now undertook a journey to Rome for the sake of making a personal appeal to the Pope; whilst the archbishop, in order to frustrate his suit, wrote letters to the Papal court, recommending Adam de Marisco, a celebrated theologian of the time, to the disputed see. Adam de Marisco was a man of great learning, but advanced in years, and incapable, on account of his vows as a Minorite friar, of accepting such preferment. He was content, however, to evade his vows, for the purpose of gratifying his ambition. Henry de Wingham wished to retire from a contest into which his name had been imported without his knowledge through the partiality of the king, confessing that either of the other candidates was better qualified than himself. At length, October 6, 1257, the Pope gave a decision in favour of Balsham, who was consecrated at Rome on the 14th of the same month. The king was induced to restore the temporalities to him on the 15th of January, 1258; and avenged himself by promoting in 1259 his nominee Wingham to the diocese of London. Being fully established in his see, Balsham set himself to accomplish those charitable purposes which he had initiated before his elevation, and especially his plan for the foundation of St. Peter's College, or Peterhouse, Cambridge, which he completed in 1284, for the maintenance of one master, fourteen fellows, two bible clerks, and eight poor scholars, whose number was to be increased according to the improvement of their revenue. Balsham died at Doddington on the 16th of June, 1286, and was buried on the 24th of the same month before the high altar of his cathedral church of Ely.

BALTARD, LOUIS PIERRE, French architect and architectural engraver, was born at Paris on the 9th of July, 1765. He began his career as a landscape painter, but during an

artistic tour through Italy, the study of the remains of ancient Rome diverted his thoughts to architecture, and encouraged and guided by Peyre, the architect of the Odéon, he became an architect by profession. Diligent, energetic, with a good deal of taste and a fair knowledge of construction, he found clients, and became a tolerably prosperous man, though he has no title to rank in the first line of the profession. He was appointed architect of the Panthéon, and of the prisons of Paris, in which latter capacity he erected the chapels of the Houses of Detention at St. Lazare and at Ste. Pélagie. In 1818 he was nominated professor in the École des Beaux-arts, and subsequently member of the council of civil buildings, and of that of public works. His principal building was the Palais de Justice, Lyon, a large and stately edifice. Though seemingly amply employed in his strictly professional labours, M. Baltard, who drew with exceeding taste and picturesque skill, found time to make a vast number of architectural drawings and engravings. Of these the following series were published: '*Paris et ses Monuments, avec des notes hist. et crit. par Amaury-Duval*,' large folio, Paris, An. XII. (1803, &c.). This is a finely executed work, but was never completed. The portion published consists of 100 plates, which include the Louvre, and complete the first volume; and the chateaux of St. Cloud, Écouen, and Fontainebleau, forming as much as was issued of the second volume: the descriptions were written by the Abbé Halma. '*Voyage Pittoresque dans les Alpes suivi d'un recueil de Vues des Monuments antiques de Rome*,' Paris, 1806, oblong 4to, with 48 plates in aqua-tinta, preceded by descriptive letters addressed to Percier. '*La Colonne de la Place Vendôme, contenant les détails des bas-reliefs qui décorent cette colonne*,' largest folio, with 145 plates engraved by Baltard, and printed at the '*Calographie du Musée*,' 1810. This splendid work had a curious fate. At first it was issued from the Musée to only a favoured few. On the Restoration, when it was the policy of the authorities to keep the deeds of the grande armée as much as possible in the shade, Baltard's book was strictly sequestered. But after 1830, the entire edition was found, with the plates, safely packed away in the Musée, and it was published by the government of Louis Philippe as vol. lxvi. of the '*Calographie*.' '*Athenæum*,' art-journal, edited and plates engraved by M. Baltard. '*Essai Méthodique sur la Décoration des Édifices et des Monuments, ou collection et choix des plus beaux morceaux de sculpture et peinture ancienne et moderne, en 120 planches ou dessins lithographiés, suivis d'un Discours*,' folio, Paris, 1817. '*Architectonographie des Prisons, ou parallèle des divers systèmes de distribution dont les prisons sont susceptibles, selon le nombre et la nature de leur population, l'étendue et la forme des terrains*,' with 40 plates, folio, Par. 1830. M. Baltard also engraved the plates to M. Denon's '*Egypt*,' folio, 1802; Cailliard's '*Voyage à l'Oasis de Thebes*,' folio, 1822; Cte. de La Borde's '*Voyage en Espagne*,' 2 vols. folio; Gau's '*Antiquités de la Nubie*,' folio, 1821—27; and continued alone the series entitled '*Grand Prix d'Architecture: projets couronnés par l'Académie*,' which was commenced by Vaudoyer and Baltard conjointly, and which since his death has been continued by his son, the subject of the following article. Besides all this, M. Baltard engraved some historical subjects, after Poussin and Le Brun, and portraits of Napoleon I., Poussin, and others. He died on the 22nd of January, 1846.

* **BALTARD, VICTOR**, an eminent French architect, son of L. P. Baltard, the subject of the preceding article, was born at Paris in 1805, and educated as an architect in the establishment of his father. Having won the grand prize of architecture in 1833 by a design for a military school, he went to Italy, where he devoted himself to close study of the ancient remains. The fruit of his researches was seen in a restoration of the Theatre of Pompeii, sent home in 1837. On his return to France he was nominated architect to the government and to the city of Paris, and in his official character he has executed several very important works. The most colossal is the vast Halles Centrales, Victor Calliat being in the first instance appointed joint architect. Other important works are the completion of the Hôtel du Timbre, begun by M. P. Lelong, and the elaborate and costly restorations of the churches of Saint Germain-des-Prés, Saint Séverin, and Saint-Eustache. Like his father, M. Victor Baltard has devoted a good deal of time to high-class book illustrations, though we believe he has not himself engraved any plates. As mentioned above, he has continued the publication of the '*Grand Prix d'Architecture*,' initiated by his father. He has also edited the text and designed the plates of a superb monograph on the '*Villa Médicis*,' fol. 1847—48; and

he made the numerous designs from nature of the costly 'Recherches sur les Monuments de l'Histoire des Normands' of M. Huillard-Bréholles, published at the expense of the Duc de Luynes. Among the works a little outside his usual course may be mentioned the cradle of the Prince Imperial, which he designed as architect to the city of Paris. M. Victor Baltard was elected a member of the Académie des Beaux-arts (section d'architecture) in 1863. M. PROSPER BALTARD, elder brother of Victor (b. 1796), has also pursued a prosperous though quiet career as an architect: he has for some time held the post of inspector of the buildings of the Louvre. A younger brother, M. JULES BALTARD (b. 1807), holds a high position as a portrait painter.

BALUZE, ETIENNE, a distinguished French scholar of the 17th century, was born on the 24th of December, 1630, at Tulle, in the province of Guienne, where he received his early education. At the age of 16 he was removed to the College of St. Martial at Toulouse, and afterwards attended the law schools; but his taste for ecclesiastical history, and a critique which he published in 1652 on the 'Gallia Purpurata' of Frizon, procured him the friendship first of Charles de Montchal, Archbishop of Toulouse, and then of his successor de Marca, who in 1656 conducted Baluze to Paris, lodged him in his palace, and at his death, June 29, 1662, bequeathed to him all his manuscripts. This mark of confidence exposed Baluze to attack and controversy. Through successive situations of honour and responsibility, Baluze became, in 1667, librarian to Colbert; and after the death of that minister, was appointed by Louis XIV., in 1670, to the professorship of canon law in the Collège Royal, a post which was created expressly for him. In 1707 he succeeded the Abbé Gallois in the directorship of the college, and was also admitted to a pension, both of which advantages he forfeited in the year following through a political inadvertence in his History of the House of Auvergne, 'Histoire Généalogique de la Maison d'Auvergne, justifiées par des Chartes, Titres, Histoires Anciennes, et autres preuves authentiques,' 2 vols. fol. Paris, 1708. This work brought upon its author the wrath of the king; and he was exiled successively to Rouen, Blois, Tours, and Orleans. He obtained his recall upon the peace of Utrecht, in 1713; but he was never re-instated in his pension or his appointments. He retired, therefore, to a small house near Paris, where he devoted himself to the prosecution of his favourite studies, and died on the 28th of July, 1718. He was buried in the church of St. Sulpice.

Baluze was a man of great learning, and had immense power of patient and intelligent research, especially in ecclesiastical and profane history, and ancient and modern canon law. The publications of which he was either author or editor, amount to no less than forty-five, many of which consist of several volumes. His principal works are 'Regum Francorum Capitularia,' 2 vols. fol. Paris, 1677; 'Epistolæ Innocentii Papæ III.' 2 vols. fol. Utrecht, 1682; 'Conciliorum Nova Collectio; cum Notis,' folio, Utrecht, 1683; a work intended as a supplement to the 'Sacrosancta Concilia' of Labbeus, but of which only one volume, out of a contemplated series, was published; 'Vies des Papes d'Avignon,' 2 vols. 4to, 1693; 'Historia Tutelensis Libri tres,' 2 vols. 4to; and 'Miscellanea; hoc est, Collectio veterum Monumentorum, quæ hactenus latuerant, in variis Codicibus ac Bibliothecis,' 7 vols. 8vo, Paris. Of this curious and valuable work the different volumes appeared severally in the years 1678, 1679, 1680, 1683, 1700, 1713, and 1715; and a new and larger edition in 7 vols. folio, was published by Father Mansi, at Lucca, in 1761.

BANCHIERI, ADRIEN, Italian poet and musical composer, was born at Bologna in 1567. After studying under Guami, organist of Lucca Cathedral, he was appointed organist at Imola and afterwards at Bologna, and became a monk of the order of the Mount of Olives. He continued to play the organ and to compose various kinds of musical pieces, almost to the time of his death, which took place in 1634. Walther ('Musikalisches Lexicon'), and Mazzuchelli ('Gli Scrittori d'Italia') give the names of a large number of his compositions. Among them are pieces for the organ, madrigals for three and five voices, part songs for eight voices, canzonets for four voices, masses and psalms, motetts and anthems, church sinfonias, pieces for four voices with an organ accompaniment, and compositions for two voices with string accompaniments. Besides these he published 'La Pazzia Senile,' Venice, 1598, 4to., a kind of musical comedy for three singers, in madrigal style; 'L'Organo Suonarino,' Venice, 1605, folio; containing among other things directions for a continued base in organ-playing; 'La Prudenza Giovinale,' 1607, a counterpart to 'La Pazzia Senile'; 'Cartella Musicale,' Venice, 1610, 4to., consisting of essays and

compositions to illustrate the theory of harmony, plain chant and counterpoint, a comparison of ancient and modern forms in music, duets in canon to illustrate solfeggio, and a suggested addition to Guido d'Arezzo's syllables in solmisation; 'Direttorio Monastico,' for the music of the Monastic church to which he belonged; Bologna, 4to., 1614; 'La Fida Fanciulla,' a musical comedy in prose; Bologna, 8vo., 1628. Banchieri also published many poetical pieces under his academical name of Camillo Scaligeri della Fratta.

BANDARRA, GONÇALO ANNES, a poet and thaumaturgist, known as the "Portuguese Nostradamus" was born about the beginning of the 16th century, at Villa de Trancoso, where he fulfilled the humble vocation of a cobbler. Although so entirely without education that he could neither write nor read, he achieved a wonderful reputation as a popular poet and prophet; and his 'Trovas Redondilhas' were in full possession of the lips and hearts of the vulgar. As a patriot, Bandarra took a gloomy view of the affairs of Portugal upon the disappearance of Don Sebastião, whose return, and the future prosperity of whose kingdom, however, he glowingly anticipated. But this, and other aspirations of the cobbler, made him obnoxious, about 1540, to the Inquisition, which was the more insolent from the circumstance of its having just been restored to power after a suspension of its functions. It has sometimes been said that Bandarra was charged before the Holy office with the crime of being a Jew; but his real accusation was that of being a false prophet. He suffered imprisonment, and took part as one of the penitents, in the auto-da-fé which was celebrated on the 23rd of October, 1541, in the Place de la Ribeira, at Lisbon. After his enlargement he returned to his poetry and his trade in his native village. He is said by Barbosa to have received the honour of burial in the church of Trancosa, where a monument was erected to him, by D. Alvaro de Abranches. His death took place about 1556. Many years after his death Bandarra began to be called *O Sapateiro Santo*, the holy cobbler. His works circulated for a long time in manuscript, but in 1581 they were prohibited, possibly upon the occasion of the printing of a small edition. An edition of Bandarra more certainly appeared in 1603, 'Paraphras e concordancia de algunas prophcias de Bandarra, sapateiro de Trancoso.' The prosecution of the living bard by the Inquisition, did not prevent the posthumous respect of the Jesuits, by one of whom was published, in 1659, a folio volume entitled 'Esperança de Portugal, quinto imperio do mundo, primeira e segunda vida del rey D. João IV., escriptas por Gonçalez Bandarra, e dada a luz pelo padre Antonio Vieyra, da Companhia de Jesus.' The works of Bandarra have been edited more than once within the present century.

*BANDEL, JOSEPH ERNST VON, a celebrated German sculptor, was born at Ansbach, on the 17th of May, 1800; studied first at Nürnberg, and then at the Kunstakademie, Munich. His earliest work, a 'Mars Reposing,' 1820, gave promise of original power. After brief visits to Nürnberg and Rome, he settled in Munich till 1834, when he removed to Berlin; of late he has resided chiefly at Hanover. Whilst at Munich he executed several busts that were greatly admired, alike for their originality of style and characteristic expression: among the most noted were those of the King, Maximilian Joseph, and the artists Hess, Gärtner, Stieler, and Quaglio. But his principal work was a statue of Charity, on which he spent several years, and which has been classed among the finest productions of modern German sculpture. At Berlin, his most celebrated works were the colossal statue of Arminius (Hermann), in copper, and a life-sized statue of Christ. Among the works executed for Hanover are the statues of Shakspeare and Goldoni, for the theatre, and a large rilievo for the Military Hospital. Besides these, he has executed a statue of King William IV., for Göttingen; several classical figures, and numerous portrait busts.

*BANDELLONI, LUIGI, an Italian poet and musical composer, was born at Rome in the early part of the present century. After studying counterpoint under a monk, named Padre Teofilo, and taking Zingarelli as his model in composition, he set to music some of the sonnets of Petrarch, the octaves of Tasso, and short pieces from Dante, with accompaniments for the pianoforte and other instruments. Among his other compositions are—a 'Preghiera a Dio,' for three voices; a 'Tantum Ergo'; a hymn to St. Agnes; masses and motetts; and psalms harmonized for a choir and orchestra. He composed many cantatas, under the collective name of 'Azioni Teatrali,' for several voices, chorus, and orchestral accompaniment. Among them were cantatas on the subjects of Alceste, Pyramus and

Thisbe, Cupid and Psyche, Clytemnestra and Ægisthus, Cassandra and Agamemnon. He also wrote a satirical poem on the Roman composers of the day—'Sulla Musica Odierna.'

BANIER, L'ABBÉ ANTOINE, a learned French writer, was born at Pont-du-Château, a little village in Auvergne, on the 2nd of November, 1673. Having completed his studies at the College of Clermont, he went to Paris, where he found employment as tutor of the sons of M. Nicolai, president of the Chamber of Accounts. The rest of his life was absorbed in literary labour. He was admitted associate of the Académie des Inscriptions et Belles-lettres in 1716, and pensionary in 1728. He died at Paris on the 19th of November, 1741, at the age of 68. His chief works are:—(1) 'L'Explication Historique des Fables,' 2 vols. 12mo, 1711; a work which was well received, and of which an enlarged edition was published a few years later. But the Abbé Banier became dissatisfied with it as it stood, and he developed his views in a much more voluminous work under the title of (2) 'La Mythologie et les Fables expliquées par l'Histoire,' 3 vols. 4to and 8 vols. 12mo, Paris, 1738; a work displaying great learning, research, and ingenuity, but the author's explanations are more hazardous and ingenious than sound, and the book is now pretty generally regarded as obsolete. (3) 'Traduction des Métamorphoses d'Ovide,' 3 vols. 12mo and folio, with the designs of Picart, 1732: to this translation Banier added a great body of learned notes, and indulged largely in his propensity for elucidating the fables: a second and more splendid edition appeared in 1767 in 4 vols. 4to. (4) A new edition of the 'Mélanges d'Histoire et de Littérature' of Dom B. Dargonne (better known as the 'Mélanges' of Vigneul-Marville), which he augmented by a third volume containing anecdotes, criticisms, and a great deal of out-of-the-way reading. (5) 'L'Histoire Générale des Cérémonies et Coutumes religieuses de tous les Peuples du Monde,' 7 vols. folio, 1741. This was a new edition of the great Dutch work of J. F. Bernard, 1735—7, undertaken conjointly with the Abbé Mascrier, with the object of purging the book from the statements and opinions of the original edition, which were held to be adverse to the Roman Catholic Church. Banier contributed to it a large amount of curious learning, but the taint of tampering with the text adhered to the book; and although in many respects superior, it has never been as much valued as the original edition. The Abbé Banier also wrote many dissertations in the Transactions of the Académie des Inscriptions; and edited the Voyages of C. Lebrun, 1725, and of Paul Lucas, to both of which he added numerous learned notes.

BANIM, JOHN, a vivid delineator of Irish life and character, was born near Kilkenny, in 1800. He was a poet and painter by nature; but after writing poetry when a mere boy, and commencing to study as a painter, he took to literature as a means of support. At the early age of seventeen he became Editor of the 'Leinster Journal.' In the next following year he wrote (in conjunction with Richard Lalor Sheil) a five act drama on the subject of 'Damon and Pythias,' which had a temporary success at Drury Lane Theatre. In 1820 he married and settled in London, where for a time he edited the 'Literary Register.' In 1821 he published 'The Celt's Paradise.' His 'Tales of the O'Hara Family,' of which the first series was published in 1825, and the second in 1826, brought him prominently forward. Almost disregarding the light and joyous elements of the Irish character, he treated the more tragic, criminal, passionate, and revengeful features, in which he excelled all his predecessors. The true Irish peasant may be best understood by combining the brighter pictures painted by Crofton Croker and Miss Edgeworth with the deeper shades by Banim. There afterwards proceeded from his pen 'The Anglo-Irish of the Nineteenth Century,' 1828; 'The Croppy, a tale of 1798,' same year; 'The Denounced,' 1830; 'The Smuggler, a tale,' 1831; 'The Ghost Hunter and his Family,' 1833; and several smaller sketches. Many of the O'Hara Tales have been frequently republished separately; and some of them have been translated into German by Lindau. Mr. Banim's health began to give way about 1832; he went to Boulogne, fell into poverty, and obtained monetary aid to enable him to return to Kilkenny, in 1835. Incapacitated from further literary labour, the Government granted him a pension of £150 per annum in 1837, with £40 additional for the education of his daughter. But continued illness kept him always impoverished, until his death, which occurred at Windgap Cottage, near Kilkenny, August 1st, 1842.

BANISTER, JOHN, though distinguished as a botanist, (his name being applied to one of the genera of the order MAL-PIGHIACEÆ), honourably mentioned by Ray, and contributor of

BIOG. DIV.—SUP.

four papers to the Transactions of the Royal Society of London, yet scarcely anything is known respecting him. In a manuscript note attached to a short notice of him in Sir Joseph Banks's copy of 'Pulteney's Historical and Biographical Sketches of Botany' (in the Library of the British Museum), 1790, vol. ii. p. 55, it is stated that he was a Missionary of the Church of England, and was some time in the East Indies. After some years he proceeded to Virginia, where he carefully examined the plants, described them, and drew figures of rare species. He also described the insects, and contemplated writing a natural history of Virginia. In 1680 he sent a catalogue of the plants of Virginia to Ray, and several letters and memoirs to Lister and Petiver, and also to the Royal Society. He met with an untimely end, 1689, in attempting to climb a rock in order to secure possession of a plant. In memory of this event we have the genus *Banisteria*: and Linnæus, in order still further to honour him, applied to one of the species the word *scandens*, or 'climbing,' because it loves to climb rocks. His herbal passed into the collection of Sir Hans Sloane. He was not a Fellow of the Royal Society, but three of his papers are in No. 198, and the fourth is in No. 247 of the Transactions.

BARAGUAY D'HILLIERS, MARSHAL. [D'HILLIERS, BARAGUAY, MARSHAL, E. C. vol. ii. col. 579.]

BARANTE, AMABLE-GUILLAUME-PROSPER, BARON DE BRUGIÈRE, E. C. vol. i. col. 521. The 'Vie Politique de M. Royer Collard, ses Discours et ses Écrits,' 2 vols. 8vo, 1861, 2nd ed. 2 vols. 18mo, 1863, was the last work M. de Barante lived to write. He died at his country seat, the Château de Barante, in Auvergne, on the 22nd of November, 1866, in the 85th year of his age.

BARATYNSKI, JEWGENIJ ABRAMOVITCH, an eminent Russian poet, was born in 1792. Of a wealthy Smolensk family, he was educated in the royal school at St. Petersburg. Having entered the army, he was promoted and sent with a command to Finland. Here he wiled away his enforced solitude by the composition of a poem entitled 'Eva,' in which the local colouring of the country and its inhabitants is preserved with great fidelity and elegance. The climate and occupation, however, ill suited him, and through the friendly intervention of Jookowski the Emperor Nicolas at length granted him permission to return. He removed to the neighbourhood of Moscow, and devoted all his leisure to poetry. The result was the production of his 'Tsigrani' (The Gipsies), a poem similar in title to Pushkin's, but wholly dissimilar in character, and by many native critics considered to be superior: by some, indeed, it is regarded as the most beautiful poem of its class in the language. Baratynski contributed a few pieces subsequently to periodicals, but wrote no long poem. Indeed, during his latter years, his health was too much shattered to permit him to undertake any serious labour. With great difficulty he obtained permission to try a milder climate, and he repaired to Italy, where he died in 1844. Baratynski's collected 'Poems' were published in two volumes, 1835.

BARBADILLO, ALFONSO HIERONIMO DE SALIS, an eminent Spanish author, was born at Madrid, about 1580. Though attached to the court, and an indefatigable writer, he was always poor, but he lived on terms of intimacy with men whose acquaintance was honourable. With Cervantes he formed a close friendship, and though both wrote novelets, there was no literary jealousy between them. Barbadillo's novelets have been placed on a level with those of Cervantes, and in mere grace and finish of style they may sustain the comparison; but they are feebler, and more superficial; whilst Barbadillo has nothing that can be in any way compared with Cervantes' great romance. Besides his tales, Barbadillo wrote poems, verselets, and comedies, which are light, sparkling, and cheerful. One of the most popular of his stories was 'El Caballero puntual,' Madrid, 1614, of which a second part was published in 1619; another was 'Da Ingeniosa Helena, Hija de Celestina,' 1612, which was several times reprinted. His 'Don Diego,' 1623, the story of a Spanish cavalier, divided into nine nights, is sprightly and amusing. Barbadillo's poems include 'Rimas Castellanas,' 12mo, Madrid, 1618, mostly sonnets, epigrams, and occasional pieces; 'Los Triunfos de la beata soror Juana de la Cruz,' 1621, a poem in heroic verse; and 'Coronas del Parnaso y Platos de las Musas,' 1635, an allegorical poem, with which are printed the comedies of 'Victoria de España Francia,' and 'El Galán Tramposo y Pobre.' The 'Fortunate Fool' of Barbadillo was translated into English by Philip Ayres, in 1670. Barbadillo died in 1630.

BARBIER, ANTOINE ALEXANDRE, a distinguished

M

French bibliographer, was born at Coulommiers (Seine-et-Marne), on the 11th January, 1765. On leaving the college of Meaux in 1782, he was made successively vicar of Arcy and of Dammartin. In 1791 he received the appointment of curé of Ferté-sous-Jouarre. He now began collecting materials for completing certain works by other hands, already published; viz., the 'Bibliothèque d'un Homme de Goût,' the 'Dictionnaire Historique' of Ladvocat, and also that by Chaudon. He renounced the priesthood in 1793, married, and gave himself wholly to letters. In 1794 he was appointed member of the temporary Commission of Arts, to whom was entrusted the duty of selecting the valuable books and MSS. from the suppressed monasteries and other establishments, and depositing them in the national libraries. Having formed a library for the Executive Directory, he was appointed librarian of it in 1798. While filling the office of Librarian to the Council of State (to which body the library of the Directory was transferred in the time of the Consulate), he published a 'Catalogue de la Bibliothèque du Conseil d'État,' 2 vols. folio, which brought him into repute among literary men. He became Librarian to the First Consul, which post he continued to hold when Bonaparte assumed the title of Emperor Napoleon. In 1806 appeared the first two volumes of the 'Dictionnaire des Ouvrages Anonymes et Pseudonymes,' which was completed by two more volumes, 8vo, 1808. The first edition of this work contained 12,403 articles; the second edition, published in 1822-27, was augmented to 23,647 articles. It is a work of great research, and generally compiled with judgment. It is now being re-issued, incorporated with Quérard's 'Supercheries Littéraires Dévoilées' (which title is given to the combined work), 6 vols. 8vo, 1869-70; but the revision appears to have been imperfectly performed, and the new matter is often inaccurate. The 'Nouvelle Bibliothèque d'un Homme de Goût' appeared in 1808-10, in 5 volumes, 8vo. Barbier retained the good graces of the Emperor, who constantly consulted him on matters relating to books and history. He founded for Napoleon the Imperial Libraries at the Louvre, Fontainebleau, Compiègne, and St. Cloud, and prepared good catalogues of the books. In 1812 he published 'Dissertation sur soixante traductions françaises de l'Imitation de Jésus-Christ, suivie de Considérations sur l'auteurs de l'Imitation,' 12mo. When the 'Biographie Universelle' was commenced, about the same time, a proposal was made that Barbier should join in the management; but the arrangement was not fulfilled. In 1820 appeared his 'Examen Critique et Complément des Dictionnaires historiques les plus répandus, depuis le Dictionnaire de Moreri jusqu'à la Biographie Universelle inclusivement,' 8vo. This work was not continued after the letter J. Some strictures on the Biographie Universelle brought him into controversy with the editors. Barbier was continued in the office of administrator of the royal libraries, until 1822. He died at Paris on the 5th December, 1825.

BARBOSA MACHADO, DIOGO, a celebrated Portuguese biographer and historian, was born at Lisbon on the 21st of March, 1682; and received his education at the University of Coimbra. He was admitted into holy orders, and became Abade of Santo Adrião de Sever, a modest preferment which he enjoyed for many years. His career was long, and undistinguished by any events of importance, apart from the publication of the results of his literary and historical labours. He died in 1770. Barbosa is the author of a great historical work upon the reign of Dom Sebastian, which is not frequently consulted, and which bears as a title, 'Memorias para a historia de Portugal, que comprehendem o governo del rey D. Sebastião, unico em o nome, e decimo sexto entre os monarchas Portuguezes. Dedicadas a el Rey D. João V., nosso Senhor: approvadas pela Academia real da Historia Portugueza: escritas pelo Academico Diogo Barbosa Machado, Ulyssipponense Abade da Igreja de Santo Adrião de Sever, do Bispado do Porto,' 4 vols. large 4to. Lisboa Occidental; 1736, 1737, 1747, and 1751. But the most important of the productions of Barbosa is a work in which for the first time there was an attempt to introduce exact bibliographic researches and precise dates into the sphere of Portuguese literature. The work was entitled, 'Bibliotheca Lusitana, Historica, Critica, e Cronologica. Na qual se comprehende a Noticia dos Autores Portuguezes, e das obras, que compuserão desde o tempo da promulgação da Ley da Graça até o tempo presente. Offercida à Augusta Magestade de D. João V. nosso Senhor, por Diogo Barbosa Machado, Ulyssipponense, Abade da Parochial Igreja de Santo Adrião de Sever, e Academico do numero da Academia Real,' 4 vols. fol., Lisboa Occidental, 1741, 1747, 1752, and 1759. This work is remark-

able for its diligence and breadth and patience of research, with which, however, the good judgment of the author did not keep pace. Materials for Portuguese history and biography are given without being subjected to the influence of a sufficiently-informed faculty of criticism. The names of foreign books are frequently outraged; and there are some considerable omissions. Yet it remains that this work, with all its imperfections, is the most valuable contribution to Portuguese biography that has ever appeared. It was to a great extent modelled upon the 'Bibliotheca Hispania Nova,' of Nicolas Antonio, which was published in 1672. Nearly seventy years before the publication of the first edition of the work last-mentioned, Dr. J. Soarez de Brito, of the University of Coimbra, had completed a dictionary of less extent, but with the same general purpose as that of Barbosa. This was in Latin, and bore as its title, 'Theatrum Lusitaniae literarium, autore Joanne Suarez de Brito,' &c. Owing to some cause or other, at present unknown, the 'Theatrum' was never published; and the original manuscript is deposited in the Bibliothèque Impériale of Paris. Barbosa confesses his obligations to this production for many useful hints, which served as a guide to that indefatigable collector, who had undertaken an enterprise from which the members of the Academy of History, in 1735, shrank in alarm at its magnitude. For the purpose of rendering the 'Bibliotheca Lusitana' as complete as possible, Barbosa exercised the liberty of access which he enjoyed to the royal, public, and ecclesiastical libraries of Lisbon, to which the earthquake of 1755 was so disastrous in its operations. The earthquake, however, in spite of the fatality it seemed to carry to the archives of the capital, did not arrest the labours of Barbosa, who, four years after, in 1759, published the fourth volume of his work, containing the supplements and necessary corrections, and a useful index of names. Barbosa likewise translated a work from the Italian of Mucio Dandini; and collected his fugitive contributions to the Academy under the title of 'Contas de seus estudos Academicos.'

BARDON, MICHEL-FRANÇOIS-D'ANDRÉ, French painter, and writer on art, was born at Aix, in Provence, on the 22nd of May, 1700. He was brought up to the law, was admitted avocat at Paris, and returned to practise in Provence, but growing disgusted with the profession he abandoned it, and took lessons in painting from Vanloo and De Troy. He commenced the practice of painting in his native place, but after a while went to Paris, where he painted historical, religious, and mythical subjects, and met with much success. He was elected to succeed Lépicié as professor of painting in the École de Peinture. Later he was appointed director of the Academy of Marseille. He devoted himself with great zeal to the instruction of the pupils, gradually abandoning the practice of his art in order to develop more thoroughly what he conceived to be its true principles. The views thus taught in the first instance from the chair, he afterwards published in a long series of works. Of these the principal are, 'Conferences sur l'utilité que les Artistes peuvent retirer d'un Cours d'Histoire universelle,' 1751; 'Livres des Principes à dessiner,' 4to, 1754, reprinted 1764; 'Traité de Peinture, suivi d'un Essai sur la Sculpture, et d'un Catalogue raisonné des plus fameux peintres, sculpteurs et graveurs de l'École Française, pour servir d'introduction à l'histoire universelle relative à ces beaux-arts,' 2 vols. 12mo, Paris, 1765; 'Histoire Universelle, traiter relativement aux arts de peindre et de sculpter,' 3 vols. 12mo, 1760. M. Bardon also wrote 'Vie de Carle Vanloo,' 12mo, Par. 1765; 'Anecdotes sur la Mort de Bouchardon,' 1764; 'Monument de la Ville de Rheims,' 12mo, 1765, and several poems, the titles of which it is not necessary to give. For M. Cochin's series of 360 plates of 'Costumes des Anciens Peuples,' 4to, Paris, 1760, 2nd ed. 1772; 3rd, 4 vols. large folio, 1784, M. Bardon wrote the historical descriptions. Some of Bardon's paintings have been engraved by Balechou, and Heineken mentions several of his own engraving. M. Bardon died at Marseille on the 14th of April, 1783.

BARÈRE DE VIEUZAC, BERTRAND, whose surname is frequently, but erroneously, spelled BARRERE, was one of the few prominent actors in the great French Revolution who survived to old age. He was born September 10th, 1755, at Tarbes, where his father was a small landed proprietor. After practising with distinction as an advocate at Toulouse, and filling a judicial function at Tarbes, Barère was elected to the States General as representative of Bigorre in 1789. From that time he became deeply engaged in all the agitating scenes of the Revolution. He first joined the Orleans party, and edited a moderate journal called 'Le Point du Jour;' but soon took a more democratic

line, pronouncing against the king and the clergy, and such of the provincial parliaments as showed royalist leanings. Early in 1790 he carried a motion for placing all the Crown property at the absolute disposal of the National Assembly, with the exception of such palaces and domains as the king might reserve. About the same time he was elected Secretary of the Assembly; and published a pamphlet, 'Les Étrennes au Peuple, ou Déclaration des droits de l'Homme et du Citoyen, précédée d'une Épître aux Nations.' During the remaining period of the existence of the Assembly, Barère took an active part in its proceedings, becoming gradually more and more revolutionary. He either proposed or supported decrees giving the rights of man and of citizenship to persons of colour; forbidding any of the Royal family from leaving France; confiscating the property of *émigrés*; refusing to the King's ministers the right of speaking in the Assembly, except to give explanations when required; and inveighing with increasing severity against the hapless King. He transferred his membership from the moderate Club des Feuillants to that of the Jacobins; and associated himself with Robespierre, Danton, and Collot D'Herbois. This course of action lasted during the continuance of the National Assembly (June, 1789, to September, 1791), and of the Legislative Assembly (October, 1791, to August, 1792). When the National Convention was chosen (September, 1792), Barère was elected representative for the Hautes Pyrénées; and he was soon chosen president. He shared fully in the audacious proceedings of that body: in one of his speeches pronouncing the words which did so much towards inciting a thirst for the blood of the deposed king ("L'arbre de la liberté croit lorsqu'il est arrosé du sang de toute espèce de tyrans"). The Jacobins gradually overpowered the Girondists in the Convention; Robespierre was the leading spirit of the Jacobins; and Barère's conduct was much influenced by fear of that terrible man. As a member of the Committee of Public Safety, he drew up most of the decrees of accusation against "the enemies of the republic;" and obtained the sobriquet of the "Anacréon of the Guillotine." He was one of the principal originators of the Reign of Terror, and was the deputy who spoke of Queen Marie Antoinette as "cette femme scélérate." After having joined Robespierre and Danton to crush the Girondists, and Robespierre to crush the Dantonists and Hébertists, he turned against Robespierre himself, when the hour of the latter was come. Under the Directory (which succeeded the Convention in 1795) Barère lived much in concealment, and wrote voluminously. One of his works was 'De la pensée du Gouvernement;' another, 'Montesquieu peint par ses Ouvrages;' and a third, 'La liberté des Mers, ou le Gouvernement anglais dévoilé.' When Napoleon assumed power as First Consul and then as Emperor, Barère was constantly employed in drawing up decrees and reports; but without being really trusted or respected. On the restoration of the Bourbons Barère was banished from France as a regicide. He took refuge in Belgium, where he augmented his moderate income by literary labours, producing several works, but none of permanent value. After the Revolution he was permitted to return to France, and he was elected to the Chamber of Deputies as representative for the Hautes Pyrénées. In 1834 he published his 'Mémoires,' with a preface by M. Carnot fils, 2 vols. 8vo, a work of questionable authority. Barère—one of the least sincere and most selfish of the Revolutionists—died January 15, 1841, at the age of 85. He published nearly 30 pamphlets and volumes, besides those above named, mostly on theoretical politics.

* **BARFOD, PAUL FREDERIK**, a Danish historian and poet, was born in 1811, in the neighbourhood of Grenoe, in Jutland. He early gained a reputation by his talent for verse, and by the merits of his historical writings. After the death of Frederik VI., whose friendly regards he enjoyed, and by whose favourable notice his aspirations had been kept in check, Barfod developed a political system of an extremely liberal and democratic kind, in which the "Scandinavian Idea" of unity and independence was a prominent object. This idea has regard to the fusion of Sweden, Norway, and Denmark into one single people and a single state; and in order to popularize it Barfod established in 1839 a quarterly review, entitled 'Brage-og-Idun,' the practical achievements of which have not up to this time been considerable. Barfod's principal historical works are a History of Denmark and Norway under the rule of Frederik III.; a Biography of the Rantzau family; and a Dissertation on the state of the Jews in Denmark.

* **BARGÈS, JEAN JOSEPH LEANDRE**, an eminent French Oriental scholar, was born at Auriol, Bouches-du-Rhône, on the 27th of February, 1810, and pursued his classical studies at

Marseille. Whilst scarcely 15 years of age, it happened that a commentary on the Scriptures, in which occurred many Hebrew quotations, fell into his hands—a circumstance which determined him to a study of that language. After finishing his course of theology, which he completed before the canonical age for admission to holy orders, he devoted himself enthusiastically to the study of Hebrew and Arabic. Early in the year 1834 he was admitted to the priesthood, and placed as curate in one of the parishes of Marseille; but quitted parochial duty, after about six months' experience, in order to pursue with greater liberty his Oriental studies. In 1837 he became acting professor of Arabic at Marseille; and in 1842 was summoned to Paris, to take the place of the Abbé Glaire as professor of the Oriental languages in the faculty of theology. In 1850 Bargès was appointed by the Archbishop of Paris an honorary canon of Notre Dame, and he has also received the decoration of the Legion of Honour. He has twice visited Algeria; once in 1839, and the second time in 1846, when he particularly investigated the history of the western province and the ancient city of Tlemcen, to the archaeology of which he had been for a long time devoting himself. From each of these excursions he returned with rare and valuable manuscripts; and their literary results will be recognised in the titles of works written or edited by M. Bargès, whose principal productions, apart from a considerable number of memoirs and notices inserted in the 'Journal Asiatique' and the 'Revue de l'Orient,' are as follow:—'Rabbi Yapheth ben Heli, Bassorensis Karaïtæ, in librum Psalmorum Commentarii Arabici e duplici codice manuscripto Bibliothecæ regiæ Parisiensis, edidit Specimen et in Latinum convertit L. Bargès, Professor linguæ Hebrææ et Chaldaicæ,' &c., 8vo, Paris, 1846; 'Aperçu Historique sur l'Église d'Afrique en général et en particulier sur l'Église Épiscopale de Tlemcen,' 8vo, Paris, 1848; 'Temple de Baal à Marseille, ou grande Inscription phénicienne découverte dans cette ville dans le courant de l'année 1845, expliquée et accompagnée d'observations critiques et historiques,' 8vo, Paris, 1848; 'Mémoire sur deux Inscriptions puniques découvertes dans l'île du Port-Cothan à Carthage,' 4to, Paris, 1849; 'Histoire des Beni-Zeïyan, rois de Tlemcen, par l'Imam Cidi-Abou-Abd' Allah Mohammed ibn Abd'el-Dielyl et Tenassy, ouvrage traduit de l'Arabe,' 8vo, Paris, 1852; 'Mémoire sur trente-neuf nouvelles inscriptions puniques expliquées et commentées,' 4to, Paris, 1852; 'Le Livre de Ruth, expliqué par deux traductions françaises,' 8vo, 1854; 'Les Samaritains de Naplouse. Épisode d'un pèlerinage dans les lieux saints,' 8vo, Paris, 1855; 'Mémoire sur le Sarcophage et l'Inscription funéraire d'Eschmounazar, roi de Sidon,' 4to, Paris, 1856; 'Nouvelle Interprétation de l'Inscription phénicienne découverte par M. Mariette dans le Séraphéum de Memphis. Examen critique de l'Interprétation donnée par M. le Duc de Luynes,' 8vo, Paris, 1856; 'Inscription phénicienne de Marseille: Nouvelle Interprétation,' 4to, 1858, of which only a hundred copies were printed; 'Notice sur un Autel chrétien antique; avec deux planches,' 4to, Paris, 1861; and 'Papyrus Egypto-Araméen appartenant au Musée Égyptien du Louvre expliqué et analysé pour la première fois,' 4to, Paris, 1862.

BARKHAM, or BARCHAM, JOHN, a divine and antiquary, the second son of Laurence Barkham, a member of a reputable Dorset family, was born about 1572, in the parish of St. Mary the More, Exeter. At the age of fifteen he was entered a sojourner of Exeter College, Oxford, in Michaelmas Term, 1587; was admitted a scholar of Corpus Christi College, in the same University, on the 24th of August, 1588; and elected a probationary-fellow on the 21st of June, 1596, at which time he was M.A., and in holy orders. In 1603 he took his B.D. degree, and proceeded D.D. in due course. He was appointed chaplain to Archbishop Bancroft, and was continued in the same capacity by Dr. George Abbot, who succeeded Bancroft in the primacy, March 4th, 1611. He became rector of Finchley, Paglesham, and Lackingdon; and on the 31st of October, 1610, was preferred to the prebend of Brownswood, in the cathedral church of St. Paul. Finally, in 1616, he became rector and dean of Bocking, when he appears to have resigned his other parochial preferments. He died at Bocking on the 25th March, 1642, and was buried in the chancel of the church of that parish. Dr. Barkham enjoys the reputation of a good linguist, critic, antiquary, and numismatologist; an exact historian, an able and sound divine, and an accomplished herald. His personal character was in all respects estimable. He was a man of considerable literary distinction; but there is nothing extant of which the professed authorship belongs to him. He contributed to Speed's 'Chronicle' the 'History or Life of John, King of England,' which is reckoned the most judicious of all the lives in

that history; and was chiefly, if not exclusively, concerned in the production, for the same work, of the 'History or Life of Henry II., King of England,' which was conceived and executed with the idea of modifying the tendency to an extravagant exaltation of Thomas à Becket. Barkham was a great lover of coins, and he once possessed the finest private collection in Great Britain. This collection he presented to Archbishop Laud, who much desired it; and from whose hands it found its way, as a gift, to the Bodleian Library at Oxford. Barkham wrote a 'Book concerning Coins,' which never attained a stage beyond that of manuscript, and the whereabouts of which has been for a long time unknown. The authorship of 'A Display of Heraldry,' folio, London, 1610, is also claimed, it would seem without challenge, for Dr. Barkham, although the work is currently known as the production of John Guillim, Rouge-Croix, Pursuivant at Arms. The only difference of opinion as to the authorship of the volume on Heraldry, refers to the proportion in which it may be considered a joint production of Barkham with Guillim, or of Barkham exclusively. Wood ('*Athenæ Oxonienses*') thus states the case:—"This book, being mostly composed in Barkham's younger years, he deemed it too light a subject for him to own, being then (when published) a grave divine, chaplain to an archbishop, and not unlikely a dean. Therefore, being well acquainted with John Guillim, an officer of arms, he gave him the copy, who adding some trivial things to it, published it, with leave of the author, under his own name, and it goeth to this day under the name of *Guillim's Heraldry*." The 'Display of Heraldry' has gone through many editions. To the fifth, which was published in 1679, was added a 'Treatise of Honour, Military and Civil, according to the Laws and Customs of England,' by Captain John Logan. Another edition, enlarged in several respects, was published in 1724. Guillim, it may be said, was born about 1565; was educated at Oxford and became Rouge Croix, Pursuivant at Arms. Barkham is known further, as the editor of Dr. Richard Crakanthorpe's '*Defensio Ecclesiæ Anglicanæ contra M. Antonii de Dominis, Archiepiscopi Spalatensis Injurias*,' 4to, London, 1625.

BARLOW, PETER [E.C. vol i. col. 537.] Mr. Barlow died at the age of 86, on the first of March, 1862.

* BARLOW, PETER WILLIAM, civil engineer, and son of Mr. Peter Barlow, mathematical professor at Woolwich, was born in the year 1800. After the usual school education, he was placed with Mr. Henry C. Palmer, under whom he studied engineering. Mr. Barlow has been largely engaged in railway construction, during a period extending over thirty years. As resident engineer, with Sir William Cubitt as principal, he executed the greater part of the London and Dover Railway, since called the South Eastern; principally between the years 1836 and 1840, including the remarkable blasting operations connected with the removal of Round-down Cliff. As principal engineer, he planned and executed the Tonbridge and Hastings railway, and the Reading and Reigate, between the years 1841 and 1846. His next works were the North Kent and the Ashford and Hastings lines, both belonging to the same company as the former, between the years 1847 and 1850. Mr. Barlow designed and executed the Lambeth Suspension Bridge, from Horseferry Road to Lambeth Church. This bridge (finished in 1862) was planned on a system of economy, to give it a fair chance of being remunerative. It is in three spans of about 280 feet each, having two piers to support the cable. It was the first suspension bridge constructed in England with wire cables of charcoal-iron instead of chain cables, rigid lattice diagonal bars in lieu of small vertical rods to suspend the platform, and a platform made of wrought-iron boiler plate, strengthened longitudinally and transversely by wrought-iron beams. Mr. Barlow went to America, to study the Niagara suspension bridge, as a preliminary to the formation of his plan for the Lambeth bridge. His latest work is the Tower Subway, planned by himself, but carried out by his son, Mr. P. W. Barlow, junior. This tunnel (opened in February, 1870) is by far the most inexpensive work of the kind ever executed in this country, and is worked upon a plan calculated to pay a fair dividend even with a small amount of traffic. The tunnel is lined with iron, and contains a narrow-gauge railway for one large carriage, which is propelled by stationary power. Mr. Barlow was elected Associate of the Institution of Civil Engineers in 1826, member in 1845, and F.R.S. in 1845. * WILLIAM HENRY BARLOW, also eminent as a civil engineer, is another son of the late Mr. Peter Barlow. He was born in 1812, and, like his brother, Mr. P. W. Barlow, had a professional training as an engineer. He was joint engineer with Mr. Hawkshaw in the

completion of the Clifton Suspension Bridge, near Bristol. Many years ago a bridge was planned to span the Avon below the city, with a stretch of nearly 900 feet, and a great elevation above the water; but after an expenditure of £40,000, chiefly in the construction of massive abutments and towers, the failure of funds led to an abandonment of the undertaking. More recently, a new company took the matter in hand; and a suspension bridge was finished and opened in 1865, to connect the ordinary road traffic between Gloucester and Somerset. Mr. Barlow's engineering works, however, have chiefly borne relation to the Midland Railway, with which he has been associated from 1842 to 1870. He has constructed numerous branches and extensions of the Midland System, including the Buxton and Manchester, and most of the lines in Derbyshire and Warwickshire. But his greatest work has been the Midland Extension, from Bedford to London, including at St. Pancras a terminal station in some respects the finest in England. Ten acres of ground were cleared, by the removal of several whole streets, to form a site. Underneath the site a curved tunnel railway has been constructed, to connect the main line near Camden Square with the Metropolitan line at King's Cross. On or about the level of the natural surface of the ground has been set up a forest of iron columns, several hundred in number. On the tops of these columns is the main floor of the station, formed of plates of buckled wrought-iron, fixed between longitudinal and transverse wrought-iron girders. Above this floor rises the largest roof in the world unsupported by pillars: it being 700 feet long, 240 feet span, and 105 feet high from the level of the rails to the apex of the roof. The form is peculiar, the arch being struck on radii of four centres. The timber scaffolding used in constructing the roof, travelling on from end to end as the work advanced, was the largest and finest ever employed. Underneath the floor of the station, the spaces between the iron columns afford a vast area of warehouse room. Mr. Scott's architectural work, combined with the structural work planned and executed by Mr. Barlow, impart many remarkable characteristics to this magnificent station. Mr. Barlow is a Fellow of the Royal Society; also a member of the Institution of Civil Engineers, and a member of its Council. In another walk of life, he is Colonel of the Railway and Engineers Volunteer Staff Corps.

BARLOW, THOMAS, an eminent divine and prelate of the 17th century, the son of Richard Barlow, a member of an ancient Lancashire family, was born in 1607 at Lang-hill, in the parish of Orton, in Westmoreland. He received his early education at the free school of Appleby, which he left in 1624, to enter of Queen's College, Oxford, where he was, says Wood, "successively a poor serving child, tabarder, then M. of A., and fellow an. 1633." Two years later he was appointed reader in metaphysics, and the lectures he delivered in that capacity were published in 1637, and a second edition in 1658, with the title, '*Exercitationes aliquot Metaphysicæ de Deo: quod sit objectum Metaphysicæ, quod sit naturaliter cognoscibilis, quousque et quibus mediis. Quod sit æternus, et immensus (contra Vorstium) et quomodo,*' etc., 4to, Oxford. Barlow contrived to keep his fellowship during the parliamentary visitation of the University in 1648; and in 1652 was elected head keeper of the Bodleian Library, and, about the same time, lecturer of Church-hill, near Burford, in Oxfordshire. On the 15th of February, 1657, he was chosen provost of his college, in succession to Dr. Langbaine, who had died five days before. After the Restoration of Charles II., Barlow procured himself to be appointed one of the commissioners for restoring the members of the University who had been ejected in 1648; and was not only created D.D. among the royalists in August, 1660, but on the 1st of September, in the same year, was elected Lady Margaret Professor of Divinity, being the very day on which he was installed in the sixth stall of the cathedral church of Worcester. On the 13th of June, 1664, he was preferred to be archdeacon of Oxford. His final preferment was tardily attained. When nearly seventy years of age, he was promoted to the see of Lincoln, and was consecrated on the 27th of June, 1675, having kissed hands for his appointment to the same on the 22nd of April previous, the very day of the death of his predecessor, Dr. Fuller. Wood ('*Athenæ Oxonienses*') avers that "all the while he was a Bishop, he never was at Lincoln, or visited any part of his diocese in his own person;" but he manifested sufficient interest in it to subscribe 50*l.* to the cathedral, 50*l.* to the city, and an additional 20*l.* towards the expense of renewing the city charter. Through all changes of government Barlow contrived to prosper, accommodating himself to all, until his death

at his manor of Buckden, in Huntingdonshire, on the 8th of October, 1691, when he was 85 years of age. He was buried in the chancel of the parish church of Buckden.

Barlow's published writings are numerous. They are chiefly in theology, and are especially conversant about controversy, or casuistry, in which latter department he had the credit of considerable excellence and experience. A list of his works may be found in Wood's 'Athenæ Oxonienses,' and in the 'Biographia Britannica.'

BARNAVE, ANTOINE PIERRE JOSEPH MARIE, one of the most prominent actors in the early scenes of the great French Revolution, was born at Grenoble, October 22, 1761. His family was Protestant; his father an advocate, and his mother a lady of high connections. Like many others of the revolutionists, Barnave was a lawyer. At the age of 21 he became an advocate in his native town. A pamphlet against the feudal laws and customs, 'L'Esprit des Édits enregistrés,' brought him into notoriety as a reformer; and he was elected as a deputy to the Tiers État for the province of Dauphiny, in 1789. He at once bid for the leadership of the popular party by the boldness of his speeches and the wide sweep of his suggestions; and when it became known that he was distasteful to the Court, his power with the people increased. He supported almost every attack on the monarchy; proposed many others in his own name; laid down a declaration of the Rights of Man, to be used as a sort of National Catechism; denounced all the claims of the clergy to Church property; declared such property to belong absolutely to the nation; and moved for the suppression of the provincial parliaments, for disobedience to the National Assembly. He went far beyond Mirabeau, with whom he had many struggles for power. He demanded the suppression of all religious orders. In colonial matters he claimed freedom for the coloured races. Barnave proposed that the power of declaring peace and war should rest in the National Assembly, instead of in the King; Mirabeau proposed a middle course; the Assembly adopted the proposition of Barnave, and he at once superseded Mirabeau in the popular esteem. When raised to the Presidency of the Assembly, he moved that all emigrés or refugees who did not return to France should forfeit their estates; and that no member of the Royal family should quit the kingdom at all. Early in 1791 he began to see that the Revolution was proceeding more wildly than he intended or wished; and he proposed measures somewhat cautious in character, thereby setting Robespierre, Siéyès, and Pétion against him. When, in June, the hapless Royal family failed in their scheme of escape from France, Barnave was one of the three commissioners sent to bring them back to Paris; and he was so touched by the sorrows of the queen, princesses, and dauphin, that he more than ever deplored the course which events had taken. In the Assembly he pronounced strongly for the personal inviolability of the king, and against the power of the Assembly to remove the king's ministers. Barnave had now all the more daring members of the Assembly against him, and his popularity out of doors soon ceased. On the dissolution of the National Assembly, towards the close of 1791, he returned to Grenoble, of which town he was made maire. In the spring of 1792 Gaudet brought a charge of treason against him, in reference to the affairs of St. Domingo; this he was able to refute; but in August a correspondence was discovered which he had kept up with the Royal family. This discovery led to a 15 months' imprisonment, first at Grenoble, then in l'Abbaye at Paris, then in the Conciergerie. At length he was tried before the Revolutionary Tribunal, found guilty, condemned to death, and guillotined on the 29th of November, 1793, having barely completed his 32nd year. Next to Mirabeau, Barnave was the greatest orator in the Assembly. His 'Introduction à la Revolution' and 'Reflexions Politiques' exhibit many of the qualities of a powerful thinker and brilliant writer, but, like his speeches, are deficient in sobriety and breadth of view. His literary productions were collected by M. Berenger (de la Drôme), in 4 vols. 8vo, 1834; and his life has been written by M. Salvandy.

* **BARNES, WILLIAM**, a poet and philologist, was born about 1810, at Rushhay, Bagbere, a hamlet of Sturminster Newton, in the vale of Blackmore, in Dorsetshire; and became a member of St. John's College, Cambridge, where he took his degree of Bachelor in Divinity. For some years he kept a school at Dorchester; and in 1847 was admitted to deacon's orders, and appointed to the curacy of Whitcombe, in Dorsetshire. He became a priest in 1848; and in 1862 was instituted to the rectory of Winterbourne-Came with Winterbourne-Farrington, in the diocese of Salisbury.

Mr. Barnes has published 'An Arithmetical and Commercial Dictionary,' 18mo, London and Dorchester, 1840; 'An Investigation of the Laws of Case in Language, exhibited in a system of natural cases, with some observations on prepositions, tense and voice, &c.,' 12mo, London and Dorchester, 1840; 'The Elements of Linear Perspective and the Projection of Shadows,' 12mo, London and Dorchester, 1842; 'The Elements of English Grammar, with a set of Questions and Exercises,' 18mo, London and Dorchester, 1842; 'Se Gefylsta (the Helper): an Anglo-Saxon Delectus, serving as a first class-book of the Language,' 12mo, London, 1849; 'A Philological Grammar, grounded upon English, and formed from a comparison of more than sixty languages. Being an Introduction to the Science of Grammar, and a help to the Grammars of all Languages, especially English, Latin, and Greek,' 8vo, London, 1854; 'Notes on Ancient Britain and the Britons,' 8vo, London and Greenwich, 1858; 'The Song of Solomon, in the Dorset Dialect,' 16mo, 1859; 'Views of Labour and Gold,' 8vo, London and Greenwich, 1859; 'Tiw; or a View of the Roots and Stems of the English as a Teutonic Tongue,' 8vo, London, 1862; 'Early England and the Saxon English, with some notes on the Father-stock of the Saxon English, the Frisians,' 8vo, London, 1869. The most distinctive and characteristic of Mr. Barnes's productions, however, are his 'Poems of Rural Life in the Dorset Dialect, with a Dissertation and Glossary,' 12mo, London, 1844 and 1848, and 8vo, 1862; 'Hwomely Rhymes; a Second Collection of Poems in the Dorset Dialect,' 12mo, London, 1859, and 8vo, 1863; 'Poems of Rural Life in the Dorset Dialect; Third Collection,' 8vo, London, 1862; and 'Poems of Rural Life in Common English,' 8vo, London, 1868.

BARO, PETER (BARON, PIERRE), a distinguished Protestant theologian of the 16th century, was born about 1534 at Étampes, in France, from which circumstance it is probable he derived his frequent surname of *Stampanus*. For several years he was a student of the civil law, and proceeded bachelor in that faculty at Bourges on the 9th of April, 1556. On the following day he was made licentiate of laws; and in 1557 was sworn an advocate in the court of parliament of Paris. But his inclination led him to the study of theology, and he repaired, in December, 1560, to Geneva, where he gave himself up to theological pursuits, and was at length ordained at the hands of Calvin himself. After his return to his native country, Baro married, at Gien, Guillemette, daughter of Stephen Bourgain. In 1572 or 1573, in consequence of the religious troubles in France, he repaired to England, where he was kindly received into the family of Lord Treasurer Burghley; and after a time he settled at Cambridge, becoming a member of Trinity College. In 1574, upon the recommendation of Lord Burghley, Chancellor of the University, and with the assistance of Dr. Andrew Perne, master of Peterhouse, he was chosen Lady Margaret Professor of Divinity. On the 3rd of February, 1576, he was incorporated at Cambridge in the degrees of bachelor and licentiate of the civil law, which he had taken at Bourges; and about the same time was created D.D. at Cambridge, in which degree he was incorporated at Oxford on the 11th of July following.

In 1581, Dr. Whitaker, regius professor of divinity, who had become master of St. John's College in 1580, and the majority of the heads of houses, and the older members of the university, who held with the greatest rigidity the doctrine of absolute predestination and all the most characteristic tenets of Calvinism, took offence at certain doctrines upheld and preached by Dr. Baro. Hereupon a controversy ensued, which came to an end without practical result. Some years afterwards a second controversy arose between Dr. Baro and Dr. Some respecting the indefectibility of faith; but this dispute was after a short time composed. Dr. Baro was thus able to maintain his ground till the 12th of January, 1596, when, in a sermon which he preached "ad clerum," at St. Mary's, he failed to convince his hearers of the simplicity and heartiness of his adherence to the famous "Lambeth Articles," and a dispute was commenced, which, though it had no legal result—notwithstanding the opposition of Archbishop Whitgift to Baro—in depriving the professor of his chair, was the occasion of calling forth so much ill-will, and of causing so much discomfort and annoyance, that in 1596 he resigned the professorship, in which he was succeeded by Thomas Playfere. Hereupon Dr. Baro repaired to London, where he lived and died in a house near St. Olave's church, in which he was buried in the ground under the communion table, on the 17th of April, 1599.

The principal works of Dr. Baro are 'Four Sermons on Psalm CXXIII., &c.,' 8vo, London, 1560; 'In Jonam Prophetam Prælectiones XXXIX; Theses publicæ in Scholis peroratæ et

disputatæ; Conciones tres ad Clerum Cantabrigiensem, habitæ in templo B. Mariæ; Precationes quibus usus est Author in suis Prælectionibus inchoandis et finiendis,' folio, London, 1579; and 'De Fide, ejusque ortu et natura, plana ac dilucida Explicatio. Adjecta sunt alia quædam ejusdem Authoris de eodem Argumento,' 16mo, London, 1580, printed by Richard Day.

* BARRAL, JEAN AUGUSTIN, was born at Metz (Moselle) in 1819, and at the age of 18 entered the Polytechnic School. After two years he became attached to the scientific staff of the Royal Tobacco Factory. In 1842, and again in 1845, he published in the *Comptes Rendus* of the Academy of Sciences the results of some researches on tobacco and its active principle nicotine. He became professor of physics at the College of St. Barbe in 1841, and also Demonstrator at the Polytechnic School. In 1850, in conjunction with M. Bixio, he made some balloon ascents in the interests of meteorology, the results of which are given in the *Comptes Rendus* (vol. xxxi.) He is perhaps best known as the editor of Arago's works, in 16 vols. 8vo. He was selected for that honourable task by Arago himself, some time before his death.

BARRE, JEAN JACQUES, eminent French medallist, was born at Paris, August 3, 1793. At the age of 17 he entered the atelier of M. Tiolier, engraver of the government medals, where he made marked progress. He was, in 1842, appointed chief engraver to the mint, a post he retained till his death, which occurred on the 16th of June, 1855. Besides coins, M. Barre engraved the dies for a large number of medals struck on public and ceremonial occasions, and others having more or less of an historical character, and generally their execution is of a very refined and superior order. Among the more important are those celebrating the 'Victories and Conquests of the French from 1792 to 1815'; 'The Coronation of Charles X.'; 'The Inauguration of the statues of Louis XIV. at Montpellier, and of Louis XVI. at Bordeaux'; 'The bringing back to France of the remains of Napoleon I.'; 'The Medaille des Chemins de Fer' (1840), one of the largest yet struck; 'The Statue of the Duc d'Orléans'; and portrait medals of Leopold, King of the Belgians, the Prince President, &c. He also engraved the notes of the Bank of France; and so much improved the processes of the Mint as to render it extremely difficult, if not impossible, to counterfeit the coins issued from it. M. Barre is the author of an elaborate and valuable paper, 'Sur les procédés anciens du Monnayage en France,' read, in 1851, before the 'Comité des Arts et Monuments historiques,' of which he was a member. He was succeeded in his post of chief engraver to the *Hôtel des Monnaies* by his youngest son, DÉSIRÉ-ALBERT BARRE (born May 6, 1818), who studied design under Paul Delaroche, and medal engraving under his father, and whose coins and medals are much admired. JEAN AUGUSTE BARRE, eldest son of Jean-Jacques (born September 25, 1811), studied under Cortot, and has attained considerable reputation as a sculptor. Among his more noteworthy imaginative works are 'David about to sling the stone at Goliath,' and 'Ulysses recognised by his Dog.' An ivory statue of Rachel (1851), was greatly praised, as was also a marble bust of Alexander Duval. His bust of Napoleon III. was chosen as the model for the coins of the empire. (*Nouv. Biog. Générale*; Vapereau, *Dict. Univ. des Contemporains*.)

BARRY, SIR CHARLES, R.A. [E. C. vol. i. col. 555]. The publication of 'The Life of Sir Charles Barry' by his son, Dr. Alfred Barry (8vo, 1867) enables us to add more precise dates and some facts to the memoir published before his death in the E. C. He was the son of a stationer in Bridge-street, Westminster, where he was born on the 23rd of May, 1795, "in a house which (until 1866) lay under the shadow of the Clock Tower of the New Palace of Westminster." His education was carried on at the ordinary private schools, and was very imperfect, but sedulously improved by himself in after years. On leaving school, at the age of 15, he was articled to Messrs. Middleton and Bailey, architects and surveyors, of Paradise Row, Lambeth; but whose business was mainly that of surveying, and in whose office he received all the regular professional training which he ever enjoyed. But though he was probably taught little of the theory or artistic principles of architecture, he learnt surveying; obtained a thorough knowledge of materials and processes, although not a very profound or scientific view of construction; gained facility in architectural drawing, and, what was of perhaps even greater advantage to him in after life, he acquired good business habits and the practice of regular steady application. That he paid much attention to architectural drawing, and was learning to look at buildings with

the eye of an artist, we know from the fact of his having, during the last three years of his apprenticeship, contributed to the exhibitions of the Royal Academy, his first contribution, in 1813, being a drawing of the 'Interior of Westminster Hall;' the others were designs for a church; a 'Museum and Library,' and a 'Nobleman's Mansion.'

His pupilage ceased in 1816. His father's death had placed a small sum of money at his disposal, and he determined to expend the greater part of it on a professional tour of wider range than was at all customary with English architects. The years 1817-20 were accordingly occupied in travelling through France and Italy, Greece and Constantinople, Egypt to Thebes, and homeward by Cairo, Palestine, Sicily, and Italy, everywhere making sketches, measuring architectural remains, and working out those principles which were to guide him in his future career. Soon after his return in August, 1820, he commenced his professional life in a small house in Ely Place, Holborn. His progress was at first slow, and for a while he felt so much in doubt as to his future prospects as to have seriously meditated emigrating. But business came in; he found himself in a position to marry with a due regard to prudence (December, 1822), and a few years later (1827) to remove to a better house at the West End (No. 27, Foley Place, Cavendish Square); and henceforward his life was that of a busy and prosperous man.

The memoir to which this is supplementary will supply as much further information as is required, and generally sufficient details respecting his buildings; but it may be convenient, following Dr. Barry, to give a catalogue of his principal works, arranged under churches and secular Gothic buildings, Italian buildings, and alterations in existing edifices, leaving the New Palace of Westminster to stand as the culminant result of his genius in a class by itself. His first works of any consequence were churches; and therefore, though he never acquired fame as a church-builder, his churches have at least a chronological claim to the first place. Prestwich and Campfield churches, Manchester, designed in 1822; St. Martin's, Outwich; Ringley chapel; and Oldham church, 1823; St. Peter's, Brighton, the largest and, on the whole, best of his churches, 1824-26; three churches in Islington parish, 1826: St. John's, Holloway, erected at a cost of 11,890*l.*, Cloudesley-square, and Ball's Pond; a new spire, and restoration of Petworth church, Sussex, 1827; Brunswick chapel, Brighton, 1828; Manchester Unitarian chapel, 1836; and Hurstpierpoint church, Sussex, a pleasing First Pointed edifice, 1843. The Birmingham Grammar-school, Tudor collegiate in style, 1835; and a new wing to University College, Oxford (facing the High-street), 1843, were the most important secular Gothic buildings erected by him prior to the Houses of Parliament; and both were for the time eminently successful.

His real power and individuality as an architect, refinement of taste, and sound judgment were, however, first fully shown in his astylar palatial Italian edifices. Of these the earliest, and of all perhaps the most elegant, was the Travellers' Club, Pall Mall, completed in 1831. Alongside of this he erected in 1837 and following years the larger and more magnificent Reform Club, the principal front of which was modelled upon that of the Farnese Palace, Rome. About the same time he built a simpler, but not less pleasing structure, the Athenæum, Manchester. More ornate in character was the last of his great Italian buildings in London, Bridgewater House, commenced in 1847, for the Earl of Ellesmere. The Town Hall, Halifax, the last Italian building designed by him, was still more enriched in character; he having in this altogether abandoned his old principle of severe symmetry in plan and elevation, and aimed at producing the utmost possible picturesqueness of effect by placing a massive tower and florid spire at one angle of the building, introducing a double order of attached columns with broken entablatures, and enriching the entire surface with sculptural ornamentation of a decidedly Renaissance character. The foundations alone, however, were completed before Barry's death, and some architectural changes, including tall Mansard roofs, were introduced by his son, Mr. E. M. Barry, to whom its completion was entrusted by the corporation.

Another class of designs, that of alterations of existing buildings, requires brief notice, as it includes some of his most elaborate and finished works. One of the first of these was the College of Surgeons, Lincoln's Inn Fields (1833, &c.), a work of severe simplicity, the leading features of the exterior (originally a couple of plain brick houses) being a massive cornice and a hexastyle Ionic portico. Walton House, on the Thames by

Walton Bridge, 1837, was his next important work in this class, and in it he altered an irregular straggling brick house into a stately Italian villa, with a degree of success that entirely turned the current of taste as regards the style of country residences. The same year he commenced the conversion, for the Earl of Carnarvon, on a far grander scale, of Highclere House, Hampshire, from a bare semi-classic into a richly decorated Anglo-Italian mansion. In 1844 he remodelled Soame's sombre edifice, the Board of Trade, Whitehall, into the now familiar Treasury. Trentham Hall, Staffordshire, the spacious seat of the Duke of Sutherland, occupied many years in its transformation, the extensive gardens being laid out in lines of ornate Italian terraces, so as to lead up to and combine with the altered building, one large wing of which was entirely new. Duncombe Park, Helmsley, the seat of Lord Feversham; and Harewood House, near Leeds, underwent a similar metamorphosis. On a smaller scale, but no less sweeping, were the changes wrought in Shrubland Park, Suffolk, where Sir Charles was suffered to give full play to his fancy, and where accordingly he looked on his work with more entire satisfaction than almost anywhere else. The rebuilding of Cliefden House, on the Thames above Maidenhead Bridge, for the Duke of Sutherland, after its destruction by fire in 1849, was the last, as it was one of his most important, works in this class that need be referred to. The house was rebuilt (1851—52) on the old foundations, but the new building was far more splendid than its predecessor. Other works carried out whilst these were in progress, as the alterations at Canford Manor, Dorsetshire; Gawthorpe Hall, Lancashire; Dunrobin Castle, Scotland, &c., might be mentioned, but it will have sufficed to notice the principal.

His greatest work of all, the New Palace of Westminster, the most important commission that had fallen to the lot of an English architect since the days of Wren, he lived to see virtually completed, though he was less happy than Wren, who lived not only to lay the last stone on his masterwork, but to contemplate year after year the finished fabric in all its splendour. The duty of superintending the actual completion of the New Palace of Westminster devolved on Sir Charles Barry's son, Mr. E. M. Barry, but along with it the less pleasing task of making material internal alterations. The building was noticed at perhaps sufficient length in the *E. C.*; and we see no reason to modify the commendation there bestowed upon it. It is the greatest architectural work of our time, and as a whole worthily sustains the reputation of the architect and of the age. It has grave shortcomings; but the gravest of all, the insufficient size and accommodation of the House of Commons, and which, according to the official report of the architect's son, will necessitate the construction of a new legislative chamber, was, it should be borne in mind, forced upon the architect, who received from the authorities the precise dimensions to which he was obliged to conform. At the time of Sir Charles Barry's death the expenditure upon the building amounted to within a few pounds of two millions sterling (1,997,246*l.*); it has now of course exceeded that sum. The cost has not unnaturally been considered excessive, but it must be remembered that it is the largest and most richly decorated structure erected in England for centuries. It may be well to add the authentic statement of its dimensions and capacity, as these are often given inaccurately. "The whole building occupies an irregular site of about eight acres. Its longest front (the river front) is 940 feet in length, each wing having a frontage of 120 feet, and the terrace occupying the remaining 700 feet. Its greatest width (exclusive of Westminster Hall) is about 300 feet. It contains above 500 rooms, and includes residences for 18 different officers of the two Houses, of whom the principal are the Speaker of the House of Commons, the Serjeant-at-Arms, the Usher of the Black Rod, and the Librarians of the Houses of Lords and Commons. It thus provides for a resident population of about 200. This large mass of building receives light and air, not only from its external fronts, but from eleven internal quadrangles, many of considerable area." The chamber appropriated to the House of Peers is 90 feet in length, 45 in width, and 45 in height, and is decorated with lavish magnificence. The House of Commons, far less richly ornamented, is 75 feet long, 45 wide, and 41 feet high to the central line of the ceiling; but, as was said, these dimensions are so inadequate that before long it will probably have to give place to one of ampler size.

The publication of *Dr. Barry's Life of Sir Charles Barry* gave occasion to a controversy which it is necessary to refer to in this connection. The son of the late Mr. A. Welby Pugin [*E. C.*

vol. iv. col. 1008] claimed for his father a much larger share in designing the New Palace of Westminster than was allowed him in the work of Dr. Barry; that though nominally only Barry's 'assistant,' he was in fact his prime adviser in regard to the main design of the building, as well as of its ornamentation, and as such ought to be considered as virtually the joint architect. This claim was certainly not made good. In the erection of the Houses of Parliament, Mr. Pugin was from the first Barry's principal assistant, but he had himself expressly stated in a letter addressed to a public journal (*'Builder,'* Sept. 6, 1845) that "his occupation is simply to assist in carrying out practically Mr. Barry's own designs and views in all respects." The exuberant ornament is undoubtedly due to Pugin; there can be little doubt that the details throughout are, in the main, his; and he may have suggested (or proposed modifications in) some of the more important features. But the work in its entirety is Barry's. It is stamped throughout with the impress of his mind, and to him belongs the honour, and on his name alone must rest the responsibility of the merits and the deficiencies of the edifice.

Sir Charles died somewhat suddenly on the night of the 12th of May, 1860. He was interred in Westminster Abbey with great solemnity, and in the presence of a large assembly of distinguished men, including the leading members of his own profession, members of the Houses of Lords and Commons, divines, and representatives of art, science, and literature. A plain memorial brass marks his resting-place in the nave; but a fine marble statue, by Mr. Foley, has been erected by subscription in the Witness Hall of his great building.

Sir Charles Barry left five sons, two of whom have distinguished themselves in the profession of their father. * CHARLES BARRY, the eldest, born in 1823, was trained in his father's office, and commenced his professional practice in partnership with Mr. Banks. The firm of Banks and Barry have executed numerous extensive works, including large ranges of offices and business premises, like the Westminster Chambers, the Westminster Palace Hotel, the City Hotel, Norwich, and the important buildings erected for the Piazza Statuto at Turin; Bilsdale Church, Yorkshire, Holy Trinity Church, Plaistow, and some other churches, as well as several costly mansions; but the merit of the designs cannot, of course, be assigned to either partner alone. Of late, however, Mr. Barry has worked apart, and the singularly beautiful Dulwich Collegiate School, built in 1869, the most ornate structure of the kind yet erected—and especially remarkable for the successful employment of terracotta decoration—is wholly by him; as are also the designs for some unusually graceful railway bridges, on the Dulwich College estate, and the pretty Church of St. Stephen, in the vicinity of the College. A younger brother, * EDWARD MIDDLETON BARRY, R.A., born in 1830, was also brought up in his father's office, but was for a while pupil to Mr. T. H. Wyatt. For some time he acted as his father's chief assistant, but afterwards commenced practice on his own account, and has secured a place in the foremost rank of the profession. Among the more important buildings erected by him may be mentioned—St. Saviour's Church, Haverstock Hill, London, 1856; the Midland Institute, Birmingham, 1857; the Royal Italian Opera House and Floral Hall, Covent Garden, 1858-9; the Leeds Grammar School, 1859; the National Schools, St. Giles's, a very superior building of its class, 1861; Charing Cross Hotel (with the restoration of the old Cross of Charing, in front of it), and the Cannon Street Terminus Hotel, at the City and West-end stations of the South-Eastern Railway; and Crewe Hall, Cheshire, rebuilt in 1868. Mr. E. M. Barry succeeded his father as architect of the New Palace of Westminster, and, as already mentioned, has carried that building to its present state of completeness; is now engaged in various alterations within it, and has made designs for more; and has restored in a superb style the ancient Chapel of St. Stephen. In the competition for a new National Gallery, 1868, the first premium was awarded to the designs of Mr. Barry, and he was appointed architect of the new building, but its erection remains for the present in abeyance. Mr. E. M. Barry was elected associate of the Royal Academy in 1861, and full Academician in June, 1869. Another son, * the Rev. ALFRED BARRY, D.D., born in 1826, has distinguished himself in an entirely different line. Educated at King's College, London, and Trinity College, Cambridge, he graduated first class in mathematics and classics in 1848; was elected fellow of his College, and was ordained in 1850. About 1854 he was elected Head Master of the Leeds Grammar School, which he greatly raised in reputation. In 1862 he was ap-

pointed Principal of Cheltenham College, which, under his management, became one of the most prosperous institutions of its class. On the resignation of Dr. Jelf, in 1868, Dr. Barry was appointed to succeed him as Principal of King's College, London. Besides the Life of his father, spoken of above, Dr. Barry has published an 'Introduction to the Old Testament,' and some other theological works.

BARTH, HEINRICH, a celebrated geographical explorer, was born at Hamburg, on the 16th of February, 1821. He early imbibed a strong desire to investigate the geography of Africa—a desire which was stimulated by his perusal of the works of Mungo Park, Lander, and other African travellers. Soon after he had taken the degree of Doctor in the Berlin University, he started off to examine the African shores of the Mediterranean, which occupied him for about two years, or from 1845 to 1847. In 1850 he commenced his more extensive explorations in North Africa, in conjunction with Messrs. Richardson and Overweg, of which details will be found under *AFRICA*, *GEOG. Div. E. C. vol. i. cols. 115-117*; and *AFRICA*, *GEOG. Div. E. C. S. cols. 14-18*. Dr. Barth's own account is embodied in his 'Travels in North and Central Africa,' published in 5 volumes, in 1857. For this work he was awarded the Patron's Medal of the Royal Geographical Society of London. After his return from Africa, Dr. Barth became one of the most active members and president of the Geographical Society of Berlin, for which body he drew up accounts of everything that was being done by travellers in Africa. In 1863 he was appointed professor of geography in the University of Berlin. He died in that city on the 25th of November, 1865. Besides the work above named, he published a vocabulary of the tribes of Central Africa, 'Sammlung und Verarbeitung Centralafrik. Vocabularien,' Gotha, 1862-64; and 'Reise durch das Innere der europ. Türkei,' Berlin, 1864.

BARTHOLIN, GASPARD, a celebrated Danish writer, born 12th February, 1585, at Malmö, in Scandinavia. He was precocious as a child, could read in his third year, and at thirteen composed Greek and Latin orations, which, after the fashion of the time, he pronounced in public. All this, which would have ruined a weaker head, stimulated Gaspar to fresh exertions. He became a student in the University of Copenhagen, and removed in 1603 to Rostock, and afterwards to Württemberg, where during three years, he devoted himself to the study of philosophy and divinity. He took his Master's degree in 1607, after which he commenced his travels in Germany, France, England and Italy, and became acquainted with most of the learned men of those countries. Some idea of the estimation in which he was held may be gathered from the fact that the Chair of Anatomy was offered to him at Naples, and that of Greek at Sedan in France, both of which he refused. He studied anatomy some time at Padua, and received his Doctor's degree at Basel, in 1610. On returning to Copenhagen he became Professor of Latin in the University, but after six months, preferred the Chair of Medicine, which he occupied during eleven years. During an illness which promised to terminate fatally, he made a vow that if health were granted to him, he would thenceforth study and teach divinity only. He recovered and kept his promise, and was appointed Professor of Divinity, March 12, 1624. The King conferred on him the Canonry of Roskild. He died of cholera on the 13th July, 1629, leaving six sons, five of whom became distinguished. He published 49 works in Latin, on Medicine, Physiology, Physics, Rhetoric, and Theology. His 'Anatomicæ Institutiones,' published in 1611, has often been reprinted, and a translation in French was published at Paris in 1647.

BARTOLINI, LORENZO, a distinguished modern Italian sculptor, was born at Florence, about 1778. Having learned the rudiments of design under Desmarests, a French painter established in Florence, he went to Paris and entered the studio of the sculptor Lemot. Here he made rapid progress, and his career was watched with much interest. He carried off the prize for sculpture at the Academy in 1803, by a bas-relief of Cleobis and Biton, which, when exhibited, attracted much attention, and was declared to possess the antique Greek feeling beyond any of the works by which it was surrounded. Bartolini now found ample patronage. He executed numerous busts, among others those of Mehl and Cherubini, which were greatly admired; and he received commissions for a colossal bust and a statue of the Emperor Napoleon I. The bust is now placed over the doorway of the Museum of the Louvre; but the statue, unfinished at the fall of the Empire, was left on the sculptor's hands, and ultimately went to America. The events of 1815 decided Bartolini to return to his native place. He

established his studio in Florence, and there pursued a steady career of prosperity, the acknowledged head of his profession, the friend of many of the more eminent among his contemporaries, and his studio the favourite resort of the most distinguished tourists. With our countrymen he was an especial favourite, and produced for them endless busts, statues, and monuments, and, it must be confessed, not a few copies of antique and modern works. He died at Florence on the 20th of January, 1850. The Pitti Palace, Florence, possesses a Venus, a fine group entitled 'Charity,' and some other of his favourite works. The monument of Lady Stratford Canning in the Cathedral of Lausanne is one of the finest of his productions in that line. His busts are very numerous, generally very good, and, those at least of his eminent compatriots, will probably do more for the permanence of his reputation than his more ambitious gods and goddesses and other semi-classical nudités.

BARTOLO, or BARTOLI, TADDEO DI, an eminent early Italian painter, was born, about 1363, at Siena, where his father, Bartolo di Fredi, was a painter of reputation. In one of his earliest works, a 'Crucifixion,' painted in 1388, in the Church of S. Agostino, Taddeo was held to have far excelled his father, and he was soon recognized as one of the ablest painters of the time. His pictures, both mural and easel, are distinguished by purity, refinement, and the expression of that deep religious feeling, approaching asceticism, which is indeed characteristic of the ecclesiastical art of the period, but in Bartolo attains more of exaltation without losing simplicity, than is usual with his contemporaries. Rio, and some other writers on Christian Art, dwell especially on the grace and sweetness he imparts to the face and form of the Madonna, and Rio points in illustration to the series of scenes from the 'Life of the Virgin,' which Taddeo painted in 1407, on the walls of the chapel of the Palace of the Signory at Siena, and to an 'Annunciation' in the Academy of the same city. An adjoining hall painted by him, in 1414, with mythological subjects, is pronounced to be very inferior. But whilst he painted in strict conformity with the tradition of the church, Bartolo was able to give play to individual feeling in composition and colour, and his works, with much archaic rigidity, exhibit the dawn of a freer style. Perugino has imitated Bartolo in the expression and disposition of his figures. Besides the pictures executed in Siena and its vicinity, Bartolo painted a 'Coronation of the Virgin' in the Chapel of the Campo Santo, at Pisa; others in the sacristy of S. Antonio, and in the Church of San Francesco at Volterra; at Padua, and elsewhere. The Academy at Perugia still possesses two or three easel pictures by him; the Louvre has a triptich with the Holy Family and two pictures of Saints attributed to Bartolo; but our National Gallery does not possess a specimen of his pencil. Taddeo di Bartolo died at Siena in 1422. His nephew and pupil, **DOMENICO DI BARTOLO** (flourished 1436-45) also attained a high reputation as a painter, but his works are coarser in execution and less refined in thought than those of the uncle. His most celebrated productions are the six frescoes in the great hall of the Hospital della Scala at Siena, illustrating the 'Acts of Mercy.' A large 'Assumption' in the Museum at Berlin is attributed to him by Waagen, who praises "a certain antique grandeur of arrangement in the colossal, solemn form of the Virgin," but adds that "the frequently ordinary and un-ideal character of the heads, and the heavy, fantastic arrangement of the drapery of the numerous angels, are unmistakable evidences of the 15th century." It is, however, by no means certain, that this picture is rightly ascribed to Domenico Bartolo.

BARTOLOCCI (BARTOLOCCIUS) GIULIO, a learned Italian priest, was born at Celano, in Naples, in 1613. He was a member of the order of St. Bernard, at Cîteaux; was appointed professor of Hebrew and Rabbinical learning at the College of the Sapienza at Rome, and died in that city on the 1st of November, 1687. Bartolucci compiled a vast compendium of Rabbinical lore in 4 folio volumes, Rome, 1675-93, to which his pupil, Fra Imbonato, who edited the fourth volume, added a fifth of his own, in 1694. It was entitled, 'D. Julii Bartolucci de Celano, Congregat. Sancti Bernardi Ref. Ord. Cisterciensis, Bibliotheca Magna Rabbinica, de scriptoribus et scriptis Hebraicis, ordine alphabetico Hebraice et Latine digestis,' and is still highly esteemed as a storehouse of Rabbinical learning; but Bartolucci's judgment is inferior to his erudition, and he has little critical skill. Imbonato's supplementary volume is inferior to the others.

* **BARYE, ANTOINE LOUIS**, a celebrated French sculptor, was born at Paris on the 24th of September, 1795. At the age of 13 he was apprenticed to an engraver of matrices for military

ornaments, and the like. Here he worked till called away by the conscription in 1812, when he served a couple of years in the army, still, however, modelling in his spare hours. When free to follow his own inclinations, he entered the atelier of Bosio, and afterwards that of Gros. He tried for the grand prize of the *École des Beaux-Arts* by a relief of 'Milo of Crotona devoured by a Lion,' but obtained only honourable mention; nor, though he gained two or three second prizes, did he ever succeed in carrying off the first. He was now employed for some time in modelling and chasing for Fauconnier, a leading goldsmith of the day; an occupation there can be little doubt that prepared the way for the remarkable success he has attained in what is by most regarded as his specialty—the modelling, casting, and chasing bronze statuettes of animals. However, his first appearance at the Salon was with busts; and in 1831 he received the medal for a life-sized figure of St. Sebastian. But the work that first arrested the public attention was a 'Tiger devouring a Crocodile,' so original in form, so full of energy, and at the same time so true in drawing and so well wrought, as to satisfy alike the connoisseurs and the multitude. It was long, however, before he could satisfy the authorities. His productions could hardly be classed under any recognized style. His works were ill-placed at the Salon, and one year were excluded. From 1836 to 1850 he accordingly refused to send anything, and, shut out from the national exhibition, he was obliged to seek for private purchasers. It was during this time that he produced the immense quantity of small bronzes of animals in action, fighting, in repose; groups of men and animals, equestrian figures, and the like, which have carried his name all over Europe, they having found purchasers not in Paris only, but even more readily in the other great European capitals. And it is on these bronzes, and not on his larger and more ambitious works, that his chance of remembrance depends. In these, alike in design, execution, material, M. Barye is without a rival. In his larger works he is one of many, and not the first. Even his lions, admirably as he models the lion, whether enraged or reposing, in his small bronzes, seem inferior creatures when in the gardens of the Louvre or in those of the Luxembourg. From 1848 to 1851 M. Barye was engaged at the Louvre; he then gave a course on design in natural history, at Versailles, and since 1854 he has given similar courses at the Museum. For the new pavilions of the Louvre he has executed large groups symbolizing Peace, War, Power protecting Labour, Order curbing Disorder, and very characteristically behind each group he has traced various symbolic animals. M. Barye has also, like every French sculptor, executed a large number of classical subjects, graces, gods, and goddesses, which are not likely to be immortal; and various religious designs, which will probably not excite many to devotion. He has likewise been officially commanded to immortalize Napoleon III. in a bas-relief, but is not considered to have succeeded. If in anything he equals his small stags, leopards, and lions, it is in his centaurs and minotaurs: the group of the Centaur and Lapithæ being indeed generally considered his masterpiece.

BASEDOW, JOHANN BERNHARD, more properly JOHANN BEREND BASSEDAU, known also by his frequently used pseudonym of BERNHARD VON NORDALBINGEN, was born on the 11th of September, 1723, at Hamburg, where his father followed the calling of a hairdresser. He became a student at the *Johanneum* of his native city, where he had for his teacher Samuel Reimarus, a distinguished advocate of the religion of nature, and the supposed author of the 'Wolfenbüttel Fragments,' by whom he was much esteemed. Thence he removed to the University of Leipzig, where he studied philosophy and theology. He read all the polemical works of his time; and the result of his reading and thinking was a system of opinion which no party in the Christian church would consider orthodox. At the close of his university career he accepted a tutorship in a Holstein family, and it was there that his natural, undemable talent for instructing first displayed itself in the great success with which he made his teaching comprehensible, and converted the process of learning almost into an amusement. He linked his instruction to nearly everything around him, in the school-room, in the house, in the garden, in the field and in the workshop. His talents soon attracted much notice, and his theory was received with such favour that in 1753 he entered upon a wider sphere as professor of Moral Philosophy and Belles Lettres in the *Ritterakademie* of Sorø, in Denmark. As a public teacher, and as a writer on education, he soon won applause. Laying great stress on a sound understanding, and considering the attainment of a practical philo-

sophy of life one of the most valuable objects of human acquisition, he became a passionate antagonist of the old theology. This hostility, combined with a certain impracticability and haughtiness of disposition, procured, in 1761, his transfer in the same capacity to the Gymnasium of Altona, where he led an active life for some time as a partizan of the new school of critical theology. Here the adjudged heresy of the works which he published on Religion and Reason again made him popularly obnoxious, so that he was forbidden to lecture, was excommunicated, and brought into danger of being stoned. His next step was to enter with all his powers upon the work of reforming the existing system of education, not only in Germany, but throughout the whole of Europe. Up to this time the school had stood under the sceptre of the church. The religious education of youth had been narrowed down to the mere committal of the catechism to memory, and the crowding of the mind with biblical and theological details. There was no real science of education; and what hitherto had been left to nature, to habit, and to traditional prejudices, had to be corrected and raised to the place of an art. Its good elements had to be reduced to law; its bad elements had to be cast away. Man must be regarded as a whole, as truly man; his education must be a gradual development and cultivation of body, mind, and soul. The old doctrine, based on the old theology, insisted on education as a process from without, inward; the new ideas regarded human nature as a germinating seed, in which a good and noble impulse dwells, and requires only fostering care, whilst the educational process goes on from within, outward. Religion was not only to be carried into the soul of the child, but was also to be evolved from the soul, and only so much was to be carried in as was adapted to its immature grasp, and to the necessity of adequate inward stimulus. The old educational system had borrowed much from the Church; to promote the interests of the Church was its great end. A large proportion of all the studies of the Gymnasium and the University looked towards theology and the clerical profession; and hence the value attached to the ancient languages. The modernized scheme of education aimed at equipping men for the world and for practical life. The utility of the ancient languages and of ancient history was, therefore, questioned; and so education was transferred from a narrow ecclesiastical field to broad cosmopolitan ground—from a positive Christian basis, to a so-called philanthropic one. Rousseau gave a great impulse to this movement by the publication of his 'Emile;' stimulated by which, Basedow, who was the author's interpreter and advocate in Germany, published several preliminary works, and at length issued a prospectus for his great work on Elementary Instruction, which was subsidized by the princes and people of Germany to the extent of 15,000 thalers, 'Elementar-Werk,' 3 vols. 4to, Altona, 1774. This production, which had been magnificently announced, was yet fortunate enough to satisfy the public expectation; and it has been many times reprinted. It was a kind of *Orbus Pictus*, made up of a hundred engravings by Chodowiecki, and accompanied by an explanatory text, in German, French, and Latin. Its object was to offer to youth, by way of amusement, the knowledge of a mass of things belonging to the real world of life and objects, in the interests of cosmopolitanism as opposed to nationality. The feature which gave this work its special success was its calculated and carefully maintained indifference with regard to dogmatic religion. In its view, Catholics and Protestants, Jews and Christians, must be treated alike; the mental powers must be awakened, the habit of observation sharpened, and a general system of morality taught which should not interfere formally with any system of positive religious faith. The book met with very wide acceptance; and its author, through the favour of Prince Leopold Friedrich Franz, of Anhalt-Dessau, had an opportunity of establishing at Dessau a normal school, in which to test the practical value of his ideas. Here, accordingly, he opened, in 1774, a school, to which he gave the name of Philanthropin, or Philanthropic Institute; in which it was his prime object to exclude all positive religious instruction, and to build chiefly upon the conception of the dignity of the human soul. Basedow was not long without eager followers; similar institutions sprang up elsewhere, and the principles enunciated by him were grafted upon the domestic training of children. Notwithstanding this success, Basedow, whose impracticable and fitful temper unfitted him for friendly contact with the eminent men whom he had been able to associate with himself in the conduct of his enterprise, was forced to retire from the curatorship of the Dessau Philanthropin in 1778. Yet his zeal for his doctrine did not abate; and he continued to

develope in various works his views on theology and on education. He went the round of the principal cities of Germany, for the purpose of propagating his system; and finally invented a new method of learning to read, which he published at Hamburg in 1785, and opened a school at Magdeburg, where he put it into practice. Basedow died at Magdeburg on the 25th of July, 1790; and his friends and disciples erected a monument to him in the Church of the Holy Spirit. Over and above the works which have been mentioned, Basedow published a considerable number, a list of which may be found in Heinsius' 'Allgemeines Bücher-Lexikon,' Leipzig, 1812; or in Kayser's 'Vollständiges Bücher-Lexikon,' Leipzig, 1834. The moral influence of Basedow has been very considerable, and the primary education of Germany received at his hands a valuable impulse; but his personal career was on the whole unhappy, on account of that turbulence and haughtiness of spirit to which he was indebted for missing the respect otherwise due to his talents and his labours.

BASILÌ or BASILY, FRANCESCO, a prolific composer, chiefly of church music, was born in February, 1766, at Loretto, where his father, Andrea Basili, was maestro di capella. While still young, Francesco filled a musical post at Foligno; and soon afterwards began to compose music for the theatre as well as for the church. About 1800 he became maestro di capella at Macerata, and many years afterwards at Loretto. In 1827 he was appointed Censor of the Imperial Conservatory of Music at Milan; and in 1837 director of the music at the Papal chapel of the Vatican. This last-named post he held till his death, which took place on the 25th of March, 1850. Among the numerous published compositions of Basili are cantatas, operas, musical dramas, pianoforte fugues and sonatas, sinfonias, and solfeggios; also a dramatic oratorio ('Il Sansone,' 1824), a Requiem Mass, an Ave Maria, Kyries, Motetts, Psalms with orchestral accompaniments, Offertories, Misereres, Magnificats, &c. Basili left an immense quantity of unpublished music, mostly of an ecclesiastical character, for monasteries and convents, as well as for churches and cathedrals.

BASIRE, JAMES, an English engraver of some reputation, was born in London on the 6th of October, 1730. Very little is known of his life. He excelled in portraits, but his most interesting plate is one engraved for the Society of Antiquaries, 1774, 'The Field of the Cloth of Gold, or the Interview between Henry VIII. and Francis I.' after the picture now at Hampton Court: this print, 47 inches long by 24 inches high, was the largest that had then been engraved on a single plate. Basire, the elder, also engraved Lord Camden, after Sir Joshua Reynolds; 'Lady Stanhope in the character of the Fair Penitent,' after Wilson, 1772; 'Captain Cook, after Hodges, 1777, and Pylades and Orestes, after Benjamin West. He died September 6, 1802. His son, JAMES BASIRE, born in 1769, learned engraving of his father, and was a good draftsman as well as a skilful engraver. For many years he executed the plates and made a large number of the drawings for the 'Archæologia,' 'Vetusta Monumenta,' and other publications of the Society of Antiquaries; and many for the Royal Society. He died May 13, 1822.

BASTWICK, JOHN, celebrated on account of his connexion with the political and ecclesiastical history of the seventeenth century, was born at Writtle, in Essex, in 1593. He was entered a member of Emanuel College, Cambridge, on the 19th of May, 1614; but leaving the university without a degree, he went abroad for nine years, where he spent his time "between the schools and the camp;" and took the degree of M.D. at Padua, then celebrated as one of the best medical schools in Europe. The ardour of his Protestantism dictated the publication in Holland of a Confutation of Popery, entitled, 'Elenchus Religionis Papisticae, in quo probatur neque Apostolicam neque Catholicam, imo neque Romanam esse,' 24mo, Leyden, 1624; 8vo, London, 1637; and 8vo, Amsterdam, 1638. He afterwards published in England his Scourge for the Pope and Latin Bishops, 'Flagellum Pontificis et Episcoporum Latialium,' 12mo, London, 1635; 8vo, London, 1641, in which he maintained the parity or equality between bishops and presbyters. The English prelates thought their dignity assailed; and Bastwick was summoned before the High Commission Court, whose sentence was that the writer should be fined 1000*l.*, should be excommunicated, and prohibited from the practice of his profession of medicine, that he should pay the costs of the suit, that his books should be burned, and that he should be imprisoned until such time as he should make a recantation. He was accordingly committed to the Gate House, where he lay for two years, during which time he produced his Apology, 'Apolo-

geticus ad Præsules Anglicanos Criminum Ecclesiasticorum in Curia Celsæ Commissionis,' 8vo, London, 1636; and 'The New Litany,' 4to, London, 1637, by which he still more exasperated the prelates of the time. An information was in consequence exhibited against him, together with Henry Burton, B.D., and William Prynn, Barrister-at-Law, in the Star Chamber, "for writing and publishing seditious, schismatical, and libellous books, against the Hierarchy of the Church;" the issue of which was that the accused were censured as scandalous, seditious, and infamous persons, sentenced to a fine of 5000*l.* each, to stand in the pillory in New Palace Yard, and there to lose their ears, and to undergo perpetual imprisonment in three several remote places of the kingdom. Dr. Bastwick was accordingly sent first to Launceston Castle, and afterwards to the castle in St. Mary's, one of the Scilly Islands, where he remained till 1640, when an order for the release of the whole three was made by the House of Commons, and they were brought back to London amidst the acclamations of the populace. The House also voted the proceedings against them unjust, and contrary to the law and the liberty of the subject; reversed their sentence; remitted their fine; and ordered 5000*l.* to be paid to each out of the estates of the Archbishop of Canterbury, the High Commissioners, and those Lords who had voted against them in the Star Chamber. But the confusion of the times prevented the payment of the money. In 1644, Bastwick's wife, however, had an allowance ordered for her own and her husband's maintenance; and on the 24th of October, 1648, there was a debate in the House of Commons, about the ordinances for him to have reparation for the illegal sentence against him in the Star Chamber. The subsequent history of Dr. Bastwick is unknown; although it has been thought very probable that he died in the parish of St. Botolph, Colchester, where he had settled for the practice of medicine, upon his first return from the continent.

The literary activity of Bastwick's later years was directed against a foe the exact opposite to Episcopacy; and he published, *inter alia*, 'Independency not God's ordinance; or a Treatise concerning Church Government, occasioned by the Distractions of these times, wherein is evidently proved, that the Presbyterian Government dependent is God's ordinance, and not the Presbyterian Government independent,' 4to, London, May 21, 1645; which in less than three weeks was followed by 'The Second Part of the Book called Independency not God's ordinance; or the Postscript, discovering the uncharitable dealing of the Independents towards their Christian brethren,' 4to, London, June 10, 1645; 'Defence of himself against Lilburn,' 4to, London, 1645; 'The Utter Routing of the whole Army of all the Independents and Sectaries, with the total overthrow of their Monarchy,' 4to, 1646; and 'The Church of England the True Church,' 4to, London, August 23, 1645.

*BATEMAN, JOHN FREDERICK, civil engineer, was born in 1810, at Wyke in Yorkshire. His father belonged to an old Yorkshire family; and his mother was descended from the La Trobes, who were expelled from France by the revocation of the Edict of Nantes. After receiving a professional training under Mr. Dunn, at Oldham, Mr. Bateman established himself as a civil engineer in 1833, taking up especially the branch of hydraulic engineering. Many of his plans and works have had relation to canal and river navigation. He became engineer of various inland canals, and consulting engineer to the Mersey and Irwell and the Forth and Clyde Canal Companies, and also to the trustees of the Clyde Navigation. Since 1863 he has constructed extensive navigation canals in Spain, and has reclaimed and drained large tracts of marsh land near the mouth of the Ebro and in the island of Majorca.

But it is in the supply of water to cities and towns that Mr. Bateman's engineering works have chiefly consisted. In 1835 he designed the Bann reservoirs, in County Down, Ireland, which he subsequently constructed. In 1836 and following years he laid out the reservoirs at Saddleworth, Glossop, and Kendal. Since 1840 he has constructed water-works at St. Helen's, Macclesfield, Bolton, Manchester, Glasgow, Chester, Gloucester, Halifax, Blackburn, Stockport, Wolverhampton, Newcastle-on-Tyne, Birkenhead, &c. Taken collectively, the water-works which he has either wholly constructed, or remodelled and extended, supply water to upwards of 2,000,000 persons. These works are the result in part of much research into the fall of rain and the flow of water in different districts. Two of the above-named undertakings are the largest of the kind in the kingdom, viz., the water-works of Manchester and of Glasgow. In the Manchester works the reservoirs are of vast size; and the details are so managed that in each affluent, or feeding stream,

the pure water is separated from the turbid: the former being utilized, and the latter allowed to flow into the rivers. The works were commenced in 1848, and have been continued till 1870: enlargements having been necessary from time to time to meet the growing wants of a city and neighbourhood now containing 600,000 inhabitants. The works, with the buying-out of a water company, have cost no less a sum than £1,780,000. The Glasgow water-works are of a still more remarkable character, seeing that the water is brought to the city along a distance of 35 miles from a series of mountain lakes. These are Loch Katrine, Loch Venear, and Loch Drunkie, which together have a water surface of 4,000 acres, and contain, within the limits to which the surface may be raised or lowered, more than 1,500,000,000 cubic feet of water. Masonry and sluice-gates accommodate the outflow to the varying level in summer and winter. The aqueduct from Loch Katrine to Glasgow consists principally of tunnels eight feet in diameter, and cast iron pipes 4 feet in diameter. One of the tunnels is $1\frac{1}{2}$ miles long, and has shafts 500 feet deep. The aqueduct and the reservoirs are adequate to the supply of 50,000,000 gallons of water per day. The works themselves cost £700,000; but a further sum of nearly £1,000,000 has been expended by the Corporation of Glasgow in the buying up of two water companies and other expenses. This extensive system of water-supply was commenced in 1855, and was opened by Queen Victoria in October, 1859. A public banquet was soon afterwards given to Mr. Bateman, by the Lord Provost and Corporation of Glasgow, in celebration of the completion of a work so important to a large and constantly increasing city.

In 1854 Mr. Bateman was appointed one of the Royal Commissioners for enquiring into the outbreak of cholera at Newcastle, Gateshead, and Tynemouth. In 1865 he projected a scheme for supplying the Metropolis with water from the sources of the river Severn, in North Wales; the scheme was one of those which were investigated by a Royal Commission in 1867 and 1868, and discussed at length in a report published among the parliamentary papers in 1869. In 1869, in conjunction with his assistant, Mr. Révy, he devised a scheme for a Channel Railway between England and France, by means of a cast-iron tube to be laid on the sea-bottom, large enough to admit trains worked by atmospheric pressure. In the same year, on the invitation of the Viceroy of Egypt, and on the representation of the Royal Society, he was present at the opening of the Suez Canal, on the subject of which he read a paper before the Royal Society in 1870. Scientific and engineering papers by him have also been read before the Institution of Civil Engineers, the Institution of Mechanical Engineers, the British Association for the Advancement of Science, the Social Science Association, and the Literary and Philosophical Society of Manchester. Mr. Bateman (who, in 1841, married a daughter of Mr., afterwards Sir William Fairbairn, the eminent engineer of Manchester) is a Fellow of the Royal, the Geological, and the Royal Geographical Societies; and Justice of the Peace and Deputy Lieutenant for Surrey, for which county he was High Sheriff in 1866.

BATHE, WILLIAM, an Irish divine, who was also a musical writer, was born at Dublin, about 1564. He changed his religion from Protestantism to Roman Catholicism, and about 1596 went to Flanders, where he became a Jesuit. He next journeyed to Italy and to Spain; in which last-named country he was appointed director of the Irish Seminary at Salamanca. He died at Madrid on the 17th of June, 1614. Bathe's first work was in English, written in his youth: 'A brieve introduction to the true art of musicke, wherein are set downe exact and easie rules for such as seeke but to know the trueth; with arguments and their solutions, for such as seeke also to know the reason of the trueth; which rules be meanes whereby any by his owne industrie may shortly, easilie, and regularly attaine to all such things as to his arte doe belong;' 4to, London, 1584. His other works were: 'Janua linguarum, seu modus maxime accommodatus, quo patefit aditus ad omnes linguas intelligentas;' Salamanca, 1611, 4to—a curious attempt to make the study of the Latin language easy; 'Methodical Institution of the principal Mysteries of the Christian faith,' published anonymously in English and in Latin. And a 'Preparation for the Sacrifice of Penitence,' published at Milan under an assumed name.

BATHURST, RALPH, M.D., Dean of Wells, was born at Hawthorpe, Northamptonshire, in 1620. He studied theology at Trinity College, Oxford, with a view to taking orders, but the condition of the Church of England rendering that unadvisable, he directed his attention to medicine. Having taken his degree,

he was one of the medical men appointed to take charge of the sick and wounded seamen, and obtained some notice as a scientific physician. A curious pamphlet of this period is attributed to him, entitled 'News from the Dead, or a true and exact narrative of the miraculous Deliverance of Anne Greene, who being executed at Oxford December 14, 1650, afterwards revived, and, by the care of certain Physicians there, is now perfectly recovered; together with the manner of her sufferings and the particular means used for her recovery. Whereunto are prefixed certain poems, casually printed upon that subject,' 4to, Oxford, 1651; 2nd ed. with additions, same year. The poems, which are in Latin, French, and English, were written by members of the university, Christopher Wren and Bathurst being among the authors. It was not, as has been said, Bathurst who effected the recovery, but Sir William Petty, who, like Bathurst had taken the degree of M.D., and was during these unsettled times acting as a physician: according to Evelyn ('Diary,' 22nd March, 1675), the young woman lived 15 years after her recovery, married, and had several children. In his capacity as a physician, Bathurst published a learned treatise on the voluntary nature of respiration, 'Prælectiones tres de respiratione,' Oxford, 1654. Dr. Bathurst's fame as a man of science stood so high that at the meeting for the foundation of the Royal Society, November 28, 1660, his was one of the names in the list drawn up by the founders of such as are deemed "fit to joyne with them in their designe;" and though not one of the original, he was one of the early members: it is, however, a mistake to state that he was president.

The restoration of Charles II. restored the Church of England, and Bathurst returned to his studies in divinity, took orders, and was appointed chaplain to the King. In September, 1664, he was elected President of Trinity College, Oxford, and in 1673 and 1674 he was vice-chancellor of the university, in the government of which he long took a leading part. He was installed Dean of Wells, June 28, 1670, and in April, 1691, was nominated Bishop of Bristol, but declined the honour, preferring not to leave his college, to which he was much attached, and of which he was a considerable benefactor, having built at his own cost the entrance tower and the chapel—the latter remarkable for its admirable proportions and the exquisite carvings by Grinling Gibbon. Dean Bathurst died on the 14th of June, 1704, and was interred in his own chapel under a tomb erected by himself. Evelyn, who often mentions him in his Diary, and always with marked respect, says in noticing his decease, "he was 86 years of age, stark blind, deafe, and memory lost, after having been a person of admirable parts and learning." Besides the works quoted, Bathurst wrote various Latin poems printed in the 'Museum Anglicæ Annalecta.' Thomas Warton published the 'Life and Literary Remains of Ralph Bathurst, M.D.,' &c., 8vo, London, 1761.

BATMAN, or BATEMAN, STEPHEN, a writer of the 16th century whose books are in great request with bibliographers, was born at Bruton, in Somersetshire, about 1537. Little is told of his life. He was a divine, and domestic chaplain to Archbishop Parker, by whom he was employed in augmenting his library, for which Batman is said to have collected upwards of a thousand MSS., and which now form part of the choicest treasures of the library of Corpus Christi College, Cambridge. Batman's works are chiefly theological, but all are quaint and curious in character, have much incidental matter that is valuable as illustrating the age in which they were written, and mostly contain curious wood-cut illustrations. The following are the principal:—1. 'Travayled Pilgreme, bringing Newes from all Parts of the Worlde, such like scarce harde before,' an allegorical poem on the life of man, 4to, printed by John Denham, 1560, black letter, with 20 wood-cuts. 2. 'Christil Glasse for Christian Reformation,' a treatise on the seven deadly sins, 4to, printed by John Day, 1569, black letter, with numerous curious wood-cuts. 3. 'Of the Arrivall of the Three Graces in Anglia, lamenting the abuses of the Present Age,' 4to, printed by W. Norton, black letter, n. d. 4. 'Joyfull Newes out of Helvetia from Theoph. Paracelsus, declaring the ruinate Fall of the Papall Dignitie: also a Treatise against Vsurie,' 8vo, London, 1575. 5. 'Golden Booke of the Leaden Goddes, wherein is described the vayne imaginations of Heathen Pagans and Counterfait Christians: with a Description of their seuerall Tables, what ech of their Pictures signified,' 4to, London, 1577. This is a very curious book. Warton speaks of it as the first systematic account of the heathen mythology in the language, though written rather "with a view of exposing the heathen superstitions, and of showing their conformity to the papistic,"

than of illustrating the religious fables of antiquity." ('Hist. of Eng. Poetry,' vol. iii. § 70). The little volume, which only contains 72 pages, is dedicated to Lord Hunsdon, and is believed to have been used by Shakspeare. Batman's most famous work is, however (6), 'Doom warning all Men to Judgement: in manner of a generall Chronicle,' 4to, black letter, 1581, imprinted by R. Nubery, a work of 437 pages, with many curious engravings of monsters, prodigies, &c. Batuman also made a translation of 'Bartholomæus de Proprietatibus Rerum.'

BAUDE, HENRI, a French poet and prose author, was born at Moulins, about 1430. He was fortunate enough, whilst still a youth, to recommend himself to the favour of Charles VII., by whom he was entrusted with a responsible revenue appointment in the province of Limousin. Baude performed the functions of his office by deputy, as was then usual, and passed most of his time at Paris, where, in the latter part of his life, he habitually resided. By a caprice of fortune Baude and his works have been much overlooked in the literary history of his country, so that his memory labours at the present day under a kind of proscription. His verse is lively, plain, and realistic; and he in great part owes his present oblivion to the ephemeral nature of his topics and allusions. At the commencement of the reign of Charles VIII., Baude produced a 'Morality,' the representation of which, although it was countenanced by the court of parliament, gave so great offence to the personages introduced in it, that the author was condemned to an imprisonment which lasted only three months, but which might have been indefinitely prolonged but for the charitable intervention of the parliament, at the solicitation of the municipal body. The text of this 'Morality' has not been preserved; but its quality may be inferred from a second one which is extant, under the title 'Pragmatique entre Gens de Court et la Salle du Palais.' The works of Baude consist for the most part of slight productions having relation to the politics and manners of the time, of epigrams, rondeaux, and ballads. About the time when Charles VIII. began really to govern, about 1492, Baude addressed to the King a 'Diet Moral sur le maintien de Justice,' in which he offered up prayers for the prosperity of his reign, and counselled him, in order that it might be happy, to an exact observance of the laws and of the rights of all men. He proposed as a model for the young prince, his grandfather, Charles VII., of whose panegyric, inserted at the beginning of Godefroy's *Historians of Charles VII.* (folio, Paris, Imprimerie Royale, 1661), and entitled 'Éloge du Roi Charles VII. tiré d'un Manuscrit anonyme,' Baude is now on good grounds concluded to have been the author. And there is a strong presumption from internal evidence that Baude was also the author of an anonymous manuscript poem in the 'Bibliothèque Impériale,' which has for its title 'Regrets et Complaintes de la Mort de Charles VII., dernier trépassé.' This piece mentions Queen Marie of Anjou as still living, and its date ranges, therefore, between 1461 and 1463. Baude died about the year 1495.

BAUDIER, MICHEL, historiographer of France under Louis XIII., was born in Languedoc about the year 1589. He was a fertile and laborious author, but his works have failed to interest biographers in the events of his life, so that few particulars concerning him are on record. He is known, however, to have been *Gentilhomme de la Maison du Roi*, and historiographer of France. At a comparatively early age he seems to have understood the advantages of private life; and he retired to his books and to the solace of the arts, and to endless writing. He employed a great part of his modest fortune in the collecting of books, MSS., and coins. The style of Baudier is heavy and diffuse; and one secret of his non-success is his deficiency in the critical faculty. His principal works are 'Histoire des Guerres de Flandre, depuis 1559 jusqu'en 1609, traduite de l'Italien de Francesco Lanario,' 8vo, Paris, 1618; which was supplemented by an original work of some interest, 'Histoire Succincte de la Flandre,' 'Inventaire général de l'Histoire des Turcs,' 4to, Paris, 1619, a work which, considering the time of its production, is one of much learning, and which has been of great service to historians; 'Histoire générale de la Religion des Turcs, avec la vie de leur prophète Mahomet et des quatre premiers Califes; plus, le Livre et la Theologie de Mahomet, traduit de l'arabe,' of which the first three editions were published severally in 1626, 1632, and 1636, Paris, 8vo; 'Histoire générale du Sérail et de la Cour du Grand Seigneur,' 4to, Paris, 1626, 8vo, Rouen, 1638; reprinted with the 'Histoire de la Cour du Roy de la Chine,' 8vo, Paris, 1642; 'Histoire de l'Administration du Cardinal d'Amboise, grand ministre d'État en France, où se lisent les effets de la sagesse politique; ensemble les félicités de la France sous un bon

Gouvernement,' 4to, Paris, 1634; 'Histoire de l'incomparable Administration de Romien, grand ministre d'État de Raymon Béranger, Comte de Provence, dans le 13^e siècle,' 8vo, Paris, 1635; a work curious for the simplicity with which the author has woven fables and romances into his narrative; 'Histoire de l'Administration du Cardinal de Ximénès,' 4to, Paris, 1635; the most considerable of Baudier's productions, and exhibiting the greatest diligence and research; 'Le Soldat Piémontais revenant du camp de Turin; ou, Histoire de la Campagne d'Italie de l'année 1640,' 8vo, Paris, 1644; 'Histoire du Maréchal de Toiras, ensemble une bonne partie du règne de Louis XIII. et la généalogie,' folio, Paris, 1644, and 2 vols. 12mo, 1666; 'Histoire de l'Administration de l'Abbé Suger,' 4to, Paris, 1645; and a MS. 'Histoire de Marguerite d'Anjou, femme du Roi d'Angleterre, Henri VI.,' which is preserved in the Bibliothèque Impériale. The precise time of Baudier's death is unknown; but it has been happily conjectured that so inveterate a writer must have died very soon after the publication of his last work, about the year 1645.

BAUDRILLART, JACQUES JOSEPH, a learned French writer on forestry and forest law, was born at Givron, in Ardennes, on the 20th of May, 1774. After studying at the College of Reethel, and making great advances in mathematics, physics, and chemistry, he entered the Garde Nationale of Charleville in 1791, and the regular army in 1792. He was at first quartermaster of the battalion of Ardennes, but afterwards joined the army administration, and was engaged in succession with the Corps d'Armée of the Sambre and Meuse, Mayence, the Danube, and the Rhine. Quitting the army in 1801, and losing the little money he had saved, he turned to forestry, of which he had gained some knowledge while in Germany. He obtained a post in the administration of forests, in which he gradually rose to the rank of chief of division; this office he filled from 1819 to 1831. A change was then made in the organization of the office, which led to his being placed in a lower post; this occasioned him so much chagrin as to hasten his death, which took place at Paris on the 24th of March, 1832. The writings of Baudrillart are numerous, chiefly on subjects connected with forestry. The following are the principal works: (1), in conjunction with Doniol, 'Collection Chronologique et raisonnée des Arrêts de la Cour de Cassation, en matière d'eaux et forêts, depuis et compris 1798 jusqu'en 1808,' 8vo, Paris, 1808; (2), in conjunction with Doniol and Chanlaire, 'Annales forestières,' Paris, 1808-14, 7 vols. 8vo; (3), 'Annuaire forestier,' 3 vols. 12mo, Paris, 1811-13; (4), 'Mémoire sur la pesanture spécifique des bois, &c.,' 8vo, Paris, 1815; (5), 'Code forestier,' with a commentary, &c., 2 vols. 12mo, Paris, 1827; (6), 'Traité Général des Eaux et Forêts, chasses et pêches,' 6 vols. 4to, and Atlas, Paris, 1821-28; (7), 'Code de la pêche fluviale,' 2 vols. 12mo, and Atlas, Paris, 1829; comprising, besides the code of laws and ordonnances, a commentary, a natural history of fishes, and a glossary of terms in river fishing and river navigation. He also translated into French some German works on forestry, by Hartig and Burgsdorff. In conjunction with Bosc, he compiled, in 1821, a volume of the 'Encyclopédie Méthodique,' viz., the 'Dictionnaire de la Culture des Arbres, et de l'aménagement des bois.' Baudrillart's great work, the 'Traité Général des Eaux et Forêts,' is one of much value and reputation. It comprises a collection of the laws and ordonnances relating to forests, rivers, hunting, and fishing, from 1219 to 1824; instructions for procedure; methods of plantation and culture; separate dictionaries of the technical terms used in all the four branches of the subject; the scientific principles embodied in forestry; natural history and implements of hunting and fishing; and a bibliographical notice of authors. Baudrillart was a Chevalier of the Legion of Honour, Member of the Royal Society of Agriculture of France, and member of other societies at home and abroad.

BAUER, ANTON, a German jurist, who was especially skilled in the principles of criminal law, was born at Göttingen, on the 16th of August, 1772. He became a student and graduate of the University of Marburg, where he was made lecturer and professor respectively, in 1793 and 1797. In 1813 he was transferred in the latter capacity to Göttingen, where he became at first councillor in ordinary, and afterwards, in 1840, councillor extraordinary of justice. He died at Göttingen on the first of June, 1843. He is the author of a treatise on the principles of evidence in criminal cases, 'Grundsätze des Criminalprocesses,' Nürnberg, 1805, afterwards published under the title of 'Lehrbuch des Strafprocesses,' Göttingen, 1835, and 1848; A Manual of Natural Law, 'Lehrbuch des Naturrechts,'

Marburg, 1808, 3rd edition, Göttingen, 1825, a work on the philosophy of criminal law, which subject he further treated in his 'Grundzügen des Philosophischen Strafrechts,' Göttingen, 1825; A Manual of Criminal Law, 'Lehrbuch des Strafrechts,' Göttingen, 1827, 2nd edition, 1833; Theory of Preventive Legislation, with an Exposition and Examination of all the Theories of Criminal Law, 'Die Warnungstheorie, nebst einer Darstellung und Beurtheilung aller Strafrechtstheorien,' Göttingen, 1830; Introduction to the Practice of Criminal Law, 'Anleitung zur Criminalpraxis,' Göttingen, 1837; Collection of Cases in Criminal Law, 'Sammlung von Strafrechtsfällen,' 4 vols., Göttingen, 1835-39; Dissertations on Criminal Law and Criminal Procedure, 'Abhandlungen aus dem Strafrecht und Strafprocesse,' 3 vols., Göttingen, 1840-43; and other works upon the criminal law of France and Hanover.

* BAUER, BRUNO, a celebrated philosopher and biblical critic, was born on the 6th of September, 1809, at Eisenberg, in the Duchy of Saxe-Altenburg, and received his education in the schools and University of Berlin. In 1834 he became Doctor in Theology; and took a lively part in the religious quarrels and speculations of his time. In 1839 he acted as a tutor at Bonn; but in 1842, on account of the hardihood of his opinions, the permission to lecture on theology was withdrawn. Hereupon he returned to Berlin, where he devoted himself enthusiastically to those critical and historical works which have placed him amongst the most learned men, and the foremost writers of Germany. At first Bauer sought to conciliate philosophy with theology, and in this spirit wrote, in 1835, a Review of the 'Leben Jesu,' of Dr. Strauss, and produced his Journal of Speculative Theology, 'Zeitschrift für Speculative Theologie,' Berlin, 1836-38, and his Critical Exposition of the Old Testament, 'Kritische Darstellung der Religion des Alten Testaments,' 2 vols., Berlin, 1838. His tendency to deflect more and more from orthodoxy was marked by the Epistle he addressed to Dr. Hengstenberg, Berlin, 1839; and his work on the Evangelical Established Church of Prussia and Science, 'Die Evangelische Landeskirche Preussens und die Wissenschaft,' Leipzig, 1840. He advanced rapidly to the boldest position of the young Hegelians, and published a series of writings, in which the prevailing mode of regarding Christianity was subjected to an unsparring criticism. Thus, in his Critique of the Evangelical History of St. John, 'Kritik der Evangelischen Geschichte des Johannes,' Bremen, 1840, and in his Critique of the Synoptical Gospels, 'Kritik der Evangelischen Synoptiker,' 2 vols., Leipzig, 1840 and 1841, he argues that the Gospel histories are a result perfectly natural to human self-consciousness, and a free product of literary individuality. It was after the publication of these views that Bauer was forbidden to lecture at Bonn, and he produced an apologetic treatise 'Die Sache der Freiheit und meine eigene Angelegenheit,' Zurich, 1843. The next of his works, Christianity Displayed, 'Das entdeckte Christenthum,' was destroyed before publication, at Zurich, in 1843. In a treatise on the Jewish Question, 'Die Judenfrage,' Brunswick, 1843, Bauer attacked the vagueness of the pretensions of liberalism; and further developed his opinions in the Universal Literary Journal, 'Allgemeine Literaturzeitung,' Charlottenberg, 1843-44, in which he analyses the German radicalism of 1842, and its consequent socialistic theories. Besides a large and important series of works devoted to a consideration of political questions, Bauer produced in his old field of criticism on the earliest writings of Christianity, a Critique of the Gospels, and History of their origin, 'Kritik der Evangelien und Geschichte ihres Ursprungs,' 2 vols., Berlin, 1850 and 1851; The History of the Apostles, 'Die Apostelgeschichte,' Berlin, 1850; and a Critique of the Epistles of St. Paul, 'Kritik der Paulinische Briefe,' Berlin, 1850, in which he attempts to shew that the four leading Epistles, which had been previously unquestioned, were not written by the Apostle Paul, but are the production of the second century.

BAUR, FERDINAND CHRISTIAN, the founder and head of the "Tübingen School" of theology, was born on the 21st of June, 1792, at Schmiden, near Cannstadt, where his father, from whom he received his early education, was settled as pastor. He became a pupil of the seminaries successively of Blaubeuren and Maulbronn. From the year 1809 to 1814 he was a student of theology at Tübingen; after which he exercised his ministry for short periods at divers places, until in 1817 he became professor in the Seminary at Blaubeuren. Here he wrote his work on Symbolism and Mythology; or the Natural Religion of the Ancient World, 'Symbolik und Mythologie; oder die Naturreligion des Alterthums,' 3 vols.,

Stuttgart, 1824-5. In 1826 he became titular professor of evangelical theology in the University of Tübingen, where he pursued his labours until his death on the 2nd of December, 1860.

The "Tübingen School" is a periphrasis for Baur; and the expression is vaguely intended to embrace the writers in the Tübingen Theological Journal, 'Zeitschrift für Theologie,' such as Zeller, Schwegler, Köstlin, Volkmar, and Hilgenfeld, all younger men than Baur, and chiefly his disciples, whose business it was to work out in detail the fertile principles of criticism which their master originated. It was the task of the Tübingen School to subject the Christian writings to the same process of dispassionate investigation as that which had been brought to bear upon heathen records and systems of religion. The edifice which these constructive rationalists set themselves to rear, was to be founded on purely historical criticism, from which all *a priori* dogmatical or philosophical hypotheses were to be excluded. The problem of Biblical criticism, they averred, could be completely solved only by a rigorous examination of each of the books of the New Testament, as well as the history which they contain. It was necessary not only to prove that the New Testament history was untrustworthy and ideal, but to construct, from such materials as might be available, a real and credible history of the beginnings of Christianity. The essential characteristic of the Tübingen, as of every modern, substitute for the life of Jesus given us in the four Gospels, is that it is a life of Jesus without the supernatural. "A conviction of nature's constancy and order," says Mr. Mackay, the interpreter and apologist of the Tübingen School, "was the necessary preliminary to a scientific treatment of history; for history ends where miracles begin. History would exhibit events in an intelligible order of connection and succession; whereas miracle, denying any natural connection, consigns them to unintelligible chaos." It follows, of course, that if a miracle be impossible, the Bible, as a whole, must be incredible. Such was the spirit in which the claims of the canonical books of the New Testament were to be severally scrutinized. One great feature of the Tübingen criticism is the stress which is laid on the disputes recorded in the Acts of the Apostles, and alluded to in the Epistles, as evidencing an early and extreme variance of the Christian world as divided into the Petrine or Judaical school on the one hand, and the Pauline on the other. Although all readers of the New Testament are cognizant of a certain running strife between these parties, it is startling to observe the dimensions which the difference is made to attain, and how much of it is affirmed to have been in fierce action in the identical age of the Apostles, and in the very books of the New Testament. The prevailing tone, when St. Paul appeared on the scene, was Jewish; much importance was attached to meats and Sabbaths, days and months, times and seasons, and there was a tendency to an obstinate fanaticism and an illiberal asceticism. In the view taken by the Tübingen School, it was St. Paul who enabled the nascent religion to surmount the local peculiarities and prejudices by which it was hampered. The clash between the universalism promoted by St. Paul, and the Judaism of the older Apostles, forms the turning point of the next fifty or sixty years of Christian history. The hostility passes through various phases; and is first observable in the personal antagonism of Paul and the Twelve, as, for example, on the subject of circumcision. With the fall of Jerusalem, and the destruction of the temple, the importance of a minute ceremonial seemed to diminish. The old forms of parties gave place to new; and by the middle of the second century, there appeared, in place of the Pauline and Petrine antithesis, the antagonism between speculative thought and the new episcopal organization. The coalition of these forces produced the church catholic, which began before the middle of the second century to stand out as the legitimate and all-embracing organ of Christian opinion and feeling, in contradistinction to the minor sects and heresies, which each embraced some peculiar and external tenet of its own. The object of the examination of each book of the New Testament is to decide to what epoch of this evolution of doctrines it belongs, and what particular tenets it was intended to recommend. Here a grave objection is raised against the Tübingen School of criticism on account of the assumption imputed to it, of the dishonesty of the writers of the New Testament history, who are hereby reduced to the condition of forgers, who were, and who knew they were, untruthful. They intended to deceive; the object which they had in view must have been to misrepresent the early age of Christianity and the teaching of Jesus Christ and His Apostles. They believed that the second century, to which most of them are affirmed by

the Tübingen School to have belonged, differed from the first century, both in the relation of Church parties, in doctrine, and in ecclesiastical organization. In these particulars they consider the second century greatly in advance of the first; they believed it to be a great advantage that early schisms had been healed, that the Christian creed had been brought into a far more correct and rigid form, and that the Christian communities were under the government of a well-defined hierarchy. They were sure that Jesus Christ was *not* what the Christendom of the second century believed him to be. They were sure that the teaching both of Christ and the Apostles was widely different from that which the second century was in the habit of attributing to them. But, inasmuch as the second century did reflect its own beliefs and organizations upon the first age, the writers of the New Testament perceived how extremely useful this delusion might be made. They wanted to strengthen the foundations of the doctrinal and ecclesiastical edifice of their own time; and to accomplish this they invented a life of Jesus Christ, and a book of the Acts of the Apostles, which they knew to be falsely originated by themselves. In the same spirit they wrote letters which they attributed to one or other of Christ's disciples, which were meant to be untrue both to the letter and the spirit of the Apostolic teaching. Upon this assumption, it is said, that every jot and tittle of the Tübingen criticism depends. On the other hand, it is urged that to father upon honoured names the authorship of treatises which were not really so related to them, would not be in ancient times the literary fraud which the present age would account it. The prophet, or the sibyl, was not an author; and hence it was lawful to *edit* the words of each as if authentically spoken. No fraud was intended. The affixed names were not pseudonymous, but eponymous. The custom was transmitted to the Christian church. The great object of parties and opinions in the second century was to prove themselves apostolic; and it is a mistake to suppose that a literature created with such an object can fairly be taxed with the intention to deceive. The alternative is not the acceptance of the document as authentic, or its rejection as useless and fraudulent. The document so originated is not only what the compilers believed to be true, but it is further what they believed to be the true expression of the Apostle whose name was affixed to it. Each compiler felt himself privileged to carry out in the best way he could his purpose of inculcating Christian truth, and forwarding Catholic interests. Of the five historical books of the New Testament, the Acts of the Apostles is that in which the ecclesiastical purpose is most unmistakable. Its object is to throw a veil over the dissensions of early Christianity, and to promote Catholic tendencies by representing Paul as acting in entire accord with the Twelve, and especially with Peter. The first Petrine epistle has a kindred object to the Acts, and on the whole is written in the spirit of the Roman Paulo-Petrine syncretism of the early part of the second century.

The results of the Tübingen criticism are that the claims to canonicity of the Gospel of St. John are disallowed, and its production is referred to an age in which Gnosticism was triumphant; and it may be said, in short, that out of thirteen Epistles commonly received by antiquity as the genuine writings of St. Paul, four only are admitted as such by Baur—that to the Galatians, to the Romans, and the two to the Corinthians. These four Epistles are in fact the basis of the whole critical inquiry; each of them has its own specific character, and exhibits a special phase of Christian development. Of what Baur calls the Deutero-Pauline letters—those to the Ephesians, Philipians, and Colossians—it is said that they have a certain likeness to each other; and that the monotonous iteration, the vagueness of the Catholic teaching, the general recommendation of practical duty, and, above all, the absence of specific purpose, mark them as later writings. They share the irenic tendency of the writings of the second century; giving to *Faith* and *Christ* an altered meaning, reducing the former to adhesion to a creed, and changing the latter from the regenerating power within the soul to a transcendental supermundane essence. The Pastoral letters, those, namely, to Timothy and Titus, have, it is affirmed, the general air of the second century. Heresy is denounced; ecclesiastical power is invoked to check it; there is a perpetual recurrence of the neutral formula combining faith and works; and by *faith* is meant not the inward condition of the soul, but allegiance to a creed. The lesson inculcated is peace; to shun speculation, now considered dangerous; and to follow practical righteousness.

The works in which Baur wrought out the details of the

criticism of which the principles are exhibited above, are chiefly the Christian Gnosis, 'Die Christliche Gnosis; oder die Christliche Religions-Philosophie,' Tübingen, 1835; the Christian Doctrine of the Atonement, 'Die Christliche Lehre von der Versöhnung,' Tübingen, 1838; the Christian Doctrine of the Trinity, and of the Incarnation of God, 'Die Christliche Lehre von der Dreieinigkeit und Menschwerdung Gottes,' 3 vols., Tübingen, 1841–43; the Difference between Catholicism and Protestantism, 'Der Gegensatz des Katholicismus und Protestantismus,' Tübingen, 2nd ed., 1836, a work in which the author attacks the famous 'Symbolik' of the Catholic theologian Johann Adam Möhler, who replied with his New Researches upon the Differences between Catholicism and Protestantism, 'Neue Untersuchungen der Lehrgagensätze zwischen den Katholiken und Protestanten,' to which Baur rejoined with his 'Erwiderung gegen Möhler's neueste Polemik.' Baur's works in the domain of New Testament criticism comprise a Treatise on the History of Christian Dogma, 'Lehrbuch der Christlichen Dogmengeschichte,' Stuttgart, 1847, 2nd ed., Tübingen, 1858; The Christ-Party in the Corinthian Church, 'Die Christuspartei in der Corinth. Gemeinde, der Gegensatz des paulinischen und petrinischen Christenthums;' The So-called Pastoral Letters of the Apostle Paul, 'Die Sogenannten Pastoralbriefe des Apostels Paulus,' Stuttgart, 1835, in which their apocryphal character is asserted; St. Paul, the Apostle of Jesus Christ, his life and works, his Epistles and Doctrine, 'Paulus, der Apostel Jesu Christi, sein Leben und Wirken, seine Briefe und seine Lehre,' Stuttgart, 1845, a critical and historical survey of primitive Christianity, which offers an epitome of the author's ideas as expressed in former works, with new researches on the apocryphal original of the Secondary Epistles; Critical Researches on the Canonical Gospels, their inter-relations, origin, and character, 'Kritische Untersuchungen über die kanonischen Evangelien, ihr Verhältniss zueinander, ihren Ursprung und Charakter,' Tübingen, 1847, in which the author seeks especially to disprove the historical character of the Gospel of St. John, and to refer it to an epoch later than the Apostolic; St. Mark's Gospel, its Origin and Character, 'Das Markusevangelium nach seinen Ursprung und Charakter,' Tübingen, 1851; The Christianity and the Christian Church of the first three centuries, 'Das Christenthum und die Christliche Kirche der drei ersten Jahrhunderte,' Tübingen, 1853, 2nd ed., 1860, a work which comprises the results of all the critical researches relative to the origin of Christianity. Two works were published posthumously under the joint editorial care of the author's son, Ferd. Friedr. Baur, and Zeller, the titles of which were 'Die Christliche Kirche des Mittelalters,' Tübingen, 1861; and 'Die Kirchengeschichte der neuern Zeit, von der Reformation bis zum ende des 18 Jahrhunderts,' Tübingen, 1863.

BAXTER, ANDREW, an ingenious metaphysician and natural philosopher, was the son of a merchant in Old Aberdeen, where he was born, in the year 1686 or 1687. He received his education at King's College, in his native city; and occupied the greater part of his life as a private tutor, having amongst his pupils Lord Gray, Lord Blantyre, and Mr. Hay of Drummelzier. In 1723, whilst resident at Dunse Castle, as preceptor to the last-mentioned gentleman, he is ascertained, by letters which passed between him and Henry Home, afterwards Lord Kames, to have been deeply engaged in both physical and metaphysical disquisitions. A few years after, possibly in 1730, he published his great work entitled, 'An Inquiry into the nature of the Human Soul, wherein its Immateriality is evinced from the Principles of Reason and Philosophy,' London, 4to; second edition, 2 vols., 8vo, 1737; third edition, 2 vols., 8vo, 1745. The object of this work, which won the singular commendation of Bishop Warburton, is to prove the immateriality, and consequently the immortality, of the soul, from the acknowledged principle of the vis inertia of matter. In 1741, Baxter went abroad with his pupil, Mr. Hay, and resided for several years at Utrecht. In the course of various excursions which he made through Holland, France, and Germany he was generally well received by the literati; and, whilst abroad, he formed an intimate friendship with the well-known John Wilkes, to whom he dedicated his 'Appendix to the first part of the Inquiry into the Nature of the Human Soul; wherein the Principles laid down are cleared from some Objections started against the notions of the Vis Inertia of Matter, by Maclaurin,' &c., 8vo, London, 1750. This work was edited by the Rev. Dr. John Duncan, of South Warnborough, who afterwards published 'The Evidence of Reason, in proof of the Immortality of the Soul, independent on the more abstruse

Enquiry into the Nature of Matter and Spirit. Collected from the MSS. of Mr. Baxter. To which is prefixed a letter from the Editor to Dr. Priestley, 8vo, London, 1779. This was, of course, a posthumous publication; for Baxter, who returned from the continent in 1747, died on the 23rd of April, 1750, at Wittingham in East Lothian, a seat belonging to Mr. Hay, where Baxter constantly resided during the last three years of his life. The only important work of Baxter remaining to be mentioned, is one entitled 'Matho: Sive Cosmotheoria Puerilis Dialogus. In quo prima Elementa de Mundi ordine et ornatu proponuntur,' &c., 2 vols. 8vo, London, 1740; a production which, designed for the use of the author's pupils and his son, was published in English, with the title of 'Matho: or the Cosmotheoria Puerilis, in ten Dialogues; wherein from the Phenomena of the Material World, briefly explained, the Principles of Natural Religion are deduced and demonstrated,' 2 vols. 8vo, London, 1745; third edition, "corrected and enlarged," 2 vols. 12mo, 1765. Another, "accommodated to the capacities and instructions of the youth of both sexes," by Samuel Whyte, 2 vols. 12mo, Dublin, 1776.

* BAYNES, THOMAS SPENCER, Professor of Logic and Rhetoric in the University of St. Andrews, was a pupil of the late Sir William Hamilton, Professor of Logic and Metaphysics in the University of Edinburgh, whose notice he attracted by his abilities and zeal in logical research in the commencement of Session 1846-47. The favourable regard developed into a friendly intimacy, and Mr. Baynes, in due course, became assistant to Sir William, who, in consequence of an attack of paralysis, had been, since 1844, incompetent to the unaided management and business of his class. Mr. Baynes has for some years filled with great ability the chair of logic and rhetoric in the University of St. Andrews. He has published 'An Essay on the new Analytic of Logical Forms. With an Historical Appendix,' 8vo, Edinburgh, 1850; 'The Port Royal Logic, translated from the French, with Introduction, Notes, and Appendix,' 12mo, 1851; 'The Song of Solomon in the Somersetshire Dialect,' 16mo, 1860; and 'The Somersetshire Dialect: Its Pronunciation. Two papers reprinted from the "Taunton Courier,"' 8vo, London, 1861. This last work was privately printed, and its issue limited to two hundred copies.

* BAZALGETTE, JOSEPH WILLIAM, engineer-in-chief to the Metropolitan Board of Works, was born in 1819. His family was of French origin; his father was a Commander in the Royal Navy. After the usual course of school education, he studied civil engineering under Sir John MacNeill. Mr. Bazalgette commenced practice on his own account in 1842, and soon afterwards executed some drainage works in the north of Ireland. In 1848 he succeeded Mr. Frank Forster as engineer to the Metropolitan Commission of Sewers. His duties brought him actively into the long and elaborate investigation which had been entrusted to the Commission, concerning the drainage and water supply of London: an investigation which showed interminable varieties of opinion between the Commissioners, the Board of Health, and civil engineers generally. Mr. Bazalgette planned and executed three hundred miles of sewers in the Metropolis while holding the above-named office. In 1855, by the passing of the 'Metropolis Management Act' (18 & 19 Vict. c. 120), the powers of the Commissioners were transferred to a new body—the Metropolitan Board of Works, entrusted also with many additional powers. Mr. Bazalgette was appointed engineer-in-chief to the Board. It devolved upon him to plan and carry out the vast system of main drainage for the Metropolis, which has since been nearly completed, with the exception of one particular line called the Low Level Sewer. The plan does not at present comprise any arrangement for the utilization of the sewage; which is allowed, under certain regulations as to tide, to flow into the Thames, near Barking and near Crossness. Mr. Bazalgette was the first to introduce subways under new streets made in the Metropolis, for carrying gas-pipes, water-pipes, and telegraph wires, and thereby lessening the necessity for breaking up the roadways when repairs have to be executed in the underground works. Another great work planned by him for the Board is the embanking of the Thames. The northern embankment, from Westminster Bridge to Blackfriars Bridge is (1870) far advanced towards completion. This important work has the effect of improving the navigation of the Thames, and at the same time of obtaining reclaimed ground for foot pavements, carriage road, a railway, the low level sewer, and possibly some buildings and gardens. The southern embankment, from Westminster Bridge nearly to Vauxhall Bridge, though on a less grand scale, renders the same kind

of service to the Surrey side of the Metropolis. Mr. Bazalgette, in virtue of his office, has to watch over the public interests with regard to all engineering works constructed within the Metropolitan area (with some exceptions within the City of London); and a code which he has laid down, for regulating the construction of bridges and the alteration of streets, is observed in all Railway Acts affecting the Metropolis. As a consulting engineer, Mr. Bazalgette has issued reports on plans for the improved drainage of Oxford, Cambridge, St. Leonards, Folkestone, Norwich, Cheltenham, Weston-super-Mare, Glasgow, Dublin, Belfast, Brussels, Port Louis in Mauritius, and other places.

* BEALE, LIONEL SMITH, an eminent microscopist and physiologist, was born in 1828. He is a Fellow of the Royal and several other Societies. He now holds the post of Physician to King's College Hospital, and has held the professorship of Physiology in King's College for several years, but resigned it a short time back. In 1852 a long paper by him, on the character of the urine in persons affected with pneumonia, was published in the 'Transactions of the Medical and Chirurgical Society,' since which date he has been a constant contributor to scientific literature. The paper above noticed was followed by others on urine and on the structure of the kidneys, which appeared in the 'British and Foreign Medico-Chirurgical Review,' the 'Quarterly Journal of Microscopical Science,' and in the 'Archives of Medicine.' The substance of these was incorporated in a book, of which the third edition was issued in 1869, under the title of 'Kidney Diseases, urinary deposits, and calculous disorders: their Nature and Treatment.' It is a volume of 472 pages, containing many figures. It shows, what is apparent in all Dr. Beale's works, great skill in methodical arrangement and much painstaking care. As an instance, we may notice that a large proportion of the figures were drawn by himself on the wood from nature; that most of the cuts have scales of measurement attached to them, and that the dates of publication of the plates are usually given. This work is a standard reference-book on the subject to which it is devoted. He has given much attention to the construction and practical application of the microscope to anatomy. The results of his inquiry are found in various papers, but are all brought together in his book, entitled 'How to work with the Microscope,' of which the first edition appeared in 1857-59, and the fourth in 1868. It is a thoroughly practical guide to microscopists, and towards the end contains a summary of the principal new physiological views which the author has originated. This work is also illustrated with many plates of figures, to which the same remarks apply as to those in his 'Kidney Diseases, &c.' One feature in it is characteristic. The page where the descriptive text referring to each cut occurs is appended to the figures; and the reader is recommended to examine the cuts and then read the text, if he wishes to gain information readily and accurately. The new views are such as could only have been arrived at by a long course of patient microscopical observation. It was mainly Dr. Beale's efforts that induced the optician to make microscopic object glasses of very high power, such as the $\frac{1}{4}$ th inch by Messrs. Powell and Lealand, the use of which led him to oppose the widely accepted view that nerves end peripherally. He found that what were called the ends were the points at which the nerves suddenly attenuated and ramified into a sort of mesh-work, some of the fibres of which were not more than the $\frac{1}{100}$ th of an inch in diameter. These so called ends are observable near the proximal extremity of voluntary muscles, while the interlacement of minute nerve fibres is visible over the whole body of the muscle, as well as on the under side of the sarcolemma; and the further continuation of the fibres is lost amidst the substance which fills up the spaces between the muscular tissue. This intermuscular tissue is usually designated connective; but Dr. Beale is convinced that in some places, especially beneath sensitive surfaces, the tissue so called is really in great part, if not wholly, composed of agglomerated nerve fibres. He believes also that the nerve never ends, but is reflected back to nerve centres, and generally to the same centre from which it originated. Impressed with these ideas, he advocates the notion that the nervous apparatus is a collection of continuous circuits analogous to electrical circuits in metallic wires. In accordance with this, he maintains that all nerve centres or ganglions are bi- or multi-polar, never uni-polar or apolar. His papers bearing on this subject are contained in the 'Proceedings of the Royal Society,' 'Philosophical Transactions,' 'Archives of Medicine,' and 'Transactions of the Microscopical Society.' Another important generalization made by Dr. Beale is that every tissue consists of two parts, one of which is coloured when prepared in a

certain way with glycerine; while the other is colourless. The coloured portion is said to be living or germinal matter, and has the property of altering its form, of growing, of multiplying, and, as we gather, vitalizing inorganic substances. It corresponds to what is usually called cell-contents, protoplasm, &c., and is distinguished by Beale as forming, growing, or active matter. The colourless portion is the effete germinal matter, and forms the parts known as intercellular substance, cell-wall, membrane, &c. Beale designates it as formed matter. According to him the protoplasm, or forming matter has the same properties in every organ and in every organism; but the formed matter varies whenever the conditions which governed its appearance varied. He considers that the protoplasm, or forming matter, is the only portion of the organism which is living or possesses vitality; and that it is the essential element of organic structure. From this it follows, almost consequently, that he opposes the school that maintains the cell to be the prime element of all tissues; and declares that there are many portions of the body which are not cells, such as the blood globules. His views on this subject are fully explained in his 'Lectures on the Structure and Growth of the Tissues of the Human Body,' published in the second and third volumes of the 'Archives of Medicine;' but his fullest and latest expositions will be found in a small book on 'Protoplasm,' of which the second edition has just been issued. Dr. Beale is the editor of the last edition of Todd and Bowman's 'Physiological Anatomy and Physiology of Man,' and he has edited the 'Archives of Medicine' from their commencement in 1857. For this last work he has written a number of articles, which are embodied in his books on the microscope, kidney diseases, &c.

BEAUFORT, REAR-ADMIRAL, SIR FRANCIS, K.C.B., F.R.S., &c. [E. C. vol. vi. cols. 970-71.] Sir Francis Beaufort lived but a few weeks after the publication of the volume of the E. C. which contained our brief notice of him. Full of years and honours he died on the 3rd of December, 1857, aged 84 years.

BEAUMONT, SIR JOHN, son of Francis Beaumont, one of the judges of the Court of Common Pleas, and elder brother of Francis Beaumont the dramatist [E. C. vol. i. col. 596], was born at Grace-Dieu, in Leicestershire, in the year 1582. He was admitted as a gentleman-commoner at Broadgate's Hall, Oxford, in 1596; and after spending three years at the University, came to London and commenced the study of the law, but tiring of it after brief trial, he returned to Leicestershire, married and lived the life of a country gentleman, amusing his leisure hours by writing verse. He was made a baronet in 1626, died in 1628, and was interred in the chapel at Grace-Dieu. His poetry is his title to remembrance. Ben Jonson began the verses which he prefixed to Sir John Beaumont's poems, "This book will live; it hath a Genius;" yet it may now be questioned whether book or name would have lived but for the additional vitality imparted by the relationship of the greater Francis. Sir John Beaumont's poetry is, however, often pleasing and suggestive. His poems were published in 1629, in a small 8vo. vol. of 208 pages (pp. 181 and 182 being missing in all known copies), under the title of 'Bosworth Field, with a variety of other poems;' reprinted in 1710, and in Chalmers's 'British Poets.' A new edition was issued (but only to subscribers), as a volume of the 'Fuller Worthies' Library,' by the Rev. A. Grosart, 1869, under the title of 'The Poems of Sir John Beaumont, Bart., for the first time collected and edited.' Besides 'Bosworth Field,' Beaumont's poems comprise, 'The Metamorphosis of Tobacco,' a 'Poetical Epistle to his late Majesty (James I.) concerning the true forme of Englishe Poetry;' religious, complimentary, and elegiac verses, and translations from the Latin poets, including Virgil's 4th eclogue; Horace's 6th satire and 29th ode of the 3rd book; Juvenal's 10th satire, &c. He also wrote a poem called the 'Crown of Thorns,' which appears to be lost.

BECCHER, or BECHER, JOHN JOACHIM, born at Spire in 1625, son of a learned Lutheran preacher. His father died when he was still young, and his family was reduced to poverty during the Thirty Years' War. He managed to educate himself, and to travel through Germany, Italy, Sweden and Holland. In 1666 he became professor of medicine in the University of Mainz, and soon after chief physician to the Elector. He now resided at Munich, where the Elector furnished for him a good laboratory; but falling into difficulties he went to Vienna, where his knowledge of finance procured for him the appointment of chamberlain to Count Zinzendorf, and afterwards he became a member of the newly erected College of Commerce. But falling again into difficulties, he proceeded with his wife and children to

Holland, and settled at Haarlem in 1678. But influence from Vienna compelled him to leave Holland. In 1680 he visited Great Britain, and examined the Scottish lead mines and smelting works, and in 1681-2 he studied the mines and smelting works of Cornwall and suggested various improvements. His friend Count Zinzendorf procured for him an appointment under the Duke of Mecklenburg-Schwerin at Güstrow, but while preparing to accept it he died (it is said) in London, 1682. His writings are numerous, the most important being his 'Physica Subterranea,' an edition of which was published at Leipzig in 1703, with a long introduction by Stahl. He had the great merit of contriving a chemical theory in which all the known facts were connected and deduced from one general principle. This was afterwards adopted and amplified by Stahl. A short account of Beccher's writings is given in Thomson's 'History of Chemistry,' i. 248. Thomson remarks that "Beccher had much more correct notions of the real objects of chemistry than any of his contemporaries." One of his works, called 'The Chemical Luck Pot,' contains a collection of fifteen hundred chemical processes. He writes in a pleasant, chatty style, saying a good deal about himself—in whom he had unbounded confidence, and a corresponding degree of contempt for other chemists. Referring to the hard life of the man of science, "who lives amidst smoke and vapour, soot and flame, poisons and poverty," he says, "yet among all these evils, I seem to myself to live so sweetly, that may I die if I would change places with the Persian king." His enthusiasm was grounded on a love of science. He says, "My kingdom is not of this world; I trust that I have got hold of my pitcher by the right handle—the true method of treating this study. For the pseudo chemists seek gold; but the true philosophers, science, which is more precious than any gold." Beccher was the discoverer of boracic acid.

BECCOLD, JOHANN, whose name varies as **BOCKHOLD**, **BOCKOLD**, **BOCKOLT**, **BOCKELSOHN**, (**JAN BOCKELSZOON**), and who is more commonly known as **JOHN** or **LEYDEN (JAN VAN LEYDEN)**, was born at the Hague in 1509 or 1510. He is chiefly distinguished for the part he took in the commotions excited at Münster, in 1535, by the Dutch Anabaptists. To the harmless principle which prescribed the limitation of baptism to such persons as were grown up to years of understanding, and to immersion as its mode of administration, the Anabaptists added tenets of a more enthusiastic, as well as dangerous nature. They maintained that among Christians who have the precepts of the gospel to direct, and the Spirit of God to guide them, the office of magistrate is unnecessary, and an encroachment on spiritual liberty; that all distinctions of birth or rank ought to be abolished; that a community of goods should be established, and that every man may lawfully marry as many wives as he thinks proper. Beccold was brought up to the trade of a tailor, at Leyden, and after having visited various countries of Europe, including England, Flanders, and Portugal, he settled at Leyden, where in his leisure hours he cultivated his natural talent for literature and the drama. Adopting the opinions of the Anabaptists, he became one of their itinerating prophets, and in pursuance of his commission from John Mathiesen, or Matthys, visited Münster in 1533, where by his amazing fluency and command of Scripture, he achieved a great reputation, and prepared a party against the coming of Matthys himself, who on one occasion suddenly appeared amongst his disciples, blowing on them, and bidding them "Receive the Holy Ghost." The Anabaptist movement now spread, for the zeal of its adherents was increased by the belief that they had received the gift of inspiration. Its leaders refused a conference proffered by the magistrates; and Ruthus, one of the chief of their preachers, pretending or supposing himself to be inspired, ran through the city, in December, 1533, crying out, "Repent, and be baptized again, or else the wrath of God will fall upon you, for the day of the Lord is at hand." This preaching was attended with wonderful success, and the re-baptized assumed the title of saints, into whose hands the government of the city at length fell, by the flight of the magistrates and principal inhabitants. Matthys held the chief authority, Beccold was his lieutenant; and the faithful were called to arms to defend the commonwealth against the forces of the Bishop, whose attempts to regain possession of Münster, at the close of 1534, were aided by the Duke of Treves and the Elector of Cologne. The besieged were so numerous as to command success, but they sustained a loss in the death of their leader Matthys, during a foolhardy sortie from the walls. This loss, however, was insufficient to damp their courage, for Beccold was forthwith raised to the vacant place, and by his powerful eloquence, soon had

them under his control. He was, indeed, regarded as a prophet, to whom was vouchsafed a series of divine revelations, in accordance with which he determined on a change in the form of government, and appointed twelve magistrates, "ancients or elders of the new Israel," in place of the former senate. A fresh revelation, at first not quite heartily acquiesced in by the people, who had been taught to believe that all the members of the Kingdom of Grace were equal, provided that the new Israel must henceforth be ruled by a king, and affirmed that as the Lord had raised up Saul, so had He raised up John of Leyden to rule His chosen people. King John now exemplified fully the principle of polygamy; objections against which were silenced by the execution of complainants. The dominion of the saints was a dominion of lust and blood. Nor were the externals of majesty forgotten. Arrayed in splendid robes, with a crown on his head, and a sceptre in his hand, the quondam tailor of Leyden sat on the judgment seat, protected by troops, and surrounded by counsellors clad in purple. The siege of Münster was now, however, prosecuted with vigour by the Bishop and his allies, and although the defence was successfully maintained for six months, the Bishop's troops were admitted by a traitor on the 24th of June, 1535, when most of the people perished, and the city was given up to an eight days' pillage. On the 22nd of January, 1536, John of Leyden and two of his companions were publicly tortured with red-hot pincers, stabbed and mutilated, and their bodies suspended in iron cages from the top of a lofty tower.

BECK, or BEEK, DAVID, an eminent Dutch portrait painter, was born at Aarnhem in Gelderland on the 25th of May, 1621. First pupil and afterwards assistant to Vandyck, he assimilated his own manner entirely to that of his master, whose ablest as well as most fortunate scholar he was generally reckoned. He painted under Vandyck in England, and was employed by Charles I. to teach design to his sons, the Prince of Wales (Charles II.), and the Dukes of York (James II.) and Gloucester. The King greatly delighted to watch him paint, and while admiring his remarkable dexterity and rapidity, is reported to have said to him, "Faith, Beck, I believe you could paint riding post." He painted many portraits here, but his name is scarcely ever found in the collections or attached to family portraits, and there can be little doubt that portraits ascribed to Vandyck are often the work of David Beck. On leaving England he painted for the King of France, and was then employed by Queen Christina of Sweden, who made him gentleman of her chamber, and commissioned him to paint the portraits of the principal sovereigns of Europe. In order to execute this commission he visited Denmark, France, Spain, Italy, and Germany. From several of the monarchs whose likenesses he painted, and to whom he presented portraits of Queen Christina, he received gold medals and chains, and the painters of Rome, as Houbraken is careful to tell, designated him the Golden Sceptre. It is related that whilst in Germany he had a severe fit of sickness, passed into a state of coma, and was actually laid out as dead. His two servants while watching the body cheered themselves with a bottle of wine, when one said, "Poor fellow, he loved a glass whilst he lived; let us give him one more before he is buried," and put the glass to his lips. A few drops were retained in his mouth; the man, vowing that his master tasted it, persisted: some was swallowed, and presently Beck sat up; revived to complete his commission; returned to the Hague, and there for some years pursued his profession. He died on the 20th of December, 1656, as some have said from poison. David Beck was undoubtedly an able portrait painter, but his individuality was sunk in the imitation of Vandyck.

BECKET, ISAAC, one of the best of the early English engravers in mezzotint, was born in Kent in 1653. His story, as collected by Walpole from Vertue, is to the effect that he was apprenticed to a calico-printer, but visiting Lutterel, who was then working at the new art of mezzotint engraving, without, however, having been able to penetrate the secret, Becket's ambition was fired. Having heard that Loyd, who kept a print shop in Salisbury-street, in the Strand, had bought the secret of a Dutchman named Blois, but being unable to engrave, and having quarrelled with Lutterel, was unable to use it, Becket offered his service to Loyd, and was employed by him. Meantime Lutterel had learned the true method from Vansomer, and Becket was fain to return to him for instruction. Becket's happy style of treating heads procured him ample employment, and, marrying a woman of fortune, he was enabled to secure the services of Lutterel to prepare the plates, leaving only the finishing for himself. He engraved several subject-pieces, as a 'Holy Family'; a 'Land-

BIOG. DIV.—SUP.

scape with Shepherd and Shepherdess; a 'Dutch Schoolmaster, after Heemskerk and others; but his portraits, which are rather numerous, are more valued. Among the best are Charles II. and the Duke of York (James II.), after Kneller; Kneller by himself; Le Piper, the painter, much prized; a full length of Lady Williams; Beau Fielding, capitally executed; Cartwright, Bishop of Chester, somewhat rare; the Duke and the Duchess of Grafton; Prince George of Denmark; and Sir Peter Lely. The year of his death is uncertain.

BECKINGTON, BEKYNGTON, or DE BEKINTON, THOMAS, was born in the parish of Beckington, about three miles from Frome, in Somersetshire, about the year 1385; and it is probable that he received his early education at Winchester. In 1403 he entered New College, Oxford, of which society he became a fellow in 1408. He held his fellowship for twelve years, and took the degree of LL.D. Within this period it is most probable that he was presented to the rectory of St. Leonard's, near Hastings, in Sussex, and to the vicarage of Sutton-Courtney, in Berkshire. He was collated to the prebend of Bilton, in the cathedral church of York, on the 19th of April, 1423; to the prebend of Longden, in Lichfield cathedral, on the 30th of August, 1436; and to that of Holborn, in St. Paul's, on the 10th of November, 1438. In October, 1424, he was appointed Archdeacon of Buckingham; and became, in addition, master of St. Katherine's Hospital, near the Tower of London. Beckington attained some reputation as an advocate in Doctors' Commons; and in 1429 he was Dean of the Court of Arches, in which capacity he was employed, jointly with William Linwood, an official of the court, and Thomas Brown, Vicar-General to the Archbishop of Canterbury, to draw up a form of law, by which to regulate the proceedings against the followers of Wycliffe. He was tutor to Henry VI., and enjoyed that monarch's favour, which was increased by the production of a book, in which, in opposition to the Salique law, Beckington vindicated the claims of his sovereign to the crown of France. In 1432 or 1433 he was named one of the ambassadors who were commissioned to treat of peace with France; and he assisted at the congress of Arras, which terminated in the treaty of the 22nd of September, 1435. In 1439 he was charged with fresh negotiations; and interested himself specially for the release of Charles, Duke of Orleans, known to this day as an accomplished poet, who had been a prisoner in England from the time of the battle of Agincourt. About this time Beckington was preferred to be Secretary of State; and on the 20th of May, 1442, was joined in a commission with Sir Robert Roos and Edward Hull, Esq., to negotiate a marriage between Henry VI. and one of the daughters of John IV., Comte d'Armagnac, on which occasion an attendant, probably one of his chaplains, wrote a journal, which supplies us with many interesting particulars respecting his conduct in that affair, and throws some light upon his character. Beckington returned to England in February, 1443, and in July following he was appointed Keeper of the Privy Seal, with an allowance of 20s. a day, but he seems to have resigned that office in the ensuing February. He was made Bishop of Bath and Wells, by the Pope's bulls of provision, dated the 13th of May, 1443; and the king restored to him the temporalities of the see on the 24th of September following. The archbishop delivered up the spiritualities on the 5th of October, and the consecration of the new prelate took place on the 13th of the same month, in the yet unfinished chapel of Eton College, which was on that day "hallowed," and the first Mass said in it by Beckington himself. The Bishop of Bath and Wells now withdrew himself almost entirely from public life; but there is reason to believe that he was present as a trier of petitions in the parliaments of 1444, 1447, 1449, 1450, and 1453. He died on the 14th of January, 1485, and was buried in Wells Cathedral, where a handsome monument was erected to his memory.

Beckington is said to have been the most elegant man of his time, and he was so famous for his scholarly attainments and the favour with which he regarded all learned and ingenious men, that he was called the Mæcenæ of the age. He contributed generously to various charities, and especially to the enlargement and embellishment of his cathedral; and he was so munificent a benefactor to several of the colleges of Oxford, that Fuller says he was "little less than a second founder." Beckington's work against the Salique law has never been published; but it is preserved in MS. in the Cottonian Library, Tiberius B. xii. Some other pieces by Beckington are in the same library, and a large collection of his Letters, chiefly, though not exclusively, on public and ecclesiastical affairs, is in the archbishop's library at Lambeth. A volume of sermons, and a few slighter productions

have also been ascribed to him. In 1828 Mr., afterwards Sir, Nicholas Harris Nicolas published 'A Journal by one of the suite of Thomas Becketton, afterwards Bishop of Bath and Wells, during an Embassy to negotiate a Marriage between Henry VI. and a daughter of the Count of Armagnac. A.D. MCCCCXLII.'

BECON, THOMAS, a divine and reformer of the 16th century, is variously said to have been a native of Kent, Suffolk, and Norfolk. It is probable, however, that he was born in the last-named county, about 1511. At an early age he was sent to St. John's College, Cambridge, and proceeded B.A. in 1530—31. During his residence at the University he was a diligent hearer of Hugh Latimer and George Stafford, and became a decided supporter of Protestant opinions. It has been assumed that this partisanship had the effect of retarding his ordination, which took place in 1538. About 1540 he was convened before the Privy Council on a charge of advocating heretical opinions in his exposition of the Ten Commandments. He obtained his release from confinement in the Lollards' Tower, to which he had been condemned, by a recantation and a confession that he had "preached and taughte evyll and false doctrine, against the continency of priests, prayers for the dead, and the sacrament of the altar, and the sacraments of confirmation and extreme unction." Then he assumed layman's apparel, and repaired to Kent, where, "changing the form of teachinge the people from preachinge into wrytynge," he produced various books, all advocating the principles of the Reformation, under the assumed name of Theodore Basille. His first preferment was the vicarage of Brenzet, in Kent. In 1543, having again fallen under suspicion, he was compelled to abjure his opinions at St. Paul's Cross; and in his recantation he not only recapitulated that which he had formerly made, but confessed the unsoundness of certain positions he had promulgated in his several books, entitled 'Nevyes out of Heaven, both pleasaunt and joyfull,' 8vo, London, 1541; 'The Right Pathway unto Prayer,' 12mo, London, 1542; 'Potacion, or Drinkyng for this Holy Tyme of Lent,' 12mo, London, 1542; 'The Christmas Banquet,' 8vo, 1542; 'The Catechisme,' 'David's Harpe,' 8vo, London, 1542; 'Invective against Swearyng,' 8vo, London, 1543; 'The Golden Boke of Christen Matrimonye,' 8vo, London, 1542; 'The Nosegay,' and 'A New Yeaer's Gift,' 8vo, London, 1543. All these books he publicly cut in pieces; and accompanied the act of their destruction with the most contemptuous expressions about himself, his pride, vanity, and want of learning. After this recantation, Becon retired to the Peak of Derbyshire, whence he proceeded successively to Staffordshire, Warwickshire, and Leicestershire, either gaining a livelihood by tuition, or being hospitably entertained by the friends and well-wishers of the Reformation. Whilst he was in the midland counties he published various works which became popular, and which are amongst those prohibited by a proclamation issued on the 8th of July, 1546. On the 24th of March, 1548, he was instituted to the rectory of St. Stephen, Walbrook, London, and about the same time became chaplain to Archbishop Cranmer, and one of the six preachers of Canterbury Cathedral. He was also chaplain to the Lord-Protector Somerset, with whom he resided for some time at Sheen. He appears, but at what period is unknown, to have commenced D.D. at Oxford. On the accession of Queen Mary, Becon was deprived of his living as a married priest, and was further committed to the Tower as a seditious preacher. He remained in custody from the 16th of August, 1553, till the 22nd of March following. His means of escape are unknown, but his release is said to have been occasioned by a mistake of Bishop Gardiner. He went abroad, and resided at Strasburg and Marburg. Whilst abroad he produced several works, of which one was entitled 'A comfortable Epistle too Goddes faythful People in Englande,' 8vo, Strasburg, 1554; and another in Latin, upon the Maas, which he addressed to Popish priests, with the title, 'Cœnæ Dominicæ et Missæ Papiasticæ Comparatio,' 8vo, Basil, 1559. After the accession of Elizabeth, Becon returned to England, and was reinstated in his London benefice, and collated, in 1559, to the fourth prebend in the cathedral church of Canterbury. He was now in high esteem, and in great request as a preacher. On the 21st of October, 1560, he was presented to the rectory of Buckland, in Hertfordshire; to the vicarage of Christ Church, Newgate-street, on the presentation of the Lord Mayor and commonalty of the city of London; and on the 10th of August, 1563, was admitted to the rectory of St. Dionis Backchurch, London, on the presentation of the Dean and Chapter of Canterbury. His death occurred at some unascertained date before the 2nd of July, 1567.

Becon was the author of tracts almost innumerable in favour of the Reformation, and many of them were collected in a

volume which did not quite answer to its title of 'The Worckes of Thomas Becon, diligently perused, corrected, and amended,' folio, London, 1563—4, by John Day, who also reprinted several publications separately. A collection of Becon's works was printed for the Parker Society under the editorship of the Rev. John Ayre, M.A., of Caius College, 3 vols. 8vo, Cambridge, 1843—44. Selections from his writings have been published by the Religious Tract Society, and by the Society for Promoting Christian Knowledge. Amongst the minor characteristics of Becon may be mentioned the quaintness of some of the titles chosen for his works, as, for example, 'The Jewel of Joy,' 'The Castel of Comfort,' 'The Sycke Man's Salve,' and 'The Pomaunder of Prayer.'

BEECHER, LYMAN, D.D., an American divine and philanthropist, was born on the 12th of October, 1775, at New Haven, Connecticut. After receiving his preliminary education successively at North Guilford and New Haven, he entered Yale College in 1793, where, after graduating in 1797, he entered the divinity school under the president, Dr. Timothy Dwight, favourably known for his important work on Systematic Theology. In the latter part of 1798 Mr. Beecher was licensed to the pastorate of a church at East Hampton, Long Island, to which he was ordained by the presbytery of Middleton, on the 5th of September, 1799. After spending several years at East Hampton, during which he acquired considerable reputation for his eloquence as a preacher, he became, in 1810, pastor of the First Church of Litchfield, Connecticut. On the 3rd of September, 1817, he preached at Boston, upon the occasion of the ordination of the Rev. Sereno E. Dwight as pastor of Park Street Church, a sermon in which he combated, with great applause, the system of the Unitarians; and the reputation then acquired was consolidated by further ministrations in Eastern Massachusetts, in 1819 and 1823. In 1826, Dr. Beecher, upon whom the degree of D.D. had been conferred in 1818, accepted a call to undertake the charge of the then newly-established church in Hanover-street, Boston; and took part with great ardour and ability in the controversy against Dr. Channing and others which then agitated many of the New England churches on the subject of Unitarianism. On the 26th of December, 1832, Dr. Beecher became President and Professor of Theology in the Lane Theological Seminary at Cincinnati; and, after the spring of 1833, combined with these offices the pastorate of the second Presbyterian church of that city. His learning, decided views, and stirring eloquence had a powerful effect on the population of the West; for he was thoroughly in earnest, and known to take an active part in the promotion of temperance and every great philanthropic movement of the day. In the year 1842 he retired from fixed professional employment and lived for some years at Boston, and in 1856-7 removed to Brooklyn, Long Island, where, in the enjoyment of physical vigour greater than belonged to his advanced age, he was a constant attendant upon the ministry of his son, the Rev. Henry Ward Beecher, at Plymouth Church. Dr. Beecher died in January, 1863, having been the father of nine children, who have all distinguished themselves in literature or by their exertions in the cause of abolition. The best known amongst them are the Rev. Charles Beecher, the pastor of a church in Newark, New Jersey, and the editor of 'Autobiography, Correspondence, &c., of Lyman Beecher, D.D.,' the Rev. Edward Beecher, D.D., known as an author, preacher, and professor; the Rev. Henry Ward Beecher, just referred to, the celebrated preacher of Plymouth Church; and Mrs. Harriet Beecher Stowe, the author of 'Uncle Tom's Cabin.' The principal works of Dr. Lyman Beecher are his 'Plea for the West,' 12mo, New York; 'Sermons on Various Occasions,' 8vo, New York, 1842; 'Views in Theology,' 12mo; 'Skepticism,' 12mo; 'Political Atheism,' &c. His collected works were published, under his own supervision, at Boston, in 3 vols. 12mo.

BEECHER, FREDERICK WILLIAM [E. C. vol. i. col. 614]. Rear Admiral Beecher (not Beechy, as by an unfortunate printer's alteration the heading of the memoir was printed in some copies of the revised issue of the E. C.) was born on the 17th of February, 1796, and died on the 29th of November, 1866.

BEGAS, KARL, an eminent German historical painter, was born at Heinsberg, September 30, 1794. His father, a retired judge, wished his son to adopt the legal profession, and sent him to study at Bonn with that view. But his passion for painting was so decided that his father gave way, and placed him under Philippart, who set him to copy Raffaele. In 1810 he went to Paris, where for 18 months he was in the atelier of Gros. A copy of the Madonna della Sedia, then in the Louvre, gained

for him the patronage of the King of Prussia, for whom, after his return to Berlin, he executed several works. From this time he worked on steadily, producing a great number of religious and historical paintings and many portraits, and winning his way in professional rank till he was generally regarded as the ablest and most accomplished painter of the Prussian school. He was painter in ordinary to the King of Prussia; professor and member of the council of the Berlin Academy; member of the Academy, Dresden; and Knight of the Red Eagle. By his countrymen he is thought a great colourist, and altogether perhaps a great artist. But his actual rank is that of a learned and able painter. He lacked the vivifying spark of genius. His pictures comprise such lofty subjects as 'Christ on the Mount of Olives,' painted for the garrison church, Berlin; the 'Descent of the Holy Spirit,' for Berlin Cathedral; the Transfiguration, the Ascension, &c., as well as more manageable religious subjects, like the Baptism of Christ, and the Finding of Moses. His historical and poetical pictures are numerous, and include Henry IV. at Canossa, the Lorelei, painted for the King of Hanover, and 'Maidens under the Oak-tree.' His portraits comprise among others Alexander Humboldt, Leopold Buch, Schelling, Thorwaldsen, Cornelius, Schadow, Rauch, and Meyerbeer. Begas died on the 24th of November, 1854. He left three sons, who have attained honourable rank in different branches of art. OSKAR BEGAS, the eldest, born 1828, was educated as a painter, won the gold medal of the Berlin Academy, and completed his studies in Rome. He has painted an 'Expulsion from Paradise,' and other religious and historical pictures. REINHOLD BEGAS, the second son, born 1831, won the first prize at the Berlin Academy, went to Rome, and has executed a Group of Fauna, a Psyche and other groups, statues, and portrait busts, which have been much admired. ADALBERT BEGAS, also completed his studies at Rome, and has acquired reputation as an engraver.

BEGER, LORENZ (BEGERUS, LAURENTIUS), an eminent German numismatist, was the son of a tanner at Heidelberg, where he was born on the 19th of April, 1653. His attainments secured for him the post of librarian to Frederick William, Elector of Brandenburg, and the friendship of many of his learned compatriots. He was a member of the Academy of Berlin, in which city he died on the 21st of April, 1705. His principal works, which are all in Latin, are—1. 'Thesaurus ex Thesaurio Palatino selectus, seu Gemmæ,' fol., Heidelberg, 1685; 2. 'Observationes in Numismata quadam Antiqua,' 4to, 1691; 3. 'Spicilegium Antiquitatis,' fol. Cologne, 1692, 2nd ed. 1694; 4. 'Thesaurus Brandenburgicus Selectus,' 3 vols. fol. Col. 1696—1701; 5. 'Contemplatio Gemmarum quarundam,' &c. 4to, 1697; 6. 'Bellum et Excidium Trojanum, ex antiquitatum reliquiis, tabula quam Raph. Fabrettus edidit Iliaca, delineatum et comment. illustratum,' 4to, Berlin and Leipzig, 1699; 7. 'Regum et Imperatorum Romanorum Numismata, a Romulo usque ad Justinianum,' folio, Cologne, 1700; 8. 'De Nummis Cretensium Serpenteris,' fol. 1702; 9. 'Lucernæ veterum Sepulchrales ditiones,' J. P. Bellorii, fol. 1702; 10. 'Numismata Pontificum Romanorum,' fol. 1703; 11. 'Hercules Ethnorum ex variis antiquitatum reliquiis delineatus,' fol. Cologne, 1700. The titles of his other works will be found in Ebert's 'Allgemeines Bibliographisches Lexikon.' Beger is charged with having written under an assumed name in defence of remarriage during the life of a first wife, at the instance of the Elector Karl Ludwig, who wished to marry his mistress, his wife being alive; and it is added that after the death of the Elector, Beger wrote a refutation of his own book, but no such work is known to have been printed.

BEHLEN, STEPHAN, an able German writer on forestry and forest laws, was born at Fritzlar in Hesse-Cassel, on the 5th of August, 1784. On leaving the gymnasium of Aschaffenburg he studied jurisprudence, economics, and forest law and management in the University of Mainz; after which he learnt in the Spessart Forest district the practical application of the knowledge he had acquired. In 1803 he was appointed land commissary, and he rose step by step till he obtained in 1819 the supervision of the Spessart district. On a re-arrangement of the forest courts in 1821 he was appointed professor of natural history at Aschaffenburg, and shortly after wrote an excellent account of the wild district in which he had spent the better part of his life—'Der Spessart. Versuch einer Topographie dieser Waldgegend,' 3 vols. Leipzig, 1823—27. He was pensioned in 1832, and died at Aschaffenburg, February 7, 1847. Besides the work just named, Herr Behlen is the author of several volumes of permanent value on the history, laws, wild sports, and administration of forests, with an ample technical lexicon—'Lehrbuch der Forst-

und Jagdthiergeschichte,' Leipzig, 1826; 'Lehrbuch der Jagdwissenschaft,' Frankf. 1839; 'Real- und Verballexikon der Forst- und Jagdkunde,' 7 vols. Frankf. 1840—45. In conjunction with Laurop he edited the 'Systematischen Sammlung der Forst- und Jagdgesetze der deutschen Bundesstaaten,' 5 vols. 1827—33, a book which he continued alone in the 'Archiv der Forst- und Jagdgesetzgebung der deutschen Bundesstaaten,' 29 vols. Freiburg, 1834—47; and he assisted in the establishment of the 'Allgemeinen Forst- und Jagdzeitung,' 1823.

BEHNES, WILLIAM [E. C. vol. vi. col. 971]. Owing to pecuniary and other troubles Mr. Behnes' last years were professionally almost unproductive. He died in the Middlesex Hospital on the 3rd of January, 1864.

* BEHR, JOHANN HEINRICH AUGUST VON, a Saxon minister of State, was born on the 13th of November, 1793, at Freiberg, where his father was pastor. He studied at the gymnasium of his native place, and in 1811 entered the University of Leipzig as a student of theology, which in 1813 he changed for the study of law. Having completed his studies the year before, he became, in May, 1816, an actuary in the bailiwick of Schwarzenberg, and in December of the same year was made judiciary successively of the courts of Pureschenstein, Olbernhau, and Rotherthal. In 1833, being appointed Aulic counsellor, he was called to Dresden by the duties of his office, which he performed with zeal and ability till 1838, when he accepted office in the department of finance. On the 1st of April of that year he entered the Home-office with the rank of Privy Councillor. On the occasion of the insurrection which broke out at Dresden, on the 30th of April, 1849, in consequence of the persistent refusal of the king to recognise the Frankfurt constitution, the means which Behr advocated for the suppression of the popular disturbances seemed too impracticable to allow of his being placed at the head of the ministry, otherwise a probable appointment; and he was consequently called upon, May 14th, to accept the post of Finance Minister. In this capacity he adopted the principle that the increase of existing taxes is preferable to the imposition of new ones. One of his first tasks was to restore the credit of the country; and externally his policy may be described as one of conciliation, which at first approved the 'Project of a Constitution for the German Empire,' drawn up at Berlin by the plenipotentiaries of Prussia, Hanover, and Saxony; but afterwards leaned towards Austria. Behr was accustomed, for intervals of varying length, to perform the duties of Minister of Justice, for Zschinsky, and upon the death of the latter, in 1859, succeeded to the office. Here he sought to carry out the reforms initiated by his predecessor, for the making of justice easily and popularly accessible. In 1862 he was promoted by the king to be provost of the cathedral chapter at Meissen. The independence of the country and of the official life of Saxony have for the present been absorbed in that North German dominion which is the creation of Count Bismarck.

BEHR, WILHELM JOSEPH, a distinguished German publicist, was born at Sülztzheim on the 26th of August, 1775. He studied the science of law at Würzburg and Göttingen, and the practice of it in the courts of justice at Vienna and Wetzlar. In 1799 he became professor of state-law in the University of Würzburg, an appointment which he held till 1821. During all this period he laboured, both in his lectures and his published works, to diffuse enlightened constitutional views throughout Germany. In 1819 he was elected a member of the Bavarian Chamber of Deputies, as the representative of his university, and took his place in the ranks of the opposition. He was likewise raised by the inhabitants of Würzburg to the office of burgomaster, and performed the duties devolving on him in that capacity with great energy. On the occasion of his election to be again a member of the Chamber, the royal assent to the appointment was refused. On the 27th of May, 1832, he publicly delivered himself of sentiments so distasteful to the government that an investigation was made into his conduct, the result of which was his deprivation of the office of burgomaster. He was arrested on the 24th of January, 1833, and imprisoned at Würzburg, and after a trial, protracted for several years, on the charge of complicity with revolutionary intrigues, he was sentenced in 1836 to apologise before the likeness of the king, and to be incarcerated during the royal pleasure. He was accordingly removed to the fortress of Oberhaus, near Passau; but in August, 1839, was permitted to live in a private house in Passau. In February, 1842, he was allowed to reside at Regensburg, under police surveillance; and finally he was not only restored to complete freedom by the political amnesty of the 6th of March, 1848, but received an indemnification of 10,000 florins. In the same year he was

chosen by the electoral district of Kronach to be its representative in the German National Assembly. After the date of his enlargement, Behr resided at Bamberg, where he died on the 1st of August, 1861.

His principal works are his *Examination of Feudal Rights and Feudal Powers*, 'Versuch über die Lehnherlichkeit und Lehnhoheit,' Würzburg, 1799; *System of public justice*, 'System der Staatslehre,' 3 vols. Frankfurt, 1810; *Constitution and Administration of the State*, 'Verfassung und Verwaltung des Staats,' 2 vols. Nürnberg, 1811—12; *Exposition of the wishes and hopes of the German people*, 'Darstellung der Wünsche und Hoffnungen deutscher Nation,' Aschaffenburg, 1816; *Science of Political Economy*, 'Lehre von der Wirthschaft des Staats,' Leipzig, 1822; *On the proper limits of the Influence of the German Confederation on the Government, Legislation, and Administration of the Confederate States*, 'Von den rechtlichen Grenzen der Einwirkung des deutschen Bundes auf die Verfassung, Gesetzgebung und Rechtspflege seiner Gliederstaaten,' 2nd edition, Stuttgart, 1820; *Claims and demands of the Bavarian Diet, and an impartial criticism of its transactions*, 'Anforderungen an Baierns Landtag im Jahre 1827, und unparteiische wissenschaftliche Beurtheilung seiner Verhandlungen,' 3 vols. Würzburg, 1827—28; and *Wants and Wishes of the Bavarians*, 'Bedürfnisse und Wünsche der Baiern,' Stuttgart, 1830.

* BEKE, CHARLES TILSTONE, a distinguished writer on African geography and exploration, was born in London on the 10th of October, 1800. He belongs to a family long settled at Bekebourne in Kent. Although at one time he studied law at Lincoln's Inn, he became a merchant, trading in London, Saxony, and the Mauritius; and from 1836 to 1838 was acting British Consul in Saxony. For nearly forty years he has paid great attention to historical and geographical subjects, especially in connection with Africa. He made a journey to Abyssinia, and explored much of the region about Shoa and Godjam, at that time almost unknown to Europeans; but his writings have been mostly as a commentator. The chief among them were published in the following order:—'*Origines Biblicæ, or Researches in Primæval History*,' 1834, London—an attempt to construct a science of history on a new basis; '*Abyssinia, a statement of facts*,' &c., 1845, relating to the British political mission to Shoa, in which he was aided by private subscriptions, after failing to obtain government support; '*An Essay on the Nile and its Tributaries*,' 1847; '*An Essay on the Sources of the Nile in the Mountains of the Moon*,' 1848; '*On the Geographical Distribution of the Languages of Abyssinia, and on the means requisite for their determination*,' 1849; '*On the Sources of the Nile*,' being an attempt to assign the limits of the basin of that river, 1849; '*An Enquiry into M. A. D'Abbadie's Journey to Kaffa in the years 1843 and 1844, to Discover the Sources of the Nile*,' 1850; '*A Summary of the recent Nilotic Discoveries*,' 1851; '*The Sources of the Nile, a general survey of the head stream, and of the steps by which discoveries in that region have been made*,' 1860; '*On the Mountains forming the Eastern Side of the Basin of the Nile, and on the Origin of the designation Mountains of the Moon, applied to them*,' 1861; '*A Few Words with Bishop Colenso on the subject of the Exodus of the Israelites, and the position of Mount Sinai*,' 1862; '*Who Discovered the Sources of the Nile?*' two letters, 1863; '*The British Captives in Abyssinia*,' 1865; '*King Theodore and Mr. Rassam*,' a letter to the editor of the '*Quarterly Review*,' 1869. Dr. Beke has also written largely in the publications of the Hakluyt Society, the '*Archæologia*,' the '*British Magazine*,' the '*Edinburgh New Philosophical Journal*,' the '*St. James's Chronicle*,' the '*Journal of the Royal Geographical Society*,' the '*Bulletin de la Société de Géographie*,' the '*Collections Topographiques et Généalogiques*,' the '*London and Edinburgh Philosophical Magazine*,' the '*Transactions of the Royal Society of Literature*,' the '*Transactions of the British Association for the Advancement of Science*,' the '*Athenæum*,' &c. Dr. Beke's '*Origines Biblicæ*' brought him the diploma of Doctor in Philosophy from the University of Tübingen; and he has since been elected Fellow of the Geographical Society and of the Society of Antiquaries.

BEKKER, BALTHASAR, a Dutch preacher and theologian, was born on the 20th of March, 1634, at Metselawier in Friesland, where his father, Hendrik Bekker, was pastor. After studying at Groningen and Franeker, he became preacher at Oosterlittens on the 13th of April, 1657; and subsequently officiated in the same capacity at Loenen and other places in Holland. He died at Amsterdam on the 11th of July, 1698.

Bekker was a follower of Descartes, and an interpreter of his system in its possible harmony with orthodox theology, in a

small work entitled '*De Philosophia Cartesiana Admonitio Candida et Sincera*,' 12mo, Wesel, 1688, and 12mo, Amsterdam, 1693. He composed a Short Catechism for Children, with the title of Cut Bread, '*Gesneden Brood*,' 1668; and one for persons of a more advanced age, entitled *Lenten Fare*, '*Vaste Spyze*,' 1670, which obtained for him in some quarters the reputation of Socinianism. He is also the author of an Exposition of the Prophet Daniel, '*Uitlegginge van der Propheet Daniel*,' 4to, Amsterdam, 1688. But the literary efforts by which Bekker is at present remembered are those in which he opposed the prevailing superstitions of his age. One of these was a small volume entitled *An Enquiry concerning Comets*, '*Onderzoek van de betekening der Kometen*,' 8vo, Leeuwarden, 1683, which was occasioned by the appearance of a comet in 1680 and 1681, and the object of which was to protest against the current opinion that comets are presages or forerunners of evil. The great work of Bekker in this kind, however, is his *World Bewitched*; or, an Examination of the Common Opinions concerning Spirits, '*De Betoverde Waereld, zynde een grondig Onderzoek van't gemene gevoelen aangaande de Geesten derzelve aart vermogen bewind en bedryf, als ook het geen de Menschen door derzelve Kragt of gemeenschap doen*,' which, appearing first in 1691, has since gone through various editions, and been translated into several European languages. In consequence of the boldness with which the writer attacked the opinions of his time, he was suspended for two years from his clerical functions, and became the object of attack to many champions of the older ways of thought.

BEL, or BEHL (BELIUS), MATTHIAS, an eminent Hungarian historian, was born in 1684 at Orsova, and completed his education at the University of Halle. On returning to Hungary he was appointed in 1714 minister to the evangelical church at Neusohl, and in 1719 rector of the Lyceum at Presburg, where he resided till his death in 1749. He held for some years the honorary post of historiographer to the Emperor Charles VI. His works, which are of much value both for their materials and treatment, especially of early Hungarian history, are—1. '*De Vetere Literatura Hunno-Scythica exercitatio*,' 4to, Leipzig, 1718; 2. '*Hungariæ antiquæ et novæ prodromus*,' folio, Nürnberg, 1723; 3. '*Adparatus ad Historiam Hungariæ, sive Collectio Miscella Monumentorum*,' Presburg, 1735—46; 4. '*Notitia Hungariæ novæ historico-geographica*,' in IV. partes divisa, 4 vols. folio, Vienna, 1735—42, a work of great erudition, but unfortunately left unfinished at the author's death, the portion of the 2nd part completed (only 71 pages) was published, but is now rarely met with: an abridgment of the work has been several times reprinted; a 4th ed. in 8vo appeared at Posen in 1792; 5. '*Scriptores rerum Hungaricarum veteres ac gemini cum Prefatione M. Belii, ex recens. J. G. Schwandtneri*,' 3 vols. fol. 1746—48. To him is also attributed '*Der Ungar. Sprachmeister*,' Presburg, 1728.

* BELCHER, SIR EDWARD, who belongs to an old English family, is best known as an intrepid Arctic voyager and as an eminent hydrographer. He was born in 1799. In 1812 he entered the navy, and in the four succeeding years saw active service on the coasts of France and Spain, at Gaeta, and off Algiers. On August 27, 1816, he shared in the battle off the last-mentioned place, which was probably one of the sharpest actions ever fought by the British navy. In 1818 he was promoted to a lieutenancy, and from 1825 to 1828 he accompanied Beechey, who was then commander of the '*Blossom*,' as assistant surveyor. Soon after his return home he himself was made a commander, and as such he carried on some survey work on the coast of Africa in the '*Etna*.' In 1833 he married a Miss Jolliffe, just before which event, however, he had carried out some special service on the river Douro. In the year of his marriage he was appointed to the command of an Arctic expedition, well known from the two ships which formed the squadron, the '*Terror*' and '*Erebus*.' In 1836 he took the command of the '*Sulphur*,' in which he sailed round the world, and materially aided in the successes of the British force in China by his surveying operations. This voyage occupied him about six years, and a full account of it is given by himself in his '*Narrative*,' published in 1843. His services in China were rewarded by his promotion to a captaincy in 1841, and by knighthood in 1843. In the last-mentioned year he was transferred to the '*Samarang*,' which was stationed in the East Indies for surveying purposes from 1843 to 1846. He published an account of this voyage in his '*Narrative*,' issued in 1848, and records his struggle with the pirates of Borneo, in the course of which he was severely wounded. From 1852 to 1854 he was engaged in prosecuting the search for Sir John Franklin, the results of which expedition will be found in his book,

entitled 'The last of the Arctic Voyages: being a Narrative of H.M.S. Assistance, in search of Sir John Franklin during 1852—54. With Notes on the Natural History by Sir John Richardson, Professor Owen, T. Bell, J. W. Salter, and Lovell Reeve,' 2 vols. 1855. In 1861 he became rear-admiral, and in 1866 a vice-admiral, since which last date he has been on the retired list of officers. He is a fellow of the Royal Geographical and other Societies. In 1867 he was made a K.C.B. During his lifetime he has had intimate communication with the natives of Arctic North America, and has thoroughly informed himself of their ways of life and modes of thought. The observations made by him to the Ethnological Society, to the British Association, and other scientific bodies, did much towards explaining the use of those pre-historic implements of Western Europe, about which so much interest is now taken.

BELGRADO, GIACOMO, a distinguished Italian mathematician, was born at Udine on the 16th of November, 1704. He was a Jesuit, and was for several years professor of mathematics at Parma, and also director of the observatory there. On the suppression of the Order of the Jesuits he retired to Bologna, where he was nominated rector of the College of Sta. Lucia. He was a member of the Institute of Bologna, and a corresponding member of the French Institute. He died on the 17th of April, 1789. Belgrado had the reputation of being one of the best mathematicians of his time and country. He wrote much on his proper science; but he also wrote on archæology; some verses; and on theology, one of his themes being a demonstration of the existence of God by the theorems of geometry. His writings are chiefly in Latin; the following are among the more important:—*Ad disciplinam mechanicam, nauticam et geographicam*, 4to, Parma, 1741; *De lignorum equilibrio Acroasis*, 4to, 1742; *De gravitatis legibus*, 4to, Parma, 1744; *De Corporibus elasticis disquisitis*, 4to, 1747; *De Analyseos vulgaris usu in re physica*, 2 vols. 4to, Parma, 1761; *Theoria cochleæ Archimedis*, 4to, 1767.

BELIN, JEAN ALBERT, Bishop of Bellay, celebrated as a popular preacher and writer, was born about 1610, at Besançon. He was received into the Order of Benedictines in 1630; was attached first to the Abbey of Cluny; afterwards to the Priory of la Charité-sur-Loire; and then to various houses in Paris and elsewhere, in every place attracting great numbers to his sermons. From time to time he put forth one and another religious publication, some being of a semi-mystical turn, others exhibiting a singular admixture of science and philosophy with the popular theology, others trusting to an attractive title. By these, and, as is said, some personal services, he gained the friendship of Colbert, who in 1666 made him Bishop of Bellay. He died in 1677. The character of his writings is tolerably indicated by their titles:—*Les Emblèmes Eucharistiques*, 8vo, Paris, 1647; *Les Fidèles Pensées de l'Âme pour la porter à son devoir*, 8vo, 1647; 12mo, 1660; *Les Solides Pensées de l'Âme*, 12mo, 1648; *Pierre Philosophale*, 1653; *Aventures du Philosophe inconnu à la recherche et invention de la Pierre Philosophale*, divisées en quatre livres, au dernier desquels il est parlé si clairement de la manière de la faire, que jamais on n'en a parlé avec tant de candeur, 12mo, 1664; 1674; *Preuves convaincantes des vérités du Christianisme*, 4to, 1666; *Traité des Talismans, ou Figures Astrales, dans lequel est montré que leurs effets et vertus admirables sont naturelles; ensemble la manière de les faire et de s'en servir avec profit*, 12mo, Paris, 1671, and several times reprinted.

BELL, ROBERT, a prolific writer, was born at Cork in 1800, and completed his education at Trinity College, Dublin. At Dublin he wrote for magazines and newspapers, composed a couple of plays, and assisted in founding the Dublin Historical Society. Removing to London, he met with ready employment as a journalist, having a fluent pen, and a genial manner. For some years he edited the 'Atlas' newspaper, and on one occasion successfully defended in person an action for libel brought against the proprietors of the journal by the Lord Chancellor Lyndhurst. For more than thirty years Mr. Bell continued to lead the life of a busy literary man, contributing to various periodicals, sometimes editing one, and diversifying his journalistic labours by writing a history or a biography, a play or a novel. Commissioned by publishers, and written for the day, none of his writings are likely to have more than an ephemeral existence, but they are favourable specimens of their class, and creditable to their author. Among the best, perhaps, are those written for 'Lardner's Cyclopædia,' the 'Lives of British Poets,' 1 vol.; 'Lives of British Admirals' (written to complete the series commenced by Southey), and 'History of Russia,' 3 vols.

Mr. Bell also wrote a 'Life of George Canning,' and edited 'Memorials of the Civil War,' a selection from 'The Fairfax Correspondence,' 'Wayside Pictures in France, Belgium, and Germany,' the novels entitled 'The Ladder of Gold,' and 'Hearts and Altars,' and the five-act comedies of 'Marriage,' 'Mothers and Daughters,' and 'Temper' sufficiently illustrate his industry and versatility. But the work by which he will be longest remembered is probably his 'Annotated Edition of the English Poets,' of which 29 volumes were published in 1854 and following years. Mr. Bell was a Fellow of the Society of Antiquaries and of the Royal Society of Literature, and a member of the committee of the Literary Fund. Of a frank, obliging, and social disposition, he was generally and deservedly esteemed. He died on the 12th of April, 1867, in his 68th year.

* BELLANGÉ, JOSEPH-LOUIS-HIPPOLYTE, a distinguished French historical painter, was born at Paris on the 17th of January, 1800. At an early age he gave strong indications of a love for art; his taste was carefully cultivated, and his artistic education was completed in the atelier of Gros, on whose style his own was formed. From the first he has pursued with almost undeviating consistency a line of art very popular in France, though little practised in this country, that dealing with the scenes and circumstances of war. He has painted a large number of the battles of the republic and the empire, always doing ample honour to his countrymen. But besides battles proper—such as 'The Battle of Wagram,' 'The Battle of Fleurus,' 'Corogne,' 'Ocagno' (which are in the Museum of Versailles), 'Alma,' 'Magenta,' and the like—he has painted various incidents of war, as an 'Episode de la Retraite de Russie,' 'Le Lendemain de la Bataille de Jemmapes,' with occasionally such subjects as 'Le Retour de l'Île d'Elbe,' and 'Episode du Retour de l'Île d'Elbe.' Two thoroughly characteristic examples of his pencil were exhibited at the International Exhibition of 1862—'Un carré d'infanterie republicaine repoussant une charge de dragons autrichiens (Campagne du Rhin, 1796),' and 'Les deux Amis (Sébastopol, 1855).' The latter, a painful but powerful picture, attracted very general attention. M. Bellangé obtained second-class medals (genre historique) in 1824 and 1855; was made knight of the Legion of Honour in 1834, and officer in 1861.

BELLAY, GUILLAUME DU, known also by his territorial designation of Lord of Langey, and celebrated as a soldier and diplomatist, was born in 1491 at the Château de Glatigny, near Montmirail. He was the eldest son of Louis du Bellay, who was of an ancient and noble family, originally of Anjou. Embracing a military career, he became celebrated at once for his skill and his courage, being esteemed by some the greatest captain of his age. He was especially noted for his adroitness in acquiring information, whether for purposes of state or warfare. He penetrated into an enemy's designs with rare address, and paid liberally for the intelligence he received of the most secret councils of Charles V. and his generals. He has the credit of having procured from some of the universities of France a judgment in favour of the divorce of Henry VIII. from Catherine of Aragon. In order to cement an alliance between Francis and Henry against Charles V., Du Bellay was sent upon several embassies into Germany, England, and Italy, where his services were as useful as they had been on the field of battle; and in acknowledgment of them he received the knighthood of St. Michael, was made lieutenant-general of the armies of Italy, and viceroy of Piedmont, A.D. 1537, where he took several towns from the Imperialists. He discovered in 1541 the web which had been woven to take the agents whom Francis I. sent to Venice and Constantinople; and it was in spite of the warnings which he furnished that they rushed upon the fate prepared for them. At the end of the year 1542, being in Piedmont, and having some important intelligence which he was desirous of communicating to the king in person, Du Bellay set out from Turin, and, in consequence of his extremely infirm state of health, had a litter prepared for his journey. The exertion of travel increased his indisposition, so that he was obliged to stop at St. Saphorin, or St. Symphorien de Lay, a small town about 24 miles north-west of Lyon, where he died on the 9th of January, 1543. He was buried in the cathedral church of St. Julien, in the ancient city of Mans, where his brothers, Jean and Martin, erected to his memory a noble monument, bearing the following inscription:—

Cy git Langey, dont la plume et l'épée
Ont surmonté Cicéron et Pompée.

Although wielding more than a courtier's influence, Du Bellay

did not conform to the general type of courtier, for his manners were remarkable for their plainness and brusquerie. Yet he was a scholar, and gave evidence of his abilities and genius as a writer. Charles V. used to say of him "that Langey's pen had fought more against him than all the lances of France." In his 'Memoires,' published jointly with those of his brother Martin in 1569, Du Bellay is betrayed by his loyalty into disparaging Charles V. in comparison with his own sovereign, Francis I. He was the author of an 'Epitome de l'antiquité des Gaules et de France,' 4to, Paris, 1556, a work which was reprinted in 1587. Another work has been ascribed to Guillaume du Bellay, which has gone through many editions, and which was first published under the title of 'Instructions sur le fait de la Guerre, extraictes des livres de Polybe, Frontin,' &c., fol. Paris, 1548; and of which an English version, translated by "P. I've, Gent.," appeared with the title of 'Instructions for the Warres, describing the method of military discipline,' &c., 4to, London, 1589. But this work is more properly referred to Raymond de Pavie, Baron de Fourquevaux, a Gascon gentleman, and a gendarme in the company of the Sieur de Négrepellisse in 1528, who, perhaps, might have served under Du Bellay in his Italian wars.

BELLAY, JOACHIM DU, a celebrated poet, known as "the French Ovid," was born about 1524, at the Château de Lire in Anjou. He was the son of Jean du Bellay, Sieur de Gonor, and the nephew of Cardinal du Bellay, and Guillaume du Bellay, Lord of Langey. His education was neglected by an elder brother to whom it was committed, and he had scarcely reached manhood when it became his own turn to undertake the guardianship of a nephew. The affairs of this relative were deeply embarrassed, and the lawsuits with other vexations that preyed upon Joachim du Bellay, brought on an illness of two years' continuance. To beguile time and pain, he read the Greek, Latin, and French poets, and produced some compositions of his own, which procured him access to Francis I., Henry II., and Marguerite of Navarre. Although an ecclesiastic, Du Bellay conformed to the fashions of the gay world, and published 'Cantiques,' which he had produced in honour of a lady whose name, Viole, he rendered under the anagram of Olive. Upon the invitation of Cardinal du Bellay, Joachim repaired in 1549 to Rome, where he passed three pleasant years, at the end of which he returned to France on family business. Ill-natured reports alienated the Cardinal, and brought on Joachim a return of his old malady; and in pity of his suffering condition his cousin-german, Eustace du Bellay, Bishop of Paris, appointed him to a canonry in the church of Notre Dame, A.D. 1555. He died at Paris of apoplexy on the 1st of January, 1560, at the moment when Cardinal du Bellay was on the point of preferring him to the see of Toulouse. His principal works are a series of sonnets on the 'Antiquités de Rome, contenant une générale description de ses monuments et comme une déploration de sa ruine,' 4to, Paris, 1558, to which he added 183 Sonnets with the title of 'Regrets,' Poems in French and in Latin; and a 'Défense et Illustration de la Langue Française,' which is the only work the author wrote in prose, and is regarded as one of the most remarkable books in the language. A recent edition of it was published by Ackermann in 1849.

BELLEAU, RÉMY, one of the seven versifiers, Ronsard being the principal, who were known in the 16th century as the 'Pleiade Française,' was born in 1528 at Nogent-le-Retrou (Eure-et-Loire). He lived in the family of the Marquis d'Elbeuf, who entrusted to him the education of his son. He died at Paris on the 6th of March, 1577. Ronsard styled him Nature's Painter, and there is less of fantastic glitter in his poetry than in that of the other pleiades. His 'Bergeries' were most admired by Ronsard, and they are very pretty pastorals in the French taste, whilst his Anacreontics are not at all in the Greek. There are besides an 'Epithalame sur le mariage de M. le Duc de Lorraine et de Madame Claude, fille du Roy,' 4to, Paris, 1559; 'Larmes sur le Trepas de René de Lorraine et de Louise de Rieux, marquis et marquise d'Elbeuf, ensemble le Tombeau de François de Lorraine, Duc de Guyse,' 4to, 1566, and other occasional pieces; also 'L'Innocence prisonnière, l'Innocence triomphante, la Vérité fugitive,' 8vo, 1561; 'Les Amours et nouveaux échanges de Pierres précieuses, discours de la vanité pris de l'ecclésiaste, eglogues sacrées prises du Cantique, &c.,' sm. 4to, 1576; 'La Reconnuë,' a comedy, 8vo, 1577, several times reprinted; and 'Dictamen metricum de bello Huguenotico et reistrorum pigliamine ad sodales,' a macaronic rhyme regarded as among the most successful of its class. The poetic works of Rémy Belleau were published in 2 vols. 8vo, Paris, 1578; 12mo, 1585, and 2 vols. 12mo, Lyon, 1592.

BELLEFOREST, FRANÇOIS DE, French poet and mis-

cellaneous writer, was born in November, 1530, at Sarzan, near Samatan, in Guienne. Having lost his father early, he was taken under the protection of Marguerite, Queen of Navarre, and at the proper age sent to study for the bar under the best professors at Bordeaux and Toulouse. But tiring of the arid details of institutes and pleadings, he abandoned the law and took to the easier profession of verse-making. Sonnet in hand, he wandered from château to château, always well received and liberally feasted, and paying in complimentary rhymes for the hospitality vouchsafed to him. Thus he idled away pleasantly enough some seven or eight years in the province of Toulouse, when, finding that he was as poor as ever in purse and little richer in fame, he determined to try his fortune in Paris. There he was welcomed as a brother singer by Ronsard, Bellay, Baif, and Vigenere, and in good time admitted into the constellation of the Pleiade. At Paris, as in Toulouse, making verses "pour plaire aux Dames et Damoiselles," he was, says his friend Du Verdier, "caressed by princes, admired by nobles, and sought after by all the best people in the realm." But here again he found that, however courted and feasted, he obtained little wealth, and so he was constrained, though much against his inclination, to leave the salons of the princes, nobles, and other great people, and turn to the booksellers, who, though they proved hard task-masters, paid so handsomely for the work they ordered that Belleforest was not only able to live well and put money in his pocket, but might, had he been so minded, have maintained a very pretty establishment. Belleforest seems to have been rarely endowed with the qualities of a successful 16th (or for the matter of that 19th) century bookseller's author. He knew no subject thoroughly, but he knew something of a good many, and was ready to write at a moment's notice on any one, or half-a-dozen, as required. And as nothing came amiss to him, he always finished off his task at a heat. It used to be said, as Bayle tells us, that he had a lot of moulds in which he cast his new books. Poems, romances, dissertations, sacred, profane, serious, and amusing matter flowed with equal facility from his pen. But as Chaudon writes somewhat sourly, "an historian without discernment and without taste, he defaced whatever he touched; a poet of the hindmost rank, he crawled at the base rather than climbed the heights of Parnassus;" he wrote because he was incapable of doing anything else, and sent forth a flood of new books without anything new in them. But if Belleforest added nothing permanent to the literature of France, he is the most characteristic illustration of a special phase of French literature in the 16th century, and the student of French literary history would make a grave mistake who overlooked him. Belleforest was appointed historiographer of France, but was dismissed for having performed its functions with too little regard to exactitude. He died poor on the 1st of January, 1583. Croix du Maine and Du Verdier Vau-Privas give long lists of Belleforest's writings. The following may serve as specimens:—'Chant Pastoral sur les Noces de Philippe d'Autriche roy des Espagnes et Madame Elizabeth, fille aînée du roy tres Christien Henri II. et d'Emmanuel Philibert duc de Savoye, avec Madame Marguerite fille et sœur des roys François I. et Henri II.,' 4to, Paris, 1559; 'La Chasse d'Amour, avec les fables de Narcisse et de Cerbere,' sm. 8vo, Par. 1561; 'La Pastorale Amoureuse, contenant plusieurs discours nō moins prouffitables que recreatifs, avec des descriptions de paysages,' 8vo, 1569; 'Arraisonnement fort gentil et profitable sur l'infelicité qui suyt ordinairement le bonheur des Grans: avec un beau discours sur l'excellence des Princes du sang de France, qui gouvernent l'estat du Royaume,' 8vo, 1569, reprinted, with altered titles, 1572 and 1585; 'Discours des Présages et Miracles advenuz en la personne du Roy, et parmy la France, dès le commencement de son règne,' 8vo, 1568, reprinted according to Brunet with somewhat different titles in 1572 and 1576; 'Histoire des Neuf Rois de France qui ont eu le nom de Charles,' folio, Paris, 1568, a sort of forecast of the Strickland series, but it is somewhat curious that none of our Belleforests have thought of the 'Four Williams' or 'Eight Henries' as the subject of an attractive history; 'Les Grand Annales et Histoires générales de France dès la venue des Francs en Gaule jusques au règne du roi Henry III.,' 2 vols. folio, Paris, 1579. This, which is Belleforest's most important contribution to history, was published, with a continuation to 1591 by Gabriel Chappuis, in 1600, and again with a continuation to 1620: as an authority it is not of the smallest value. Besides these, there is a crowd of compilations, translations, and verselets to which Belleforest's name is attached.

BELLICARD, JÉRÔME-CHARLES, French architect, draftsman, and engraver, was born at Paris, on the 21st of

February, 1726. Having gained the grand prize in architecture, 1747, he went to Rome, where, in addition to the usual architectural studies, he gave much time to engraving, in which he became a proficient, and published, about 1750, many views of Rome and its vicinity. He also published the first full description of the discoveries made at Herculaneum, then newly exhumed, 'Observations sur les Antiquités de la Ville d'Herculaneum, avec quelques réflexions sur la Peinture et la Sculpture des Anciens et une courte description des Environs de Naples,' 8vo, with engravings, 1754, 2nd edition, 1757: an English translation followed almost immediately upon the publication of the original. On his return to Paris he was nominated member and professor at the Royal Academy of Architecture, and appointed comptroller of the royal buildings. He made numerous drawings and engravings, and published, among other things, the 'Loge des Chances de Lyon,' and various of his own designs. But he erected no building of consequence, and his last years were embittered by poverty, the result of his addiction to gaming. He died on the 27th of February, 1786, leaving unfinished a work on which he had been employed for over ten years—'Architectographie, ou Cours Complet d'Architecture.'

BELLORI, GIOVANNI PIETRO, an eminent Italian archaeologist, was born at Rome in 1615. From his youth Bellori devoted himself to the study of art and antiquity, in which he was encouraged, and at the outset greatly assisted, by his uncle, Francesco Angeloni, secretary to Cardinal Aldobrandini, himself a good antiquary, and author of an account of the coins of the Roman Emperors, and of the 'Historia di Terni.' Bellori wrote many works of great use in their day, and which are still often referred to with advantage. He was nominated Antiquario di Roma by the Pope, Clement X., and Queen Christina of Sweden, then resident at Rome, appointed him her librarian and keeper of her cabinet of antiquities. He died at Rome in 1696. Most of his works are in Latin, but the two now most valued are in Italian—'Vite de' Pittori, Scultori, ed Architetti Moderni,' part i., with 12 portraits engraved by Bloemart, 4to, Rome, 1672—75; this is a valuable and pleasantly written book, but remained unfinished at the author's death: an augmented edition appeared at Rome in 1728, and another, in 3 vols. 8vo, at Pisa in 1821; 'Descrizioni delle Immagini dipinte da Raffaello d'Urbino nel Vaticano,' &c., small folio, with a portrait of Raffaele and vignettes of his designs, Rome, 1695: of this work, which has always been a favourite with artists, an augmented edition was published at Rome in 1750, and another, still further enlarged, in 1821. Among the more noteworthy of Bellori's other works are—'Icones et segmenta illustrium e marmore tabularum que Romæ extant,' large folio, Rome, 1645; 'Le Gemme Antiche figurate di Leonardi Agostini, con l'annotazioni di G. P. Bellori,' 4to, Rome, part i. 1657, part ii. 1670; 'Notæ in Numismata tum Ephesiæ, tum aliarum urbium apibus insignita,' 4to, Rome, 1658; 'Columna Antoniniana a Petro Sante Bartolo delineata et incisa, cum notis excerptis ex declarat. J. P. Bellorii,' oblong fol. with 80 plates, on which Bellori's explanations are engraved; 'Fragmenta vestigii veteris Romæ ex lapidibus farnesianis, nunc primum in lucem edita, cum notis Bellorii,' with 20 engravings, fol. Rome, 1673; reprinted in the 4th vol. of Gronovius' 'Thesaurum Ant. Rom.'; 'Scelta di Medaglioni più rari nella Bibliotheca del Cardinale Gasparo Carpegna,' 4to, Rome, 1679; 'Admiranda Romanarum Antiquitatum ac veteris sculpturæ vestigia, a P. Sante Bartolo del. et incisa, notis J. P. Bellorii illustrata,' with 81 plates, oblong folio, Rome, n. d., 2nd ed., with 84 plates, 1693; 'Le Pitture antiche del Sepolcro de' Nasoni, designate da P. Sante Bartoli,' with 35 plates, folio, Rome, 1680, a splendid work, the plates being regarded as Bartoli's finest productions; 'Historia Augusta da Giulio Cesare a Constantino il Magno, illustrata da Francesco Angeloni et J. P. B.,' &c., fol. Rome, 1685; 'Veterum Illustrium Philosophorum, Poetarum, Rhetorum et Oratorum imagines, vetustis nummis, gemmis, hermis, marmoribus aliisque antiquis monumentis desumptæ,' with 90 plates, Rome, 1685; 'Expositio Symbolici Dædæ Cypriæ simulacri,' fol. Rome, 1688; 'Veteres Arcus Augustorum triumphis insignes,' &c., with 52 fine plates by Bartoli, large folio, Rome, 1690, one of Bellori's most important works. The same plates were employed in the 'Admiranda Romanarum,' noticed above. Several of Bellori's works were posthumous; among them may be noticed—'Le Antiche Lucerne Sepolcrali, figurate, raccolte dalle cave sotteranee e grotte di Roma, disegnate ed intagliate da P. Santi Bartoli, con l'osservazioni di G. P. Bellori,' 3 parts, in 1 fol. vol. with 116 (some copies 12 more) plates, Rome, 1691, 2nd ed., 1729, Latin version, by L. Beger, 1702; 'J. P. Bellorii Adnota-

tiones, nunc primum evulgatæ in duodecim priorum Cæsarum numismata, ab Enea Vico olim edita, noviter additis eorundem Cæsarum imaginibus,' with 84 plates, folio, Rome, 1730: this was edited by B. Amidei. G. Bottari published an imaginary conversation on the arts of design between Bellori and Carlo Maratti—'Dialoghi sopra le tre Arti del Disegno,' 8vo. Lucca, 1754.

BELOE, WILLIAM, the son of "an eminent china-man" of Norwich, and both of whose parents were estimable for their virtue and ability, was born in 1756. After receiving the rudiments of education at a good school at Norwich, he was placed under the care successively of the Rev. Matthew Raine, of Hartforth, near Richmond, Yorkshire, and of the celebrated Dr. Parr, then residing at Stanmore, in Middlesex. He became a member of Bene't, or Corpus Christi College, Cambridge, where he obtained the Declamation Prize, and took the degree of B.A. in 1779. Upon the invitation of Dr. Parr, who in 1778 had become head-master of the grammar-school at Norwich, Mr. Beloe accepted the post of under-master in that institution, and held this situation for about three years. In this interval he married the daughter of William Rix, Esq., town-clerk of London. Whilst in Norfolk he acted as curate of Earham, near Norwich, and was afterwards preferred to the living. But finding the emoluments of his vicarage insufficient, he removed to London, where he entered upon the pursuit of literature with great zeal and industry. He was elected master of Emanuel Hospital, Westminster, and continued so for upwards of 20 years. In 1792 he was made F.S.A., and in 1796 was presented by Lord Chancellor Loughborough, afterwards Earl of Rosslyn, to the rectory of Allhallows, London Wall. On the 24th of September, 1800, he was collated by Bishop Pretymann to the prebend of Milton Manor, in the cathedral church of Lincoln; and on the 8th of June, 1804, Beilby Porteus, Bishop of London, collated him to the stall of St. Pancras in St. Paul's Cathedral. In 1804, on the recommendation of the Honourable Shute Barrington, Bishop of Durham, to whom he afterwards dedicated the first two volumes of his 'Anecdotes,' Beloe was appointed under-librarian in the British Museum; which situation he lost by an act of treachery and fraud on the part of a plausible person who purloined valuable literary property which was under Beloe's charge, so that it "was thought that the good government of the institution demanded his dismissal." Thus, further to quote substantially his own words, "all his literary and domestic plans were, in one unexpected moment, overthrown, and he exchanged peace, competence, and a situation most congenial to his feelings and pursuits, for loss, anxiety, uncertainty, and, above all, dread of unmerited obloquy." The obloquy, however, he was glad to confess, was spared him; and he passed through the ordeal without the sacrifice of reputation. Yet the disappointment was acutely and disastrously felt; and "a constitution of body, delicate and irritable to an unusual degree, proved unable to sustain the repeated shocks of grief and vexation, which sound religion had disciplined the mind to bear; and in his latter years physical disease of a painful and incurable kind was added to his other sufferings." His intellect, however, remained unclouded, and his literary activity almost unslackened. In the latter part of March, 1817, he was seized with an attack which terminated in his death on the 11th of April, when he "had very recently entered into his 60th year. He was buried in his own church of Allhallows, London Wall, attended only by his sons, and three or four select friends."

Beloe's works are very numerous, and embrace his 'Ode to Miss Boscawen,' 4to, 1783; 'The Rape of Helen, from the Greek of Coluthus, with Notes,' 4to, London, 1786; 'Poems and Translations,' 8vo, London, 1788; 'Alciphron's Epistles, translated from the Greek,' 8vo, London, 1791, produced jointly by Mr. Beloe and Mr. Monro; 'The History of Herodotus, translated from the Greek, with Notes,' 4 vols. 8vo, London, 1791, a work which had a very favourable reception, and which has gone through several editions, but of which the laurels are at present somewhat faded; 'The Attic Nights of Aulus Gellius, translated into English,' 8vo, 1795, to which Dr. Parr contributed a learned preface; 'Miscellanies, consisting of Poems, Classical Extracts, and Oriental Apologues,' 3 vols. 8vo. London, 1795; 'Translation of the Arabian Nights' Entertainments, from the French,' 4 vols. 12mo.; 'Joseph, translated from the French of M. Bitanbé,' 2 vols. 12mo.; 'A Sermon preached on Wednesday, October 19th, 1803. Being the day appointed for a general fast,' 8vo, London, 1803; 'Anecdotes of Literature and Scarce Books,' 6 vols. 8vo, London, 1807—12, a valuable work, indicative at once of great research and of the fact that its author was a disappointed

valetudinarian; and 'The Sexagenarian, or Memoirs of a Literary Life,' London, 1818, which was a work of posthumous publication, and edited by a friend. Mr. Beloe was also a frequent contributor to the 'Gentleman's Magazine,' and was from May, 1793, to December, 1813, joint conductor with Archdeacon Nares of the 'British Critic,' of which they, with the publishing house of Rivington, were also the proprietors. Another of Beloe's joint labours was upon a 'Biographical Dictionary,' in 15 volumes, 8vo, which he undertook in conjunction with the Rev. W. Tooke, Mr. Morrison, and the Rev. R. Nares.

BELTRAFFIO, GIOVANNI ANTONIO, a celebrated Italian painter, was born at Milan in 1467. He was a pupil of Leonardo da Vinci, whose manner he imitated. His pictures are characterised by exceeding gentleness of expression and refinement of execution, bordering often on tameness. Like his master, he was fastidious and painted little, and his works are consequently rare. The National Gallery, London, possesses a very fine 'Madonna and Child' (No. 728) by him. The figures are life-size and very beautiful, but hardly divine. There is also in the Louvre a good 'Madonna and Child' (No. 71), somewhat larger than that in the National Gallery, and known as 'The Casio Virgin.' Beltraffio died at Milan on the 15th of June, 1516, aged 49.

* **BENDEMANN, EDUARD**, German historical painter, chief of the Düsseldorf School, was born at Berlin, on the 3rd of December, 1811. The son of a banker he received a good general education, and evincing a strong passion for painting he was placed as a pupil with W. Schadow. His progress was great, and in 1832 he made his début at the Berlin Exhibition with a large picture, 'The Mourning of the Jews by the Rivers of Babylon,' which excited much attention, was awarded a prize of the highest class, was purchased by the king for the museum at Cologne, was engraved by Ruscheweyh, and lithographed by Weiss and Schreiner. 'Girls at the Fountain' followed, and then another large and elaborate work, 'Jeremiah lamenting over the Ruins of Jerusalem,' which gained a medal of the first class at the Paris Salon in 1837, was lithographed by Weiss, and purchased for his private collection by the king of Prussia. Bendemann now turned aside for awhile from high art to works of a lighter character, like 'Harvest,' 'Shepherd and Shepherdess,' for Count Raczynski, and the 'Daughter of a Servian Prince,' in illustration of poems by Uhland and Herder. In 1838 he was appointed professor and member of the council of the Academy of Arts at Dresden. He now recurred to the more ambitious subjects of his earlier days, his style however having gained in strength, and his technical knowledge being enlarged by a visit to Italy. The great pictorial undertaking of his residence in Dresden was the decoration of the royal palace with a series of large paintings in fresco. On the walls of the throne room he filled four large compartments with the leading events in the life of the Emperor Henry, the founder of the city, and four other compartments with symbolical subjects, adding elsewhere a series of portraits of distinguished men of all ages, and a frieze symbolising the life of man. The decoration of this room was treated in the spirit of the German middle-ages. The great ball-room, on the other hand, he filled with subjects from the heathen mythology chiefly of a festal character. The Hall of Alliance he decorated with religious subjects. His other paintings of this period include a fresco of 'Poetry and the Arts,' a portrait of the Emperor Lothar II., for the Römer, or old Palace of Frankfurt, and 'Ulyses and Penelope' for the Cassel Museum. He also designed the monument of Sebastian Bach, erected at Sandstein, under the superintendence of Knauer. In 1859 he was appointed director of the Düsseldorf Academy, a dignity to which he seemed naturally entitled on the retirement of his father-in-law Schadow. He has since painted several works which have fully sustained his previously high reputation: notably 'The Death of Abel,' for Naumburg and a frieze for the Realschule of Düsseldorf. He has also painted some portraits which have been greatly admired, as the Countess von Hohenzollern-Sigmaringen; his wife, Schadow's daughter, whom he married in 1838; and Wilhelm von Schadow for the Antwerp Academy. Bendemann is remarkable for breadth of treatment, power combined with sweetness of expression, and freedom from the excessive academical frigidity of some eminent contemporary German historical painters.

* **BENEDEK, LUDWIG VON**, a celebrated commander in the Austrian service, and son of a medical professor, was born at Odenburg, in Hungary, in the year 1804. He received his education at the Imperial Military Academy of Neustadt, which he quitted at 18 to join the army as a cadet. He received his

first commission in 1831, was promoted to be second lieutenant, placed on the staff, and sent to Italy. In 1835 he was a captain, five years later he was advanced to the rank of adjutant-major, and left Italy for Poland, where he manifested great tact and clemency. In 1843 he attained the rank of lieutenant-colonel. The breaking out of the insurrection in Galicia in February, 1846, gave him the opportunity of displaying his courage and conduct as a commander; and, entering the western district with a commission from the governor of the province, the Archduke Ferdinand d'Este, whose adjutant he was, his operations in and around Wieliczka enabled General Collin to act on the offensive and to take Podgorze by assault. This capture involved the general pacification of Galicia, and for his important services Benedek was rewarded with the insignia of the Order of Leopold. In August, 1847, he obtained the full rank of colonel, and received the command of the regiment of Gyulai Lancers, at the head of which he next year joined the army of Italy. Here he took part in the memorable campaign under Radetzky, and distinguished himself by his conduct of the retreat from Milan to Verona, at Osone, and especially at the battle of Curtatone, where, being in command of a brigade, his prudence and courage procured for him an honourable mention by Marshal Radetzky, and, later, the Cross of the Order of Maria Theresa. He won fresh honours in the campaign of 1849 by his brilliant occupation of Mortara on the 21st of March, and his important share in gaining the decisive battle of Novara on the 24th. On the 3rd of April, 1849, he was promoted to the rank of major-general in the Heynau brigade, and being transferred to the army of the Danube, took an active part in the military events of Hungary. He led the vanguard at Raab and Oszöny, and was slightly wounded at Uj-Szegedin, and more seriously by the fragment of a shell at Oza-Ivany. Both in Hungary and in Poland, Benedek's name, from the necessity of his duty, became connected with many proceedings little in accordance with his real nature. But though he was most exact in obeying orders once received, his voice in the council-chamber was always heard in favour of conciliation and mercy. At the conclusion of the Hungarian war he was appointed to be chief of the quartermaster-general's staff of the second army of Italy under the veteran Radetzky. In 1853 Benedek became Lieutenant-Field-Marshal, and received, in view of the possibility of Austria taking part in the Russian war, the command of the fourth army corps in Lemberg. In 1859, at the outbreak of the war of Italian independence, he was appointed to the command of the eighth army corps; and, though for a time his energy was spent in unimportant skirmishes, he distinguished himself at Solferino, where the right wing of the Austrians, which was under his command, had for an instant the advantage over the left wing of the allies. He unwillingly obeyed the emperor's command to retreat behind the left bank of the Mincio, and the peace of Villafranca filled him with vexation. Though the war of 1859 ended disastrously for Austria, Benedek made himself both known and dreaded by the French and Italian troops; and at the cessation of hostilities he remained in Venetia at the head of the Austrian forces. For a few months in 1860 he acted as master of the ordnance and governor-general of Hungary, which he vacated upon his appointment to the chief command of the Austrian army in Italy. In the late German war Benedek was summoned by the Emperor to be commander-in-chief of the Austrian army, and fixed his headquarters successively at Pardubitz and Olmütz, from the latter of which he issued an order of the day full of confidence in the successful termination of the struggle. But, impeded from the first by both actual and diplomatic clogs upon his movements, and by the fact of his previous war-training having been chiefly in the plains of Lombardy; failing to appreciate the improved tactics of the Prussians, and the increased power of their weapons; and over-estimating the capabilities of his own army, Benedek sustained on the 3rd of July, 1866, the crushing defeat of Sadowa, and was soon afterwards superseded by the Archduke Albert.

In person General Benedek is of the middle height, spare, wiry, and exceedingly active; of upright and military bearing, with finely sharp-cut features, and a high aquiline nose, and, like most of the continental officers, much shorn and shaven, with the exception of a pair of thick moustaches. He has quick, penetrating eyes, and his manner is distinguished by the courtesy and attractive mixture of gentleness, high courage, and gaiety, which used to be the mark of the old school. He boasts of being every inch a Hungarian, and in his staff appointments he was accustomed to show a marked preference for Poles and Hungarians over Germans. Whether in success or adversity, in his

private or his public character, the reputation of General Benedek for scrupulous honour remains unshaken.

* **BENEDEN, PIERRE JOSEPH VAN**, an eminent Belgian zoologist, but about whom we can find very few easily accessible biographical facts. In one of his early papers he alludes to M. Stoffels, a chemist at Malines as his master and guide. In 1835 he was the keeper of the natural history museum at Louvain, but how long before he had filled this post we are not aware. In this year or in the following he was appointed professor of zoology at the Catholic University of Louvain. It was also in 1835 that his earliest paper was published. The subject was *Dreissena*, a genus of mussel-like shells which he was the first to establish. The paper indicates a full and comprehensive mode of treatment, which characterizes most of his later productions. In it he urges the importance of drawing generic characters from the soft as well as the hard parts, as he was convinced these last alone could not be exclusively relied on. This idea was more fully developed in 1836 in his paper on *Helix algira*. He notices the great increase in the number of species of *Helix* during the few previous years, and remarks that the characters of the 1200 or more species then known were based upon the shell. He compared *Helix algira* with *H. pomatia* for the purpose of discovering what was the value of the characters afforded by the soft parts. He came to no noteworthy conclusion, recognising the necessity of examining a far larger number of species; but he pointed out that the lingual band promised to yield good classificatory points, an observation which has been confirmed by the subsequent researches of Troschel and others. About this time Alcide D'Orbigny, who was on the eve of departure for South America, requested Beneden to co-operate with him in investigating the *Pteropoda*, and he agreed to do so. The first result of the agreement was his memoir on *Pneumodermion violaceum*, in which he discovered a sympathetic or stomato-gastric system of nerves, the occurrence of which had not been observed before in the *Mollusca*. In 1836 he was elected a corresponding member of the Royal Academy of Belgium, and in 1842 a full member thereof. He has written very few separately-published works, but has contributed largely to the 'Bulletins' and 'Mémoires' of the Royal Academy of Belgium. The list of his communications in the Royal Society's catalogue of scientific papers comprises 122 items, to which must be added about half-a-dozen more which have appeared since the catalogue was issued. Looking at these papers as a whole, they may be described as the materials for an excellent anatomical, developmental, and synoptical account of the Belgian fauna. The most important are, 'Mémoire sur les Campanulaires de la côte d'Ostende, &c.'; 'Sur l'Embryogenie des Tubulaires'; 'Recherches sur l'Anatomie, la Physiologie, et le développement des Bryozoaires qui habitent la côte d'Ostende'; a similar memoir on the Ascidians; 'Les Vers cestoides considérés sous le rapport physiologique, embryogénique, et zoologique'; 'Recherches sur quelques Crustacés inférieurs', which is a monograph on the *Lernæidæ*; 'Histoire Naturelle du genre *Capitella* de Blainville, &c.', in which he added much to the knowledge already acquired by Oersted and Leuckart; and a series of papers which began in 1861, entitled 'Recherches sur la Faune littorale de Belgique.' Much of our present knowledge respecting the curious changes of form undergone by the *Hydrozoa* and *Entozoa* or *Scolecida* is due to his research. In conjunction with M. Gervais he has recently written a magnificent work on whales, 'Ostéographie des Cétacés vivants et fossiles.

BENEDETTO DA MAIANO [MAIANO, BENEDETTO DA, E. C. vol. iv. col. 56.]

BENEDICT, BISCOP, an ecclesiastic of the 7th century, famous as the teacher of Bede, and still more for the influence he exerted on Anglo-Saxon or Early English arts and civilization, was born about 629, of a noble family in Northumbria, and brought up at the court of King Oswy. At the age of 25 he went by command of the king to Rome, having for companion a young man named Wilfrid, afterwards the celebrated Bishop of York. Benedict remained at Rome nearly ten years, seemingly engaged in study, returning to England soon after the synod of Whitby. He found King Alfred of Northumberland preparing to visit Rome; but he was persuaded to abandon his intention and send Benedict as his messenger. During this second visit to the Holy City Benedict arrived at the determination to become a monk. He was accordingly admitted into the abbey of Lerins in Provence, received the tonsure, and passed through the usual course of monastic training. After a short visit to Rome, 668, he set out on his return to England in company with Bishop Theodore and Abbot Adrian [E. C. S. col. 28]; and at Theodore's request served as abbot of St. Peter's, Canterbury, until the arrival of

Adrian, who had been detained on the Continent, and did not reach England till some months after his companions. Benedict now made a third journey to Rome, with what specific object is not known, but it was probably in connection with some religious establishment, as it was on this occasion that he first appears in the character by which he is still remembered, that of a collector of pictures, works of ecclesiastical art, and books. With his collected stores he went into Northumberland, where the king, Ægfrid, gave him a piece of land near the mouth of the Wear on which to found a monastery, and the erection of which Benedict pressed forward with so much vigour that the building was completed within a year of its commencement. This was the afterwards famous Abbey of Wearmouth, and according to Bede (Vita Abb. Weremouth) was the first in England which was "built of stone in the Roman manner." For its erection Benedict had brought masons from Rome, and when it was drawing towards completion he sent messengers to Gaul to bring over workers in glass, "who were at this time unknown in Britain, that they might glaze the windows of his church as well as those of the cloisters and dining-rooms. This was done, and they came, and not only finished the work required, but taught the English nation their art, which was well adapted for enclosing the lanterns of the church, and for the vessels required for various uses." Bede, when he wrote this, it must be remembered, was not only the contemporary of Benedict, but himself an inmate of the monastery whose erection he describes. Wearmouth Abbey church was not, as is sometimes stated, the first church built in England of stone, but the first stone church built in the Roman manner, and of which the windows were glazed. Four years later, 678, Benedict made another voyage to Rome, and this time, as we are told, expressly in order to collect books, pictures, and relics, and to obtain from the pope special privileges and exemptions for his monastery. He succeeded in all these objects, bringing back with him a large number of ecclesiastical ornaments for his monastery, and also John, the archcantor of St. Peter's at Rome, to introduce the Roman choral service into England, of which, as well as of other Roman rites and dogmas, Benedict was an ardent advocate. About this time King Ægfrid gave Benedict land at Jarrow for another monastery, the new house, which he dedicated to St. Peter, being made dependent upon that of Wearmouth, and placed under the same abbot.

Having finished his new monastery, Benedict transferred the abbacy to one of his monks named Eosterwin, and again set out, 685, for Rome. From this his fifth, and, as it proved, his last, journey, he returned in 687, as usual laden with books and works of art. Besides rich vestments, including "two palls of matchless workmanship" for the service of his monasteries, he brought a series of paintings from the Old and New Testament in type and antitype, which he placed in the church at Jarrow, and another series of events in the life of Christ, which he set up in the church at Wearmouth. Shortly after his return he was seized with paralysis. For three years he endured grievous bodily suffering, but he never ceased to exhort his monks to continue the good work he had begun; and whilst he related the history and pointed out the value of the literary and pictorial treasures he had collected, he exhorted his monks to read and carefully preserve the books. He died on the 12th of January, 690, and was buried in his own church at Wearmouth; but in the tenth century, Ethelwold, Bishop of Winchester, transferred his relics to Thorney. His library was destroyed by the Danes in one of their predatory excursions.

Benedict was, for his age, a man of great learning as well as refined taste. Several books, chiefly on the monastic rule, are attributed to him, but none have come down to us; and he left several distinguished scholars, the most eminent being the Venerable Bede. But his great merit is that he was the first to introduce or cultivate a knowledge of art among the English people, and he divides with Adrian the honour of stimulating a taste for literature. In the sermon which he delivered in the church at Wearmouth on the day of Benedict's commemoration, Bede very clearly and distinctly set forth this phase of Benedict's character and the purpose he had in view—a purpose it is necessary to keep in mind in considering the history and character of early ecclesiastical art:—"He never returned from abroad empty-handed, always bringing with him a large supply; at one time of holy books, at another relics of the blessed Martyrs of Christ; introducing, on one occasion, architects for the building of the church; on another, glass manufacturers, for the ornament and security of its windows; on a third, instructors for teaching singing and the services of the church; at one time, too, he imported paintings of the holy histories, which should

serve not only for the decoration of the church, but for the instruction of beholders; so that those persons who could not learn from books what had been done by the Saviour, might be thus far instructed by the representations placed around them."

(Bede, Homily on Benedict Biscop, printed in Bede's Minor Works, 1841, p. 335; *Vita S. Benedicti Abbatis*; *Vit. Abbot. Weremuth*, and *Hist. Ecc.*; Malmesbury, *De Gestis Regum*, B. i. c. 3; Capgrave, *Nova Legenda*; Warton, *Hist. of Brit. Poetry*, vol. i. Diss. ii. p. xcvi.; Wright, *Biog. Britt. Lit.* vol. i. pp. 185—192; Hardy, *Desc. Cat. of Materials, relating to the History of Great Britain*, vol. i. pp. 366—68.)

BENEFIELD, SEBASTIAN, a learned English divine of the early part of the 17th century, was born at Prestbury, Gloucestershire, Aug. 12, 1559; was admitted scholar of Corpus Christi College, Oxford, in 1586; and elected fellow in 1590; proceeded M.A. and took holy orders; and in 1599 was appointed reader in rhetoric in his college. In 1608 he took the degree of D.D., and in 1613 was appointed Margaret Professor of Divinity in the University. This office he filled with great reputation for 14 years, when he resigned it, and returned to his rectory of Meysey Hampton, near Fairford in Gloucestershire, where the rest of his life was spent in study, writing, and the diligent discharge of his parochial duties, and where he died on the 24th of August, 1630. Benefield was a man of earnest piety, of great learning, and an excellent teacher. In doctrine he was a decided, or, as he was termed, a "downright and doctrinal" Calvinist. He wrote many books, in their time much read, but now probably seldom if ever looked into. The following are the principal:—1. 'Doctrinæ Christianæ sex capita totidem prælectionibus in schola Theolog. Oxon. pro forma habitis discussa et deceptata,' 4to, Oxford, 1610; 2. 'A Commentary or Exposition upon the First Chapter of Amos, delivered in 21 sermons, in the parish church of Meysey Hampton, in the diocese of Gloucester,' 4to, Oxford, 1613; 3. 'Commentary or Exposition upon the Second Chapter of Amos, delivered in 21 sermons in the parish church of Meysey Hampton,' 4to, London, 1620; 4. 'Commentary or Exposition on the Third Chapter of Amos,' &c., 4to, London, 1629; 5. 'Eight Sermons publicly preached in the University of Oxford, the second at St. Peter's in the East, the rest at St. Mary's Church,' 4to, Oxford, 1614; 6. 'The Sin against the Holy Ghost, and other Christian Doctrines, delivered in 12 sermons, upon part of the Tenth Chapter of the Epistle to the Hebrews,' 4to, Oxford, 1615; 7. 'Prælectiones de perseverantia sanctorum,' 8vo, Frankfurt, 1618.

BENEKE, FRIEDRICH EDWARD, a German philosopher, was born at Berlin on the 17th of February, 1798. After having taken part, as a volunteer, in the war for the independence of his country in 1815, he entered in 1816 the University of Halle, where he studied theology. In 1817 he removed to Berlin, where he devoted himself to the study of philosophy, in which faculty he commenced in 1820 a course of lectures which were interrupted by the prohibition of the minister von Altenstein, on account of their opposition to the doctrines of Hegel. Hereupon he removed to Göttingen, where he held private lectures, until, being recalled by family circumstances to Berlin, he received permission to resume his lectures at the university of that city, of which, after the death of Hegel in 1832, he was named extraordinary professor of philosophy, and successfully laboured in that capacity until the year 1853. After suffering from a severe physical affliction, Beneke was missing for a period of twelve months from the 1st of March, 1854, when he was found a corpse in the water.

The central point of Beneke's system is to be found in his conviction that the true principle of philosophy is a free and determined attachment to the phenomena of our own self-consciousness, a studying of our own sensations and emotions; and his psychology is therefore to be characterized as empirical and inductive. The following are the most important of the works of Beneke:—Experimental Psychology as the principle of all Science, expounded in its leading Features, 'Erfahrungseelenlehre, als Grundlage alles Wissens, in ihren Hauptzügen dargestellt,' Berlin, 1820; Doctrine of Perception, &c., 'Erkenntnislehre nach dem Bewusstsein der reinen Vernunft, in ihren Grundzügen dargelegt,' Jena, 1820; Psychological Sketches, 'Psychologische Skizzen,' 2 vols. Göttingen, 1825—27; Concerning the Relation of Soul and Body, 'Ueber das Verhältniss von Seele und Leib,' Göttingen, 1826; and a Handbook of Psychology, considered as a Physical Science, 'Lehrbuch der Psychologie als Naturwissenschaft,' Berlin, 1833, 2nd edition, 1845. To these works were added a series of amplificatory or explanatory treatises—The New Psychology, 'Die neue Psycho-

logie,' Science of Education and Instruction, 'Erziehungs- und Unterrichtslehre,' 2 vols. Berlin, 1835—36, 2nd ed. 1842; Outlines of the Natural System of Practical Philosophy, 'Grundlinien des natürlichen Systems der praktischen Philosophie,' 3 vols. Berlin, 1837—41; System of Metaphysics, and of the Philosophy of Religion, &c., 'System der Metaphysik und der Religionsphilosophie aus den natürlichen Grundverhältnissen des menschlichen Geistes abgeleitet,' Berlin, 1840; System of Logic, &c., 'System der Logik als Kunstlehre des Denkens,' 2 vols. Berlin, 1842; and Pragmatic Psychology, or the Doctrine of the Soul in its application to Life, 'Pragmatische Psychologie, oder Seelenlehre in der Anwendung auf das Leben,' 2 vols. Berlin, 1850. For the further exposition of the subject treated of in the last-mentioned work its author instituted the publication of a quarterly journal, entitled Records of Pragmatical Psychology, 'Archiv für die pragmatische Psychologie,' &c.

* BENFEY, THEODOR, a distinguished German Oriental scholar, was born January 28, 1809, at Nörten, near Göttingen. After completing his course at the Göttingen Gymnasium, in 1824, he entered the university, where he studied philology under Karl Otto Müller and Dissen. In 1827 he proceeded to Munich, and thence to Frankfurt and Heidelberg universities, returning in 1834 to Göttingen, where he was named professor in the faculty of philosophy, and has long held the chair of Sanskrit and Comparative Grammar. The Oriental languages have since mainly engaged his attention, and without having attained to the same elevation, either as discoverer or scholar, as one or two of his countrymen, he is generally regarded as in the very foremost rank of living systematic orientalisks. In 1861 he was elected corresponding member of the French Académie des Inscriptions. Of his numerous works the following are among the most valuable:—'Ueber die Monatsnamen einiger alten Völker' (On the Names of the Months among the ancient peoples), Berlin, 1836; 'Griechisches Wurzellexikon' (Greek roots Lexicon), 2 vols. Berlin, 1839—42; 'Ueber das Verhältniss der ägyptischen Sprache zum Semitischen Sprachstamm,' an essay on the connection of the Egyptian with the Semitic language, Leipzig, 1844; 'Der Hymnen des Samaveda' (the text of the hymns of the Samaveda, with a glossary and translation), Leipzig, 1848; 'Beiträge zur Erklärung des Zend' (contribution towards an explanation of the Zend), Göttingen, 1853; 'Vollständige Grammatik der Sanskritsprache' (Complete Grammar of the Sanskrit Language), Leipzig, 1855, which was followed by a shorter grammar in 1855, and by a modified English version, 'A Practical Grammar of the Sanskrit Language,' 8vo, 1863; and 'A Sanskrit-English Dictionary,' 1865; 'Pantschatantra,' 2 vols. Leipzig, 1859. He has also contributed largely to 'Orient und Occident,' Göttingen, 1863, &c.; and he is the author of the elaborate article 'Indien,' in Ersch and Gruber's 'Encyclopädie.'

BENOIT DE SAINTE MAUR, a Norman trouvère of the 12th century, was probably a native of Sainte Maur in Provence, and a monk of the convent of Marmontier. Little or nothing is known of his personal history. From his chief work, the metrical chronicle of the Dukes of Normandy, we learn that he wrote that poem by desire of "le bon Henri Secund, flors des princes de tut le mond" (our Henry II. of England), after Robert Wace had ended his chronicle, and consequently after the year 1170. The chronicle extends from the creation to the reign of Henry II., and contains about 30,000 lines. He is very laudatory of the Norman dukes generally, but particularly so of Henry II., to whose liberality Benoit makes frequent reference. The descriptive passages are not without elegance, and there is something of simplicity and directness in the narrative, but as a whole it is insufferably tedious; and whilst it has a certain value for the student of the literature of the period, and will probably continue to be referred to by the historian, it has in itself little historical value, the greater part being translated from the earlier Latin chroniclers and memoir writers. Benoit's other great work is a metrical History of Troy, written before his Dukes of Normandy; indeed it was in consequence of the popularity of the History of Troy that Benoit was asked by Henry II. to write the Norman chronicle. The History or Romance of Troy is almost as long as the Dukes of Normandy, and to readers of the present day very much duller and more wearisome, since it wants even the interest which the Chronicle possesses in the fact of the poet being contemporary with at least some of the persons and events he treats of. 'The Roman de Troye' has only been printed in parts: by M. Michel in the work cited below, by Keller in his 'Romvart,' and a few brief extracts by Wright in his 'Biographia Britannica Literaria,' vol. ii.; but a fine MS. of it is in the British Museum, Harl. Coll., No. 4482. Portions of the Chronicle

of the Dukes of Normandy were printed by M. Michel at the end of 'L'Histoire de Normandie de Th. Licquet,' Rouen, 1835, and in his 'Chroniques Anglo-Normandes,' Rouen, 1836; and it was printed at length in the 'Collection de Documents inédits sur l'Histoire de France,' under the special title of 'Chroniques des Ducs de Normandie, par Benoit, trouvère Anglo-Normand du XII^e siècle, publiées pour la première fois d'après un manuscrit du Musée britannique, par Francisque Michel,' 3 vols. 4to. Paris, 1837-44. Some writers have attempted to show that Benoit the author of the 'Chronique des Ducs de Normandie' was a different person from the Benoit who wrote the 'Roman de Troye,' and at first M. Francisque Michel was of that opinion; but a second MS. of the Chronicle, discovered in the Public Library of Tours, is considered by M. Michel to leave no doubt that both poems were written by Benoit de Sainte Maur.

A metrical life of Thomas à Becket, 'La Vie Saint Thomas, le glorieux Martir de Canterberie, par Benoit le Moine,' of which several MSS. are extant, and which is printed by M. Michel at the end of his edition of the 'Chroniques des Ducs de Normandie,' has also been attributed to Benoit de Sainte Maur; but the author calls himself "Benet a black monk," and he probably belonged to St. Alban's Abbey, as he speaks of "Saint Auban nostre patron."

* BENTHAM, GEORGE, an eminent botanist, who is so generally ignored in the principal text-books on biography, that we are unable to say when or where he was born. In 1833 he was appointed secretary to the Royal Horticultural Society, and as such drew up several reports on the plants collected for the society by the travelling botanists, Douglas and Hartweg. In this capacity also he took an active share in the general management of the Society's affairs until the cessation of his secretaryship in 1841. During this period he contributed several important papers on systematic botany to the scientific journals, the most noteworthy of which is his enumeration of the plants collected in British Guiana by Schomburgk, extending over more than two hundred pages of Hooker's 'Journal of Botany.' Enjoying as he did the personal friendship of Sir W. J. Hooker, he had free opportunities of consulting and examining that gentleman's library and herbarium as also the extensive collection at Kew; and from 1841 onwards many papers issued from his pen, descriptive of plants sent from all parts of the world by Hinds, Barclay, Schomburgk, Hostmann, Leprieur, Champion, Hohenacker, and others. Not only did he consult the collections at home, but for some forty years or more he has spent much time in visiting all the principal herbaria on the continent, and has personally examined many parts of Europe for the purpose of studying the living plants. Constantly engaged in describing plants, and accustomed to check the observations made on dry specimens by others drawn from the growing organisms, he has acquired an almost unrivalled skill in framing the diagnoses of genera. It is his later works which more especially give him a claim to be regarded as the most eminent systematic botanist of his day. The first of these was his 'Manual of the British Flora,' in which he evinces so great an aversion to the founding of species upon characters of trivial importance, that his estimates of the British species falls far short of the estimates of most other authorities. Thus he considers that there are 1285 phanerogamous plants in the British Isles, while Hooker and Arnott give 1571, and Babington 1708, as the number. Another special feature of this book is the analytical key which it contains, and which is intended to help the unlearned student to determine the name of any plant he may have found from its character by a process of exhaustive analysis. This key, although it necessitates a somewhat artificial grouping of the plants, is an excellent example of its kind. In 1861 appeared his 'Flora Hongkongensis,' which does for the neighbourhood of Hong Kong what the above-noticed Manual does for our own islands. In 1863 the first volume of his 'Flora Australiensis' was published, and was succeeded soon after by three others. This work was entrusted to Mr. Bentham in preference to Dr. Ferd. Mueller (who was specially fitted for the task by his local knowledge) in consequence of his intimate acquaintance with the Australian herbaria in Europe. Another of his works which requires mention is the 'Genera Plantarum,' which is being drawn up by him in conjunction with Dr. J. D. Hooker. The first volume, in three parts, was published at intervals from 1862 to 1867. It promises to be the most important work on systematic botany published during the last quarter of a century, and will be invaluable to the botanical student. In addition to the papers and books mentioned, Mr. Bentham has published many others. He has been President of the Linnæan Society since 1861.

BENTKOWSKI, FELIX, a learned Polish writer, was born in 1781. From the foundation of the University of Warsaw in 1817 to its suppression in 1831, Bentkowski was professor of history and bibliography, dean of the faculty of letters, and principal librarian of the university; he was also professor of history at the Warsaw lyceum, and keeper of the archives of the kingdom of Poland. He died at Warsaw in 1852. Bentkowski's most valuable literary production is his History of Polish Literature ('Historia Literatury Polskiej'), in two large 8vo volumes, Warsaw, 1814. It displays little critical power, but it is comprehensive; the bibliographical details are full and accurate; and on the whole it affords a useful general survey of the subject. Bentkowski wrote an 'Introduction to General History,' 8vo, Warsaw, 1812, and translated Guizot's 'History of Civilization in Europe' into Polish. He likewise contributed several biographical notices of members and various antiquarian and philological papers to the Royal Society of Warsaw.

* BENTLEY, ROBERT, a botanist who has given much attention to the pharmaceutical aspects of the science he cultivates. He is the son of William Bentley, a solicitor at Hitchin, Herts, and was born March 25, 1823. His medical education was carried on at King's College, London, with which institution his own subsequent career has been intimately connected. In 1847 he qualified himself as a member of the College of Surgeons, and in the following year was elected lecturer on botany at the London Hospital. In 1849 he became a medical associate of King's College, lecturer on botany at the Middlesex Hospital, and professor of botany to the Pharmaceutical Society of Great Britain. In 1851 this last appointment was conjoined with the professorship of materia medica, which had been held by Dr. Pereira. In 1854 when Forbes was transferred to the chair of botany at Edinburgh, he had not delivered more than half-a-dozen lectures out of his full course of forty at King's College. In this emergency Professor Bentley undertook to complete them. The next year a successor to Forbes was sought for, and Professor Bentley appeared as a candidate, but Dr. Henfrey obtained the appointment. Upon this a testimonial was given to him by the students, in which they thanked him for his urbanity and instructive lectures; and regretted he was not to be their professor. In 1859, however, the chair again became vacant in consequence of Dr. Henfrey's death, and Professor Bentley was appointed to be his successor. Just before this he became lecturer on botany at St. Mary's Hospital, but this and his other botanical lectureships were given up on his joining the staff at King's College. In 1862 he became professor of botany to the London Institution; and in 1863 Dean of the Medical Faculty of King's College, as also a honorary fellow thereof. He is a fellow of several learned societies, and was President of the British Pharmaceutical Congress in 1866 and 1867. He has been long an energetic worker on the Council and Garden Committee of the Royal Botanical Society. His principal separate work is his 'Manual of Botany,' of which a second edition will be shortly published. He was associated with Dr. Farre and Mr. Warrington in editing Pereira's 'Manual of Materia Medica and Therapeutics,' of which also a second edition is nearly ready for publication. This work is an amended abridgment of Dr. Pereira's 'Elements of Materia Medica and Therapeutics,' and Professor Bentley's share in it chiefly relates to the description of organic substances and of the beings from which they were obtained. He has published a work of somewhat similar scope, comprising lectures on the organic materia medica of the 'British Pharmacopœia.' He has also contributed numerous articles to the 'Journal of the Pharmaceutical Society,' mostly upon the plants and plant substances used in pharmacy, and of which a list is given in the Royal Society's 'Catalogue of Scientific Papers.'

BENVENUTI, GIOVANNI BATTISTA, an eminent Italian painter, commonly called L'Ortolano (the Gardener) from the occupation of his father, was a native of Ferrara. The years of his birth and death are alike unknown; the former must, however, have occurred towards the close of the 15th century; the latter probably soon after 1525, in which year he is known to have been painting. Between 1507 and 1513 he was at Bologna, studying the works of Raffaele and Bagnacavallo. According to Lanzi he was compelled to leave Bologna on account of an act of homicide. His manner of painting most resembles that of Garofalo, with whom indeed he is often confounded, as well from the similarity of their names (Garofalo's being Benvenuto Tisio) as of their styles. Several of Benvenuti's altarpieces have been removed to Rome; others are still in the churches of Ferrara. Lanzi makes particular mention of one

which, when he wrote, was in the church of Bondino, near Ferrara, in which are represented the saints Sebastian and Rocco, with Demetrius in military costume, leaning on his sword absorbed in thought. This fine work, which is also eulogised by Scannelli, is now in our National Gallery (No. 669), having been brought from the church of Bondino in 1844.

BÉRANGER, JEAN PIERRE DE [E. C. vol. i. col. 659]. M. Béranger died at Paris on the 16th of July, 1857. The announcement of his death called forth a universal expression of sorrow from his countrymen, and the government of the emperor, in recognition of the general feeling, directed that the interment should be of the most solemn and stately kind, and at the public cost. Shortly after his death appeared the autobiography which it had been long known he was preparing, and to which reference was made in the article above cited (col. 660). It was printed in a single volume entitled 'Ma Biographie,' with an appendix by Paul Boiteau, 8vo, 1858. A posthumous volume of poetry, 'Dernières Chansons de Béranger, de 1834 à 1851, avec une lettre et une préface de l'auteur,' appeared about the same time in one large 8vo volume; it contained 74 new pieces, some of them possessing all the old charm if not quite all the old freshness. The two works were republished under the title of 'Œuvres Posthumes de Béranger,' in two large 8vo vols. with 23 engravings, Paris, 1860. Béranger had completed a revised edition of his works shortly before his decease, 'Œuvres Complètes de Béranger, nouv. éd. revue par l'auteur,' 2 vols. 8vo, with 53 engravings, Paris, 1856—57. The 'Correspondance de Béranger, recueillie par Paul Boiteau,' appeared in 4 vols. 8vo, Paris, 1860. M. Paul Boiteau had already published (1858) a volume on the 'Philosophie et Politique de Béranger.'

BERCHETT, PIERRE, French painter, was born in 1659; studied under Charles de la Fosse, and was employed at Marly. In 1681 he came to England in order to assist another French painter, M. Rambour, then much occupied in decorating the houses of the nobility. He only stayed a year in England; but afterwards came over again, and was engaged for fifteen months in painting the palace of William III. at Loo. On his third visit he decided on settling in England. His paintings which at this time drew most attention were the staircase of the Duke of Schomberg's mansion in Pall Mall, and the ceiling of the chapel of Trinity College, Oxford. The former has been long destroyed, but the latter, a representation of the Ascension, is still brilliant, and divides the admiration of visitors with the exquisite carvings with which Grinling Gibbons adorned the chapel. His health failing, Berchett gave up mural painting, retired to the then rural district of Marylebone, and filled his time with executing small mythological and bacchanalian pieces. He died at Marylebone in January, 1720.

*BEREDNIKOFF, JAKOFF IVANOVICH, an eminent Russian archaeologist, was born in 1802. Having completed the usual studies, and shown a talent for antiquarian pursuits, he was in 1830 entrusted with the arrangement of the materials collected by M. Ströjff during an archaeological journey in Western Russia. The success with which he executed this task caused him to be commissioned to accompany M. Ströjff in a visit of inquiry through Eastern Russia. From this journey he returned laden with a rich treasure of historical documents, of which four volumes, 4to, have been since published under his superintendence as part of a complete collection of the Russian Chronicles. In 1840 he edited and annotated a curious account of the empire written by a priest in the 16th century, under the title of 'Russia under the Czar Alexei Michailowitz.' Berednikoff contributed largely to the great Slavonic Dictionary of the Petersburg Academy, published in 4 vols. 4to, 1847, &c.

BERGENROTH, GUSTAVE ADOLPH, a German architect and writer, was born on February 26th, 1813, at Oletzko, or Marggrabowa, a small town on the Russian boundary of East Prussia, of which his father was chief magistrate. His school education was completed at the University of Königsberg, where he distinguished himself less by progress in studies than as a leader in the sports, and the most accomplished duellist of the university. In 1836 he was appointed auscultator to the Königsberg tribunal; in 1839 refendary in Köslin, in Pomerania; and in 1843 assessor to the court at Cologne. Here he remained till 1845, when he obtained leave to travel, and having made a journey through Italy, returned to Berlin, to fill the post of assessor to the high court. He now busied himself in examining and registering a collection of treaties at the Foreign Office, apparently without any very definite purpose; wrote papers on statistics and commercial economics; and made a rather prolonged stay in France, where he had gone to make

inquiries for the Berlin Board of Statistics. He was, however, in an unsettled state of mind, and on the breaking out of the insurrection in Berlin in March, 1848, he joined the insurgents. On its suppression, he escaped to France, but in March, 1849, was informed that he might return, he having been transferred as assessor from Berlin to the lower court at Wittstock. Refusing to submit to this degradation, he threw up his office; wrote a democratic pamphlet, and became more than ever an object of suspicion to the authorities. Finding that it would be unsafe to remain in Prussia, Bergenroth agreed to proceed to California as agent for a body of his countrymen, to inquire into the practicability of establishing a democratic colony there. He reached San Francisco in September, 1850, knocked about the country in very vagrant fashion for several months, and got back to Bonn towards the end of 1851, only to find that the enthusiasts of the previous year had grown faint-hearted, and that the projected democratic colony was already regarded as a vision. Bergenroth quitted Germany in disgust. For four or five years he wandered about Europe, how employed and how maintained is not very clear, though for a part of the time at least he seems to have acted as tutor in a German family. But recognising the necessity for a fixed occupation, he determined to settle for a while in England with a view to the composition of a history of the Tudor period, as a preliminary to which he sought to make a thorough investigation of the English records. From 1857 to 1860 he accordingly resided in London, steadily prosecuting his inquiries, and occasionally writing a paper in an English or a German periodical. Having, however, by this time, convinced himself that his labours would be incomplete without a like examination of the Spanish records, he in the summer of 1860 proceeded to Spain, armed with the proper introductions, and with some difficulty obtained permission to search the national archives deposited in the Castle of Simancas, "for historical documents concerning the history of England during the reigns of the kings and queens of the House of Tudor." Of the extent of the collections, the difficulty of deciphering the more important despatches, and the obstacles interposed by the ignorance and jealousy of the officials in charge, Mr. Bergenroth gave an interesting account in a series of letters published from time to time in the 'Athenæum,' and which have been reprinted in Mr. Cartwright's Memoir. These letters attracted the notice of the Master of the Rolls, who had already been in quest of a person qualified to compose a Calendar of State Papers in Simancas, relating to English history and, having satisfied himself that Bergenroth possessed the necessary qualifications, he offered him the commission, which Bergenroth gladly accepted. From March, 1861, to the close of his life he laboured incessantly at the accomplishment of what proved to be a task beyond the strength of a single man. Except rapid visits to Madrid, Barcelona, Paris, and London—all connected with his undertaking—the whole of his time was spent in examining and copying the records at Simancas, in deciphering them in his comfortless lodgings, and in calendaring them for publication, and there can be little doubt that the excessive labour in that unhealthy locality undermined his naturally strong constitution, and prepared the way for his premature death. In the autumn of 1868 malignant fever prevailed at Simancas. Bergenroth was taken ill in December, as he thought merely from a cold, but growing worse, he resolved to try the effect of a journey to Madrid. The fatigue increased the malady, which proved to be gastric fever, and he died at Madrid on the 13th of February, 1869.

The results of Mr. Bergenroth's assiduity appeared in three volumes, published under the direction of the Master of the Rolls, entitled 'Calendar of Letters, Despatches, and State Papers, relating to the Negotiations between England and Spain, preserved in the Archives of Simancas, and elsewhere,' 8vo, 1862—68. The first volume contains the Spanish papers of the reign of Henry VII. (from 1485 to 1509); the second volume those of the first sixteen years of the reign of Henry VIII. (1509—25); whilst a supplementary volume includes a mass of information collected from the Simancas and Madrid Archives, relating to the private life of Queen Katharine, the first wife of Henry VIII., and to the projected marriage of Henry VII. with Queen Juana, widow of Philip of Castile, and mother of the Emperor Charles V. Of the immense value of these documents in the hands of a competent and well disciplined historical student there can be no question, and Mr. Bergenroth deserves all honour for the zeal and industry with which he rendered them available. But, as was not unnatural in a discoverer, he overrated their value, or rather perhaps took

an undue estimate of their quality. Naturally of an impetuous temperament, and unaccustomed to a judicial consideration of evidence and the bearings of great historical questions, he seemed to have almost persuaded himself that all modern history ought to be re-written by the light of secret despatches. Alike in reference to the course of public occurrences, and to the conduct and character of individuals, he appeared to be willing to throw aside as worthless the broad accepted verdict of historians and the general voice of contemporaries and countrymen, in order to adopt the statements and opinions of men ignorant for the most part alike of the people, the language, and the customs of the country respecting which they wrote; men who dwelt in an atmosphere of deceit, receiving their information from dissatisfied persons who played on their credulity; from rumour and gossip they or their servants picked up in conversation and commonly misunderstood; often either directly, or through agents, from astute ministers who knew what they were seeking after, and took care to furnish that which would most effectually mislead them: whilst the writers of the despatches, there can be little doubt, were more anxious to send what should satisfy their employers, or further their own purposes, than to state the simple truth. In the documents themselves Bergenroth has given simply what he found, though in some instances, from the haste with which he worked, or from an imperfect acquaintance with the subject, he may possibly have misunderstood and unintentionally misrendered. It is in the Introductions to the several volumes that he has enunciated his peculiar views. The more novel and startling of these—especially those relating to the private character of Queen Katharine; the denial of the reputed insanity of Queen Juana and the account of the cruelties inflicted on her at the instance of her father and her son; and the judicial murder of Don Carlos by his father—have been vigorously opposed by foreign as well as English scholars, and will be accepted by no one probably without further inquiry; but respecting less prominent personages and events the novel views set forth in these volumes may possibly for a while somewhat colour the statements of historians and biographers. But though Bergenroth put forth his views with unusual emphasis, he was always ready to retract them when satisfied that they were erroneous. The supplementary volume was published to refute the opinions he had published in the two previous volumes, and as new documents came to light new supplements would have been required to correct or to contradict what now seemed to him irrefragable. We cannot profess to regret that Mr. Bergenroth did not write either of the histories he contemplated. The discoveries he made at Simancas early caused him to dismiss his purpose of writing a history of the Tudors as too narrow, and to resolve to write instead "that of Charles V., as a subject of truly comprehensive range, embracing naturally a cosmopolitan survey of the politics of Europe." But like its predecessor, it was never written, perhaps never really commenced. His literary monument is the Calendar, and, after all abatements are made, it is a worthy one.

(Cartwright, *Gustave Bergenroth: a Memorial Sketch.*)

BERGERAC, SAVINIEN CYRANO DE, a witty French writer of the 17th century, was born about the year 1620, at the Château de Bergerac, Périgord. After an irregular course of study, under a poor country priest, he went to Paris, and entered as cadet in the regiment of Guards. He acquired a reputation for reckless bravery, fought many duels, acted as second in many more, and challenged any one who watched too closely a deformity which affected his nose. He received two severe wounds in war, and retired from the army. Deciding upon the cultivation of letters, he entered the service of the Duc d'Arpajon, after declining that of the Maréchal de Gassion. In a tragedy written by him, called 'Agrippina,' he placed in the mouth of one of the characters, Sejan, sentiments which brought upon the author a suspicion of atheism—one being to the effect that men are not made by gods, but gods by men, from the blood of burnt offerings. He wrote a comedy in prose, 'Le Pédant Joué,' in which a peasant speaks in his own jargon or country patois: Molière is believed to have derived some of his ideas from this work. Two other works by Bergerac, 'Voyage dans la Lune,' and 'l'Histoire Comique des États et Empires du Soleil,' in like manner furnished hints to later writers—Fontenelle, in the 'Pluralité des Mondes,' Voltaire in 'Micromégas,' and Swift in 'Gulliver's Travels.' Boileau also expressed a kind of relish for Bergerac's burlesque audacities. Amid the extravagance of these two works, Bergerac nevertheless exhibited a pretty good acquaintance with the philosophy of Descartes. He died in 1666. His works were published in Paris, 1677; Amsterdam,

Paris, and Trévoux, 1699, 2 vols. 12mo; and Paris, 1741, 3 vols. 12mo.

* BERKELEY, REV. MILES JOSEPH, a botanist who has acquired a considerable reputation for his knowledge of the lower forms of plant life, more especially the mosses, mushrooms, and other cryptogams. He was born at Oundle in 1803, and after going through the ordinary course of education at Rugby and at Christ's College, Cambridge, which terminated in his graduation in 1825, he became a curate at Margate. In 1833 he was appointed incumbent of two small parishes near Wansford, Northamptonshire, and also a rural dean. He is a fellow of the Linnæan Society, and a member of several foreign scientific bodies. Judging from his works, he seems to have discharged his clerical duties most assiduously, and to have occupied his leisure time in studying those subjects which could be pursued without staying much from his home. His earliest papers, for instance, which were published from 1828 to 1834, relate to various annelids and mollusks which were found at or near Margate; while his work entitled 'Gleanings of British Algae,' 1833, was to a certain extent the consequence of his seaside residence, and at the same time the forerunner of a series of works in the same branch of natural history. There is, however, one paper of this period which is an exception to the above remarks, viz., that entitled 'Observations upon the *Dentalium tubulatum* of Deshayes,' published in the 'Zoological Journal,' vol. v.; in which he indicated that the species lived both off Ireland and near Madeira, and really belonged to the annelidan genus *Ditrupa*, not to the molluscan genus *Dentalium* [DITRUPA, E. O., NAT. HIST. DIV., vol. ii. col. 364]. In 1836 he announced the discovery of *Dreissena polymorpha* in Northamptonshire; but after this date all his papers relate to cryptogams; and are for the most part descriptive of those of his district, of those which were sent to him from other parts of the British Isles and of the world, and of those which he could examine in the Hookerian, British Museum, and other herbaria. These were published in Jardine's 'Magazine of Zoology and Botany,' 'Annals of Natural History,' Hooker's 'Journal of Botany,' Hooker's 'London Journal of Botany,' 'Transactions of the Linnæan Society,' 'Journal of the Horticultural Society,' 'Gardener's Chronicle,' and 'Intellectual Observer.' He has given attention to the fungoid growths which occur in various diseased culinary vegetables, such as the potato, onion, cabbage, as also in the pear, vine, and hop. He has written several separate publications, the most noteworthy of which are his 'Introduction to Cryptogamic Botany,' which is a standard work; the 'Outlines of British Fungology,' and the 'Handbook of British Mosses.' He also contributed most of the articles on cryptogams in Lindley and Moore's 'Treasury of Botany,' 1866.

BERLIOZ, HECTOR, [E. C. vol. i. col. 668]. After the publication of the memoir of M. Berlioz, in the E. C., he produced two operas, 'Beatrice et Benedick,' 1862, and 'Les Troyens à Carthage,' 1864, which failed at Paris, but was successful at Moscow. He also published some more of his musical criticisms, under the title of 'Les Grotesques de la Musique,' 1859, and 'A Travers Chant,' 1862. He died on the 11th of March, 1869.

* BERNARD, CLAUDE, an eminent French physiologist, was born July 12th, 1813, at St. Julien, near Villafraanche, Rhone Department. His early medical education was received in the Parisian hospitals, and in the course of it he became Magendie's assistant or prosecutor in 1841, doctor of medicine in 1843, and doctor of science in 1853. In 1847, he was appointed assistant professor to Magendie; in 1854, he was called to the chair of general physiology, which was then founded by the Faculty of Science of Paris, and, also in this year, he was elected to succeed Roux in the Academy of Science. In 1855, he succeeded Magendie as professor of experimental physiology in the College of France. In 1861, he was elected a member of the Academy of Medicine, and in 1862, an officer of the Legion of Honour.

Associated with Magendie for upwards of ten years, he has been thoroughly imbued with the same principles of action and method of working, and may be considered to be carrying on the work which his master left unfinished. In his opening address, in 1854, he insists upon the necessity of the experimental method of inquiry in collecting physiological facts, and of testing the value of every statement and conclusion, which has been arrived at by pure reasoning, by a direct appeal to nature. The experimental method did not originate with Magendie and Bernard, but before their time it was rarely resorted to by physiologists, while mainly in consequence of their exertions, it has become generally employed. The advantage of

the method is abundantly manifested in the works of Bernard, which contain many original views and discoveries, but although these are of the highest importance, perhaps the benefits he has conferred upon physiology have arisen, not so much from his enunciation of them, as from the impetus he has given to the science by showing the best way of collecting and testing facts.

He has been a diligent writer, as will be seen from the list of his papers in the Royal Society's 'Catalogue of Scientific Papers,' which numbers sixty-five items, the first being dated 1843, and the last 1862; so that on the average he writes about three papers every year. In addition he has written several separate works, and as these embody most of the facts he has published in the scientific journals, we shall refer mainly to them in the following summary of his principal discoveries. His first important separate work is a 'Précis iconographique de Médecine opératoire et d'Anatomie chirurgicale,' which was written in conjunction with M. Huet. The publication commenced in 1846, and spread over several subsequent years. American and German editions of this work have also appeared. In 1855 was published the first volume of his 'Leçons de Physiologie expérimentale appliquée à la Médecine.' It contains the course of lectures he had delivered in 1854, and is the first of a long series of volumes which comprise the lectures of subsequent courses. It is a most elaborate treatise on sugar considered in its physiological aspect. At one time it was believed that starch and sugar were found in plants only, but Dr. Schmidt demonstrated the presence of the former in some animals; and in 1848, Bernard ascertained that sugar is found in animals; in 1850 he demonstrated that it was generated in the liver, not derived from the plant tissue; and in papers published in subsequent years, he has thrown new light on the subject. Sugar is found in animals belonging to all the orders, and is about equally abundant in those which feed on vegetables as in those whose diet is exclusively flesh. Experiment showed that its formation persisted in man and herbivores even when food containing no sugar or starch was resorted to; that it is formed most abundantly just after ingestion, gradually decreasing for some hours, when the bile flows in full stream, the secretion of the two substances alternating with each other; that in the period of diminished action the blood flowing to the liver is wholly devoid of sugar, while that which flows from it contains it in considerable quantities; that the proportion gradually diminishes in the passage of the blood towards the lungs where it entirely disappears. When, however, the formation of sugar is going on most rapidly, and more especially when the maximum rate is abnormally great, the sugar passes through the lungs into various other tissues, and into the urine, forming one of the symptoms of a diabetic constitution. In diabetes the lungs and skin are nearly always out of order, and hence the lungs cannot consume the sugar so rapidly as formed, while the extra activity of the circulation of certain liquids carries the sugar more rapidly through the body. Connected with this subject may be mentioned Bernard's discovery of glycogen or animal starch, although this did not occur until about 1858. Having experimentally ascertained that when a liver had been thoroughly cleansed with water, and was again filled by injection, a fresh supply of sugar was obtained, this fact indicated that the sugar was capable of being formed independently of life, and that it was probably formed from the metamorphosis of some substance pre-existing in the tissue. On searching he found (almost simultaneously with Hensen and Pavy,) glycogen, a substance having the same chemical composition as starch, but differing from it in its physical properties. This substance is constantly present in the liver in considerable quantities, and according to Bernard and others, is transformed into sugar. In the development of animals the formation of glycogen precedes that of sugar. Thus, in very young fetuses glycogen is abundant, while sugar first appears at a more advanced stage of intra-uterine life; in the case of the calf, not before the fourth month. The transformation is effected, or at any rate influenced, through the agency of certain nerves; for Bernard brought about so abundant a generation of sugar as to induce a temporary attack of artificial diabetes by pricking the floor of the fourth ventricle; and he suddenly checked its production by dividing the spinal cord just below the origin of the phrenic nerves. In 1859 he detected the presence of glycogen in the placenta.

In the second volume of the work above cited he treats of the salivary glands and of the pancreas. His investigations on the salivary glands is an admirable example of how experimental physiology supplements physiological anatomy. These glands

present two types of structure in animals; but in the same individual all are structurally identical. Experiment shows that there are three quite distinct salivary organs, one for gustation, one for mastication, and one for deglutition, and that the saliva from each has its own special characters. Hence it seems that identity of structure does not necessarily imply identity of function. His principal discovery in connection with the pancreas is, that it is the essential, though not sole, organ for digesting fatty bodies, and that it aids in the conversion of albumen into peptone like bodies. His 'Mémoire sur le Pancréas, etc.,' 1856, excited much attention at the time, and established his reputation as a sound physiologist more than anything he had previously written. In the same year his 'Mémoire sur la Chaleur Animale' was published.

In 1857 appeared his 'Leçons sur les Effets des Substances Toxiques,' in which he treats of oxygen, carbonic oxide, and other poisonous gases; as also of curare, the poison of the viper, strychnia, and nicotine. His 'Leçons sur la Physiologie et le Pathologie du Système Nerveux,' 2 vols., 1858, is an excellent work of its kind, but does not call for special comment here. In the following year we have, 'Leçons sur les Propriétés Physiologiques et les Altérations Pathologiques de Liquides de l'Organisme,' in two volumes. The first volume, comprising upwards of 500 pages, is devoted entirely to the blood, of which it is an almost exhaustive monograph. The second volume is devoted to the urine, sweat, bile, saliva, as well as to the pancreatic and gastric juices. In 1865 was published the 'Introduction à l'Étude de la Médecine Expérimentale,' in which he gives a full account of the method of experimental inquiry, more especially as it concerns animal functions. He points out that the conditions prevailing in a living animal modify or mask the effects produced by substances on each other when in atmospheric air; and that this is so not on account of any vital principle, but because the conditions (essentially physical in nature) are not the same. For instance, when he injected the yellow prussiate of potash and an iron salt by separate veins so as to insure their meeting in the blood, and out of contact with air, no Prussian blue is formed; but as soon as the substances find their way into the bladder or the stomach, the combination takes place. This was followed by the 'Principes de Médecine Expérimentale,' 2 vols. 8vo, 1866.

BERNARD, SIR THOMAS, the originator of a large number of philanthropic institutions, was born at Lincoln, on the 27th of April, 1750. He received a collegiate education at Harvard University, his father being, at the time, governor of one of the New England settlements; and during the later portion of his stay in America, he acted as private secretary to his father. Returning to England in 1769, the father was made a baronet as Sir Francis Bernard, in recognition of his services. After some years' study of the law, Mr. Thomas Bernard became, in 1780, one of the benchers of the Middle Temple. Practising as a conveyancer, he realised a competency in about fifteen years, and devoted the remaining twenty-three years of his life to benevolent pursuits. In 1795, when treasurer of the Foundling Hospital, he introduced Count Rumford's plan of warming and ventilating, by which he lessened the expenses and increased the comfort and healthiness of that establishment. He was next instrumental in causing similar improvements to be introduced into Marylebone Workhouse. In 1796, he published the outlines of a plan for a 'Society for bettering the condition and increasing the comforts of the Poor.' Adopting the golden maxim, that "If the manner in which relief is given is not a spur to industry, it becomes in effect a premium to sloth and profligacy," he drew up the scheme accordingly. The objects were—to collect information concerning the poor; to circulate printed reports on this subject throughout the kingdom; to facilitate the admission of children into useful occupations; and to apply new inventions and discoveries to the benefit of the poor, in regard to dwellings, gardens, fuel, cooking, furniture, &c. These tracts, or reports, which began to be issued in 1797, wrought many good effects. As chairman of Petty Sessions, at Stoke, in Bucks, Mr. Bernard wrote and published concise useful instructions for the guidance of overseers and poor law officials, and improved in many ways the workhouse at Iwer. About the same time he introduced the Rumford system of warming at Christ's Hospital; and published a tract on the frugal use of garden allotments. In 1798, he encouraged great improvements in the Foundling Hospital at Dublin; established temporary soup-houses in various places during a time of scarcity; and aided the founding of various provincial societies for bettering the condition of the poor. In 1799, he was instrumental in

forming the Royal Institution; in 1800, the School for the Indigent Blind, a society for the protection of climbing boys or chimney sweepers, and a free church in the purlieus of Seven Dials; in 1802, city missions and district visiting societies; soon after this, the Cancer Institution, the Fever Institution, and the Jennerian or Small Pox Institution; and the passing of an Act for the protection of children in cotton and woollen mills. In 1805, he took part in the founding of the British Institution, the Naval and Military Bible Society, the Patriotic Fund, and the African Institution. Among other useful projects of his, was the establishing of the Alfred Club in 1809, distinct alike from the drinking clubs, gambling clubs, and party clubs; the furtherance of Dr. Bell's national system of education; the relief of the poor in the manufacturing districts, in 1812; the increased supply of fish to busy towns, in 1813; and the lessening of the salt duties, in 1816. Mr. Bernard (who became Sir Thomas Bernard on the death of his father in 1810) closed his honourable and useful life on the 1st of July, 1819. Sir Thomas Bernard was the author of 'The Comforts of Old Age,' a work which ran through several editions, and of a valuable work on salt duties. His labours in getting up evidence and arguments to lay before a committee of the House of Commons, appointed to consider these duties, with a view to their repeal, is said to have brought on the illness which proved fatal. He also edited 'The Political Life of William Wildman, Viscount Barrington,' for his friend Shute Barrington, Bishop of Durham, whose name it bears. A memoir of him, by the Rev. James Baker, was published in 1819.

BERNARDES, DIOGO, an eminent Portuguese poet, called by his countrymen "the prince of pastoral poets," was born at Ponte de Barca, in the second quarter of the 16th century. He was the friend of the poet Caminha, the disciple of Ferreira, the Horace of Portugal, and an imitator, as some affirmed, a plagiarist, of Camoens. He was secretary to Pedro de Alcaçova Carneiro, in his embassy to the court of Spain. Afterwards he accompanied King Sebastian in his Quixotic expedition into Africa, and was made prisoner at the battle of Alcacer, at which Sebastian was killed. Bernardes, after a time, recovered his liberty, and returned to Lisbon, where, in the enjoyment of a pension granted him at the instance of Cardinal Albert of Austria, he continued to reside till his death, in 1596. Bernardes' poems have the collective title of 'O Lymas,' from the river which he celebrated, and by which most of them were composed. They are mainly pastoral; very melodious in versification, but full of conceits, beyond the toleration of a more northern taste. By his countrymen he is, however, still held in high esteem. The following are the principal editions of his works. 'Varias rimas ao bom Jesus e a Virgem gloriosa, sua Mãe, e Santos particulares,' 4to, Lisbon, 1594; 'O Lyma; em o qual se contem as suas Eglogas, e Cartas,' 4to, Lisbon, 1596; and 'Flores do Lyma,' 8vo, Lisbon, 1597.

BERND, CHRISTIAN SAMUEL THEODOR, a learned German writer on heraldry, was born at Meseritz, April 12th, 1775; passed from the Gotha Gymnasium to the University of Jena; became tutor in a family, but pursued his philological studies, and produced, with Campe, a 'Wörterbuch der Deutschen Sprache'; went to Brunswick in 1811 as assistant in the library; in 1813, was appointed teacher in the Gymnasium at Posen; in 1818, was nominated secretary to the newly founded University of Bonn; and in 1822, professor of diplomatics, sphragistics, and heraldry. He died on the 14th of September, 1854. Besides a large number of papers in reviews and journals, Bernd wrote several philological works, including an essay on the Posen dialect of the German language, 'Die deutsche Sprache im Grossherzogthum Posen,' Bonn, 1820; on the affinities of the Slavonic and German languages, 'Der Verwandtschaft der slavischen und germanischen Sprachen,' Bonn, 1822; a work that was followed some time afterwards by an essay on the double forms of German verbs, 'Die doppelformigen Zeitwörter der deutschen Sprache,' Aachen, 1837. His first publication on the subject with which his name is now chiefly associated, was one on the general knowledge of inscriptions in heraldry, 'Allgemeine Schriftenkunde der gesammten Wappenwissenschaft,' 3 vols. Bonn, 1830—35; with supplement, 1841; the heraldry of the Prussian Rhine province, 'Wappenbuch der preussischen Rheinprovinz,' 2 vols. 1835; with a supplement, 1842; the chief points of the science of heraldry, 'Die Hauptstücke der Wappenwissenschaft,' the most generally valuable of all Bernd's writings, 2 vols. Bonn, 1841—49; and a handbook of heraldry, 'Handbuch der Wappenwissenschaft,' also a very useful work, Leipzig, 1856.

BERNOULLI, CHRISTOPH, belonging to the remarkable

family of that name [E. C. vol. vi. col. 972], and himself a distinguished authority on economical and technical science, was born at Basel on the 15th of May, 1782. After studying under his father, Daniel Bernoulli, who was professor of elocution in that city, he went to the French college at Neuchâtel to finish his education. He soon afterwards filled a municipal office at Lucerne in 1799, and then one at Basel. After prosecuting a course of study in the natural sciences in 1801, he became in 1802 titular professor at the primary school of Halle. He travelled in Prussia and in France; and on his return opened a school at Basel in 1806, which he maintained for eleven years. In 1817 he accepted the appointment with which his services are chiefly associated—that of professor of natural history in the university of Basel. As a writer he raised technology to the rank of a science by improved methods of treatment. The following are the principal works from his pen:—An essay on the light of the sea, 'Über das Leuchten des Meers,' Göttingen, 1802; 'Physische Anthropologie,' 2 vols. Halle, 1804; introductions to physics and mineralogy, 'Leitfaden für Physik,' and 'Leitfaden für Mineralogie,' Halle, 1811; on the injurious influence of trade guilds on industry, 'Über den nachtheiligen Einfluss der Zunftverfassung auf die Industrie,' Basel, 1822; first principles in the theory of the steam-engine, 'Anfangsgründe der Dampfmaschinenlehre,' 1824; observations on the cotton manufacture, 'Betrachtungen über die Baumwollen Fabrikation,' 1825; 'Handbuch der Technologie,' 2 vols. 1833—34, 2nd edition, 1840; 'Handbuch der Dampfmaschinenlehre,' Stuttgart, 1833, 2nd edition 1847; 'Handbuch der industriellen Physik, Mechanik, und Hydraulik,' 2 vols. Stuttgart, 1834—36; a history of the English cotton manufacture (based on Baines), 'Geschichte des britannischen Baumwollen Fabrikation,' Stutt. 1836; 'Handbuch des Populationistik,' Ulm, 1840; 'Technologische Handencyclopädie,' Stutt. 1850. Bernoulli, who also edited several volumes of Swiss official statistics, died at Basel on the 6th of February, 1863, having resigned his professorship two years before.

BERNSTEIN, GEORG HEINRICH, a distinguished German Orientalist, was born at Kospeda, near Jena, on the 12th of January, 1783. The son of a Protestant clergyman, he was educated at the Orphan House, Halle, and studied theology and the Oriental languages at the University, Jena, where he was admitted professor in 1810. He afterwards went to Göttingen and Leipzig Universities, where he read courses of lectures on language, and then became adjunct professor at Berlin. For a couple of years, 1813—14, his studies were interrupted by the war, during which he served in the volunteer cavalry. Peace proclaimed, he taught for a time at Jena; then proceeded, aided by the Prussian Government, to Leyden, Oxford, Cambridge, and London, to make collections for a Syriac Lexicon, and whilst in London he entered upon the study of Sanskrit. On his return to Berlin in 1819 he was appointed professor of the oriental languages, and the duties of his office, the investigation of his special department of philology, the preparation of a great Syriac lexicon, which, however, he did not live to complete, the writing of occasional papers, diversified only by journeys to explore the libraries of Italy, and by a second visit to Oxford, amply occupied the remainder of his life. He died on the 7th of April, 1860. His principal works are 'De Initii et Originibus Religionum in Oriente dispersarum,' 8vo, Berlin, 1817; 'Arabische Grammatik und Chrestomathie,' Göttingen, 1817; a dissertation on some recent translations of the New Testament; editions of the 'Hitopadasha' in Sanskrit; of some Arab texts; the Syriac vocabularies 'Bar-Bahleel' (1842); 'Gregorii Bar-Hebraei Chronici Syriaci' (1846); and numerous papers in journals, or contributed to the learned societies of Germany. A work on which he expended much labour was G. W. Kirsch's 'Chrestomathia Syriaca cum Lexico,' 2 vols. 8vo, Leipzig, 1832—41, the lexicon being mainly Bernstein's work; his own great Syriac lexicon, as we have said, he did not live to finish.

BERRY, CAROLINE-FERDINAND-LOUIS, DUCHESSE DE [E. C. vol. i. col. 675]. The Duchesse de Berry died of paralysis of the brain on Sunday, the 17th of April, 1870, at her residence in Upper Styria, where she had lived in privacy since the death of her husband in 1864.

BERRY, MARY AND AGNES, known from their long and close friendship with Horace Walpole, were born at Kirkbridge, Yorkshire, Mary on the 16th of March, 1763, Agnes on the 29th of May, 1794. Their father, a member of a wealthy Scotch family, was disappointed in the inheritance he expected, and being of an indolent, unsettled disposition, was for some time in straitened circumstances, but a younger brother to whom the

bulk of the property was bequeathed settled on him an annuity of 1000*l.*, and he was enabled to give his daughters an elegant education and carry them into society, where, being accomplished and of attractive manners, they were much noticed. From May, 1783, to June, 1785, they travelled about Holland, Germany, Italy, and France, and the Diary of Miss Berry gives evidence of an unusually observant, intelligent, and appreciative spirit. In the autumn of 1788 they first made the acquaintance of Horace Walpole. No longer young, he was yet fascinated by the elder sister almost at first. He had heard of their cleverness, and the first night he met them he would not venture near, as he "concluded they would be all pretension." But, he writes, "the second time, in a very small company, I sat next to Mary, and found her an angel, both inside and out." In the same letter (of Oct. 11, 1788, apparently only a few days after the meeting) he says, "They are the best informed and the most perfect creatures I ever saw at their age. They are exceedingly sensible, entirely natural and unaffected, frank, and being qualified to talk on any subject, nothing is so easy and agreeable as their conversation, nor more apposite than their answers and observations. The eldest, I discovered by chance, understands Latin, and is a perfect Frenchwoman in her language. The younger draws charmingly. . . . They are of pleasing figures," and so forth. The acquaintance thus happily commenced soon ripened into friendship. The father took a cottage at Kew, and henceforth they were never long separated. The old wit after a time became almost wholly dependent upon them for his happiness. When they were absent from him, as frequently happened, on the Continent, visiting friends in the country, or when by his removal into London, they were separated though but for a few days, he kept up a constant stream of letters, filled with news, gossip, anecdotes, criticism, which coming at a time when the correspondence with his older friends had slackened, are not only full of interest and charm for the matter and style, but will be invaluable for the historian and student of the period. It was for the amusement of the Miss Berrys, too, that Walpole first narrated and afterwards wrote his caustic 'Reminiscences of the Courts of George the First and Second.' In 1791 Walpole was able to offer his friends Little Strawberry Hill (or as he called it Cliveden, it having been Mrs. Catherine Clive's dwelling), and thus secure their residence near him. When by the death of his nephew he became Lord Orford, he is understood to have made her the more important offer of his hand, but feeling the possibility of misconstruction of her motives if she accepted it, she gave a firm refusal, and he acquiesced in the propriety of her decision. Their friendship and intimacy continued unabated till his death, when he left the sisters his unpublished MSS. and made them a modest provision. Both the Miss Berrys survived to an unusual age. During their latter years their house in Curzon-street was the favourite resort of all shades of distinguished persons who had acquired the right of *entrée*, happy in the opportunity of conversing with ladies who to unvarying cheerfulness and good nature added a singular charm of manners; one of whom, "born in the third year after the accession of George III. lived to be privately presented to Queen Victoria," and who had both "lived constantly in society both at home and abroad; had seen Marie Antoinette in all her pride and beauty, and lived to regret the fall of Louis Philippe, for whose prudence and ability Miss Berry had for many years conceived a high respect, and with whom she was personally acquainted," and who, in consequence of their great age and unusual opportunities, were the possessors of an unfailing store of anecdotes and reminiscences. Agnes Berry died on the 29th of January, 1852; Mary followed her on the 20th of September in the same year: they were interred in the same grave in Petersham church-yard.

Mary Berry was the real editor of the MSS. bequeathed by Horace Walpole to Mr. Berry and his daughters, and published, ostensibly under the editorship of Mr. Berry, in 5 vols. 4to, 1798. In 1802 a comedy in five acts, written by her, was brought out at Drury Lane Theatre, but it was only performed three nights: it was afterwards published in her works, with her own explanation of the cause of its failure on the stage. In 1810 she edited the 'Letters of Madame du Deffand' (4 vols. 12mo), bequeathed to Walpole, and prefixed to them a remarkably well written preface. Her next publication was the 'Letters of Lady Rachel Russell,' selected from the originals in the possession of the Duke of Devonshire, to which she added a brief but excellent memoir of Lady Russell. Her most elaborate original work appeared under the title of 'A Comparative View of the Social Life of England and France, from the Restoration of Charles II. to the Present Time,' in 2 vols. 8vo, 1828—31, a

book more praised than read, but which will still repay the perusal. Walpole's 'Letters, addressed to the Misses Berry,' were first published in Bentley's 'Collected Edition of the Letters of Horace Walpole, Earl of Orford,' with a preface by Miss Berry, which is a spirited defence of Walpole against the severe criticism of Macaulay contained in his famous article in the 'Edinburgh Review' on Walpole's 'Letters to Sir Horace Mann,' and reprinted in his 'Works.' A complete edition of Miss Berry's printed works appeared in 1844; but she will be longest remembered by Walpole's letters to her and by 'Extracts of the Journals and Correspondence of Miss Berry from the year 1783 to 1852,' in 3 vols. 8vo, London, 1865, 2nd ed., 1866, a work of exceeding interest and value, very gracefully edited by Lady Theresa Lewis.

BERRYER, PIERRE-ANTOINE [E. C. vol. i. col. 676]. For a dozen years after the *coup d'état* of December, 1851, M. Berryer refrained from taking any ostensible part in political affairs. He was known to have lent his best services in endeavouring to bring about a formal reconciliation and arrangement between the two branches of the House of Bourbon; but the first public announcement of his willingness again to share in political discussions was the offering himself as a candidate along with M. Thiers for the representation of Bouches-du-Rhône in the Corps Législatif at the election of 1863. From this time he was constant in his attendance in the Legislative Chamber, and rendered important aid to the opposition. He was no longer physically capable of those remarkable displays which had secured for him the reputation of being the greatest living orator of France; but his breadth of view and clearness of expression, vigour, brilliancy, and occasional withering sarcasm, were always effective. His last great legal orations, that in defence of M. de Montalembert in 1858, and those in the action of M. Patterson against the ex-King Jerome Bonaparte, 1860—61, were amongst the most eloquent and effective he ever delivered. In the autumn of 1865 M. Berryer paid a visit to England, where he received the almost unexampled compliment of an invitation to a dinner given in his honour, in the name of the English bar, by the Benchers of the Temple and of Lincoln's Inn. A like honour awaited him from the bars of Besançon and Bordeaux on his return to France. Three or four days before his death, M. Berryer, feeling that his end was approaching, begged to be carried to his villa of Argenville, as he was unwilling to die in Paris. His request was complied with, and, surrounded by his family, he died at Argenville, on the morning of the 29th of November, 1868.

BERTANI, GIOVANNI BATTISTA, Italian painter and architect, was born about 1568, at Mantua; and was a scholar of Giulio Romano, whom he accompanied to Rome. On the death of Giulio, Bertani was made head of the Academy at Mantua, and became a marked favourite with the Duke Vincenzo, who employed him in painting several of the apartments of his palace, and in other ways. In executing these commissions, Bertani trusted much to scholars and assistants, at the head of whom was his brother Domenico: Giovanni made the designs, but seldom touched the pencils. Besides the palace, Bertani painted in this way a Martyrdom of St. Agatha, and many other pieces for churches in Mantua. He also found employment as an architect. The church of St. Barbara, the Carmelite convent, his own house, and other buildings, remain in attestation of his skill. Bertani wrote 'Gli oscuri e difficili parti dell' opera Ionica di Vitruvio, di latino in volgari tradotti,' fol. Mantua, 1558.

BERTHAULT, LOUIS, French architect and landscape gardener, was born at Paris about 1771, and learnt his profession under an uncle. He was well employed as an architect, but his celebrity is due to his having been the most successful designer of what was called "les jardins Anglais," and the founder of the present style of French garden arrangement. For the Empress Josephine, he laid out the gardens at Malmaison, which were exceedingly admired. Napoleon I. made him architect of Compiègne, where he restored the palace with much elegance. The Emperor also commissioned him to design a large and costly palace and grounds at Rome, as a royal residence for his son, but the design remained unaccomplished. The embellishments made around some of the ancient monuments, by order of Pius VII., were the only works carried out at Rome from his designs. Many of the finest gardens in France were designed or remodelled by Berthault, among others those of Pontchartain, Château-Margaux, Saint-Leu, Arminvilliers, Raincy, Baille, Condé, &c. M. Berthault died in August, 1823.

* **BERTHIER, JEAN FERDINAND**, one among the few deaf and dumb persons who have acquired distinction as teachers, and who have written excellent books for the benefit of their fellow-sufferers, was born about the year 1805, and for several years has been professor in the Institution des Sourds-Muets, at Paris. M. Berthier has especially endeavoured to elucidate and extend the methods of teaching deaf-mutes devised by the Abbé de l'Épée and the Abbé Sicard. In 1823, in the names of himself and other inmates of the institution, he produced 'Adieux gesticulés,' on the tomb of Sicard. In 1839 appeared his 'Notice sur la vie et les Ouvrages d'Auguste Bebian, Censeur des Etudes à l'Institut des Sourds-Muets.' His treatise 'Les Sourds-Muets avant et depuis l'Abbé de l'Épée,' Paris, 1840, obtained for him the gold medal of the Society of Moral Sciences of Seine-et-Oise. Berthier's next work was 'L'Abbé de l'Épée, sa vie, son apostolat, ses travaux, sa lutte, et ses procès, avec l'histoire des Monuments élevés à sa Mémoire,' 8vo, Paris, 1840. Some years later he addressed to the Academy of Medicine, and to that of the Moral and Political Sciences, a refutation of certain opinions expressed by the late Dr. Itard, 'Sur l'Opinion de feu le Docteur Itard, relative aux facultés intellectuelles et aux qualités morales des Sourds-Muets,' 8vo, Paris, 1852. In 1853 he published 'Observations sur la Mimique considérée dans les rapports avec l'enseignement des Sourds-Muets.' M. Berthier received the decoration of the Legion of Honour in 1849.

BERTHIER, PIERRE, mineralogist and metallurgist, was born on July 3, 1782, at Nemours, in the department of Seine-et-Marne. His early education was received at the École Polytechnique and was completed in the Corps des Mines, which he joined in 1801. In 1816 he was appointed professor of assaying in the School of Mines, at Paris, which post, as also an inspector-generalship of mines, he retained till 1845. He was elected member of the Academy in 1827, and died in August, 1861. His best known work is his 'Traité des Essais par la voie sèche ou des propriétés de la composition et l'essai des substances métalliques et des combustibles,' 2 vols, 1833. He has also written upwards of one hundred papers in scientific journals, principally in the 'Journal de Mines,' and its continuation the 'Annales des Mines,' and the 'Annales de Chimie.' A full list of them will be found in the Royal Society's 'Catalogue of Scientific Papers.'

BERTHOLD, ARNOLD ADOLF, zoologist and physiologist, was born Feb. 26, 1803, at Soest, in Westphalia, and was connected for the greater portion of his life with the university of Göttingen. It was there he passed through his course of medical study, and from it he received his degree of doctor when only twenty-one years of age. A few months were then spent in extending his knowledge by visiting the medical educational institutions at Berlin and Paris. In 1825 he settled down at Göttingen, where he was occupied for several years in practising his profession. From the last-mentioned date onwards he was also engaged in lecturing on zoology, physiology, and comparative anatomy; first as an occasional substitute for the ordinary professor; then as assistant; and after 1836 as professor. He died on January 3, 1861. His writings comprise about fifty papers contributed to Oken's 'Isis,' 'Nova Acta Acad. Cæs. Leopold. Nat. Cur.,' 'Müller's Archiv,' the 'Abhandlungen' of the Royal Scientific Society of Göttingen; the 'Nachrichten' issued by this society in conjunction with the university; and one or two other periodicals. These in their various ways added to the current stock of knowledge, but none possesses any special mark of merit. The more important are those on the anatomy of rabbits and hares ('Einleitung in die Zergliederung des Hasen und des Caninchens,' Isis for 1825; on *Gordius aquaticus* in vol. i. of the Göttingen 'Abhandlungen'; on new or little known reptiles in vols. i. and iii. of the same work; and on the duration of pregnancy in various animals, but chiefly the human species, in vol. ii. The other subjects on which he has written are the anatomy of *Picus viridis*; the skull of the otter; the structure and growth of eggs; the anatomy of *Apus cancriformis*; the nerves of *Mollusca*; hybernation; on the occurrence of living reptiles in the human body; on the dentition of the narwhal; and several more. He is best known by his 'Lehrbuch der Zoologie,' 1st edition, 1829; 2nd edition, 1837; and his 'Lehrbuch der Physiologie des Menschen und der Thiere,' 1845, which were at one time much used as class-books in some parts of Germany.

BERTHOLD VON REGENSBURG, one of the greatest preachers of the middle ages, who exercised on the 13th century the same kind of influence as St. Bernard had exercised on the 12th, was born at Regensburg, or Ratisbon, in Bavaria, in some

unascertained year between 1210 and 1220. He became a minor friar of the order of St. Francis, and entered upon his career as a preacher in 1250. He itinerated in various parts of Austria, Moravia, Thuringia, and Bohemia, preaching in the open air, in the fields, and in the woods, to congregations which are said to have frequently ranged from 60,000 to 100,000 in number. He died on the 13th of December, 1272, and was buried in a church attached to a house of his order at his native place of Regensburg.

There is extant in the library of Heidelberg, a manuscript copy of some of the sermons of Berthold, which was executed in 1370, by command of the Princess Elizabeth; whilst in other libraries of Germany there exist his 'Sermones de Tempore et de Sanctis,' and 'Sermones Rusticani.' One of the groups of Seasonable Sermons, 'Predigt am Michaelisfeste,' occurs in R. Nesselmann's 'Buch der Predigten, oder 100 Predigten und Reden aus den verschiedenen Zeiten, Ländern und Confessionen,' &c., 8vo, Elbing, 1858. Other sermons of Berthold have been published, without date, at Paris, by Jean Gourmont, with the title of 'Fratris Bertholdi Teutonis Horologium devotionis circa Vitam Christi'; and an octavo collection of German Sermons of Berthold the Franciscan, &c., with a preface by Neander, was published at Berlin, in 1824, by Christian Friedrich Kling, with the title of 'Berthold des Franciskaners deutsche Predigten, aus der Zweiten Hälfte des dreizehnten Jahrhunderts, theils vollständig, theils in Auszügen. Herausgegeben von C. F. Kling. Mit einem Vorwort von Dr. A. Neander.' The Berthold literature may be completed with the mention of F. Pfeiffer's 'Berthold von Regensburg, vollständige Ausgabe seiner Predigten mit Anmerkungen und Wörterbuch,' 8vo, Vienna, 1862, &c.

BERTON, the name of three generations of French musicians, composers, and musical writers, who acquired considerable distinction.

PIERRE-MOUTAN BERTON, was born at Paris in 1727. When only twelve years old, he composed motetts which were sung at the cathedral of Senlis; and in 1744, when about seventeen, he became chorister in a church, and a singer in operas. His first regular appointments were those of church organist and orchestral director at Marseille. Between 1755 and 1780, he was successively chef d'orchestre at the Paris opera, director of spectacles, director of the opera, and chef d'orchestre at the Chapelle du Roi. Berton composed many operas, and the music for a still larger number of ballets and spectacles; but his chief services were as a director and conductor, in which capacities he raised orchestral performances to a degree of excellence which they had not before attained in France. It was under his direction that the operas of Glück and Piccini were chiefly produced. He died May 7th, 1780. **HENRI-MOUTAN BERTON**, son of Pierre-Moutan, was born at Paris, 17th September, 1767. In his fifteenth year he played the violin at the Paris opera. Then he studied composition under Sacchini. In 1786, a sacred cantata by him was played at Paris, and in 1787 appeared his first opera, 'Promesses de Mariage.' After many other compositions, the first which gained him notoriety was the opera 'Les Rigueurs du Cloître,' marked by new characteristics of style. In 1795, he was appointed professor of harmony at the Conservatoire de Musique; and in 1807, director of music at the Opéra Italien. In 1815, he was chosen one of the six members of the musical section at the Institute of France; and in 1816, professor of composition at the Conservatoire. He filled several other musical posts during the remaining twenty-eight years of his life. Henri-Moutan Berton composed five oratorios and sacred cantatas, nearly fifty operas and musical pieces for the stage, and many canons, romances, and smaller compositions. His best works were the operas 'Les Rigueurs du Cloître,' 'Montano et Stéphanie,' 'Le Délire,' and 'Aline, Reine de Golconde.' His literary works comprised a voluminous 'Système Générale d'Harmonie' (1815, 4 vols. 4to), many musical articles in journals and cyclopedias, and essays read before societies and institutions. He died 22nd of April, 1844. A notice of his life and works was published in the same year, by Raoul-Rochette. **FRANÇOIS BERTON**, natural son of Henri-Moutan, was born at Paris, on the 3rd of May, 1784. After studying, from 1796 to 1804, at the Conservatoire de Musique, he became, for a time, teacher of singing, and composed several minor pieces for the voice and pianoforte. Next appeared his operas 'Monsieur Desbosquets' (1810), 'Jeune et Vieille' (1811), 'Ninette à la Cour' (same year), and 'Les Caquets' (1821). In 1821, he was appointed professor of vocalisation at the Conservatoire. In 1827, he brought out an opera, 'Une heure d'Absence.' François Berton died of cholera in July, 1832. A

notice of his life and works was published by Raoul-Rochette soon afterwards.

BERTRAM, or BERTRAND DE BORN, Comte de Haute-ford, a renowned French troubadour, was born at the Château de Haute-ford, in Perigord, about the middle of the 12th century. The earliest mention of him is in the year 1185. The sons of Henry II. were referring their claim to the sovereignty of Aquitaine to the decision of the sword, when Bertram, taking sides with the younger brother, Prince Henry, addressed a fervid *sirvente* (or martial song) to the feudal lords of Aquitaine, calling upon them to form a league against the Comte de Poitou (Richard, afterwards Cœur-de-Lion). The energy of Richard was, however, too much for the confederates, who, finding matters proceeding adversely, broke up the league and left Bertram to his fate. Richard laid siege to the Castle of Haute-ford, which, after a brief defence, capitulated. Bertram, however, full of resources, was not dismayed. In an interview he easily succeeded in reconciling himself to the conqueror. His castle and lands were restored to him, and he expressed his gratitude, and vowed service and fidelity, pure as refined silver, to his new lord, in a fresh *sirvente*, full of adroit flattery of Richard, and bitter denunciation of the faithless allies who had sworn to combat to the end, but on the first emergency had left him to carry on the struggle single-handed. When the brothers shortly after joined their arms in rebellion against their father, Bertram was foremost in inciting them forward, and played a prominent part in the unnatural strife. The death of Prince Henry threw the rebellious forces into disorder, and Bertram was again a prisoner. But once more his good fortune prevailed. Summoned before the king, Henry expressed surprise that a man who so vaunted himself on his intelligence, should have acted as he had done. "I might have thus boasted once," was Bertram's answer, "but in losing your son, Sire, I have lost all the intelligence and ability I ever possessed." The king had dearly loved his eldest boy, and his resentment at his unfilial conduct had been softened by the message sent by the penitent prince from his death-bed. The broken-hearted man could not refrain from tears: "I know that you loved my son," he said, "and was loved by him. Go: I restore you your castle and territories," and, knowing that he had been impoverished by the war, he ordered 500 marks to be given him to defray his expenses. Bertram wrote a *sirvente* on the death of Prince Henry, which is considered to be the most touching and beautiful of all his compositions.

Henry II. died shortly after, July, 6th, 1189, and Richard ascended the throne. The next year he set out, with Philip of France, on the third great crusade. According to all feudal obligations, Bertram should have accompanied them. He preferred to stay at home; but he published another vigorous *sirvente*, inciting others to the enterprise he declined, and mocking, by name, the prudent warriors who followed his own example. When Richard returned, unsuccessful and weakened, Bertram, faithful to his old tactics, wrote *sirvente* after *sirvente*, in order to arouse the lords of Aquitaine to form a new league against the English king, and to incite the King of France to break the treaty he had concluded with him; and when war was decided on, Bertram wrote a jubilant address to Philip, urging him to begin the war with fire and with sword, and not to cling to peace like a monk. Bertram was now in his proper element, but the unexpected death of Richard put an early end to the strife. Of Bertram we hear little more. His occupation gone, and finding age creeping on him, he retired to the monastery of Cîteaux, and, it is said, became a monk, and ended his days in penitent austerity. The year of his death is uncertain: it is supposed to have occurred before 1212, as in that year the sons of Bertram did homage to the King of France for the lordship of Haute-ford; though this might well have happened if the father had been living, and a monk of Cîteaux.

Bertram de Born is regarded by most recent critics, as the ablest and most characteristic of the warlike troubadours of his time. His poems are full of life and energy, and passages of great beauty as well as power occur in them. The malevolence, however, predominates greatly over the tenderness; and seemingly he was as ready to carry on fratricidal strife in person, as to urge it upon the young princes. In one of his *sirventes*, he savagely warns his brother, who had urged him to cede him a portion of his territory, to beware how he meddles with him, for he would tear out the eyes of any one who should seek to take anything from him. "Peace I abhor, war only delights me." His conduct and sentiments have been defended, or palliated, as being in accordance with the spirit of the age. But this does

not agree with early opinion. Dante, emphatic in condemnation, has placed Bertram in the lowest regions of hell; wandering—thing he might fear to tell of, but that conscience makes him strong—a headless trunk, and bearing pendant by the hair, as though it were a lantern, the severed member. This "grievous torment," explains the unhappy sufferer (who asks "can any other be terrible as this,") is inflicted on him because on earth he "set father and son at mutual war;" so "for parting those thus closely knit, my brain I carry parted from its source that in this trunk inhabits. Thus in me the law of retribution fiercely works." (*Inferno*, canto xxviii.) Raynouard has printed the best of the *sirventes* of Bertram de Born, in the fifth volume of his 'Choix des Poesies des Troubadours.'

BERTRAND DE DOUE, JACQUES MATHIEU, was born Oct. 23, 1776, at Le Puy Cantal. His life was principally occupied in commercial pursuits, and in fulfilling the duties of many public offices in his native town. He is best known to science by his 'Description géognostique du Puy en Velay,' which was published in 1823, and of which the author was preparing a second edition at the time of his death. A 'Notice préliminaire' to this edition was inserted in the 'Annales de la Société d'Agriculture, etc. du Puy,' xxiv. p. 275—340, 1861. He contributed several other papers to the same society, mostly relating to the meteorology of his district, of which he was a diligent observer. He noticed a constant relation between the direction of the lower and upper currents of the atmosphere, which he announced as the "law of interversion." At one time he was president of the Society of Agriculture, Sciences, Arts, and Commerce of Puy. He died in 1862, when eighty-six years of age.

BÉRULLE, PIERRE DE, a cardinal, and founder of the French Congregation of the Oratory, was born on the 4th of February, 1575, at the Chateau de Sérilly, near Troyes, in Champagne. His father, Claude de Bérulle, was the descendant of a noble family of Champagne, and a counsellor or judge in the parliament of Paris. Pierre received his education successively amongst the Jesuits, and at the University of Paris. He was early distinguished for his piety, learning, and sweetness of temper and disposition. At the age of eighteen, he is said to have written an excellent book on self-denial. In 1599, after forty days spent in assiduous prayer, and great austerities, in a convent of Capuchins, he was admitted to holy orders; and the next year distinguished himself at the conference of Fontainebleau, held by order of Henri IV., in which Cardinal du Perron combated the views of Du Plessis-Mornay. Bérulle, who had been appointed almoner to Henri IV., was, in 1603, sent by that prince to Spain, for the purpose of inducing some of the Teresian or Carmelite nuns to settle at Paris; and with considerable difficulty, and after encountering much opposition, succeeded in establishing that order in France. But he is chiefly remarkable for his completion of a task at once of greater difficulty and of greater interest, to which he was incited by the strong persuasions of St. Francis de Sales, César de Bus, and F. Coton, and by the repeated commands of Cardinal de Retz, his diocesan. This undertaking, in which he had to encounter the most lively and jealous opposition of the Jesuits, was the foundation of a French Congregation of Priests of the Oratory, a society of seculars which owed its establishment in Italy to St. Philip Neri, in 1564. The French Oratorians, whose differences from their Italian brethren are great enough to justify them in being considered as an independent congregation, are a society of priests who live in voluntary poverty and obedience, without the obligation or sanction of a vow. The connection of individuals with the congregation, which was confirmed by a bull of Paul V., in 1613, is therefore terminable at their own discretion.

Bérulle was frequently called upon to take part in public affairs, and amongst other useful and honourable services, he effected the first reconciliation of Louis XIII. with his mother, Mary de Medicis. Shortly after this difficult and delicate service, he was sent as ambassador to Spain, where he negotiated a peace favourable to his own country. When the marriage of the Princess Henrietta Maria with the Prince of Wales, afterwards Charles I., was concluded, Louis XIII., who had unbounded confidence in Bérulle, sent him to Rome, in 1624, to procure a dispensation on account of the difference of religion. In this mission, the difficulties of which were much increased by the intrigues of the Spanish ambassador, he was finally successful; and when he conducted the princess to England, he gained, during his short stay in this country, great commendation for his discretion and amiability.

In early life, Bérulle had made a vow not to accept any

ecclesiastical dignity, and he refused, therefore, the offered bishoprics of Laon and Nantes, and other appointments pressed upon him by Henri IV. and Louis XIII. When the latter monarch threatened to apply to the Pope to compel Bérulle to break his vow, he replied that "if the king continued to press him, he should be obliged to quit the kingdom." Notwithstanding this, when Pope Urban VIII., who, after various conversations with M. Bérulle, said of him that he was "not a man, but an angel," sent him, in 1627, a cardinal's hat, with an express command to accept it, he reluctantly did so, along with two abbacies, which were forced upon him to enable him to sustain the dignity of the cardinalate. His elevation to this high rank excited the jealousy of the French bishops, as his promotion to be minister of state gave umbrage to Richelieu, whom some authors have not scrupled to charge with having occasioned Bérulle's death by poison. Certainly the latter was smitten suddenly with apoplexy, whilst engaged in saying mass, on the 2nd of October, 1629, and expired on the same day. He was buried in the church of the Oratorians, in the Rue St. Honoré, Paris; and a marble statue, representing him on his knees at prayer before the altar, was placed in the chapel of St. Mary Magdalene, in the church of the Carmelite nuns, of which society he was superior-general in France. Cardinal Bérulle added to his other claims to distinction, that of being throughout his life the friend and patron of men of letters; and especially he encouraged Lejay in the enterprise of his 'Bible Polyglotte,' and smoothed the obstacles, which arose at Rome, to its being printed, and was one of the first to favour and appreciate Descartes and his philosophy. He found time to compose various works of piety and religion; and in particular to produce treatises on the points in controversy between the Catholics and Protestants. Some of these he published himself; and they achieved considerable popularity. His 'Controversial and Spiritual Works' were published after his death, under the care of Fathers Bourgoing and Gibieuf, in 2 vols. folio, 1646. His 'Life' has been frequently written, by Bourgoing, Doni d'Attichy, Hubert de Cerisy, Caraccioli, and others.

* BESCHERELLE, LOUIS-NICOLAS, French grammarian and lexicographer, was born at Paris on the 10th of June, 1802. His education was completed at the Collège Bourbon; in 1825 he was appointed to a post at the Archives du Conseil d'État, and three years later nominated librarian of the Louvre. Besides a great number of articles in 'Le France Littéraire,' and the 'Revue Encyclopédique,' and several excellent elementary books for the young, M. Bescherelle has written some valuable dissertations on the French language, and is the joint author with M. Lamotte of 'La Grammaire de l'Académie,' with MM. Braconnier and C. Martin of a 'Cours pratique de Cosmographie et de Géographie, appliqué surtout à l'étude de la France,' and with M. Devars of a 'Grand Dictionnaire de Géographie Universelle,' 4 vols. 4to, 1856—58. His principal independent works are the 'Grammaire Nationale,' 2 vols. large 8vo, Paris, 1834—38; 'Dictionnaire grammatical et usuel des Participes Français,' 2 vols. 8vo, double columns, 1842—43; and 'Dictionnaire National, ou Grand Dictionnaire Critique de la Langue Française,' 2 vols. large 4to, treble cols. Paris, 1843—46. This last is by far the most valuable of M. Bescherelle's works. It does not pretend to be exhaustive, like M. Littré's great dictionary, but it is sufficient for all ordinary purposes, is well arranged, clear and precise in definition, and ample in illustration: altogether one of the best dictionaries of a modern language extant.

* BESSEMER, HENRY, inventor of a new process for the manufacture of steel, was born in Hertfordshire, in 1813. Associating himself chiefly with mechanical engineering, he invented or improved various machines; but his more important labours relate to metallurgy. In October, 1855, he took out a patent for improvements in the manufacture of steel; by "forcing currents of air or of steam into and among the particles of molten crude iron, or of re-melted pig or refined iron, until the metal so treated is thereby rendered malleable, and has acquired other properties common to cast steel, and still retaining the fluid state of such metal, and pouring and removing the same into suitable moulds." Two months later he obtained another patent, for "the refinement of pig or cast iron by a single process, and casting the same into ingots suitable for rolling at once into bars or rods." In February, 1856, a third patent related to the conversion of crude iron into steel, or into malleable iron, without the use of fuel for reheating; the conversion being effected by forcing into the molten mass currents of air, which give up their oxygen to support the combustion of the carbon contained in the iron. A fourth patent was taken out in March,

1856; and others have been obtained since. The title of a paper read by Mr. Bessemer, at the Cheltenham Meeting of the British Association for the Advancement of Science, in 1856, 'On the Manufacture of Iron and Steel without Fuel,' led to a misconception of his meaning, and a distrust of his method by steel manufacturers. After a long course of further experiments and improvements, works were established at Sheffield by Mr. Bessemer, for the manufacture of iron and steel on his new plan; and from that time the success of the scheme was ensured. The metallurgists of the continent viewed the Bessemer process more favourably than those of Great Britain; and at the present time there are more Bessemer steel works abroad than at home. The estimate in 1869 was 52 converters (large egg-shaped vessels, in which the conversion of crude iron into steel takes place) in Great Britain, 12 in France, 24 in Prussia, 14 in Austria, 15 in Sweden, 2 in Belgium, 2 in Russia, and 2 in Italy. In these converters, and in some in the United States, it is roughly estimated that 200,000 tons of Bessemer iron and steel were made in the year 1869. The expiration of the original patents, however, appears likely to stimulate the application of the Bessemer process very considerably in this country. Irrespective of advantages in regard to price, the new process has this peculiarity—that by checking the extent of conversion, any intermediate quality of metal may be obtained, from mere iron, through all the intermediate stages, up to absolute steel. Papers by Mr. Bessemer, relating to this invention, have been read before the Institution of Civil Engineers, and other scientific bodies. The Bessemer process has been described at length by many continental metallurgists—Vicaire, Kohn, Boman, Tunner, Grüner, Hingenau, Fréimly, Wedding, Kerl, Chenot, &c. The description is full and complete in the 'Metallurgy' of Crookes and Röhrig, London, 1869.

BETTINA [ARNIM, ELIZABETH VON, E. C. S. col. 113].

BEUGNOT, ARTHUR-AUGUSTE, COMTE, an eminent French writer and publicist, was the eldest son of Jacques-Claude, Comte Beugnot (b. 1761, d. 1835), minister of state under Napoleon I. and Louis XVIII. He was born on the 25th of March, 1797, at Bar-sur-Aube; completed his school training at the Lycée Bonaparte; and was called to the bar in 1819, but soon definitely abandoned law for literature. He first acquired notice by a work for which he divided with M. Mignet the prize of the Institute, 'L'État du Gouvernement et de la Législation en France à l'époque de l'avènement de Saint Louis et des Institutions de ce Prince.' M. Beugnot seemed to have a faculty for these academic prize essays, he having carried off successively those of Paris, Strasburg, and Ghent by his works on 'Les Juifs d'Occident, ou Recherches sur l'État Civil, le Commerce, et la Littérature des Juifs en France, en Espagne et en Italie, pendant la durée du Moyen Âge,' 8vo, Paris, 1824; 'Conquêtes de Philippe Auguste,' 8vo, 1824; 'Des Moyens de Civiliser les Populations Israélites de l'Alsace,' 8vo, 1825; 'Des Banques Publiques, des prêts sur gages, et de leurs inconvénients,' 8vo, 1829; and 'Histoire de la Destruction du Paganisme en Occident,' 2 vols. 8vo, 1835—a work of more research and ability than some of its predecessors, but which, though the author was a good Catholic, fell under the censure at Rome for the freedom of some of its remarks on the state of the early pontificate. M. Beugnot now occupied himself for some time in searching the archives bearing on the proceedings of the early parliaments, the ancient jurisprudence, the guilds and the municipal governments of France, drew up some Reports for presentation to the chambers, and began an elaborate historical survey, which, however, was, we believe, never completed. Partly in consequence of these investigations he was requested by the Minister of Public Instruction, M. Cousin, to edit the 'Olim, ou Registres des Arrêts rendus par le Cour du Roi, sous les règnes de Saint Louis jusqu'à Philippe le Long,' 4 vols. 4to, 1840—48, forming part of the 'Collections des Documents Inédits sur l'Histoire de France.' M. Beugnot also prepared an account of the ' Coutumes du Beauvoisis,' preceded by a notice of Philippe de Beaumanoir, 2 vols. 8vo, 1842; and an edition of 'Assizes de Jérusalem, ou Recueil des Ouvrages de Jurisprudence composée pendant la Treizième Siècle dans les royaumes de Jérusalem et de Chypre,' 2 vols. folio, 1841—49.

In 1832 M. Beugnot was elected to succeed M. Thurot as member of the Institute. On the 25th of December, 1841, he was named peer of France. In the upper chamber he united himself with M. de Montalembert in demanding in the interest of the clergy what was called the liberty of teaching; and later he argued with warmth against the proposal for the expulsion of the Jesuits. Returned after the revolution of 1848 to the Legis-

lative Assembly as representative for Haute-Marne, he distinguished himself as the advocate and reporter of the Loi sur l'Instruction Publique of March 15, 1849, by which, under the pretext of allowing liberty of teaching, public instruction was handed over to the almost exclusive control of the priesthood. The coup-d'état of the 2nd of December relegated Beugnot to private life and to literature; but he published nothing more of any value, and died March, 1865.

* BEULÉ, CHARLES-ERNEST, a distinguished French archaeologist and author, was born at Saumur on the 29th of June, 1826; completed his educational course at the Ecole Normale, 1845—48; and somewhat later was nominated professor of rhetoric at Moulins. Sent to the Ecole Française at Athens, he engaged actively in the exhumations at the Acropolis and in various investigations in Hellenic archaeology, his proceedings tending considerably to raise the character of the school. He returned to France in 1853, and the following year published his first work of any consequence, his previous publications having been academical dissertations and articles in journals: 'L'Acropole d'Athènes,' 2 vols. 8vo, 2nd ed. 1863. This was followed by 'Etudes sur le Péloponèse,' 8vo, 1855, published, like the preceding, by direction of the Minister of Public Instruction. Other works on Greek antiquity were 'Les Temples de Syracuse,' 8vo, 1856; and 'Les Monnaies d'Athènes,' 4to, 1858. The 'Histoire de la Sculpture avant Phidias,' 8vo, 1864, though archaeological in subject, was treated rather from an artistic point of view. M. Beulé has also written an éloge of Horace Vernet, 1863; one of Hippolyte Flandrin, 1864; 'Meyerbeer,' 1865; 'Cours d'Archéologie,' 1860; 'Causeries sur l'Art,' 1867; 'Tibère et l'Héritage d'Auguste,' 1868; 'Le Sang de Germanicus,' 1869; and numerous reviews and essays for the Revue des Deux Mondes, the Gazette des Beaux-Arts, and other journals. 'Phidias, drame antique,' appeared in 1863. About 1860 M. Beulé directed extensive exhumations at Carthage, and obtained some interesting results, which he communicated to the public in various papers. M. Beulé received the doctorate, succeeded M. Raoul-Rochette as professor of archaeology at the Bibliothèque Impériale, and was decorated with the order of the Legion of Honour, in 1854. In 1860 he was elected member of the Académie des Inscriptions, in succession to M. Charles de Lenormant; and in April, 1862, he was chosen permanent secretary of the Académie des Beaux-Arts.

* BEUST, FRIEDRICH FERDINAND, FREIHERR VON, a German statesman, was born at Dresden on the 13th of January, 1809. His education was conducted privately until his 13th year; after which he was for some time (1822—1826) a pupil of the Kreuzschule of his native city. Subsequently he studied at the universities of Göttingen and Leipzig, at the latter of which he graduated, whilst at both he developed an inclination for a political and diplomatic career. Returning to Dresden in 1831, he received an appointment in the Foreign Office; and after having held the post of assessor of land-survey (lands-direction) in 1832, devoted two or three years to travelling in Switzerland, France, and England. In 1836 he became secretary of the Saxon legation at Berlin, and in 1838 was appointed to fill the same position at Paris. He quitted the latter city in 1841, in order to proceed as chargé d'affaires to Munich, where he married the daughter of Lieutenant-General von Jordan. In 1846 he was diplomatically resident in London, and was appointed ambassador to the court of Berlin in 1848. He accepted office in the Held cabinet on the 24th of February, 1849, as Minister for Foreign Affairs; with which, in the following May, as a member of the anti-constitutional cabinet of Zschinsky, he conjoined the duties of Minister of Agriculture. He took a prominent part in the discussions preceding the treaty of 1852, and in 1853 became Minister of the Interior. On the breaking out of the Danish war in 1863 Baron von Beust distinguished himself by his loyalty to federal interests, and by a rebuke he administered to Lord John Russell, in answer to a despatch from the latter. He represented the Germanic Diet at the London Conference of 1864, during the continuance of which he twice visited Paris to confer with the Emperor Napoleon, whose guest he afterwards was at Fontainebleau. After the conclusion of the struggle between Austria and Prussia, Baron von Beust was appointed, October 30th, 1866, to be Minister of Foreign Affairs of the Austrian monarchy; Minister of the Household, November 14th, 1866; and on the 4th of February, 1867, on the retirement of Count Belcredi, President of the Council of Ministers. On the 1st of July following, he was invested, by a decree of the emperor, with the title of Reichskanzler, or Chancellor of the Empire. As an Austrian minister, the guiding policy of Count von Beust has been that of conciliation towards Hungary, to

which country the emperor, acting upon his advice, has made considerable and graceful concessions. The later career of Count von Beust is the principal theme of a recent volume entitled 'The Austro-Hungarian Empire and the Policy of Count Beust,' 8vo, London, 1870, a political sketch of men and events from 1866 to 1870, which, divided into 3 parts, treats of "(1) The New Constitution; (2) Foreign Policy; and (3) Question of the Nationalities; Electoral Reform; the late Ministerial Crisis." The author adopts the cryptonym of "an Englishman."

* BEUST, FRIEDRICH KONSTANTIN, BARON VON, elder brother of the Austrian minister, was born at Dresden, April 13, 1806. He studied mathematics and the natural sciences at Freiburg, and law at Leipzig and Göttingen. He then devoted himself to the mining industry, and ultimately rose to be the general-superintendent (Oberberghauptmann) of the Freiberg mining district. He has written several papers and pamphlets relating to the minerals: some of these bear upon the distribution and mode of occurrence of various ores, while others deal with several schemes for making the mineral deposits contribute to the finances of the State, and for developing new lines of railway. In one of his pamphlets he criticises Werner's theory of mineral veins. ('Kritische Beleuchtung der Werner'schen gangtheorie aus den gegenwärtiger Standpunkte der Geognosie,' 1840.) Another pamphlet relates to the masses of porphyry near Freiberg, and is entitled 'Geognostische Skizze der wichtigsten Porphyrgebilde zwischen Freiberg, Frauenstein, Tharand und Nossen,' 1835. The 'Berg- und hüttenmännisches Zeitung' for 1859 and subsequent years, contains several papers by him on rocks, minerals, and mineral veins.

BEVERLAND, ADRIAN, a learned but licentious Dutch writer, was born about 1653 at Middelburg in Zeeland. He was a pupil of Vossius; is said by Wood to have been at Oxford University in 1672; studied law, obtained the doctorate, and practised as an advocate at the Hague. But his addiction to erotic literature interfered with his legal pursuits; and he was brought into trouble with the authorities by the publication of his treatise on Original Sin, 'Peccatum Originale, κατ' ἐξοχήν sic nuncupatum, philologicæ, ὁρολογητικῆς elucubratum a Themidis alumno,' sm. 8vo, having at the end "Eleutheropoli in horto Hesperidum typis Adami Evae filii," 1678; 2nd ed. Leyden, 1679. A free translation into French, by J. Bernard, appeared at Paris in 1714, and numerous editions, altered and added to, down to 1740. For publishing this book Beverland was imprisoned and his book burned by the public executioner, but he was released on the payment of a fine, and promising that he would not write again on any such subject. He deemed it, however, prudent to leave the city, and he withdrew to Utrecht, where his dissolute conduct and freedom of speech are said to have caused so much scandal that the magistrates privately ordered him to remove elsewhere. At Leyden, where he went next, he was equally unlucky, for he soon brought himself into difficulties by publishing an obscene work, 'De Stolate Virginitatis jure Lucubratio Academica,' sm. 8vo, Leyden, 1680, and circulating in MS. a libel on the magistrates, entitled 'Vox Clamantis in Deserto,' of which an edition without date is still extant, though very rare. Driven from Leyden, he took refuge in England, where Isaac Vossius, moved by the poverty to which he was reduced, and admiring his undoubted erudition and ability, procured him a small pension. Even this he is said to have wasted by buying books and medals of all kinds which illustrated the class of subjects in which his perverted intellect delighted to revel; but he at any rate professed regret for the pain he had caused to purer minds by his libidinous writings and conversation, and as a proof of the reality of his penitence and the rectitude of his intentions, issued a work, 'De Fornicatio Cavenda admonitio, sive adhortio ad Pudicitiam et castitatem,' sm. 8vo, London, 1698; another edition of which, with a German imprint, followed in the same year. But the honesty of his recantation was generally doubted, and the book itself was regarded as anything but a chaste exhortation to purity of conduct. The decease of Vossius deprived Beverland of a portion of his resources, and he fell into a state of great misery. He had probably from opening manhood been in a condition of incipient insanity, and at length his mind entirely gave way. The last that is known of him is that he was wandering about the country destitute, and haunted by the belief that he was pursued by a band of two hundred men who had entered into a league to assassinate him. He is believed to have died in 1712.

BEYERLINCK, LAURENT, a Flemish divine and writer, was the son of an apothecary at Antwerp, where he was born in April, 1578. He studied in the college of the Jesuits at Louvain;

became professor of rhetoric and poetry at Ghent; and was afterwards director of the seminary, librarian, and canon of the cathedral of his native city. He died at Antwerp on the 7th (or according to some authorities on the 22nd) of June, 1627. A man of considerable learning and a most industrious compiler, he published a surprising number of volumes, considering their bulk and range of their contents and his comparatively short life and various occupations. His great work is the 'Magnum Theatrum Vitæ Humanæ: hoc est Rerum Divinarum Humanarumque Syntagma Catholicum, Philosophicum, Historicum, Dogmaticum, Alphabetica serie Polyanthæ Universalis instar,' a vast cyclopædia of information on every variety of subject, as the title implies, arranged alphabetically, in 7 large folio volumes, Antwerp, 1631; reprinted in 8 fol. volumes, Ant. 1678, and Venice, 1707. Of little positive value now for the information it gives on any particular branch of knowledge, it is still useful as a convenient book of reference for the views held on any matter by intelligent and well-informed persons in the early part of the 17th century. The book, it should be stated, is not wholly Beyerlinck's, but an extension and recasting of a work compiled by C. Wolffhart (Lycosthenes) and his son-in-law, Th. Zwinger. Another heavy work of Beyerlinck's is his 'Biblia Sacra variarum translationum,' 3 vols. fol. Antwerp, 1618: others are 'Apophtegmata Christianorum,' 8vo, 1608; 'Opus Chronologicum ab anno 1570 usque ad an. 1612,' fol. 1612; 'Promptuarium Morale super Evangelia Festorum anni totius,' 3 vols. 8vo, 1613, and more than once reprinted; 'Martyrologium Sanctorum Virginum,' &c., fol., with plates by T. de Leu, 1615. Beyerlinck also published some theological tracts; several funeral orations; lives, in Flemish, of 'the three Apostles of Antwerp,' &c.

BEYLE, MARIE HENRI, a popular French writer, better known by the name of STENDHAL, was born at Paris on the 23rd of January, 1783. His habit of adopting various pseudonyms led, not merely to the popular use of the name *Stendahl*, but to a curious diversity in the Christian name or names by which he was known. Thus, Quérard ('La France Littéraire') called him *Louis Alexandre César*; Colomb des Battus ('Catalogue des Dauphinois dignes de Mémoire'), *Arthur Louis Alexandre César*; Quérard, in a later work ('La Littérature Contemporaine'), *Henri*; and 'La Nouvelle Biographie Générale,' *Marie Henri*. Fétis, to whom he was personally known, gave him ('Biographie Universelle des Musiciens') the same name as Quérard's first version; but in a later edition followed the authority of the 'Nouvelle Biographie.' Throughout the greater part of his life, Beyle was constantly shifting from one profession or avocation to another. After receiving his early education in the Central School at Grenoble, he went to Paris when sixteen years old, and studied first the military sciences at l'École Polytechnique, then the law under one of his own relations, and then painting under Regnault. Serving for a time in a regiment of French cavalry in Italy, he returned to Grenoble in 1802. With the hope of giving him a taste for some definite pursuit, his friends in 1805 placed him in the counting-house of M. Raybaud, a merchant at Marseille. Wearying of this in a few months, he went in 1806 to Germany with a member of the family, M. Daru, and was appointed intendant of the domains of the Emperor in Brunswick. In 1807 he joined the Commissariat. In 1810 there fell to him the office of auditor to the Council of State, and financial inspector of crown lands and buildings. His next move was to join as an amateur the Grand Army in the invasion of Russia in 1812. In 1815, while filling some civil post at Grenoble, he gave umbrage to the Allies who entered Paris, and found it prudent to live at Milan until 1821. He resided at Paris from this last-named year till 1830, with occasional journeys to Germany, England, and Italy. He then turned to diplomacy, and filled for a time the post of French Consul at Civita Vecchia, after being objected to in the same post at Trieste by Prince Metternich. He died at Paris, 23rd of March, 1842. Beyle wrote a prodigious number of books and essays. The following may be mentioned as among the more important:—'Lettres écrites de Vienne en Autriche sur Haydn; suivies d'une vie de Mozart, et de Considérations sur Métastase,' 8vo, Paris, 1814 (little more than an unacknowledged translation from the Italian); 'Histoire de la Peinture en Italie,' 2 vols. 8vo, 1817; reprinted with some change of title in 1824 and 1831; 'Rome, Naples, et Florence en 1817,' 8vo, 1817; 'De l'Amour,' 2 vols. 12mo, 1822; 'Vie de Rossini,' 2 vols. 8vo, 1824; 'Racine et Shakspeare,' 1823—25, 8vo; 'Promenade dans Rome,' 2 vols. 8vo, 1829; 'La Rouge et le Noir, chronique de dix-neuvième siècle,' 2 vols. 8vo, 1831; 'Mémoires d'un Touriste,' 2 vols. 8vo, 1838; 'Le Chartreuse

de Parme,' 2 vols. 8vo, 1839; besides numerous articles in the 'Journal de Paris,' the 'Courrier Français,' the 'Temps,' the 'National,' the 'Globe,' the 'Revue de Paris,' and the 'Revue des Deux Mondes.'

BIANCHI-GIOVINI, ANGELO AURELIO, an eminent Italian author and publicist, was born at Como on the 25th or November, 1799. Of poor parentage, he had received but an imperfect education, when at the age of nine he was placed in a commercial establishment at Milan. His employment led him to travel, and he devoted all his leisure to study, so that in early manhood he was unusually well-informed and enterprising. Taking the earliest opportunity which offered to enter upon a more congenial pursuit than that in which he had been occupied, he, in 1830, accepted an engagement in a publishing house at Capolazo, in Ticino, of which after a time he became the manager. Whilst here he for some months in 1835 edited a journal, 'L'Ancora,' and translated Daru's 'Histoire de Venise.' In 1835 he removed to Lugano, where he conducted 'Il Repubblicano della Svizzera Italiana,' but, differing in policy with the extreme liberals, of whom it was the organ, at the end of a couple of years he resigned the editorship. In 1836 appeared his 'Biografia di Fra Paolo Sarpi,' Zurich, 2 vols. 8vo, of which a French translation was published at Brussels in 1863. This work, though too uniformly eulogistic, is the best biography extant of the famous friar. Compelled to leave Ticino on account of his political opinions, Bianchi took refuge in Zurich, where he published some pamphlets on the condition of Ticino, which attracted considerable notice. Permitted by the amnesty granted by the Emperor Ferdinand I. of Austria on his coronation to return to Milan, he remained there from 1840 to 1847, diligently occupied in historical studies, but taking part as occasion offered in Italian national politics. During these years he published his 'History of the Hebrews,' 'Storia degli Ebrei e delle loro sette e dottrine religiose durante il secondo tempo,' 1 vol. 8vo, Milan, 1844, which fell under the censure of Rome, but was translated into German; a Topographical Dictionary of Lombardy, 'Dizionario Corografico della Lombardia,' 1 vol. large 8vo, Milan, 1844, which passed into a second edition, but to which the Austrian authorities would not allow the author to affix his name; a Dictionary of the Bible, 'Dizionario Storico-filologico della Bibbia,' 4 vols. 8vo, Milan, 1845, &c.; an essay on the fable of Pope Joan, 'Esame Critico degli Atti e Documenti relativi alla Favola della Papessa Giovanna,' Milan, 1845, a work that had a great success; 'Thoughts on the Decline of the Roman Empire in the West,' 'Idee sulla Decadenza dell' Impero Romano in Occidente,' 3 vols. 8vo, Milan, 1846. These works were produced far too rapidly to allow of such important subjects being adequately treated, but it should be remarked that several of them were more or less closely connected with the History of the Popes, for which he had been already some years collecting and digesting the materials. In January, 1848, Bianchi was called to Turin to enter upon a new occupation. Italy was seething with impatient expectation of the moment when the blow was to be struck for the expulsion of the foreigner, and General Durando, about to join the Army of Independence, desired to entrust to Bianchi the direction of his journal, 'L'Opinione,' that was intended to lead and inform the public mind. Under Bianchi's editorship 'L'Opinione' advocated frankly the fusion of Italy under the leadership of Carlo-Alberto, the expulsion of the Austrians, and the limitation of the papal power. The Italians were defeated in their first great struggle, and Austria in granting peace stipulated for the expulsion of Bianchi, who again retired to Switzerland. But his exile was not of long duration. Cavour, on becoming minister, insisted on the recall of Bianchi, who resumed the direction of 'L'Opinione.' The journal had, however, passed into the hands of fresh proprietors, who were opposed to the government, and Bianchi withdrew from it and started a new journal, 'L'Unione,' in which he laboured unceasingly to keep alive the animosity of his countrymen against Austrian rule in Italy, to protest against the doctrines of Mazzini, and to urge resistance to the encroachments of Rome. He continued his journal almost till his death, which occurred on the 16th of May, 1862. But during all these last years he had been working with equal earnestness on his 'Storia dei Papi,' of which the first volume appeared at Capolazo in 1852, and of which in all ten volumes have been published, the later volumes at Turin. Besides the works already mentioned, Bianchi wrote a popular summary of his Hebrew History under the title of 'Storia Biblica,' 1 vol. Turin, 1851; 'Critica degli Evangelii,' Turin, 1853; and 'L'Austria in Italia,' 2 vols. 8vo, Turin, 1853, translated into French by Madame Camille Lebrun, Paris, 1854; as

well as several pamphlets and occasional pieces. He also commenced a History of the Longobards, of which only one volume was published, 'Storia del Longobardi,' 8vo, 1848. On the decease of Bianchi the government of Victor Emmanuel granted his family a pension of about 80*l.* a year in recognition of his services to Italy.

* BIDDER, GEORGE PARKER, civil engineer, was born June 14, 1806, at Moreton Hampstead, in Devonshire, where his father was a mason. At an early age he developed so remarkable a talent for mental calculation as to attract much attention from mathematicians, by whom he was known as the "calculating boy." The solution of very intricate questions was with him an affair of a few minutes, often only a few seconds: the result being announced by him long before able mathematicians could work it out on paper. His name was associated with the names of Jedediah Buxton and Zerah Colburn, as the possessor of powers not easily comprehended by other persons. In this case, however, the boy-calculator lived to give in later years a subtle analysis of the powers in question, which will be found in the 15th volume of the 'Minutes of Proceedings of the Institution of Civil Engineers.' The kindness of a friend enabled young Bidder to acquire a solid education at the University of Edinburgh, where he formed an acquaintance with the late Robert Stephenson, which influenced the whole of his subsequent career. After a short engagement at an insurance office, distasteful to himself, he was employed for a time upon the Ordnance Survey. The experience which he acquired here enabled him to fill the post of assistant engineer to Mr. H. R. Palmer, who was engaged in the construction of the Eastern Dock at the London Docks. Mr. Bidder's next engagement was with Messrs. Walker and Burgess, in superintending the construction of the Brunswick Wharf at Blackwall—noteworthy for the first use of cast-iron piles in river-walls. When Robert Stephenson, about 1831, planned the London and Birmingham Railway (now forming part of the London and North-Western system), Mr. Bidder joined him as assistant; and during a long series of years he took part in many works on which the two Stephensons were engaged—including the earlier portions of the South-Eastern Railway, the North Kent, the London and Blackwall, the Norwich and Yarmouth, the Northampton and Peterborough, the Trent Valley, the North Staffordshire, and numerous other lines. He took an active part in the obstinate parliamentary contests concerning atmospheric railways and the 'battle of the gauges.' Mr. Bidder was afterwards sole engineer of the Norwegian Trunk Railway, and with Mr. George Robert Stephenson, was engineer of the Royal Danish Railway. He has long been consulting engineer for the system of railways in the North-west of India, including the Delhi, the Punjab, and the Scinde lines, as well as the Indus Steam Flotilla. Mr. Bidder constructed Lowestoft Harbour. As engineer of the Victoria (London) Docks, he introduced many novel features of construction. In connection with Mr. Jennings, he enlarged the Surrey Canal Docks. At an early period in the introduction of the electric telegraph system Mr. Bidder recognised its importance in connection with railways, especially in working single lines; and he introduced it on the Blackwall and the Norwich and Yarmouth lines. He was one of the founders of the original Electric Telegraph Company, and has been a constant adviser to the board down to the recent (1870) transfer of the company's wires and rights to the Government—a transfer which he assisted in completing. Mr. Bidder became member of the Institution of Civil Engineers in 1825, and is now one of the oldest of the body in that capacity. He was for many years a member of the council, and was president in 1860 and 1861. The paper already adverted to, relating to his calculating powers, was the result of two oral lectures given by Mr. Bidder at the Institution, under the presidency of Mr. Robert Stephenson. Mr. Bidder was president of the section on Engineering and Mechanics at the Norwich meeting of the British Association for the Advancement of Science, in 1868; and president at the meeting of the Western Association at Dartmouth in 1869. He is lieutenant-colonel commanding of the Engineer and Railway Volunteer Staff Corps. It may be well to mention here as the corps is very little known to the general public, that its officers are chiefly civil engineers, railway managers, and great contractors, and that it corresponds directly, and in a confidential way, with the War Office. The corps has been constituted for the purpose of directing the application of skilled labour, and of railway-transport, to the purposes of national defence; and for preparing, in time of peace, the system on which such duties shall be conducted.

BILLAULT, AUGUSTE ADOLPHE MARIE, a French

lawyer and statesman, was born at Vannes, on the 12th of November, 1805. He studied law at Rennes, where he was admitted as an advocate in 1825. In November of the same year, he went to Nantes for the exercise of his profession, and became presently one of the most distinguished and busy members of the bar of that city. After the Revolution of July, 1830, he began to take a prominent part in public affairs, being named a member of the Municipal Council of Nantes, and in 1833, a member of the council-general of the department of the Loire-Inférieure. He wrote upon various important questions of the day; and especially published a pamphlet entitled 'De l'Education en France, et de ce qu'elle devrait être pour satisfaire aux besoins du pays,' 8vo, Nantes, 1835. In 1837 M. Billault was returned to the Chamber of Deputies by three electoral colleges of the department—Nantes, Paimbœuf, and Ancenis, the last being the constituency he chose to represent. In the chamber he joined the party of the left centre, of which M. Thiers was chief; and when Thiers became president of the council, Billault was made under-secretary of state for agriculture and commerce, March 3rd, 1840. He vacated office on the fall of the Thiers ministry, October 29th, 1840; and during his short experience of public business, effectively co-operated in bringing about a treaty of commerce with Holland, so as to gain the order of the Lion of the Netherlands, and the decoration of the Legion of Honour. In the last he became commandeur, grand officier, and grand'croix, respectively on the 8th of December, 1852, 30th of December, 1855, and 15th of August, 1857. Relieved from the pressure of public functions, M. Billault was admitted, in 1841, an advocate of the Cour Royale of Paris; and his fame, both as a forensic and a parliamentary orator, increased from day to day. At the elections of 1846, M. Billault was returned for the third arrondissement of Paris; but he preferred to remain faithful to his old constituency of Ancenis, which had re-elected him. At the approach of the Revolution of 1848, although he had loudly denounced in the chamber "the corruption, which, covering the whole of France, threatened to swallow up representative institutions," he took no part in the organization of the Reform banquets. After the Revolution of February, M. Billault was elected as representative to the Constituante, and joined the ranks of the moderate democratic party, voting on all occasions with the right, except when he recorded his vote, with the left, for the banishment of the Orleans family. Gradually, however, he leaned to the left, especially upon questions of foreign policy; and his attitude in this respect gave so little satisfaction, that he failed of re-election to the Legislative Assembly. Once more the bar engrossed the energies of M. Billault, who, remaining faithful to his democratic principles, particularly opposed himself to the law of the 31st of May, 1850. After the coup d'état of the 2nd of December, 1851, he was named deputy of Saint Girons (Ariège), and was chosen as the first president of the new Corps Législatif, which position he held until the re-establishment of the Empire. On the 23rd of July, 1854, M. Billault succeeded M. de Persigny as Minister of the Interior, and was called to the Senate on the 4th of December. On the 8th of February, 1858, he was required to yield his portfolio to General Espinasse; but was recalled to office on the 1st of November, 1859, in the place of the Duc de Padoue. By a decree of the 23rd of June, 1863, M. Billault was placed in the ministry of state, in succession to M. Walewski; a few months after which he died, October 13th, 1863, at his château de la Goulaine, near Nantes, and was honoured with a magnificent funeral at Paris, at the public expense. M. Billault, in addition to the honours already mentioned, enjoyed the membership of the Academic Society of Nantes, and of the Industrial Society of Angers. He is, *inter alia*, the author of pamphlets on the 'Question Italienne'; Discours prononcé au Sénat dans la Séance du 3rd Mars, 1862, 8vo, Paris, 1862; and 'La Question Polonaise'; Discours, &c., 8vo, Paris, 1863.

BILLINGTON, ELIZABETH, a very celebrated English singer, was born in London, in 1760. The daughter of a clever violinist named Weichsel, the remarkable taste for music she displayed was carefully fostered, and under the instruction of her father, and of another German musician named Schröter, she made such astonishing progress, as, when only seven years old, to play a concerto on the pianoforte at the Haymarket Theatre, with great applause. Singing she probably learned of her mother, who had been the favourite pupil of J. Ch. Bach, and who was at this time the leading vocalist at Vauxhall. When eleven years old, she wrote and published some musical compositions, but they were said to have been rather freely borrowed. In her fifteenth year she made a clandestine match with

Mr. James Billington, a member of the orchestra at Drury Lane Theatre, who had been one of her musical instructors. Billington carried her off to Dublin, where she obtained an engagement to sing at the theatre. The exquisite beauty and freshness of her voice, and the ease and charm of her style, entranced the audience, and her success was unbounded. She returned to England at the end of 1785, and was at once engaged at Covent Garden Theatre, at a salary of 1000*l.* for the remainder of the season, a sum unprecedentedly large for a debutant. In London her reception was no less enthusiastic than in Dublin. Her performance of Rosina, in 'Love in a Village,' was the topic of the season. Michael Kelly, who witnessed it, "thought her an angel in beauty and the Saint Cecilia of song." (Reminiscences, i. 297.) But friends counselled further training, and at the end of the season she went to Paris and placed herself under the tuition of Sacchini, nor did she return to London till his death, in October, 1786. In 1793-4, she made a tour through the principal towns of France and Italy, accompanied by her husband, and by her brother, a distinguished violinist, and everywhere she carried away her audience by storm. At Naples she was introduced by Sir William and Lady Hamilton, to the King and Queen of Naples, and greatly fêted. But the tour was not throughout so favourable. Her free and careless manner already gave occasion to the voice of scandal; her husband died suddenly at Naples, in May, 1794; and finally, a sum of 20,000 sequins, a large part of the profits of her tour, which she had deposited in the Bank of Venice, was seized by the French. After many vain efforts to recover her money, she married a M. Felessent, a commissary of the French army, who had assisted her applications, and retired with him to a villa she purchased with a portion of her savings, in the neighbourhood of Venice. After staying here for a couple of years, she returned alone to England, and reappeared at Covent Garden Theatre, October 3rd, 1801, in Dr. Arne's opera of 'Artaxerxes.' She was received, as Michael Kelly records, "with rapturous applause, and on each night drew crowded houses." So great was the desire to hear her, that the lessees of the two theatres came to an agreement that she should sing the part on different nights at Covent Garden and Drury Lane, her income for the season exceeding 10,000*l.*, a sum then unparalleled as the payment for an English singer. Henceforth, for sixteen years, she reigned undisputed queen of English song. She continued to receive a very large income, lived in great style at Hammersmith, the most distinguished personages resorting to her fêtes and parties, yet, though exceedingly liberal to all who had any claim upon her, she acquired considerable wealth. In 1817, the repeal of the Alien Act permitted M. Felessent to come to England; his wife returned with him to the continent, and she died at St. Arrien, her Venice villa, on the 25th of August, 1818. Mrs. Billington is, by general consent, considered as the first of English singers. She was an excellent musician, and her voice, of unusual range, brilliancy, and power, was remarkable also for its richness of tone, sweetness, and the fascination it exercised over the listener. Her morals were, unhappily, less pure than her voice and taste, but a book that is sometimes met with, purporting to be 'Memoirs of Mrs. Billington, from her birth,' &c. (8vo, London, 1792), is an obscene libel, compiled, as is frankly avowed in the "Advertisement" and "Prefatory Address," for the purpose of extorting money.

BILSON, THOMAS, an Anglican prelate and divine, was born in 1536, at Winchester; and, after being fitted for the University at William of Wykeham's school in that city, became a member and perpetual fellow of New College, Oxford, where he graduated in arts, entered holy orders, and acquired a reputation for the solidity and consistency of his preaching. He became a master in Winchester College, of which he was subsequently appointed warden. On the 12th of January, 1576, he was installed in the eighth stall of Winchester Cathedral; and, having completed his degrees in divinity, was elected Bishop of Worcester on the 20th of April, 1596, to which he was confirmed on the 11th of June, consecrated at Lambeth on the 13th, the temporalities being restored to him on the 27th of July. He was translated to Winchester, April 29th, 1597, his confirmation to this see taking place on the 13th of May following. About this time Bishop Bilson gave great offence to the Puritans, by opposing, in sermons delivered at St. Paul's Cross, the Calvinistic doctrine of particular election, and by asserting that the descent into hell of the Creed was to be understood as an actual descent into the place of torment. An account of the controversy in which the preacher became involved in consequence may be found in Strype's 'Life of Archbishop Whitgift,' its literary results, so far

as Bilson was concerned, being chiefly represented by a work entitled, 'The Effect of certain Sermons, touching the full Redemption of Mankind by the Death and Blood of Christ Jesus; wherein besides the Merit of Christ's Sufferings, the Manner of his Offering, the Power of his Death, the Comfort of his Cross, the Glory of his Resurrection, are handled,' &c., London, 1599; 'The clearing of certain objections made against the aforesaid Doctrine;' and 'A Survey of Christ's Sufferings and Descent into Hell,' folio, London, 1604. In this work the author maintained that Christ descended into hell, not to suffer, not to preach, and not to liberate any, but to take possession and to triumph. Bishop Bilson preached the coronation sermon on the accession of King James I., and it was published as a 'Sermon at Westminster before the King and Queen at their Coronation, on St. James's Day, 28th July, 1603.' He was called upon next year to be one of the managers of the conference at Hampton Court; and took part especially in the discussions on lay baptism, to deny the validity of which, he held, would be to cross all antiquity; and on the Apocrypha, in the course of which he insisted upon the distinction of St. Jerome:—"Canonici sunt ad informandos mores, non ad confirmandam fidem." It was to Bishop Bilson, conjointly with Dr. Smith, Bishop of Gloucester, that King James committed the final revision of that translation of the Bible known as the authorized version. Bilson died on the 18th of June, 1616, and was buried, say some, on the south side of Westminster Abbey, near the monument of King Richard II., or, according to the register, near the entrance into St. Edmund's Chapel.

Bilson left several volumes in MS., containing 'Orationes,' 'Carmina Varia,' 'Vulgaria,' &c.; in addition to which his principal published works still remaining to be noticed are:— 'Of the True Difference between Christian Subjection and Unchristian Rebellion, wherein the Prince's lawful Power to command and bear the sword are defended against the Pope's censure, and Jesuits' Sophisms in their Apology and Defence of English Catholics. Also a Demonstration that the things reformed in the Church of England by the Laws of this Realm are truly Catholic, against the late Rhemish Testament,' 4to, Oxford, 1585. This work, which owed its inspiration to Queen Elizabeth, was intended on the one hand to confute the Romish party who were plotting against her throne; and on the other to defend her interference to save the Protestants of the Low Countries from sinking under the power of their old master, the King of Spain. It is still valuable as representing the *via media* of 16th century Anglicanism; but its results, although it served the present turn of Elizabeth, were disastrous to her successor, Charles I., inasmuch as no book was so constantly quoted by that unfortunate monarch's opponents when they wished to justify their antagonism to his power. Besides the 'Young Man's Help,' &c., which in 1704 had been printed five times, Bilson produced his great work, which enjoys the reputation of being one of the most able and complete treatises ever written in defence of the apostolic succession and the doctrine of episcopacy. Its full title will sufficiently describe its method and its contents:—'Of the Perpetual Government of Christ, his Church; wherein are handled the fatherly superiority which God first established in the Patriarchs for the Guiding of His Church, and after continued in the tribe of Levi and the Prophets; and lastlie confirmed in the New Testament to the Apostles and their successors. As also the Points in Question at this day, touching the Jewish Synedrion; the true Kingdome of Christ; the Apostles' Commission; the Laie Presbiterie; the distinction of Bishops from Presbyters; and their succession from the Apostles' Times and Hands; the calling and moderating of Provincial Synodes by Primates and Metropolitans; the allotting of Dioceses, and the popular electing of such as must feed and watch the Flocke; and divers other points concerning the Pastorall Regiment of the House of God,' London, 1593; 4to, London, 1610; in Latin, 4to, London, 1611. An edition of this work was published at the Oxford University Press in 1842.

BINET, CLAUDE, a French poet, who flourished in the last half of the 16th century. He was a native of Beauvais; was an advocate, and held an official appointment. He wrote and published eclogues, court pastorals, and occasional pieces, but his poems, so far from preserving his memory, would themselves hardly have been remembered, but for his connection with Ronsard, who charged him with the posthumous publication of his complete works, and of whose life he has preserved some interesting particulars. These are contained in what he called a 'Discours de la Vie de P. de Ronsard, Prince des Poëtes Fran-

çois ; avec une Eclogue représentée en ses obsèques, par Claude Binet. Plus les vers composez par le dict Ronsard peu avant sa mort : ensemble son tombeau recueilli de plusieurs excellens personages,' 4to, Paris, 1586. The funeral obsequies here referred to were performed three months after the death of Ronsard, when, after a sermon preached in honour of the deceased poet by Duperron, bishop of Evreux, and afterwards cardinal, the ceremony was terminated by the recitation of Binet's allegorical eclogue. Binet's 'Vie de P. de Ronsard,' is printed in the 'Archives Curieuses de l'Histoire de France,' 1ère serie, tom. 10, 8vo, 1834. Binet's verses include an "Ode sur la Naissance et sur le Baptême de Marie Elisabeth de Valois, fille unique de France," 1572 ; 'Adieu de la France au Roi de Pologne, et l'Adieu du Roi de Pologne à la France,' 1573 ; 'Rencontre merveilleuse sur les noms tournés du Roi et de la Roïne,' 1574 ; 'Les Daulphins, ou le Retour du Roi, avec le chant des sereines, qui est une Épithalame sur le mariage du Roi, Henri III.,' 1575 ; 'Adonis, ou le Trepas du Roi Charles IX.,' 1583. Several of his poems were published by Binet, at the end of the 'Œuvres de Jean B. Laperuse.' Besides his original poems, Binet published a metrical translation of Jean Dorat's Latin version of the Oracles of the Twelve Sibyls ; and a discourse 'Ad Deum Opt. Max. Oratio pestilentia tempore,' 4to 1581.

BINNEY, AMOS, an American conchologist, who carried on the line of pursuit which had been commenced by Say, viz. the investigation of the terrestrial and fluviatile gasteropods of North America. Possessed of ample means, he devoted much leisure time and money to the acquisition of shells and conchological works ; and gradually collected a library which at the time of his death was probably the best of its kind in the United States. He wrote several papers for the 'Proceedings' and 'Journal' of the Boston Society of Natural History, of which society he was one of the founders and presidents. His principal paper is 'A Monograph of the *Helices* inhabiting the United States,' which extends over upwards of 100 pages in vols. i. and iii. of the above-mentioned 'Journal.' This was one result of the more extended inquiries which he pursued for many of the later years of his life, and which culminated in the magnificent work which will always be associated with his name as one of the pioneer conchologists of his country, viz. his 'Terrestrial Mollusks of the United States.' He himself did not live to complete it, but in his will he provided for its continuation and publication. This task devolved upon Dr. A. A. Gould, who issued the first two volumes in 1851, and the third in 1859, at a cost of 2500l. The work is very rare, as only 400 copies were printed. His son,

WILLIAM G. BINNEY has also attained eminence as a conchologist. He has followed the same branch of the study as his father, and has contributed a supplement to the 'Terrestrial Mollusks,' forming vol. iv. of that work. He has written several papers for the 'Proceedings of the Academy of Nat. Science' at Philadelphia from 1857 onwards ; but his principal work has been done in connection with the Smithsonian Institution, for which he has drawn up check lists and descriptions of the terrestrial and fluviatile gasteropods of the United States ; and 'Bibliography of North American Conchology previous to the year 1860,' Pt. I. 1864, which is a most valuable work of reference on the subject it pertains to.

* BINNEY, THOMAS, an eminent Congregational divine, was born at Newcastle-on-Tyne about the year 1798. His parents were in rather humble circumstances, and for a period of seven years he was engaged in a bookseller's shop. Whilst so occupied he nevertheless found it possible, by a strict economy of his spare moments, to acquire a considerable acquaintance with Latin and Greek, and a great facility in English composition. He received his professional education at Wyndley College ; and after presiding over a congregation at Bedford, removed to Newport in the Isle of Wight, where he was ordained to the ministry. In 1829 he migrated to London, in order to undertake the pastorate of the "King's Weigh-House Chapel," at that time situated in Eastcheap. The new King's Weigh-House Chapel, Fish-street Hill, was commenced in 1834 ; and on the occasion of the laying of the first stone of this building, December 12th, Mr. Binney delivered an address which attracted much attention and gave rise to considerable discussion. He soon afterwards published a sermon preached at the Poultry Chapel, London, entitled 'Dissent not Schism,' in which, as well as in other vigorous productions, he explained and vindicated the position of Congregational dissenters. One of the best known of these is his 'Conscientious Clerical Nonconformity,' 1839, of which a fifth edition was issued in 1860. Mr. Binney's life has been diversified by two important

journeys. In 1845 he travelled in America and the Canadas ; and in 1857 he set out on a tour through the Australian colonies, to which he was attracted in part by the settlement of his sons there. Here he continued for about two years, preaching and lecturing to large audiences. As an instance of the favour with which he was received, it may be mentioned that the clergy of the Episcopal Church wished to welcome him to their pulpits. This led to an important correspondence between Mr. Binney and the Bishop of Adelaide, which excited much attention when it appeared in the English and Australian journals. During his stay in Australia, Mr. Binney published a work on 'The Bishop of Adelaide's Idea of the Church of the Future,' which was afterwards published, with additions, in London, with the title 'Lights and Shadows of Church Life in Australia, including Thoughts on some Things at Home,' 1860. On his return to England Mr. Binney resumed his pastorate at the King's Weigh-House Chapel, with which he still continues in close relation, though he has retired from the pastorate. He prefers to use an untitled name, although he has received from the University of Aberdeen the degree of LL.D., and that of D.D. from a university in the United States of America. Especially eminent as a powerful and eloquent preacher, Mr. Binney is scarcely less eminent as a writer. Without seeking to be an author, and without adequate time for authorship in his busy life, he has yet, almost in spite of himself, become an extensive book-producer. His Lectures and Sermons have been asked for in print, and have sometimes on revision grown into books. Notably was this the case with two of his 'Lectures to Young Men,' which grew under his hand into two small volumes—one on Sir Thomas Fowell Buxton, and the other entitled 'Is it Possible to make the Best of Both Worlds?' Others of Mr. Binney's numerous productions are :—'Life of the Rev. Stephen Morrell,' 1826 ; a discourse on the 'Ultimate Design of the Christian Ministry,' 1827 ; pamphlets discussing religious questions, and signed 'Fiat Justitia,' about 1830 ; 'The Practical Power of Faith,' 1830, a series of discourses on the eleventh chapter of Hebrews, regarded by its author as one of his principal works, and which has reached a third edition ; the 'Service of Song in the House of the Lord,' 1848 ; and the 'Closet and the Church,' 1849. Mr. Binney's later works include 'Money : a Popular Exposition in Rough Notes,' 1864, which reached a fourth edition in 1866 ; 'St. Paul, his Life and Ministry,' second edition, 1866 ; a work on Ritualism, entitled 'Micah, the Priestmaker,' 1867, which immediately went into a second edition ; and 'From Seventeen to Thirty, the Town Life of a Youth from the Country : Lessons from the History of Joseph,' 1868. A few hymns of considerable merit vindicate Mr. Binney's claim to the title of being a sacred poet.

BIOT, JEAN BAPTISTE. [E. C. vol. i. col. 699—701.] M. Biot died on the 2nd of February, 1862, within two months of completing his 88th year. Four years before his decease, he had collected and published his less strictly scientific writings, under the title of 'Mélanges Scientifiques et Littéraires,' 3 vols. 8vo, Paris, 1858.

* BIRCH, SAMUEL, a distinguished Egyptologist and antiquary, keeper of the department of Oriental and British antiquities in the British Museum, was born in London, November the 3rd, 1813. The son of the Rev. Samuel Birch, D.D., rector of St. Mary Woolnoth, London, and vicar of Little Marlow, Buckinghamshire, he was educated in private schools under his father's eye, till he was transferred to Merchant Taylors' School, where he completed his academic training. After occupying a post under the Record Commissioners, Mr. Birch was in 1836 appointed an assistant in the department of antiquities in the British Museum. In this department he has ever since continued, rising step by step, till at the rearrangement of offices in 1861 he was placed at the head of the section of Oriental, Mediæval, and British Antiquities and of the Ethnographical Collections, with the title of keeper. In this important and responsible office Mr. Birch has of course had to perform a vast amount of merely routine labour, but beyond that the selection, purchase, and rearrangement of the great collections have entailed immense toil. Yet withal Mr. Birch has found time to pursue original investigation in Egyptian archaeology, philology, numismatics, the ceramic arts, and general antiquities, and to enrich our literature with one or two works of standard value, besides contributing a very large number of papers to learned societies, and to antiquarian and scientific journals.

Egyptian antiquities in the broadest sense of the term formed almost from his youth Mr. Birch's leading subject of study. As early as 1838 he published a 'Sketch of a Hieroglyphical Dic-

tionary,' 4to, and from that time his dissertations on special subjects have been very numerous. From among them a few may be cited by way of illustration:—'On an Egyptian Tomb in the British Museum,' 'Upon an Historical Tablet of Rameses II. of the 19th dynasty, relating to the Gold Mines of Æthiopia,' and several others in the 'Archæologia'; 'Observations upon the Hieratical Canon of Egyptian Kings at Turin,' 'Upon the newly-discovered fragment of the Statistical Tablet of Karnak,' 1862, and several others in the 'Transactions of the Royal Society of Literature'; 'Lettres à M. Letronne' in the 'Revue Archéologique,' Paris, 1847—48; 'Sur l'Expression Hiéroglyphique du mot Egyptien *Calasiris*,' 'Sur la Famille de Psammetichus dans la 26^e Dynastie,' 'Sur le Cartouche Egyptien, trouvé par M. Layard dans les ruines de Nimroud,' 'Sur l'Expression Hiéroglyphique de deux noms propres Egyptiens,' 'Sur quelques Groupes Hiéroglyphiques à propos d'un ouvrage de l'Abbé Lanci,' and 'Sur un Papyrus Magique du Musée Britannique,' 1859; 'Observations on an Egyptian Calendar of the reign of Philip Aridæus,' 'Notes upon a Mummy of the age of the 26th Egyptian dynasty,' 'On a remarkable object of the reign of Amenophis III.,' 'On Gold Jewelled Ornaments found near Thebes in 1859,' and several others in the 'Archæological Journal'; 'Researches relative to the Connection of the Deities represented upon the Coins of Egyptian Nomes with the Egyptian Pantheon,' and several others in the 'Numismatic Chronicle'; 'Notes upon Obelisks,' in the 2nd vol. of the 'Museum of Classical Antiquities,' and various papers elsewhere. Some of his most elaborate descriptions are those of an official or semi-official character, as 'Descriptions of the Papyrus of Nas-Khem, Priest of Amen-Ra, discovered in an excavation made by direction of H.R.H. the Prince of Wales . . . in a tomb near Gournal, at Thebes,' 4to, 1863; 'Fac-similes of the Egyptian Relics discovered at Thebes in the Tomb of Queen Aah-Hotep (circa B.C. 1800), exhibited at the International Exhibition of 1862,' obl. 4to, 1863; 'Fac-similes of two Papyri found in a Tomb at Thebes. With a Translation by S. B.,' obl. fol. 1863; 'Inscriptions in the Hieratic and Demotic Character, from the Collections in the British Museum,' folio, 1868. On subjects of a somewhat similar class we have 'Inscriptions in the Himyaritic Character, discovered chiefly in Southern Arabia, and now in the British Museum,' 4to, 1863; some translations from the Chinese in the 'Asiatic Journal,' and papers in the 'Archæologische Zeitung.' Mr. Birch's Egyptian studies brought him into close intimacy with the late Baron Bunsen, whose laborious investigations in early history he for many years greatly assisted, and by Bunsen's particular request the revision of his great work, 'Egypt's Place in Universal History,' was undertaken by Mr. Birch, who made important additions to the fifth and concluding volume, and revised and enlarged the new edition of the first volume. In numismatics, and particularly in reference to Greek and Oriental coins, Mr. Birch has largely augmented our information by descriptions of particular coins and catalogues of inedited specimens published in the 'Numismatic Chronicle' from 1839 to nearly the present time. His chief substantive work, however, is his 'History of Ancient Pottery,' 2 vols. 8vo, 1858, by far the most complete, and generally accepted as the standard, work on the subject. The 'Catalogue of Greek and Etruscan Vases in the British Museum' was written by Mr. Birch in conjunction with Mr. Newton. He also wrote the descriptive and historical notices in 'The Gallery of Antiquities, selected from the British Museum,' by F. Arundale and J. Bonomi, 4to, 1842; 'Views on the Nile, by Owen Jones and Jules Goury,' folio, 1843; also the 'Introduction to the Study of Egyptian Hieroglyphics' prefixed to Sir Gardner Wilkinson's Crystal Palace hand-book, 'Egypt in the time of the Pharaohs.' To the Arts and Sciences division of the English Cyclopædia Mr. Birch contributed, among others, the articles Hieroglyphics, Mummy, Pyramid, Serapeum, Papyrus, Seal, Numismatics, Pottery, and Vases. The honorary degree of LL.D. was conferred upon Mr. Birch by the University of St. Andrews in 1839, and he is a member and director of the Archæological Institute of Rome, a member of the Académie des Inscriptions and of the Oriental Society of France (1861), of the Berlin Academy, of the Ethnological Society of America, and of other foreign learned societies, a fellow of the Society of Antiquaries, and an honorary member of the Royal Society of Literature.

BIRKENHEAD, BERKENHEADE, or BIRKENHOUT, SIR JOHN, a noted Royalist writer, was born at Rudheath, Cheshire, about 1615; and in 1632, was entered as a servitor at Oriel College, Oxford. On leaving college he was, on the recommendation of his tutor, Humphrey Lloyd, afterwards

BIOG. DIV.—SUP.

Bishop of Bangor, appointed Secretary to Archbishop Laud, who in 1639 created him master of arts, by diploma, and secured his election in 1640, as Fellow of All Souls' College, Oxford, where he went into residence. When Charles I. was at Oxford, Birkenhead was recommended as well qualified to write the broadsheet which it was proposed to set up in support of the court. Birkenhead accordingly brought out his 'Mercurius Aulicus,' and carried it on regularly and with abundant vigour and scurrility from 1642 till towards the end of 1645, after which its appearance was only occasional. The 'Mercurius Aulicus' was the favourite newspaper of the Royalists, and was long held up as a model of wit and satire. Its satire, at least its invective, was sufficiently keen and trenchant, but its wit would now be thought very coarse buffoonery, and it probably did more harm than good to the royal cause. The king did not think so, however, and when about to leave Oxford he showed his sense of Birkenhead's service by procuring his election as reader in moral philosophy. This office Birkenhead retained till 1648, when he was expelled by the parliamentary visitors. Removing to London, he studied civil law, and employed his pen in composing various satires, Hudibrastic ballads, and political lampoons, which were freely circulated in MS. It was about this time that he wrote his once famous 'Assembly Man,' though it was first printed in 1662: it was reprinted in 1682, 1704, and in the 'Harleian Miscellany.' 'Paul's Church Yard,' in two parts, or centuries, also belongs to this time; the first editions are quartos of eight pages each, without dates; the reprint entitled 'Two Centuries of Paul's Church Yard,' was a thin 12mo volume, having at the end Birkenhead's 'Bibliotheca Parliamenti'—all are unsparing satires on republicans and parliament men. 'News from Pembroke and Montgomery; or Oxford Manchestered,' 1649, is another satirical pamphlet, in the form of a pretended speech, delivered by Philip Earl of Pembroke and Montgomery, on being sent by the Parliament to new-model the University of Oxford, as the Earl of Manchester, the Parliamentary chancellor, had remodelled Cambridge. Birkenhead's loyalty caused him to be suspected, and brought him more than once within the walls of a prison: but he escaped without material hurt, and at the Restoration received his reward. In pursuance of the royal letters he was created D.C.L. at Oxford, on the 6th of April, 1661; was elected the same year M.P. for Wilton; was knighted November 14, 1662, and appointed Master of the Faculty Office and of the Court of Requests. He continued a favourite at court, though his prosperity excited some envy and enmity. He died on the 4th of December, 1679, and was buried in the church of St. Martin-in-the-Fields. Sir John Birkenhead was one of the early Fellows of the Royal Society.

* **BIRNBAUM, JOHANN MICHAEL FRANZ**, an eminent German jurist, was born at Bamberg, in Bavaria, on the 19th of September, 1792; studied successively at Erlangen, at Landshutt, and at Wurzburg, where he was admitted D.C.L. in 1815. For two years he dwelt at Frankfurt as tutor to the sons of the Count von Westphalen, filling his leisure with the composition of a trilogy called 'Adalbert von Babenberg,' and a drama entitled 'Alberade,' both of which were produced on the stage with a certain measure of success. But he soon satisfied himself of the incompatibility of poetry with law, and determined to concentrate his energies on the latter pursuit. In 1817 he obtained the appointment of professor of law in the newly-restored University of Louvain. His learning, lucidity of exposition, and the depth and breadth of his teaching gave his chair a great reputation, which steadily increased till the Revolution of 1830, when Birnbaum and the other foreign professors were discharged from their posts by a vote of the Provisional Government of Belgium. Birnbaum retired to Bonn, where he gave lectures. Removing to Freiburg, he was named Councillor of the Court and Professor of Civil and Criminal Law. In 1833 he went as professor to Utrecht, but removed by invitation, in 1840, to Giessen, where, in addition to his professorship, he was in 1847 nominated Chancellor of the University. Whilst at Louvain, he founded the 'Bibliothèque du Jurisconsulte,' to which he contributed some valuable papers: it was afterwards merged in the Parisian 'Themis.' His separate works are—1. 'Deduction der Rechte des Herzogs von Loos-Corswarem auf das Fürstenthum Rheina-Wolbeck,' Aix-la-Chapelle, 1830, a work which though dealing primarily with local rights, was so treated as to be of more than local value. 2. 'Die Rechtliche Natur der Zehnten,' Bonn, 1831, a work on the Legal Character of Tithes, considered by German lawyers the ablest that had been produced on the subject. 3. 'Commentatio de Hugonis Grotii

R

in definiendo jure naturali vera mente,' Bonn, 1835, also an important and standard work. The great treatise on the principles of criminal law which had for many years been looked for from Herr Birnbaum he appears never to have found leisure to complete.

* BISCHOF, CARL GUSTAV CHRISTOPH, an eminent German chemist and physical geologist, was born January 18, 1792, at Nürnberg, Bavaria, and received his education at the University of Erlangen, where he first gave attention to mathematics and astronomy; but afterwards abandoned these for chemistry, upon which subject Hildebrandt was then the lecturer. From 1819 onward he frequently assisted the professor of chemistry and technology at Bonn; and he himself took the chair in 1822, since which time he has performed the duties connected therewith uninterruptedly at the university of Bonn. He has written numerous papers (106 being cited in the Royal Society's 'Catalogue of Scientific Papers'); they relate to chemistry and physics more especially as applied to natural phenomena. One paper, mostly by him, is apparently omitted in the above-mentioned Catalogue. It gives the details of an inquiry upon the phosphorescent qualities of subterranean rhizomorph plants, which he undertook in co-operation with Nees von Esenbeck and others. It is, however, entered under Bischoff, G. W. He has also written several works, of which the most important are 'Die vulkanischen Mineralquellen Deutschlands und Frankreichs,' 8vo, 1826; 'Die Wärmelehre des Innern unseres Erdkörpers,' 8vo, 1837; and 'Lehrbuch der chemischen und physikalischen Geologie,' 3 vols. 8vo, 1847—1854, of which a second edition appeared in 1863—64. His reputation and fame mainly rest upon the last-mentioned work, which is well known to English geologists in the translated, rearranged, and condensed form issued by the Cavendish Society. This work is a storehouse of valuable facts; but its main purpose is to show that a large number of eminent geologists had assigned to heat a share in the formation and alteration of minerals and rocks far greater than observable facts warrant. This he does by demonstrating what laws of combination prevail amongst minerals; the conditions under which pseudomorphoses and metamorphoses occur; and by describing the composition, distribution, and alternative action of waters and native gases. He has done excellent service to geology by his experiments and reasonings indicating what water can do, or has done. His enthusiasm for his own views seems, however, to have led him, in many instances, to depreciate the true influence which heat has had in altering rocks, and to misconceive the precise views held by plutonists. On the whole, then, his conclusions, though not entirely safe or satisfactory, seem to be more right than wrong.

BISCHOFF, GOTTLIEB WILHELM, botanist, was born at Durckheim, in 1797. In his early manhood he acquired considerable skill in painting and drawing, the result of his attendance at the Academy of Art at Munich. In 1821 he went to Erlangen, and there he zealously devoted himself to the study of botany under the instructions of Koch and Martius. These studies were prosecuted for nearly three years. It was during this period that he produced what seems to be his earliest botanical work. It is entitled, 'Die botanische Kunstsprache,' 1822, which is a dictionary of the technical terms used in botany, illustrated by upwards of 500 lithographed figures, all of which are drawn by himself. To this period also belongs his article in 'Flora,' vol. vi., on a 'Botanische Alpenreise durch Salzburg und einen Theil von Kärnten und Tyrol, im Juni und Juli, 1822.' In the autumn of the following year he returned to his native town, and stayed with his father for a few months, after which he proceeded to Erlangen, and in 1824 commenced his career as a teacher of botany. In the following year his 'De plantarum præsertim cryptogamicarum transitu et analogia' was published, which led to his undertaking a more elaborate work on the same subject. Of this the first part was issued in 1828, under the title of 'Die Kryptogamische Gewächse,' and soon after a second part appeared; but the work does not seem to have been completed. The first part comprises the *Characeæ* and *Equisetaceæ*; and the second the *Rhizocarpeæ* and *Lycopodiaceæ*. They give an excellent and well-arranged epitome of all that was then known respecting the groups named. There are thirteen plates, the figures on which are drawn from nature by the author. The work promised to be, when finished, his most important production. In 1831 he published his 'Grundriss der Medicinischen Botanik,' which is a general outline of botany for the use of medical students, and was the forerunner of his 'Medicinische-pharmaceutische Botanik,' which covers the same ground; but the matter is handled in a better way and on

a different plan. From 1830 to 1844 his time was, however, mostly occupied in compiling the work with which his name is usually associated, viz., the 'Handbuch der botanischen Terminologie und Systemkunde,' forming three thick quarto volumes, and which is intended as a substitute for a second edition of his earlier work of 1822. The terms are arranged according to a method; but the search for any particular word is rendered easy by an elaborate alphabetical index, which extends over 350 pages. In his earlier works the full merit of his original drawings is not perceived as rendered by the lithographer; but in the present his skill and taste, as well as his accuracy, are exceedingly well rendered by Prestele and Schach. There are 3911 cuts, all, or at any rate nearly all, of which are drawn from nature, and it is upon these that his reputation as a skilful draughtsman has been based. While engaged on this work he was appointed, first, in 1833, extraordinary, and next, in 1839, ordinary professor of botany, which latter post he retained till he was carried off by a fit of apoplexy on September 1, 1854. In addition to the above-mentioned works, he wrote several papers for the scientific journals, most of them relating to cryptogams. The most important of them is 'Bemerkungen über die Lebermoose, vorzüglich aus der Gruppen der Marchantien und Riccieen, nebst Beschreibung mehreren theils kritischer, theils neuer Arten,' in the 'Nova Acta phys. med. Acad. Cæs. Leop. Carol. Nat. Curiosorum,' xvii. p. 909—1088 (1835), which may be regarded as a third instalment of his work on cryptogams. It is accompanied by five plates of cuts drawn by himself, which are equal to the best in his 'Handbuch.'

* BISCHOFF, THEODOR LUDWIG WILHELM, physiologist and anatomist, was born on October 28, 1807, at Hanover. His father, Christophe Heinrich Bischoff, was a professor in the university of Bonn, and superintended the studies of his son at Düsseldorf, Bonn, and Heidelberg, who, after gaining the doctorates of philosophy in 1829, and of medicine in 1832, was appointed an assistant physician at the lying-in hospital connected with the university of Berlin. Here he became acquainted with Müller and Ehrenberg, and commenced the line of study to which a large portion of his subsequent life has been devoted. Thus in 1833 the treatise he wrote as a proof of his qualifications to be a teacher was entitled, 'Beiträge zur Lehre von der Eihüllen der Menschlichen Fötus,' but it was not published till the following year. In 1834 he first gave his attention to the development of the egg in the rabbit, which inquiry hung on his hands for several years. In 1835 he commenced, at Heidelberg, a course of lectures on comparative pathological anatomy; in the following year he was appointed extraordinary professor of anatomy, and in 1843 ordinary professor. From the time when he first attained professorial rank his studies, so far as original research are concerned, have been almost exclusively devoted to the development of the egg, and of the embryo, more especially in the *Mammalia*. In 1840, the Prussian Royal Academy of Science proposed a prize for the best memoir on the embryology of some mammal, and this stimulated him to prosecute his researches on rabbits with greater vigour; and his memoir, 'Entwicklungsgeschichte des Kaninchens Eies,' won the first prize, and was published in 1840. Thus encouraged, he pursued his work, and issued similar treatises on the eggs and embryos of the dog (in 1845), the guinea-pig (in 1852), and of the roe-buck (in 1854). These are also illustrated by numerous plates, and have taken rank amongst the best works of this class, and obtained for him a high reputation. While thus occupied, however, various personal events had occurred. Thus in 1843 he moved to Giessen, having been appointed to the chair of physiology there, and in the ten following years he founded and established a physiological institute and an anatomical hall. In 1844 he contributed the seventh volume to the new edition of Sömmerring's work on the Anatomy of Man. It is entitled 'Entwicklungsgeschichte der Säugethiere und der Menschen,' and is a complete digest of what was known at the time respecting the growth and changes of structure undergone by the egg and embryo in the mammalian class. This work exemplifies his power of reading and digesting large masses of literature, and his skill as a reporter is further shown by the series of reports, which he drew up for Müller's 'Archiv,' on the progress of physiology, during the years 1839 to 1846, both inclusive. In 1850 he was a witness in the celebrated Görlitz law case, in which eminent physiologists took up positions both for and against the possibility of death arising from spontaneous combustion of the body. Siebold was a prominent defender, and Bischoff a conspicuous opponent, of the hypothesis of spontaneous combustion. His fame, by this time

had so spread that many universities had asked him to join their professorial staff, but he declined all such offers until in 1854 he was induced to accept the chair of human anatomy and physiology at Munich. Many papers and separate publications have been written by him in addition to those already noticed; a full list of the papers up to 1863 will be found in the Royal Society's 'Catalogue of Scientific Papers;' and we add here his principal productions since that date. In the 'Sitzungsberichte' of the Bavarian Academy of Science for 1865 occur—'Ueber das Vorkommen eines eigenthümlichen Blut und Hæmatoidin enthalten den Beutels an der Placenta der Fischotter (*Lutra vulgaris*);' and 'Ueber die Ei- und Placentabildung des Stein- und Edelmarders, *Mustela foina* und *martes*, und des Wiesels, *Mustela vulgaris*.' In 1867 appeared a work on the influence of recruiting in modifying the development and stature of peoples, and his memoir, 'Ueber die Verscheidenheit in der Schädelbildung des Gorilla, Chimpanse und Orang-outang, vorzüglich nach Geschlecht und Alter, nebst einer Bemerkung ueber die Darwinische Theorie,' which is an important work on the skulls of the apes mentioned. It is fully illustrated and contains a chapter on the Darwinian theory, in which he comes to conclusions opposed to the hypothesis of the descent of man from any of them. In 1868 it was followed by another memoir, which may be regarded as the complement to that of 1867; it is entitled 'Die Grosshirn Windungen des Menschen mit Berücksichtigung ihrer Entwicklung bei den Fœtus und ihrer Anordnung bei dem Affen.' In this year he also published some new observations on the development of the Guinea-pig.

As regards our knowledge of the mammalian egg, Bischoff takes a prominent place among those who established and more fully developed the general facts which had been announced by the pioneers in this line of discovery, viz., Purkinje, Wagner, Baer, Coste, Wharton Jones, and a few others.

BISHOP, GEORGE, F.R.S., a munificent encourager of astronomical science, was born in 1784. His occupation was that of a manufacturer of sweets, or British wines, but his favourite subject of study was astronomy. When, in 1836, he took up his abode at South Bank, Regent's Park, he built a well-designed observatory, and stocked it with the best instruments. This observatory acquired a European reputation, on account of the important discoveries made there. The first regular observer was the Rev. W. R. Dawes, who took charge of the instruments in 1839. To him succeeded Mr. Hind, in 1844. In the hands of this accomplished observer, no fewer than ten planets, or minor planets, were discovered by the great telescope at Mr. Bishop's observatory; the first being *Isis*, discovered on the 13th of August, 1847. Mr. Marth, at the same place, discovered an eleventh planetoid, *Amphitrite*, on the 1st of March, 1855. Three comets were also discovered there. Not only were the instruments of high character, but the system of exploring adopted was very complete. Mr. Bishop was successively secretary, treasurer, and president of the Astronomical Society, in the management of which he took an active part for twenty-five years. He was also a member of the council of University College, and a fellow of the Royal Society. Mr. Bishop published a splendid volume, containing Mr. Dawes's valuable catalogue of measures of double stars; and at his expense was also prepared a series of charts of telescopic stars situated near the Ecliptic, which were guides to the discovery of the planetoids *Iris*, *Flora*, *Victoria*, *Irene*, *Melpomene*, *Fortuna*, *Calliope*, *Thalia*, *Euterpe*, *Urania*, and *Amphitrite*, by Mr. Hind and Mr. Marth. Mr. Bishop died on the 14th of June, 1861. Since his death, the instruments have been removed to Meadow Bank, Twickenham, where Mr. Bishop, jun., has built a larger observatory for them. The Equatorial, by Dollond, is 7 inches aperture, 10½ feet focal length; the altitude and azimuth instrument is by Troughton.

* BISMARCK-SCHÖNHAUSEN, OTTO EDWARD LEOPOLD, GRAF VON, Minister-President of Prussia, and Chancellor of the North German Confederation, was born on the 1st of April, 1815, at Schönhausen, the ancestral estate of his family, in the Alt Mark. But the scene of his earliest years was Kniephof, in Pomerania, a nightly estate, to which, with two others, his parents succeeded on the death of a cousin in 1816. About Easter, 1821, he entered the school of Professor Plamann, at Berlin, where he remained till 1827, when he left it to pursue his more classical studies at the Friedrich Wilhelm Gymnasium. He migrated in 1830 to the Graue Kloster Gymnasium, for the advantage of being an inmate of the house of Professor Prévost, from whom, after a year, he passed to Dr. Bonnell. With the

last-named he continued until, at Easter, 1832, he quitted the Kloster, after his examination, to study law, to which he devoted himself with irregular assiduity, at the universities, first of Göttingen, and afterwards, in the autumn of 1833, of Berlin. About Easter, 1835, he was sworn in as Amscultator, or Examiner, in a magistrate's court at Berlin; but, in 1836, left the department of Justice for that of Administration, in which, as a future diplomatist, it was necessary for him to serve. He accordingly went to Aachen (Aix-la-Chapelle) to the Crown Court, from which, in the autumn of 1837, he found it expedient to be transferred to the Crown-office at Potsdam. In 1838 he entered the Jäger Guard, to fulfil his military duties; and, in the same year, exchanged into the second battalion of Jägers, at Greifswald, hoping to attend the lectures of the Agricultural Academy of Eldena. In the summer of 1839 he entered, jointly with his elder brother Bernhard, on the management of the paternal estates in Pomerania, which were in a very critical condition, and which were granted to them by their father, as the only way in which they could be preserved. In 1841 a division of the estates took place in such a manner that Bernhard von Bismarck retained Külz, whilst Otto received Kniephof and Jarachelin. The latter now succeeded his brother as Landrath of the circle of Naugard, and was chosen representative in the Provincial Pomeranian Diet, the unimportant functions of which, however, he impatiently resigned. His life at Kniephof oscillated between political discussions, studies in history, philosophy, and theology, and eccentricity and dissipation of such a nature as to win for him from the sedater society of Pomerania the sobriquet of "Mad Bismarck." About this time he visited France and England, of the languages of which he had a competent knowledge; and upon his return resumed the position of Referendarius under the Crown at Potsdam. After the death of the elder Bismarck, in November, 1845, the sons so divided the property that the elder retained Külz and received Jarachelin, whilst the younger retained Kniephof and added to it Schönhausen. Thereupon, Otto von Bismarck fixed his residence at Schönhausen, became Dyke Captain there, and afterwards Knights' Deputy in the circle of Jerichow in the Saxon Provincial Diet at Merseburg. In that capacity he attended the first meeting of the United Diets in 1847, on which occasion he first attracted the notice of the public to himself in more extended circles. But before his life becomes more exclusively political, it may be mentioned that, on the 28th of July, 1847, he married Johanna, only daughter of Herr von Puttkammer, of Kartum, and the Lady Luitgarde, born Von Glasenapp of Renfeld. On his wedding tour, Bismarck accidentally met his king, Friedrich Wilhelm IV., at Venice, a circumstance which laid the foundation for the favour with which he was always regarded by that monarch. His marriage has been blessed with three children, a daughter and two sons, born respectively in 1848, at Schönhausen; in 1849, at Berlin; and in 1852, at Frankfurt-on-the-Main. At the first United Diet, which met, in 1847, in the White Saloon of the Royal Palace at Colln-on-the-Spre, Bismarck was impressed with the idea that liberalism might endanger the throne of his feudal lord, the Margrave of Brandenburg, the King of Prussia; and he indulged in bold and unpopular speeches in favour of the royal prerogatives. It is imputed to him that he expressed an opinion that all great cities should be levelled with the ground, as being centres of democracy and constitutionalism. When the first news arrived of the Revolution of February in Paris, Bismarck knew that the signal for a struggle with the Prussian monarchy had there been given; but he neither modified the theories to which he had given utterance, nor abated his preparations for resistance. Against the democratic precipitation of the Second United Diet, which held its first session on the 2nd of April, 1848, he found himself powerless for the moment to do much more than protest. Yet he went on in such a course of action as he found practicable, holding conferences, instituting clubs and patriotic societies, and founding or furthering such journals as the 'New Prussian Gazette' and the 'New Prussian Sunday News.' During that summer, so fraught with weighty events, Bismarck was often called to Sans Souci, and the king took his advice in many affairs of importance. After the publication of the December constitution of 1848, he was, in the same month, elected in Brandenburg the representative of West-Havelland, as a member of the Second Chamber; and was among the first members to repair to the opening of the Diet, on the 26th of February, 1849. In 1849—51 Bismarck occupied a position in the Diet as one of the chief leaders of the conservative party against the democratic; and he entered into the strife with ardour, defending

at every point of attack, whether at Berlin or at Erfurt, the threatened sovereignty of Prussia.

"Our watchword," he wrote, in an album of Dr. Stahl's, at Erfurt, 24th April, 1850, "our watchword, therefore, is not 'a united state at any price,' but 'the independence of the Prussian crown at every price.'" In May, 1851, Bismarck was appointed to the post of First Secretary of the embassy to the Diet of Frankfurt, with the title of privy councillor; and on the 18th of August following, received the rank of ambassador. The duties of this position were, at this time, exceptionally difficult, as the circumstances of Prussia were exceptionally critical. Bismarck expressed the conviction that Austria would strive to retain Prussia in such a state of humiliation as would end in the final destruction of Germany; and in spite of his traditional inclination to the Austrian alliance, he resolved upon opposition. Notwithstanding the antagonism which arose from his claims to achieve for Prussia an equality with Austria at the Diet, Bismarck lived on terms of greater or less friendship and intimacy with a series of three Austrian ambassadors who were his contemporaries at Frankfurt, a circumstance in great part owing to the fact that in his federal policy he went hand in hand with them. In May, 1852, he was intrusted with an important mission to Vienna, on which occasion he followed the imperial court into Hungary; and in the summer of the following year, fulfilled other missions in various parts of Europe. During the summer of 1855, he visited the Exhibition at Paris, and was introduced to the Emperor of the French, with whom, on a subsequent visit to Paris in 1857, he had his first special political conference. He was recalled from his Frankfurt mission in 1859, and sent as Prussian ambassador to the court of St. Petersburg, to which he was accredited on the 1st of April. Here, amongst his other duties, he endeavoured to further the plans he had conceived at Frankfurt, of an alliance between Russia, France, and Prussia, for the purpose of securing to Prussia supremacy in Germany, in the interests of German unity. His residence at St. Petersburg, varied by several absences to different parts of Russia and Germany, extended to 1862, by which time he had gained the esteem and confidence of the Czar, who conferred on him the order of St. Alexander Newski. On the 23rd of May of this year, he was appointed ambassador to Paris, and delivered his credentials to the Emperor, on the 1st of June; at the end of which month he took a short trip to the Exhibition in London, returning to Paris on the 5th of July. His mission to France commenced with the best of omens, but it was of short continuance; for, whilst enjoying an excursion to the Pyrenees, he was summoned by telegraph to Berlin, where he arrived, in September, 1862, to undertake, in extremely critical circumstances, the Premiership and the Ministry of Foreign affairs. It was to be his task to uphold the kingdom of Prussia against the parliamentary spirit, and to accomplish the new organization of the army, on which the future of Prussia and of Germany depended. But he could not overcome the resistance of the Chamber of Deputies to the re-organization of the army, which they opposed as tending to weaken the landwehr, and to strengthen the army, the representative of reaction. On the 29th of September, 1862, he announced the withdrawal of the budget for 1863, "because the government considered it their duty not to allow the obstacles towards a settlement to increase in volume." He then announced his purpose and his aims, as clearly as he dared, and concluded with the expression that "Prussia must hold her power together for the favourable opportunity, which had already been sometimes neglected; the frontiers of Prussia were not favourable to a good state constitution. The great questions of the day were not to be decided by speeches and majorities,—this had been the error of 1848 and 1849—but by iron and blood!" The Chamber responded by arriving at a resolution on the 7th of October, by which all expenditure was declared unconstitutional if declined by the national representatives; and having thus proved itself hopelessly impracticable for Bismarck's purposes, the session of the Diet was closed, on the 13th of October, by a royal message. Immediately after assuming the Ministry, in December, 1862, Bismarck opened negotiations with Austria, with whom he was prepared to enter into coalition, if she could decide upon the dismissal of that enemy of Prussian policy, Schwarzenberg, and give Prussia her proper position in Germany. He expressed his convictions to Count Karolyi, that the relations of Prussia to Austria "must unavoidably change for the better or the worse;" and repeated that it would be for the advantage of Austria herself, to allow to Prussia such a position in the Germanic Confederation, as would render it consonant with the interest of

Prussia to throw all her strength into the common cause. But the overtures of Bismarck, as recapitulated in his famous circular despatch of the 24th of January, 1863, were of little or no avail. To this period belongs the conclusion of the Prusso-Russian treaty, on the common measures to be pursued for the suppression of the Polish insurrection. This convention, by which the friendly relations of Prussia and Russia were confirmed, has, according to the complaints of Bismarck's apologists, been frequently misinterpreted; and it excited so much indignation in London and Paris, that it was at least formally abandoned.

At a moment when war seemed imminent between Prussia and Austria, the world was startled at seeing them ally themselves for the purpose of an aggressive war against Denmark, for the recovery to Germany of Schleswig and Holstein; and the victorious standard of Prussia was planted on the walls of Düppel in April, 1864. On the occasion of a visit which Bismarck now paid to Vienna, he was received with great distinction by the Emperor Franz Joseph, from whom he received the Order of St. Stephen; whilst by his own sovereign he was invested with the Order of the Black Eagle. In the summer of 1865, when it has been assumed that Bismarck already believed that the hour of the great conflict between Prussia and Austria had arrived, the treaty of Gastein was concluded, August 14th, which divided the co-domination of Prussia and Austria in Holstein and Schleswig. On the 13th of September, 1865, Bismarck was raised to the rank of a Prussian Count; and before the year was at an end, had become firmly convinced that Austria had returned to the central state policy, the advocate of which was the Freiherr von Beust. On the 7th of May, 1866, Count Bismarck, who was abroad for the first time after a severe illness, escaped from a determined attempt at assassination, made in open day (five o'clock p.m.), in the centre allée of the Unter den Linden, at Berlin. The preparations for war were complete, and aided by an alliance with Italy, the Prussian columns set out for that sharp, short struggle, which is still in the memory of Europe and the world. On the 18th of June, Prussia formally declared war against Austria; on the 29th the first news of victory arrived at Berlin; on the 30th, Bismarck left the capital, in the suite of the king, for the seat of war; and on the 3rd of July, the Austrians sustained the decisive defeat of Sadowa. In the final days of July, the preliminaries were settled at Count Mensdorff's castle of Nicolauburg, resulting in the peace of Prague, which was probably facilitated by the attitude assumed by the Emperor Napoleon, who, in his speech to the French Chambers, declared that he had arrested the conqueror at the gates of Vienna. On the 4th of August, Bismarck returned with the king to Berlin; and on the next day came the solemn opening of the Diet. Peace treaties with individual states now occupied the Minister-President, together with the consolidation of the conquered provinces, and the formation of that North German Confederation, of which he was appointed Chancellor, on the 14th of July, 1867. In this year, one of the principal things which drew attention to Bismarck, was the question of Luxembourg, and war with France was avoided by a declaration of its neutrality. Since that time, Count Bismarck has been occupied in developing the Prussian system, retiring occasionally for rest and health to his estates in Pomerania. He is tall and athletic, given to field sports, and fully accepting, at intervals, the duties and position of a country gentleman. His countenance is animated, his head large, his forehead capacious, his mouth firm and resolute, and his bearing and conversation those of a soldier. He is fair and somewhat bald, and his brilliant and singularly restless eyes rather take from the otherwise thoroughly German character of his features. "Count Bismarck," says Herr L. Bamberg, author of a work entitled 'Monsieur de Bismarck,' Paris, 1868; 'Graf von Bismarck,' Breslau; 'Count Bismarck,' London, 1869; "Count Bismarck is certainly no orator in the usual sense of the word. In the year 1866, one of his admirers, who had attended a sitting of the reichstag, drew his portrait in the following terms: 'No oratorical ornamentation, no choice of words, nothing which carries the audience away. His voice, although clear and audible, is dry and unsympathetic, the tone monotonous; he interrupts himself and stops frequently; sometimes even he stutters, as if his recalcitrant tongue refused obedience, and as if he had difficulty in finding words in which to express his thoughts. His uneasy movements, somewhat lolling and negligent, in no wise aid the effect of his delivery. Still, the longer he speaks, the more he overcomes these defects; he attains more precision of expression, and often ends with a well-delivered, vigorous—sometimes, as every one is aware, too

vigorous—peroration.” Interesting particulars of his manners, appearance, and conversation, have also been given by M. Villebort, in a recent work entitled ‘L’Œuvre de M. Bismarck, 1863—1866,’ and in a longer life by Herr J. G. L. Heseckiel, ‘Das Buch des Grafen Bismarck,’ translated, with an introduction, explanatory notes, and appendices, by Kenneth R. H. Mackenzie, with the title of ‘The Life of Count Bismarck, Private and Political, with descriptive notes of his Ancestry,’ 8vo, London, 1870. Count Bismarck received the Grand Cross of the Legion of Honour, in 1862, and, in 1866, was appointed by his own sovereign Major-General and Chief of the Seventh Heavy Landwehr Regiment of Horse.

BISSÉN, HERMANN WILHELM, a distinguished Danish sculptor, was born in the neighbourhood of Schleswig, on the 13th of October, 1798. Having studied art in the academy at Copenhagen, he went in 1815 to Rome, where he remained ten years, working under the direction of Thorwaldsen. Returning to Denmark, he received a commission to carve four statues of angels for the Chapel Royal at Christiansborg; was much employed on portrait-busts, that of Oersted being regarded as the most successful, and he also executed some classical statues, among others a ‘Cephalus with a hound,’ and an ‘Atalanta,’ which were much admired. In 1840 he was appointed professor in the Copenhagen Academy, and the next year proceeded to Rome to prepare the designs of a series of 18 colossal statues, from the Greek and Norse mythologies, for the decoration of the royal palace. Whilst at Rome he occupied himself also in executing some statues of Venus, Cupid, and other classical divinities. On his return to Copenhagen, Bissen executed for the palace an immense frieze representing the classical version of the Creation, and statues of Apollo and Minerva for the great hall of the University. His later works include a colossal statue of a Danish soldier, for the national monument commemorating the success at Flensburg; a statue of Tycho Brahe for the University Observatory; classical statues of Achilles, Orestes, Flora, &c., and many busts, among them one of Garibaldi. At his death Thorwaldsen bequeathed to Bissen the duty of completing his unfinished works. Bissen was elected President of the Copenhagen Academy in 1850, and received the appointment of Director of the Museum. He died at Copenhagen on the 10th of March, 1868. By his countrymen he is ranked as their next greatest sculptor to Thorwaldsen, but he had less natural genius, whilst he suffered from the same pseudo-classical propensity.

BISSOLO, PIER FRANCESCO, a celebrated Venetian painter, was a scholar of Giovanni Bellini, whose manner he imitated. Nothing certain is known of his life. He painted between 1500 and 1530. Lanzi refers to his altar-pieces at Murano and in the cathedral of Treviso as among his distinctive works. The former, perhaps his finest production, is now in the Academy of Venice—‘Christ exchanging St. Catherine of Siena’s Crown of Thorns for a Crown of Gold.’ His easel-pictures, which are rarely met with, are usually small, and remarkable for their fine colour, delicacy of expression, and refinement of execution, rather than for original power. In the National Gallery is a very sweetly painted ‘Portrait of a Lady’ (No. 631) by him.

* BIXIO, JACQUES-ALEXANDRE, French politician, man of science, and writer, was born at Chiavari, department of the Apennines, on the 20th of November, 1808. On completing his collegiate course at Sainte Barbe in 1830, he commenced the study of medicine, and in due course received the degree of M.D. Since then his life may be divided into three periods of very different length, but in each of which he has effected something of service to his country. In the years preceding the revolution of 1848 M. Bixio was known chiefly by his connection with literature. With M. Buloz he assisted in founding the ‘Revue des Deux-Mondes;’ in 1837 he founded the ‘Journal d’Agriculture pratique,’ and continued to direct it till 1848; aided by M. Ysabeau, he published in 1844 ‘La Maison Rustique du dix-neuvième siècle,’ still regarded throughout France as one of the safest manuals of agriculture and horticulture; and in 1844 and following years he established the ‘Annuaire de l’horticulteur,’ ‘Almanach du Jardinier,’ and ‘Almanach du Cultivateur et du Vigneron.’

Though taking as yet no prominent public part in political matters, M. Bixio was among those who were watching with intense interest the development of events. A strong democrat, one of the editors of the ‘National,’ and intimately connected with the leading journalists, M. Bixio came to the front when the opposition to Louis Philippe assumed the character of a revolution. He was president of the committee of the electors

of the 10th arrondissement; declared at first for a regency, and at the meeting of the 24th of February urgently opposed the publication of the decree which proclaimed the republic. But the republic being proclaimed, M. Bixio cast in his lot with it, and accepted the post of chief of the cabinet under the Provisional Government. Shortly after he was selected to represent France at the court of Turin. Elected representative of the département du Doubs, he resigned his diplomatic functions, but only reached Paris in time to witness the disorders in the capital which culminated in the terrible scenes of the 24th of June. On the evening of that day, when General Bedeau fell wounded in the Rue St. Jacques, Bixio, who was by him, charged with a message from the Assembly, attempted to rally the soldiers, but was shot in the chest. On his recovery M. Bixio was received with enthusiasm by his legislative colleagues, and immediately elected Vice-president of the Assembly—an election several times renewed. When Prince Louis Napoleon was chosen President of the Republic, he appointed M. Bixio Minister of Agriculture and Commerce in his first cabinet (December 20, 1848), but eight days later Bixio resigned. In the discussions of the Legislative Assembly he, however, continued to take an active share. A moderate Liberal, the freedom with which he criticized their speeches and manners offended both parties, and some remarks which were construed as personal led to a duel with Thiers. On the evening of the *coup d’état* M. Bixio was arrested, but after a month’s captivity he was set at liberty.

He now retired into private life and to his scientific pursuits. With M. Barral he has made some remarkable aeronautic ascents, ample accounts of which have been published. He is proprietor and conductor of important agricultural publications, and director of various railway and other industrial enterprises. Separated from politics, his position is one of much influence, and personally he is very generally esteemed.

* BJÖRNSEN, BJÖRNSTJERNE, a popular Norwegian poet and novelist, was born on the 8th of December, 1832, at Kvikne, a lonely parish in the heart of Norway, of which his father was pastor. He was educated at Romsdal, to which district his father had been removed, and in 1852 proceeded to the University of Christiania. A visit to the theatre incited him to write a play, though he had never read one. It was offered at the theatre and accepted, but never acted. After wasting some time and raising some enmity, by writing a series of sharp theatrical and literary criticisms, for which he was as yet wholly unqualified, he went to Copenhagen, and there printed the first of his Norwegian tales. They were well received in Copenhagen, and soon became popular throughout Denmark, but his countrymen were slow to admit their merit. Bjørnson, however, kept on his way. For two years he was manager of a theatre at Bergen; then he founded a semi-political journal in Christiania; visited Rome, where he wrote his drama of Sigurd, and dreamed of regenerating the Norwegian stage, and founding a national drama. Later he was at Hamburg, and then returned to Copenhagen.

Bjørnson’s writings are eminently individual, yet thoroughly imbued with Norwegian character and spirit. His poems, mostly short lyrical pieces, are few in number, simple in texture, but singularly sweet, strange, and powerful. With the exception of a few short religious and patriotic pieces, they are mostly based on some Norse legend or old Norwegian ballad or tradition; wild, weird, mystical, dreamy, sombre, often melancholy, but always musical. His most recent poem is ‘The Song of the Viking.’ His stories are generally little idylls of ordinary Norwegian peasant life, whence he has been called the Norwegian Auerbach. The chief are ‘Arne,’ the hero of which is a solitary youthful mountaineer, grave of manner, a dreamer, and unconsciously to himself a poet; ‘The Fisherman’s Daughter;’ ‘The Cheerful Companion;’ and ‘Synnøve Solbakken,’ by many esteemed the happiest picture yet sketched of Norwegian country life and manners. A German translation of these was published at Berlin, in 3 vols. 8vo, 1861—62, under the title of ‘Aus Norwegens Hochlanden,’ from the Norwegian Highlands. Bjørnson’s dramas, all intensely national in character, and founded on Norwegian sagas, are:—‘Halte Hulda,’ 1858; ‘Kong Sverre,’ and ‘Sigurd Slembe,’ 1863.

BJÖRNSTERNA, MAGNUS FRIEDRICH FERDINAND, COUNT, a distinguished Swedish statesman and writer, was born on the 10th of October, 1779, at Dresden, where his father was secretary of the Swedish legation. Till the age of 14 he remained in Germany; he was then taken to Sweden, entered the army, served in the war in Finland, when he attained the rank of major; and in 1809 was charged with a mission to

Napoleon immediately before the battle of Ecmühl. In 1812 he negotiated in London the sale of Guadeloupe; the next year served with the Swedish army in Germany; was wounded at Dessau, but fought at Leipzig; concluded with Lallemand the surrender of Lübeck and of Mastricht; was with the Swedish army in Norway, and settled with Prince Christian Frederick of Denmark the Convention of Moss, which terminated the war between Sweden and Norway. He had now secured the confidence of his sovereign, who had formed a high estimate of his tact and ability. He was created adjutant-general in 1820 and count in 1826, and in 1828 he was sent as minister plenipotentiary to the court of Great Britain. This post he held with great credit to himself and his country till 1846, when he returned to Stockholm, where he died on the 6th of October, 1847. Count Björnsterne wrote several works, the general tendency of which was to ameliorate the political institutions and improve the financial policy of his country, as well as others of more general interest. Among the more important of the latter class were—'Hindu Theology, Philosophy, and Cosmogony,' published both in Swedish and German, Stockholm, 1843; and 'Anteckningar,' 2 vols., Stockholm, 1851, a work of historical value as containing his notes and observations on the Napoleonic war.

* BLACKIE, JOHN STUART, Professor of Greek in the University of Edinburgh, and the son of Alexander Blackie, Esq., a banker in Aberdeen, was born at Glasgow in July, 1809, and educated at Aberdeen and Edinburgh. He afterwards had the advantage of a two years' sojourn abroad, in the course of which he resided successively at Göttingen, Berlin, and Rome, and devoted himself to the study of German, Italian, and classical philology. In 1834 he became a member of the Scottish bar; and in the course of the same year published Goethe's 'Faust: a Tragedy.' Translated into English verse, with notes, and preliminary remarks. In 1841 he was appointed to the chair of the Latin Language and Literature in Marischal College, Aberdeen, and fulfilled the duties of this office for eleven years, during which his activity was great and varied. In 1843 he published a treatise 'On Subscription to Articles of Faith: a plea for the liberties of the Scottish Universities;' and was otherwise closely connected with the movement which resulted in the abolition of the Test Act, which required the professors of the Scottish Universities to be members of the Established Church. He likewise took up a very decided position, both with tongue and pen, in the agitation for university reform in Scotland, which led, in 1858, to the appointment of a Parliamentary Commission, by which some important changes were effected in the higher branches of education in that country. Professor Blackie declared himself as a defender of Scottish nationality; and was a frequent contributor of articles, chiefly in German and classical literature, to various Encyclopædias, reviews, and magazines. In 1850 he published 'The Lyrical Dramas of Æschylus; translated into English verse,' 2 vols. 8vo, London; in 1852 produced a Philological Inquiry into 'The Pronunciation of Greek: Accent and Quantity;' and in the course of the same year was appointed Professor of Greek in the University of Edinburgh. In 1853 he travelled in Greece, and on his return home warmly advocated the study of modern Greek. Professor Blackie continues to vary the discharge of his professional functions by authorship, and by lectures and discussions on questions in politics, philology, and education. His principal works, in addition to those already enumerated, are 'A Discourse on Beauty: with an Exposition of the Theory of Beauty according to Plato appended,' 8vo, 1858; 'Lays and Legends of Ancient Greece, with other Poems,' 8vo, 1857; 'Lyrical Poems,' 8vo, 1860; and a work in four volumes on 'Homer and the Iliad,' 1866, of which the first two are occupied with a translation of the Iliad in ballad measure; a third with Critical Dissertations, and a fourth with notes Philological and Archæological. The work is the result of twelve years of Homeric study, and is a valuable contribution to Homeric literature.

BLACKWELL, GEORGE, an English divine of the Romish Church, was born in 1545, in Middlesex, and on the 27th of May, 1562, was entered a scholar of Trinity College, Oxford, of which, in 1565, when B.A., he became a probationer. The next year he became an actual fellow; and on the 21st of April, 1567, was admitted to the M.A. degree. He was, however, already becoming inclined to the Church of Rome, and vacating his fellowship, he retired for a time, first to Gloucester Hall, now Worcester College—a house which was under suspicion of sympathy with the old religion, and several of whose sojourners

privately belonged to that communion—and afterwards, in 1574, to Douay. In 1575 he received priest's orders; and resided for some time at Rome, where by his learning and good conduct he conciliated the friendship of Cardinal Bellarmine, Father Parsons, and other eminent persons. In 1576 he returned to England as a missionary, and from this time his history becomes blended with the general history of the country.

Shortly after the accession of Queen Elizabeth, ten of the dioceses had become vacant by death, so that there were only sixteen bishops remaining in the Church. Of these, Kitchin of Llandaff was the only one who acknowledged the Queen's supremacy; the other fifteen refused to take the oath, and were deprived. All quietly submitted to the sentence passed upon them, and took no steps to continue their succession, which therefore ended, so far as they were concerned, with Watson, the deprived Bishop of Lincoln, who died in Wisbeach Castle, in September, 1584. Even with Watson's death, the want of a Romish Episcopacy was not greatly felt. William Allen, or Allan, made Cardinal in 1587, was considered as the Cardinal of England; and being resident in the Low Countries, where he had founded the famous College or Seminary of Douay, he was sufficiently within reach of any appeal from his native country. But after his death, October 6th, 1594, the English Romanists found themselves entirely without a leader; and their secular clergy unanimously resolved to present a supplication to Pope Clement VIII., praying him for a restoration of an ecclesiastical hierarchy in the government of bishops, "which bishops should be elected by the common consent of the clergy, and appointed by them to different districts." This took place about the year 1597. Meanwhile before the supplication could be presented, Father Parsons, the Jesuit, fearing a loss to the influence of his order, whose constitutions exclude its members from the mitre, if an Episcopal jurisdiction were set up in England, intrigued so successfully as to obtain the papal nomination of Blackwell to the office of Archpriest and Superior of the Clergy in England. Cardinal Cajetan, "Angliæ Protector," "Protector of the English nation at Rome," accordingly sent letters to Blackwell, dated March 7th, 1598, investing him with this office and authority; privately forbidding him, however, with the twelve assistants who were allowed him, from determining any matter of importance without advising with Garnet, the Superior of the Jesuits, and some others of the order. When the new Archpriest entered upon his functions, a violent spirit of resistance to him arose amongst the secular priests, who looked upon him as a mere creature of the Jesuits, and who objected to his credentials, as bearing the authority of an individual Cardinal only, and as having been procured by misrepresentation. The malcontent clergy, quickened into opposition by the intemperance of Blackwell's proceedings, determined upon an appeal to the Pope, and two of their body, Dr. Bishop and Mr. Charnock, delegated by the rest, arrived at Rome about the beginning of 1599. Here they were offensively received by Cardinals Cajetan and Borghese, and, after several examinations, were committed to prison, where they remained until a fortnight after the issue of a brief, dated April 6th, 1599, in which the Pope had confirmed whatever Cardinal Cajetan had enacted, and sanctioned the appointment and the conduct of the Archpriest. This brief restored tranquillity for a season; but the clergy would not endure to have their concerns subjected to the Jesuits, nor could they thus submit to the harsh conduct of the Archpriest, who was wont to exert a power beyond the limits of his commission. The result was another appeal to the Pope against the oppression and maladministration of their Superior, November 17th, 1600; which produced a brief, dated August 17th, 1601, and addressed to Blackwell and the Catholic clergy and laity of England, containing forcible exhortations to peace and charity. The clergy, however, found it necessary to make a third appeal to Rome; and this time with such success as to procure the issue of a brief, October 5th, 1602, in which the Archpriest was admonished to use his power discreetly, and not exceed his commission. He was forbidden, also, in transacting the duties of his charge, to communicate or treat with the Provincial of the Jesuits, or any member of that society; and thus the instructions of the late Cardinal Protector about that matter were cancelled. The brief proceeded to condemn all books written against the Society, or against any persons of either party, and closed with a suitable exhortation to brotherly charity and unity. Thus was the contention terminated; and all the clergy were unanimous in their obedience to the Archpriest and Prothonotary Apostolical, so long as that economy continued.

But Blackwell was afterwards more seriously embroiled with the Holy See. In order to give the Roman Catholics an opportunity of displaying their loyalty after the Gunpowder Plot, November 5th, 1605, an Oath of Allegiance was framed in the following year, to which it was thought every Romanist would cheerfully submit who did not believe that the Bishop of Rome had power to depose kings and to give away their kingdoms. This oath was accordingly taken by many, both clergy and laity, "and a ray of returning happiness gleamed around them. But," says Mr. Barrington, "a cloud soon gathered on the Seven Hills; for it could not be that a test, the main object of which was the rejection of the deposing power, should not raise vapours there." The Pope at that time was Paul V., the late Cardinal Borghese, to whom the Oath was presented by Father Parsons. After deliberation the Pope condemned the Oath in a brief addressed to the English Romanists, "as containing many things obviously adverse to faith and salvation." Blackwell had already argued in favour of the Oath; and even after a second papal brief re-asserting its unlawfulness, he persisted in maintaining and defending the opinion he had taken up. Blackwell was apprehended, notwithstanding, on the 24th of June, 1607, apparently for corresponding with Cardinal Bellarmine, without permission from the Government. He was detained in close custody for twelve days, during eight of which he underwent very rigorous examinations at Lambeth, before a board of commissioners. They examined him at great length, and elicited from him a series of judgments adverse to the political pretensions of Rome. The particulars of this examination were immediately published, under the following title:—"The large Examination taken at Lambeth, according to His Majesty's direction, point by point, of Mr. George Blackwell, made Archpriest of England by Clement VIII., upon occasion of an answer of his, without the privy of the State, to a Letter lately sent to him by Cardinal Bellarmine, blaming him for taking the Oath of Allegiance, together with the Cardinal's Letter, and Mr. Blackwell's Letter to the Catholics in England, as well ecclesiastical as lay. Imprinted at London, by Robert Barker, printer to the King's Most Excellent Majesty, 1607." Not only did Blackwell take the oath himself, but several of the clergy and laity of his communion followed his example. Such conduct in the Archpriest gave great umbrage at Rome; and in 1608 Blackwell was "eased of his dignity," in which he was succeeded by George Birket, a clergyman of more pliant conscience and conciliatory manners. Blackwell died suddenly on the 13th of January, 1613.

His works comprise 'A Letter to Cardinal Cajetan, in favour of the English Jesuits,' 1596; 'Answers at Sundry Examinations while he was a Prisoner,' 4to, London, 1607; 'Letters to the English Clergy, touching the Oath of Allegiance,' London, 1607; 'Epistolæ ad Anglos Pontificios,' 4to, London, 1609; 'Epistolæ ad Cardinalem Bellarminum'; 'Several Letters concerning the Appealing Clergy,' 1600; 'An Answer to the Censure of the Paris Divines, concerning his Jurisdiction,' 1600; and a 'Treatise against Lying and Dissimulation,' a manuscript in the Bodleian Library, more truly ascribed to Francis Tresham. Many works were published against Blackwell, chiefly by Dr. Bishop, Mr. Colleton, Mr. Watson, Dr. Champney, and others of the clergy; besides 'Quæstio bipartita de Jurejurando contra Blackwellum,' 4to, London, 1609; 'Examination of George Blackwell,' 4to, London, 1607; and 'Hope of Peace. A Treatise against Blackwell,' 4to, Francof., 1601, by J. B.

BLACKWOOD, ADAM, a Scottish theologian and historian, was born at Dunfermline in 1539. His education was conducted at the Universities of Paris and Toulouse, at the latter of which he especially applied himself to the study of civil law. Through the influence of his patron, James Beaton, the expatriated Archbishop of Glasgow, with Queen Mary and her husband, the Dauphin, Blackwood was chosen a member of the parliament of Poitiers, and afterwards appointed to be professor of civil law at that court. Poitiers was henceforth his constant residence, and the scene of all his literary exertions, which took persistently the direction of partisanship in favour of Queen Mary. He died in 1623; and was splendidly interred in the church of St. Porcharius, at Poitiers, where a marble monument was erected to his memory, charged with a long panegyric epitaph. Blackwood's works are 'Caroli IX., Pompa funebris Versibus Expressa,' Paris, 1574; 'De Vinculo seu Conjunctione Religionis et Imperii, et de Conjuratorum Insidiis Religionis Fuco adumbrata, Libri duo,' 8vo, Paris, 1575; to which a third book was added

in 1612. The object of this work is to show the necessity under which rulers are laid of preserving the true, that is, the Catholic, religion, from the innovations of heretics, as all rebellions arise from that source. His next work developed in a more perfect manner the extreme monarchical and Romish principles of the author. It was entitled 'Adversus Georgii Buchanani Dialogum "de Jure Regni apud Scotos," pro Regibus Apologia,' 4to, Poitiers, 1581, of which a second edition, "per auctorem recognita, aucta, et emendata," appeared in 8vo, Paris, 1588. He next published, in French, a work in which he calls upon all the princes of Europe to avenge the death of his benefactress, Queen Mary:—"Martyre de Marie Stuart, Reine d'Ecosse, douairière de France," &c., 8vo, Edinburgh, 1587, and 8vo, Antwerp, 1588. Blackwood's other works comprise his 'Sanctarum Precationum promissa, seu mavis Ejaculationes animæ ad orandum,' &c., 8vo; 'Augustorum Pictonum (Limoges), 1598, and 12mo, 1608; 'Jacobi I. M. Britanniae, seu Scot-Angliæ et Hiberniæ Regis Inauguratio,' 4to, Paris, 1606, &c.; 'In Psalmum Davidis Quinquagesimum Meditatio,' 12mo, Aug. Pict. 1608. Blackwood's works were published in a collected form under the following title:—"Adami Blackvoodæi, in Curia Pictonum Presidis et Consilarii Regii, Opera Omnia," 4to, Paris, 1644, edited, with a life and eulogium of the author, by Gabriel Naudé; and his 'History of Mary, Queen of Scots, a Fragment,' &c., 4to, Glasgow, 1834, was published by the Maitland Club.

BLAIR, PATRICK, M.D., anatomist and botanist, practised at Dundee. In 1706 an elephant that was exhibited in the place died, and Blair took advantage of the circumstance to acquaint himself with the anatomy of an animal at that time rare in Great Britain. He sent his account to the Royal Society, and it was published in the 27th and 30th vols. of the 'Transactions.' Blair was a nonjuror, and a warm partisan of the Stuarts, which got him into some trouble. He came to London, read several papers before the Royal Society, and became a Fellow in 1712. His paper on the 'Sexes of Plants,' read before the society, was published in an enlarged form in 1720, under the title of 'Botanic Essay.' This work, at the date of its publication, was a valuable contribution to science, "and contains much knowledge, which, even at this time, may appear respectable." Blair settled as a physician at Boston, in Lincolnshire, where he commenced his 'Pharmaco-botanologia; or, an Alphabetical and Classical Dissertation on all the British indigenous and garden Plants of the New Dispensatory.' This was published in 4to, in London, between 1723 and 1728. It was issued in parts, of which only seven, as far as the letter H, appeared. He continued to send papers on botany and anatomy to the Royal Society, several of which will be found in the 30th and 31st vols. of the 'Transactions.'

* BLANC, AUGUSTE - ALEXANDRE - PHILIPPE-CHARLES, French writer on art, is the brother of M. Louis Blanc [E. C. vol. i. col. 717], and was born at Paris on the 15th of November, 1815. Educated as an engraver he early exchanged the burin for the pen; wrote the notices of the 'Salon' and other art-exhibitions for various journals; and in 1841 became editor of the 'Propagateur de l'Aube.' When the revolution of February, 1848, gave his brother a share in the provisional government, M. Charles Blanc was appointed to the important post of director of the fine arts, an office which he retained till 1852. The name of M. Charles Blanc is associated with several valuable works either as author or editor. In 1845 he edited the first volume of a 'Histoire des Peintres Français'; and he was editor and part author of the more pretentious 'Histoire des Peintres de toutes les Écoles,' large 4to, 1840, &c. His most original and valuable work is 'L'Œuvre complet de Rembrandt,' 2 vols. large 8vo, with numerous engravings, Paris, 1859, &c. He has also published a 'Grammaire des Arts du Dessin,' various biographical notices and occasional pieces, and was the founder and from its origin has been editor of the 'Gazette des Beaux Arts.'

* BLANCHARD, AUGUSTE-THOMAS-MARIE, an eminent French engraver, was born at Paris, May the 18th, 1819, and learnt engraving of his father. He is one of the ablest living engravers in line, a rapidly decreasing class, and he has executed many excellent plates, mostly from the works of contemporary painters. But his style is remarkable rather for clearness, neatness, and a species of brilliancy, than for largeness and grandeur. Among his most noteworthy prints are the 'Repose in Egypt,' after Bouchet, 1843; 'Head of the Saviour,' after Paul Delaroche; 'Le Christ Rémunérateur,' 1850, and 'Faust and Marguerite,' 1853, after Ary Scheffer; 'The Smokers' and 'The Chess Players,' after Meissonier; and the Portrait of the Emperor Napoleon III., after Ed. Dubufe.

The largest and one of the most carefully finished of M. Blanchard's plates is 'The Derby Day,' after Frith, with which every one is more or less familiar. One of the few of his engravings from the old masters is the 'Jupiter and Antiope' after Correggio, 1857. M. Blanchard was awarded a medal of the 3rd class (gravure) in 1843; of the 2nd class in 1847, and of the 1st in 1857; and he was decorated with the cross of the Legion of Honour in 1861.

* BLANCHARD, EMILE, a zoologist whose sphere of observation has been mainly amongst the invertebrate animals. He was born March 6, 1819, at Paris. His father was Emile Theophile Blanchard, a surgeon and painter, who directed his son's attention to the study of articulated animals. Thus guided and aided, the subject of our notice imbibed a love for biological knowledge, and that too at a very early age, for in 1835 a paper of his, descriptive of *Mantis chlorophaea*, appeared in the 'Magasin de Zoologie,' and since that time papers and books have issued steadily from his pen. In 1833 he was employed in the Museum d'Histoire Naturelle, and in 1840 was appointed assistant naturalist, soon after which he was several times entrusted with the delivery of lectures forming part of Milne-Edwards' course on entomology. From 1844 to 1857 he took part in several scientific missions to Italy and Sicily. He is a member of many learned societies, was decorated with the cross of the Legion of Honour in 1860, and was elected to the Academy of Science in the place of Isidore Geoffroy St. Hilaire in 1862. His papers are too numerous for mention here; but amongst the most important are 'Recherches sur l'Organisation des Vers,' 1837; 'Histoire naturelle des insectes, orthoptères, nécroptères, hyménoptères, hémiptères, lépidoptères, et diptères' 1837—1840,—illustrated with 72 plates; the 'Histoire des Insectes,' forming vols. 8 and 9 of Comte's 'Traité complet d'Hist. Nat.,' 1844; 'L'Organisation du Règne Animal,' 1859, &c.; and 'Metamorphoses, Mœurs, et Instincts des Insectes,' 1868. Most of his works are especially noticeable on account of their illustrations, which are usually profuse, and frequently coloured. As early as 1827 he wrote the 'Nouvelle Manuel complet du Coloriste' for the Roret series of manuals, and in 1834 he assisted in a similar work, entitled 'Die Illuminir Kunst.' In addition to the work he has performed in elucidating the characters and physiology of the *Scolecida*, insects, spiders, and molluscs, he has written several papers on the osteology of birds, of which that entitled 'Recherches sur les caractères ostéologiques des Oiseaux appliquées à la classification naturelle de ces animaux,' in the 'An. des Sci. Nat.' (Zool.) xi. p. 10—145 (1859) is an exceedingly valuable contribution.

BLARRU (or, less correctly, BLARU,) PIERRE DE, an historical poet of the 15th century, was born on the 6th of April, 1437, at or near Pairis, an abbey of the order of St. Cîteaux, situated in the valley of Orbay, between Alsace and Lorraine; and died canon of St. Diez, in Lorraine, in November or December, 1506. He was blind during several of the latter years of his life, on which sole account a parallel has been instituted between him and Homer. He is the author of a Latin poem, in six books, of posthumous publication, and the work of his life-time, which was published in a small folio volume in 1518, under the care of his friend and brother-canon of St. Diez, Jean Batin de Sandaucourt. This production, though of no great poetical merit, is valuable on account of the historical details with which it abounds; and is prized at present for its great rarity, the beauty of its typography, and of the wood-engravings with which it is illustrated. It has for its title 'Petri de Blarrorivo Parhisiani insigne Nanceidos opus de Bello Nanceiano. Hac primum, exaratura elimatissime nuperrime in lucem emissum.' The immediate subject of this poem is the siege of Nancy by Charles the Rash, Duke of Burgundy, who was killed under the walls of that town in 1476. The first two books of the poem, of which a MS. had found its way into the library of St. Germain-des-Près, were translated into French by Claude Romain, a doctor of civil law, Provost of Pont-a-Mousson. The latest editor and translator of De Blarru is F. Schütz, who published the Latin text with a French translation under the title of 'La Nanceide, ou la Guerre de Nancy, Poème Latin de P. de Blarru, avec la traduction française,' &c., 2 vols. 8vo, Nancy, 1840. Blarru exercised his talents in French verse, but without much success, if his attempts are to be judged by an epitaph composed by himself, and which was copied by Dom Calmet from his monument in the collegiate church of St. Diez. He is also reputed to be the author of a poem in Latin verse on 'La Chasse à la pipée,' a sport which he is said to have much affected.

BLAZE, the surname of a family of French writers, mostly musical.

HENRI SEBASTIEN BLAZE was born at Cavailon, in 1763. A notary by profession, his inclination led him towards musical pursuits. At different times he composed masses with organ accompaniment, masses with full orchestral accompaniment, an opera called 'L'Heritage,' another opera, 'Semiramis,' sonatas for the pianoforte, duets for the pianoforte and harp, and other pieces. He was an intimate acquaintance of Grétry and Méhul, and was elected a member of the Institute. He died May the 11th, 1833.

FRANÇOIS HENRI JOSEPH BLAZE, known in the literary world as CASTIL-BLAZE, was a son of Henri Sebastian. He was born at Cavailon, December 1st, 1784. Like his father, his profession was the law; but after some years' practice, he abandoned the law definitely, and devoted his attention wholly to musical writing. He published a work entitled 'L'Opéra en France,' 2 vols. 8vo, Paris, 1820, in which he was severely critical on the condition of the French opera stage, and made many suggestions for improvements in management and in the cultivation of taste. In 1822 he became rédacteur of the musical department in the 'Journal des Débats,' in which he gave a higher tone to musical criticism. About the same time appeared his 'Dictionnaire de Musique Moderne,' 2 vols. 8vo, of which a new edition was published in 1825, and a Brussels edition in 1825 (incorporated in a larger work by Mées). In 1832 he quitted the 'Journal des Débats,' and began to write in the 'Constitutionnel.' Other periodicals in which he took the musical department were the 'Revue de Paris,' the 'Ménestrel,' the 'Revue et Gazette Musicale de Paris,' and the 'France Musicale.' Some of his essays in these periodicals were collected in several small volumes, published occasionally between 1832 and 1856. He translated and arranged for the French stage the principal operatic works of Mozart, Rossini, Weber, and Beethoven, which were brought out at the Théâtre de l'Odéon on a scale of great completeness. His original compositions comprised quartettes, trios, many minor pieces, and two comic Operas; but he was more distinguished in connection with the literature of music. He died on the 11th of December, 1857.

ANGE HENRI BLAZE, known as BLAZE DE BURY, son of François Henri Joseph, was born at Avignon in 1813. In 1833—34 he became connected with the 'Revue des Deux Mondes,' and the 'Revue de Paris.' After acting as attaché to a foreign embassy, by which he gained the title of Baron, he returned to Paris, and published a considerable number of works; the chief of which were 'Études littéraires sur Beethoven,' 'Musique des Drame de Shakespeare,' 'Poètes et Musiciens de l'Allemagne,' 'De la Musique des Femmes,' 'Lettres sur les Musiciens Français,' 'Vie de Rossini,' and 'Musiciens Contemporains'—mostly as series of articles in periodical publications. He took the affix of Bury from his mother, the Baroness Blaze de Bury, an Englishwoman, herself the authoress of 'Racine and the French Classical Drama,' 12mo, 1845, and 'Molière,' 12mo, 1846, which formed parts of Knight's 'Monthly Volume'; 'Germania, its Courts, Camps, and People,' London, 1850; and a 'Voyage en Autriche,' 12mo, Paris, 1851.

BLES, HENRI DE, a celebrated painter, was born at Bouvines, near Dinant, in 1480. Though a Frenchman by birth, he belongs as a painter to the early Flemish school, he having been the pupil of Patinir, to whose manner he adhered, and a resident the larger part of his life in Flanders. His pictures, like those of his master, are mostly landscapes with figures which represent some scriptural or legendary event. From his habit of introducing an owl in some corner of his landscape the Italians named him *Civetta* (the Owl); by his Dutch compatriots he was called *Henrik met De Bles*, or Henry with the Forelock. He lived at Mechlin in 1521, and he is believed to have died in Liège in 1550. Authentic examples of his works are somewhat rare. The National Gallery possesses two specimens, presented by the Queen in 1863—'Mount Calvary—Christ on the Cross,' No. 718, an excellent work; and 'The Magdalen,' No. 719.

BLETTERIE, JEAN-PHILIPPE-RÉNE DE LA, an eminent French historian, was born at Rennes, on the 25th of February, 1696. He was a member of the Oratory, where he was professor successively of rhetoric and ecclesiastical history; but he withdrew on the promulgation of the rule against wearing perruques. Still he always retained his affection for the order he had quitted, and in an age when scepticism was general preserved and avowed his religious belief, for which he had to bear the sarcasm of Condorcet and Voltaire. On leaving the

Oratory, the abbé went to Paris, where he was appointed professor of eloquence at the Collège Royal. In 1742 he was elected member of the Académie des Inscriptions, and the Académie Française nominated him to a fauteuil, but the king refused to sanction the election on the ground of his having exhibited Jansenist tendencies in a brochure entitled 'Lettres à un Ami, au sujet de la Relation du Quétisme de M. Phélypeaux,' 1733. His exclusion was greatly regretted by the academicians, who were exceedingly anxious to have him among them. But he was generally much esteemed, and Gibbon was proud of being able to number him among his friends. He died on the 2nd of June, 1772. His chief works are 1.—'Histoire de l'Empereur Julien l'Apostat,' 12mo, Paris, 1735; 2nd edition, revised and enlarged, 12mo, 1746. A learned, fair, and succinct work; Voltaire and the Encyclopédistas attacked it with much acrimony: on the other hand, Gibbon found "merit both in the hero and the historian." 2. 'Histoire de l'Empereur Jovien, et traduction des quelques ouvrages de l'Empereur Julien,' 2 vols., 12mo, 1748; 3rd edition, 1776. Of this work Gibbon writes in the *Journal* of his reading (February 25, 1764):—"The History of Jovian, and the translation of some works of Julian, by the Abbé de la Bletterie: admirable, in point of erudition, taste, elegance, and I will add, moderation. Julian was a pagan, but the abbé hates only the Jesuits." In his History, however, Gibbon cannot refrain from one of his ironical touches. "The Abbé de la Bletterie has composed an elaborate history of Jovian's short reign; a work remarkably distinguished by elegance of style, critical disquisition, and religious prejudice." (D. & F. vol. iv. p. 206, n. 103.) 3. 'Œuvres de Tacite, traduits en François,' 6 vols., 12mo, Paris, 1755—68. The translation has the credit of fidelity, but the style was much criticised at the time it appeared, and Voltaire launched keen epigrams against it. The abbé's other works were of merely passing interest.

BLICHER, STEEN STEENSEN, a Danish poet and novelist, was born on the 11th of October, 1782, at Vium, a village in the county of Viborg, and province of Jutland. The extreme delicacy of his health retarded his education, and his university course at Copenhagen was so interrupted that he did not pass his examination till 1809. In 1819 he settled as pastor at Thorning, which he exchanged in 1825 for the more lucrative cure of Spentrup, where he died on the 26th of March, 1848. His marriage was not a congenial one, and his family was large, so that, in spite of his great literary productiveness and popularity, his circumstances were narrow and frequently embarrassed. When the idea of the Scandinavian union was launched, he adopted it with enthusiasm, and travelled much in Denmark and Sweden for the purpose of advocating it. For the dramatic force and skill with which he depicted the past life and characters of Scandinavia, Blicher has been called by the honourable title of the "Danish Walter Scott," which, however, does him rather more than justice. His first literary effort was a translation of the poems of Ossian, 'Ossian's Digte,' 2 vols. 8vo, Copenhagen, 1807—1809. His other principal translation is a Danish version of the *Vicar of Wakefield*, 'Præsten i Wakefield,' 16mo, Copenhagen, 1837. His works comprise 'Sneeklokken,' 1826, a kind of Almanac of the Muses; contributions to a monthly publication called the *Aurora Borealis*, 'Nordlyset,' 1827—1829, in which first appeared his Tales and Poems in the dialect of Jutland, of which, in a collected form, a third edition was issued with the title of 'E Bindstouw, Fortællinger og Digte i jydsk Mundarter,' 8vo, Randers, 1853; 'Johanna Gray. Tragedie i 5 Acter,' 8vo, Copenhagen, 1825; a volume entitled *My Times*, 'Min Tidsalder,' 8vo, Copenhagen, 1843; *Winter Doings* in 1844 and 1845, 'Min Vinterbestilling i 1844 og 1845,' 12mo, Copenhagen, 1845; *Collected Poems*, 'Digte,' 2 vols. 8vo, Copenhagen, 1847; and a collection of his novels, old and new, 'Gamle og nye Noveller,' 7 vols. 8vo, Copenhagen, 1846—1847. Specimens of Blicher's manner have been offered to the English reader in the first and third volumes of Mrs. A. S. Bushby's work, entitled 'The Danes sketched by themselves,' &c., 3 vols., 8vo, London, 1864.

BLOCH, MORITZ (in his own vernacular, BALLAGI MOR), a distinguished philologist, was born of Jewish parents on the 17th of April, 1816, at Tarnoka, in the county of Zemplin, in the North-east of Hungary. He studied the Oriental languages successively at the universities of Pesth and Paris. In 1840 he published a work in favour of the emancipation of the Jews, which he entitled 'A'Zsidókról,' Pesth, 1840; and the same year began to issue a Magyar translation, annotated, of the *Books of Moses and Joshua*, Pesth, 1840—1843. In 1844 he was appointed professor in the lyceum at Szarvas, which he

quitted at the revolution of 1848, in order to undertake the duties of secretary to the Minister of War. He returned in 1851 to his former position at Szarvas, which he left once more for Kecskemet, and finally for an appointment in the Evangelical Reformed Theological Institution at Pesth. His principal works, besides those already mentioned, are a Complete Magyar Grammar, in German, 'Ausführliche theoretisch-praktisch Grammatik der ungarischen Sprache,' 8vo, Pesth, 1841, 3rd edition, 1850, 5th edition, 1861; a Magyar Anthology, which serves as a complement to the Grammar, 'A Magyar nyelv szepségei,' 8vo, Pesth, 1847; a Complete Dictionary of the Hungarian and German Languages, 'Neues vollständiges Taschenwörterbuch der ungarischen und deutschen Sprache,' 2 vols. 8vo, Pesth, 1843—1844, 2nd edition, 1847—1848; 3rd edition, 1862—1863; a Collection of Magyar Proverbs, 'Magyar példabeszédek, Közmondások és Szójárások gyűjtemenge,' 2 vols. 8vo, Pesth, 1850. In ecclesiastical controversy Bloch has produced 'A Protestantismus harca az Ultramontanizmus ellen,' 8vo, Pesth and Kecskemet, 1867; and a work on M. Rénan's 'Vie de Jésus,' entitled 'Renaniana. Irta Ballagi M.,' 8vo, Pesth, 1864.

BLOMFIELD, CHARLES JAMES, Bishop of London [E. C. vol. i. col. 724]. Increasing infirmity at length convinced Bishop Blomfield that he could no longer adequately fulfil the duties of his office. There were found to be many legal and ecclesiastical difficulties in the way of an episcopal resignation, but these were eventually removed, and in July, 1856, a short Act was passed (19 and 20 Vict. cap. 115), providing for the acceptance of the resignation of Charles James Bishop of London, and that he should retain for life the episcopal palace at Fulham, with a pension of 6000*l.* a year. His remaining days were spent in the pleasant retirement of Fulham, where he died on the 5th of August, 1857. 'A Memoir of Charles James Blomfield, D.D., Bishop of London, with Selections from his Correspondence, edited by his son, Alfred Blomfield, M.A.,' was published in 1863, in 2 vols. 8vo.

BLONDEAU, JEAN BAPTISTE ANTOINE HYACINTHE, professor of Roman Law in the University of Paris, was born at Namur on the 20th of August, 1784. He studied philosophy and law successively at Brussels, Antwerp, and Paris; and six months after maintaining his thesis, he was named assistant-professor in the School of Strasbourg, from which he was transferred in 1808 to that of Paris. At each of these schools he encountered opposition on account of the slight degree of respect which he showed for juridical opinions based on mere precedent and tradition. In 1819 he was appointed to the chair of civil law, through the influence of M. Royer-Collard, then president of the commission of public instruction; and in his new capacity Blondeau justified and increased the reputation he had previously acquired. He is an honorary member of the Academy of Moral and Political Sciences, and correspondent of the Academies of Brussels and Turin. His works comprise 'Tableaux Synoptiques du droit romain, suivant la législation de Justinien,' 4to, Paris, 1811, 2nd edition, 1812, which was followed by a supplementary work entitled 'Tableaux Synoptiques du droit privé, offrant l'essai d'une classification et d'une nomenclature nouvelle des droits privés,' 4to, Paris, 1818; 'Esquisse d'un Traité sur les obligations solidaires,' &c., 4to, Paris, 1819; 'Institutes de l'Empereur Justinien, traduites en français, avec les textes juridiques relatifs à l'Histoire externe du droit romain et du droit privé ante-Justinien,' 2 vols. 8vo, Paris, 1839, which, so far as the translation only is concerned is the work of M. Bonjean; 'Chrestomathie, ou Choix des textes pour un cours élémentaire du droit privé des Romains, précédé d'une introduction à l'étude du droit,' Paris, 1830—1833; 'Traité de la séparation des patrimoines, considérée spécialement à l'égard des immeubles,' 8vo, Paris, 1840; 'Mémoire sur l'organisation de l'enseignement du droit en Hollande,' 8vo, Paris, 1846; 'Essais de législation et de jurisprudence,' 8vo, Paris, 1850, which is a collection of articles contributed to the 'Magasin Encyclopédique: la Décade Philosophique,' the 'Bibliothèque du Barreau,' &c. M. Blondeau was also one of the contributors to the 'Annales du Barreau français,' and one of the founders, and the principal editor of 'Themis, ou Bibliothèque du Jurisconsulte,' 10 vols. 8vo, Paris, 1820—1830.

BLONDEL, FRANÇOIS, Sieur des Croisettes, in his day famous as an architect and engineer, was born in 1617 at Ribemont, in Picardie, where his father was professor of mathematics. His ability and attainments as a young man led to his being appointed preceptor of the Comte de Brienne, son of De Lomenie, Secretary of State, and he accompanied him, July, 1652, as governor in a tour of three years through Germany and Italy: a narrative of the journey, in Latin, was published in 1663. The tact and judgment displayed in this service

suggested to the Secretary the idea of employing him to conduct some delicate state negotiations, and in 1659 he was sent as Envoy Extraordinary to Constantinople respecting the detention of the French ambassador. On this occasion he made a visit to Egypt. His success was rewarded with the title of Councillor of State; he was selected to instruct the young Dauphin, son of Louis XIV., in mathematics and polite literature; and he was nominated professor of mathematics at the Collège Royal. Blondel commenced his career as engineer and architect in 1665. The bridge over the Charente, which unites the city of Saintes with the faubourg des Dames, was, owing to the nature of the site and the character of the river, found to be very difficult to construct and more difficult to maintain, and at that time the only communication was by a ferry. The king, to whom the case was presented, thought a mathematician might resolve the problem, and sent Blondel. Blondel built a bridge of massive but novel construction, and across the approach to it from the city erected a triumphal arch, with Corinthian columns, and thus established at a blow his double professional title. Louis XIV., abundantly satisfied, gave Blondel other commissions, and ordained by letters patent that all public works henceforth erected in Paris should be done in accordance with a plan drawn up by Blondel, and deposited by him at the Hôtel de Ville. The proceedings of Louis and his architect at this time were probably in the mind of Wren when he laid his plans for the re-edification of London before Charles II. after the fire of 1666. Blondel's works were after all not very numerous, and of those he executed not many remain. He enlarged and remodelled the gate of St. Antoine, and designed and erected that of St. Bernard. Both these have been destroyed, but his chief work of this class, the well-known Porte St. Denis, survives to serve as evidence of his architectural skill. The extensive rope-houses and forges of the arsenal at Rochefort were among his principal constructive successes. He also designed various fortifications after a system devised by himself, which he described in a treatise entitled 'Une Nouvelle manière de Fortifier les Places,' but which the king would not permit to be published for the information of his enemy; he rewarded Blondel, however, 1675, with the rank of Maréchal de Camp. His architectural labours Louis had already recognised by appointing him director and professor of his Academy of Architecture, founded in 1671; and the lectures which Blondel delivered in this capacity he afterwards remodelled and published under the title of 'Cours d'Architecture, enseigné dans l'Académie Royale,' enriched with numerous good engravings, folio, Paris, 1675, 2nd edition, revised and augmented, 1698. Blondel had previously written 'Résolution des quatre principaux problèmes d'Architecture,' large folio, 1673; reprinted in the 'Recueil de plusieurs Traités de Mathématiques de l'Académie des Sciences,' folio, 1676. Blondel le Grand, as he was called in his later years, died at Paris on the 1st of February, 1686. Besides the works above cited, he wrote a 'Comparaison de Pindaire et d'Horace,' 12mo, Paris, 1673, Latin translation, 8vo, 1704, which, if of no other value, is noteworthy as an illustration of his remarkable versatility; 'L'Art de Jeter les Bombes,' 4to, Paris, 1683; 'Cours de Mathématiques contenant divers traités, composez et enseignez à Monseigneur le Dauphin, où sont l'arithmétique spéculative et l'arithmétique pratique,' 2 vols., 4to, Paris, 1683.

BLONDEL, JACQUES-FRANÇOIS, nephew and pupil of François Blondel, of Rouen (b. 1683, d. 1756), acquired reputation as an architect, but was more esteemed as a writer on architecture. He was born at Rouen on the 7th of January, 1705, and, after practising some time in the provinces, settled in Paris, in 1739, his chief object being to open a school of architecture in which the theoretical principles as well as the practical details should be taught. The school was so successful that, after watching the experiment for several years, the Académie d'Architecture, in 1755, invited Blondel to join their body, and to continue his system as their professor. In this new position Blondel displayed the greatest zeal, and, as the result of his public and private teaching, French architecture, according to D'Argenville, experienced a happy revolution. But Blondel laboured as zealously with his pen as from the professorial chair for the revolution of architectural taste. For the general public he wrote the whole of the articles relating to architecture in the 'Encyclopédie Méthodique,' and 'De la distribution des Maisons de Plaisance, et de la décoration des édifices' (often referred to by its second title), 'Traité d'Architecture dans le goût Moderne,' 2 vols. 4to, Paris, 1737. Addressed more particularly to architectural students were his 'Discours sur la Manière d'étudier l'Architecture,' 4to,

1767; and his great works, 'Architecture Française,' 4 vols. folio, Paris, 1752-56, a work very valuable for the details it gives of buildings of historical celebrity now destroyed or transformed; and 'Cours d'Architecture Civile,' 6 vols. of text and 3 of plates. This last work is in three parts, the first, published in 3 vols. 8vo, in 1771, relates to the artistic character of the exterior of buildings, considered not merely as elevations, but also in connection with their sites and artificial as well as natural surroundings. The second part, also in 3 vols., published in 1773, treats of the ground-plan, distribution of the apartments, and the general internal arrangements of palaces, mansions, and hotels. The third part, left unfinished by Blondel, but completed and published by M. P. Patte in 1777, refers to the construction of buildings. The preparation of these works, and particularly the last, exhausted Blondel's pecuniary resources. His last years were passed in comparative poverty and acute disease, but he never ceased from his labours, and when he found his end approaching he begged that he might be carried to the Louvre and allowed to die in the school where he had for so many years delivered his lessons (D'Argenville, p. 472). He died there on the 9th of January, 1774. Besides the works named above, M. Blondel published 'Discours sur la nécessité de l'étude d'Architecture,' 4to, 1754; 'De l'Utilité de joindre à l'étude de l'Architecture celle des sciences et des arts qui lui sont relatifs,' 8vo, 1771; and one or two treatises of no great value appeared posthumously. Many of the plates in his works were engraved as well as designed by Blondel. The buildings erected by him were chiefly provincial. Among them were the episcopal palace, the entrance to the cathedral, the hôtel-de-ville, barracks, &c., at Metz, and by order of the king he drew up a general plan for the improvement of the city by widening and straightening the old streets and forming new streets and places. He also made designs for the improvement of Strasbourg, and for the erection of a new senate-house and hôtel-de-ville; and he erected an episcopal palace at Cambrai, and some buildings at Chalons.

BLOOTELING, or BLOTELING, ABRAHAM, an eminent Dutch engraver, was born at Amsterdam, in 1634, and was a pupil of Visscher, whose manner he followed. When the French invaded Holland, 1672-3, Blooteling came to England, and was fully employed during the short time he stayed here. Vertue notes that "he received 30 guineas for etching a portrait of the Duke of Norfolk." He engraved many other English portraits in the same manner, and several in mezzotinto. Among those executed with the point may be mentioned—James Duke of Monmouth, Prince Rupert, the Earl of Sandwich, the Earl of Montague, and some others, after Sir Peter Lely; and Sir Thomas More, the Earl of Shaftesbury, Dr. Stillingfleet, Bishop Wilkins, &c.; with the scraper—The Prince of Orange, the Duchess of York, Nell Gwynne, the Earl of Arlington, the Earl of Derby, Titus Oates, and several more: all of them much in request with collectors. His portraits engraved in Holland with the point include Admirals De Wit, Van Tromp, De Fries, Kortenaar, and Ruyter; Ferdinand, Bishop of Paderborn, the Marquis de Mirabelle, &c.; his mezzotints—Erasmus, after Holbein, John De Wit, Cornelius de Wit, the Emperor Leopold, and numerous others. He also engraved some Studies of Lions, and Heads of Children, after Rubens; Six Views of the Environs of Amsterdam, after Ruysdael; and other figure-pieces and landscapes; and etched and published, 1685, Leonardo Augustino's Gems, while several of Blooteling's designs were engraved by other hands. There is some uncertainty about the year of Blooteling's death, but 1685 appears to be the best supported.

BLOUNT, CHARLES, a deistical and political writer of some notoriety in the 17th century, was the second son of Sir Henry Pope Blount (b. 1602, d. 1682, whom Evelyn always mentions as the "famous traveller," and the author of 'A Voyage into the Levant,' 1636, which went through 8 editions). Charles Blount was born at the house of his grandfather in Upper Holloway, near London, on the 27th of April, 1654; was educated under the eye of his father, and as a young man was regarded as unusually accomplished and of promising parts. He was not long in bringing his capacity to the proof. He had already made himself conspicuous as a politician, and he had gained the favour of Dryden by a pamphlet written in defence of his Conquest of Granada, when, in 1679, he published his 'Anima Mundi; or an Historical Narration of the Opinions of the Ancients concerning Man's Soul, according to unenlightened Nature.' This work, which gave great offence to religious people, called forth several replies, and was formally censured

by Compton, Bishop of London. It was followed in 1680 by a still more offensive publication, 'The Two first books of Philostratus, containing the Life of Apollonius Tyanens, written originally in Greek, with philological Notes upon each chapter,' the notes being remarkable, as Macaulay observes, for the "flippant profaneness" with which they attacked the most sacred subjects. Bayle says that these notes were taken for the most part from the manuscripts of the famous Lord Herbert, and Blount, as we shall see, was quite capable of such an appropriation: as Bayle, himself a sceptic, adds, instead of the grave and serious reasoning which such matters require, they are marked "almost always by profane raileries and by trifling subtleties." As might be expected, the book was answered, anathematized, and formally condemned. But Blount seemed to enjoy the annoyance his heresies excited, and continued his irreverent polemics in 'Great is Diana of the Ephesians; or the Original of Idolatry,' 1680; 'Religio Laici,' 1683; and other brochures, which were collected after his death by his disciple Gildon, under the title of 'Oracles of Reason.' His polemics were not, however, confined to religion. He was a Whig, and his pen was as active and virulent as that of the most scurrilous of the opposite party. In a pamphlet on the Popish plot, published under the signature of Junius Brutus, and entitled 'An Appeal from the Country to the City for the Preservation of His Majesty's Person, Liberty, Property, and the Protestant Religion,' he "magnified the virtues and public services of Titus Oates, and exhorted the Protestants to take signal vengeance on the Papists for the Fire of London and for the murder of Godfrey." But even Macaulay, who handles Blount in his severest manner, admits that as a political writer he rendered one important service: "little as either the intellectual or moral character of Blount may seem to deserve respect, it is in a great measure to him that we must attribute the emancipation of the English press." (Hist. of Eng. vol. vi. p. 365). The reference is to a pamphlet entitled 'A Just Vindication of Learning and of the Liberty of the Press: by Philopatris,' which was published without licence, and attracted, as indeed it deserved, very general attention, but what is most remarkable about it is that it "consists chiefly of garbled extracts from the *Areopagitica* of Milton," which noble work was then so little read that neither partizan nor opponent detected the plagiarism. It was followed by a second tract, 'Reasons for the Liberty of Unlicensed Printing,' which was concocted from the second part of the '*Areopagitica*,' as the 'Just Vindication' had been from the first. To this second tract was appended a postscript entitled 'A Just and True Character of Edmund Bohun,' the licenser of printing, written with the utmost bitterness. This second tract is not reprinted among Blount's acknowledged works, but Macaulay "unhesitatingly attributes" it to him, and seemingly with good reason. Bohun had deeply offended him by mutilating some of his pieces before licensing them. Blount's revenge was not satisfied with the 'Just Character.' He wrote a pamphlet with the portentous title 'King William and Queen Mary Conquerors: or a Discourse endeavouring to prove that their Majesties have on their side, against the late King, the principal reasons that make Conquest a Good Title; showing also how this is consistent with that Declaration of Parliament, "King James abdicated the Government, &c.," written with a special regard to such as have hitherto refused the oath, and yet allow of the title of conquest, when consequent to a just war.' Bohun was a Tory, a High Churchman, and an advocate of passive obedience, yet he had taken the oath and obtained his present place. In the pamphlet he had not only a justification of his own conduct, but an argument which he thought would certainly remove the doubts of his friends the non-jurors, and without a moment's hesitation he authorized its publication. The commotion caused by its appearance was extraordinary. Within a week of its publication, January, 1693, the book and the doctrine it set forth were condemned by a vote of both Houses of Parliament; and, as the author was unknown, the licenser was taken into the custody of the Sergeant-at-Arms, examined at the bar of the House of Commons, and remanded to prison, it being at the same time voted that the king be requested to remove him from the office of licenser. It was the feeling aroused by this book of Blount's that led to Bishop Burnet's famous Pastoral Letter, issued in 1690, being laid before the House of Commons as containing a similar doctrine, and to its being condemned, like the 'King William and Queen Mary Conquerors,' to be burned by the common hangman. Macaulay thinks that, "his own opinions being diametrically opposed to those which, on this occasion, he put forward in the

most offensive way. . . . it is therefore impossible to doubt that his object was to ensnare and to ruin Bohun," and probably most who now look into the pamphlet will be of the same opinion. But this was not the opinion of his contemporaries. By none of them does it appear to have been regarded as ironical. Blount's admirers believed that he had been carried too far by the warmth of his regard for King William; Burnet thought that he "had set the doctrine forth with great modesty and judgment;" and Bohun never suspected its sincerity. Blount's end was tragical. After the death of his wife, he wished to marry her sister, a lady of great wit and beauty. Her objection being on the score of affinity, he drew up an elaborate defence of the lawfulness of such marriages, and the case was submitted to the Archbishop of Canterbury. The decision was of course adverse, and the lady regarding this as final, Blount, in a state of phrenzy, shot himself. He lingered a few days, and died, August, 1693, aged 39. This at least is the received, and doubtless the correct, account, though Macaulay says he languished long, adopting the statement of Pope ("who had the very best opportunities of obtaining accurate information") that Blount "being in love with a near kinswoman of his, and rejected, gave himself a stab in the arm, as pretending to kill himself; of the consequence of which he really died." But the contemporary statements are agreed as above given; Pope was only five years old when Blount died, and the Blounts with whom he much later in life became intimate were of a different and not associated branch of the family; and Pope, always careless in such statements, had in this note to a random line ("If Blount despatched himself he played the man") nothing to induce him to unusual precision. Blount's writings were published by Gildon under the title of 'The Miscellaneous Works of Charles Blount, Esq.,' 12mo. 1695, with a meagre Life of the Author prefixed.

BLOUNT, SIR THOMAS POPE, the elder brother of Charles Blount, and like him, a prolific writer, was born at Upper Holloway on the 12th of September, 1649. He received a careful education; was created a baronet in his father's lifetime, 1679; was elected the same year member of parliament for St. Alban's, and was afterwards returned during three sessions member for Hertfordshire; and in 1694 was appointed by the House of Commons commissioner of accounts. He was a Whig in politics, but free from his brother's errors in religion. His writings, much admired in their day, comprise: 'Centuria celebriorum Authorum,' &c., folio, London, 1690, reprinted at Geneva in 1694, and again in 1710 and 1718; 'Natural History; containing many not common Observations, extracted out of the best modern Writers,' 8vo, London, 1693; 'De Re Poetica: or Remarks upon Poetry: with Characters and Censures of the Most Considerable Poets, whether ancient or modern, extracted out of the best and choicest critics,' 4to, 1794—like the preceding, a book of extracts and opinions threaded together in consecutive order; 'Essays,' 8vo, 1697. Chalmers asserts that "these essays are in no way inferior to those of the celebrated Montaigne." This is absurd; they are in every way inferior. They have neither the wit nor the wisdom, the shrewd insight into character, the knowledge of the world, nor the inimitable humour. Their only point of resemblance is in the extent of the quotations; but then the quotations are applied differently. Sir Thomas died at his seat, Tittenhanger, on the 30th of June, 1697, and was interred with his brother in the family vault at the neighbouring church of Ridge, in Hertfordshire.

BLOUNT, THOMAS, a learned writer of the 17th century, was born in 1618 at Bordesley, in Worcestershire. Of a Roman Catholic family, his education was private, but excellent, and he acquired a considerable store of erudition. He was a barrister and a member of the Inner Temple, and seems to have been both prosperous and respected; but the breaking out of the Popish Plot in the beginning of 1679 caused him, as a Roman Catholic, so much alarm and anxiety as to bring on a palsy, and he died on the 26th (his friend Dugdale says the 16th) of December of that year, at his residence, Orleton, in Herefordshire. The following are his principal works:—1. 'The English Academie of Eloquence,' 12mo, London, 1654. 2. 'Glossographia, or a Dictionary interpreting such hard words, whether Hebrew, Greek, Latin, Italian, &c., that are now used in our refined English tongue,' 8vo, London, 1656, and many times reprinted. This is an able and still useful work, but it involved the author in an angry controversy with Edward Phillips, his rival dictionary-maker, whose book he attacked in a pamphlet entitled 'A World of Errors discovered in the New World of Words,' &c., published in folio (1673) so that it might be bound with his rival's book.

3. 'The Lamps of the Law and the Light of the Gospel: or the Titles of some late spiritual, polemical, and metaphysical new books,' 8vo, 1658; 4. 'Boscobel, or the compleat History of his sacred Majesties most miraculous Preservation after the Battle of Worcester, September the third, 1651,' 8vo, 1660, 3rd ed. 1680; 5. 'A Law Dictionary, interpreting such difficult and obscure words and terms as are found either in our common or statute, ancient or modern laws,' folio, London, 1671, 3rd ed. with additions, 1717; 6. 'Journey to Jerusalem in 1669,' 12mo, 1672; 7. 'Fragmenta Antiquitatis: or Ancient Tenures of Land, and Jocular Customs of some manors,' 8vo, 1670, and many times reprinted, the last edition being "with considerable additions" by H. M. Beckwith, 4to, London, 1815.

* BLUHME, or BLUME, FRIEDRICH, a German jurist and professor of law, was born at Hamburg on the 29th of June, 1797. He studied law at the universities of Göttingen, Berlin, and Jena, and took his doctor's degree in 1820, with a thesis entitled 'De gemitibus et similibus, quæ in digestis inveniuntur, capitibus,' Jena, 1821. He afterwards contributed to the 'Zeitschrift für geschichtliche Rechtswissenschaft,' an article on the Order of the Fragments in the titles of the Pandects, 'Die Ordnung der Fragmente in dem Pandektentiteln.' In 1821, in the interests of his science, Bluhme undertook a journey to Italy, where he explored a great number of libraries. The results of his researches were seen in the notes which he furnished, after a revision of the palimpsest, for a second edition of the 'Institutes' of Gaius; for the 'Monumenta Germaniæ Historica;' for Schrader's edition of the 'Corpus Juris Civilis;' for Savigny's History of Roman Law in the Middle Ages, 'Geschichte des Römischen Rechts im Mittelalter;' and for the Archives of German History, 'Archiv für ältere deutsche Geschichts-Kunde.' Besides these he published, as the fruits of his Italian tour, his works entitled 'Iter Italicum,' 4 vols. 8vo, Berlin and Halle, 1824—1836; and 'Bibliotheca Librorum Manuscriptorum Italica,' 8vo, Göttingen, 1834. The reputation attending the learned activity of Bluhme, has procured for him various posts of honour and emolument. His academical progress was rapid, and he was advanced to the professorship of law at the university of Halle, which he exchanged in 1831 for a similar appointment at Göttingen. In 1833 he was named a Counsellor of the High Court of Appeal of the Free Cities at Lübeck; and in 1843 succeeded Rufe as professor of law in the university of Bonn. Besides the works already named, Bluhme is the author of Elements of the Ecclesiastical Law of Jews and Christians, 'Grundriss des Kirchenrechts der Juden und Christen besonders in Deutschland,' 8vo, Halle, 1826, 2nd edition, 1851; Outlines of the Pandects, 'Grundriss des Pandektenrechts,' 8vo, Halle, 1829, 2nd edition, 1843; and Encyclopædia and System of the Laws in force in Germany, 'Encyclopædie und System der in Deutschland geltenden Rechte,' 3 vols. Bonn, 1847—1858. Bluhme has also edited works on Jurisprudence, and contributed to the 'Rheinisches Museum für Jurisprudenz.'

* BLUM, JOHANN REINHARD, an eminent German mineralogist, was born at Hanover, on the 28th of October, 1802. After attending one of the elementary schools in his native town, where he manifested his natural history tendencies, he proceeded to the university of Heidelberg in 1821, where he formed the acquaintanceship of Leonhard, which determined his resolve to study mineralogy. In 1826 he was appointed to take charge of a mineralogical shop at Heidelberg; in 1828 he qualified himself as teacher, from which year he has been constantly lecturing on his special branch of knowledge; and in 1838 he became extraordinary professor of mineralogy. He has written several papers and separate publications, but his name is best known in connection with 'Die Pseudomorphosen der Mineral-reiches,' 1843, with continuations published in 1847 and 1852; a work which is indispensable to the investigator of pseudomorphism amongst minerals.

BOCCHI, ACHILLE (ACHILLES BOCCHIUS), a scholar and man of letters, was born in 1488, at Bologna, where he died on the 6th of November, 1562. When scarcely twenty years old, he published his 'Apologia in Plautum, cui accedit vita Ciceronis, auctore Plutarcho,' 4to, Bologna, 1508. He attached himself to the celebrated Albert Pio, count of Carpi; and became imperial orator at the court of Rome, obtaining the titles of chevalier and count Palatine. At Bologna he was professor of Greek and Latin, rhetoric and poetry, and in 1522 was chosen one of the Anziani, or elders of the city. He founded in 1546 the Academia Bocchiana, which frequently went by the name of Ermetana, from its device, exhibiting the union of Hermes and Athené. He also established a printing-office in his palace, and

employed himself, with his academicians, in correcting the many beautiful editions which they printed. He was named historiographer to the city of Bologna, of which he wrote a Latin history, which runs through seventeen books, and which, although never printed, is still preserved in the library of the Bologna Institute. There is likewise in the Laurentian library at Florence, a MS. collection of poems, with the title of 'Achillis Philerotis Bocchii Lusum Libellus ad Leonem X,' where the name of Phileros is supposed to refer to the friendship that existed between himself and Lilius Gyraldus. Other of Bocchi's works are his 'Carmina in Laudem Joannis Baptistæ Pii,' 4to, Bologna, 1509; 'Symbolicarum questionum de universo genere, quas serio ludebat, Libri V.; Bononiæ, in ædibus novæ Academiæ Bocchianæ,' 4to, 1555, reprinted in 1574, a work which is valued on account of the emblems, which are almost all the invention of Bocchi, and were engraved for the first edition by Giulio Bonasoni, and retouched for the second by Agostino Carracci.

BOCCHI, FRANCISCO, one of the most voluminous writers of Florence, was born in that city in 1548, and died there in 1618. He left many works in Latin and Italian, which are to a great extent of merely local interest. They comprise 'Discorso a chi de' maggiori guerrieri, che insino a questo tempo sono stati, si deve la maggioranza attribuire,' 4to, Florence, 1573 and 1579; 'Discorso sopra la lite delle armi e delle lettere, e a cui si deve il primo luogo di nobiltà attribuire,' 8vo, 1579, 1580; 'Discorso sopra la Musica, non secondo l'arte di quella, ma secondo la regione alla politica pertinente,' 8vo, Florence, 1581; 'Discorso sopra il pregio dell'umano valore,' 8vo, Florence, 1587; 'Le Bellezze della città di Firenze, dove a pieno di pittura, di scultura, di sacri templi di palazzi, i più notabili artifizi e più preziosi si contengono,' 8vo, Florence, 1591, 1592, and 1595; a new edition, enlarged by Cinelli, 1677; 'Elogia Virorum Florentinorum,' 4to, 1604 and 1607; 'Della Grandezza di Roma,' 8vo, Florence, 1598; 'Oratio de Laudibus Henrici IV. Regis Galliarum,' 4to, Florence, 1610; and other biographical, historical, and literary productions.

BOCH, or BOCHIUS, JAN, a Flemish poet, who on account of his skill in Latin verse was called the "Belgic Virgil," was born at Brussels on the 27th of July, 1555. After a course of study he attached himself to Cardinal Radzivil, whom he accompanied to Rome, where he studied theology under Bellarmine, afterwards the celebrated cardinal. Leaving Rome after a time, he prosecuted his travels into other parts of Italy, and visited Poland, Livonia, Russia, and other countries. On his way to Moscow, his feet were frozen to such an extent as to make some of his friends advise their amputation. The Czar's physician, however, recommended him to defer the operation. Meanwhile the place in which he was staying was surprised by the attack of an enemy, and the poet found in his own fear a better cure for his disease than the skill of the surgeons. He fled so fast and so far as to secure his own safety, and to re-establish for the rest of his life, the strength and soundness of his feet. On his return home he devoted himself to his literary pursuits, especially to poetry; and on account of a panegyric which he addressed to the Duke of Parma on the taking of Antwerp, he was appointed by the conqueror to be town-secretary. He died on the 23rd of January, 1609.

The principal literary remains of Bochius are 'De Belgii Principatu;' 'Historica Narratio professionis et inaugurationis Alberti et Isabellæ,' folio, Antwerp, 1602; 'Psalmorum Davidis Parodia heroica. Ejusdem varii in Psalmos Observationes physicae, ethicae, politicae, et historicae,' 8vo, Antwerp, 1608. His 'Poemata,' consisting of epigrams, elegies, &c., were collected and printed at Cologne, 1616, with the addition of some poems by his son, Jan Ascanius Bochius, a promising youth, who died in Calabria. It is, lastly, to Bochius that we owe the verses which occur underneath the engravings in Verstegan's extravagant book against Queen Elizabeth, entitled 'Theatrum Crudelitatum Hereticorum nostri temporis,' a work which has been defined as a sort of Popish martyrology.

BOCHOLT, FRANZ VON, one of the earliest German engravers, was a native of Bocholt, in Westphalia, and lived in the last half of the fifteenth century. Nothing authentic is known of his personal history, and the archives of Bocholt have been searched in vain for any reference to him. His engravings are signed FVB. His style shows the influence of the Van Eycks, but he displays both originality and invention in his designs and great freedom and mastery over the burin, his handling of which Passavant thinks resembles that of a goldsmith. He has been spoken of as the earliest German engraver, but he was preceded by Martin Schongauer, whose engraving of the 'Temptation of St.

Anthony' he copied, and he preceded Israel van Menecken, who erased Bochoit's mark from some of his plates and substituted his own. Bochoit's works are necessarily rare, but 55 are described by Bartsch and Passavant; good impressions of several are in the British Museum. A 'Veronica' is regarded as one of his first works; a 'Nativity,' an 'Annunciation,' a 'Christ on the Cross,' the series of 'Christ and the Apostles,' and the 'Judgment of Solomon,' are among the finest.

BOCKHORST, JAN VAN, an eminent painter of the Flemish school, was born at Munster, in Westphalia, in or about 1610. He learned painting of Jordaens; was admitted freemaster by the corporation of St. Luke, Antwerp, in 1633, and carried on his profession in that city till his death, which occurred on the 21st of April, 1668. Bockhorst practised both historical and portrait painting, and made designs for the Antwerp tapestry weavers. Some of his best pictures were painted for the Augustinian convent at Antwerp, but dispersed on its suppression by Joseph II. His best work now in that city is in the Church of the Beguinage, a triptych having a representation of the Resurrection in the centre, the Annunciation on the right wing and the Ascension on the left. Another noteworthy picture is 'The Empress Helena holding the true Cross,' in the old church of the Augustines. The Antwerp Museum contains a 'Coronation of the Virgin.'

BOCTOR, ELLIOUS, an oriental philologist, was born on the 12th of April, 1784, at Siut, in Upper Egypt, the see of a Coptic Bishop, and supposed to be the ancient Lycopolis. He was brought up in the Coptic communion, and became attached, in the quality of an interpreter, to the French army in Egypt. He accompanied this army on its return to France; and in 1819 he succeeded the Syrian priest Raphaël as professor of Arabic at the King's Library. He held this position for two years, and died of disease of the liver on the 26th of September, 1821. His works include 'L'Explication de l'inscription arabe qu'on lit sur une cassette conservée dans la cathédrale de Bayeux,' which was inserted in the 'Revue Encyclopédique'; 'Discours prononcé à l'ouverture d'un cours d'arabe vulgaire de l'École royale des Langues orientales vivantes, le 8 Décembre, 1819,' Paris, 1820; 'Alphabet arabe, accompagné d'exemples,' Paris, 1820; 'Abrégé des conjugaisons arabes, corrigé et augmenté,' Paris, 1820; and a Dictionary which was posthumously published by M. Caussin de Perceval, with the title of 'Dictionnaire Français-Arabe, revu et augmenté,' &c., 2 vols. 4to. Paris, 1827—1829, reprinted, with additions and corrections, in 1848, in a single large octavo volume.

BODE, JOHANN ELERT, a distinguished German astronomer, was born at Hamburg, on the 19th of January, 1747. He received his early education from his father, who kept a commercial school in that city; and having shown a decided taste for the mathematical sciences, received special instruction from Johann Georg Büsch. While assisting his father in the school, young Bode constructed a telescope and other astronomical instruments for his own use, and began to watch the stars sedulously. At the age of 18 he made accurate calculations concerning lunar eclipses and planetary movements; and soon afterwards published a small work relating to the solar eclipse of the 5th of August, 1766, 'Berechnung und Entwurf der Sonnenfinsternisse,' Berlin, 1766. The favourable reception of this work led to the publication of a book which has had great success, his Introduction to the study of the starry heavens, 'Anleitung zur Kenntniss des gestirnten Himmels,' Berlin, 1768. More than twenty editions of this useful popular work have appeared in Germany. Olmanns published a Supplement to it in 1833. In 1769 Bode put forth instructions for viewing the transit of Venus; and in the same year discovered a comet in the constellation Taurus. In 1770 he commenced a series of monthly notices of the positions and movements of the moon and planets, which he continued for seven years. In 1772 he received the appointment of Astronomer to the Berlin Academy of Sciences. In the following year he assisted in founding the Society of Naturalists at Berlin, whose archives were enriched with many memoirs from his pen. In 1776 he commenced his valuable 'Astronomische Jahrbücher oder Ephemeriden,' of which he lived to prepare 54 annual volumes, and which was continued after his death by Encke under the title of the 'Berliner Astronomische Jahrbuch.' In 1778 he published a useful guide to the stars, 'Erläuterung der Sternkunde.' This was followed, in 1782, by a work in French, 'Représentation des Astres,' consisting of thirty-four small maps, on which were represented all the stars visible to the naked eye, and the chief telescopic stars visible in the latitude of Berlin, with a catalogue, and a description of the constellations. In the same year Bode was

elected fellow of the Berlin Academy, and soon afterwards director of the Berlin Observatory. His observations on Uranus, while still regarded as a star, assisted the elder Herschel in determining the planetary nature of that body. In 1793 appeared his sketch of astronomical science, 'Entwurf der Astronomischen Wissenschaften,' Berlin, 2nd ed. in 1825; and in 1801, 'Allgemeine Betrachtungen über das Weltgebäude,' Berlin, 3rd ed. in 1834. A larger and more important work was published in Latin, 'Uranographia sive Astrorum descriptio,' Berlin, 1801; this work contained, on twenty maps, 17,240 stars and nebulae, being 12,000 more than those contained in any preceding atlas. This production gained admission for Bode into the chief learned societies of Europe, and honours and decorations from sovereigns. A jubilee, or 50th anniversary, of Bode's official connection as astronomer with the Berlin Academy, was held in 1822, and was attended with very flattering honours to him. Failing health gradually compelled him to resign his active offices; but he still continued to make the calculations for his Astronomical Ephemeris until his death, which took place on the 23rd of November, 1826. An autobiography of Bode, brought down to his 59th year, was published in Lowe's 'Biographie des Savans,' 1806. 'Bode's Law,' as it is called by astronomers, is an empirical formula relating to planetary distances from the sun. Kepler had observed some numerical peculiarities in those distances; and Bode so far tabulated them as to render apparent a great gap between Mars and Jupiter; and he boldly predicted the probable discovery of some planet that would fill up this gap, at a distance from the sun which he approximately estimated. There have been discovered, between 1801 and 1870, not indeed one large planet, but more than a hundred planetoids, or asteroids, which collectively pretty well fulfil Bode's conditions. His law appears, however, to fail in regard to Neptune.

BODE, JOHANN JOACHIM CHRISTOPH, a remarkable writer, composer, musician, diplomatist, and translator, was born at Brunswick, on the 16th of January, 1730. His father, an old soldier, on quitting the army, worked as a journeyman at a tile-work, in a village between Helmstadt and Brunswick; and in the village school the boy learned to read and write. After acting as shepherd on the farm of a relation, young Bode, at the age of 15, was placed by his uncle with Kroll, the musician; and though his position was little removed from servitude, he eagerly availed himself of all opportunities to learn music, in which he acquired such proficiency as to be able to play on nearly all kinds of instruments. He married early, and had to struggle against much poverty. In 1749 he removed to Helmstadt, and placed himself under Stolze, an eminent bassoon-player. In 1750 he served as oboist in a Brunswick regiment. A friend, Schlabeck, taught him the French and Italian languages; Stockhausen taught him English, while he taught himself Latin; acquirements which were of great value to him in later years. He returned to Brunswick, but being disappointed in the hope of engagement at the Court Chapel, he removed to Hanover in 1752, where he obtained the post of court oboist at Celle, at the same time studying musical composition. He published two lyrical collections, 'Scherz-und-Ernsthafte Oden und Lieder.' On the death of his wife, in 1757, Bode removed to Hamburg, where he established himself as a teacher of music and languages, and translated many tales and dramas from the English and French. In 1762—3 he edited the 'Hamburger Correspondenten,' in which his musical criticisms attracted much attention. Having about this period become a freemason, he entered with much zeal into the interests of the craft, and travelled extensively about Germany to acquire information, gradually collecting a library of 800 volumes on the subject. When Weisshaupt founded the singular 'Illuminatenorden,' or Society of Illuminati, Bode became one of the members, and remained so until the suppression of the order. Meanwhile he supported himself by directing concerts, conducting orchestras, and giving music lessons. Having, by a second marriage, acquired some property, he bore the expense of printing Lessing's 'Dramaturgie'; and being again made a widower, he married the widow of a bookseller named Bohn. Lessing and he joined in establishing a printing and publishing business for high-class books; but neither of them being versed in the ways of trade, the undertaking failed. His translations attracted great notice by their excellence. Among them were Sterne's 'Sentimental Journey,' in 1768; Smollett's 'Tristram Shandy,' in 1774; Goldsmith's 'Vicar of Wakefield,' in 1776; and Fielding's 'Tom Jones,' in 1786; together with Smollett's 'Humphrey Clinker,' Marмонтel's 'Incas,' Montaigne's 'Essays,' Clavigo's 'Pensador,' &c. In 1778 he went to Weimar, and accepted the post of geschäfts-

fihrer, or man of business, to the Countess of Bernstorf; this brought him several diplomatic honours from the petty courts of Germany. In 1787 he visited Paris, deputed by the freemasons of Germany to become acquainted with the Société Philaethes, and to investigate the origin and history of the masonic order. On his return to Saxony he published a pamphlet, 'Mehr Noten als Text,' against a specious plan of public education which had been submitted to him at Weimar. When about to commence a translation of Rabelais, he died, on the 13th of December, 1793, at Weimar. As a composer, Bode left behind him several solos, concertos, and symphonies; but he is chiefly remembered for his excellent translations, which are highly esteemed in Germany. A memoir of him by Böttiger, 'Bode's literarisches Leben,' was published at Berlin in 1796.

BODEMER, JAKOB, a distinguished German enameller, was born in 1777, at Nöttingen, near Carlsruhe, learned the art of enamelling at Geneva, and went to Vienna, where he completed his studies under Füger and other professors in the Academy. His enamels, which are in great request with collectors, are remarkable for technical excellence as well as artistic taste. Many of them are reductions of celebrated works by the great painters, but he also executed portraits. He died at Vienna in 1824.

BODIN, JEAN, a French political writer, was born at Angers about 1530. After having studied law at Toulouse, he endeavoured to establish himself as an advocate at Paris; but, dissatisfied with the slowness of his professional advancement, he abandoned law for literature. In 1555 he published a Latin verse translation of Oppian's 'Cynegetica,' with a commentary, a work in which it has been charged that he made an unfair use of the then recently published edition of Turnebus. Bodin enjoyed for a short time the favour of Henri III., and when this declined, secured that of the Duke of Alençon, with whom he visited both England and Flanders. In 1576 he retired to Laon, where he married; and in the same year was deputed by the *tiers état* of Vermandois to the States-General. He fulfilled the duties of his office with much independence, and declared for liberty of conscience with such vigour as to alienate the king, who refused to complete his appointment to a place actually promised to him. He continued accordingly to reside at Laon, and by his personal influence caused that town to declare successively for the League and for Henri IV. Bodin died at Laon, of the plague, in the year 1596.

His works comprise 'Methodus ad facilem Historiarum Cognitionem,' 4to, Paris, 1566, 8vo, Lyon, 1583 and 1595, 8vo, Basel, 1679, &c., a book with small claims to either method or judgment; 'De la Demonomanie, ou, Traité des Sorciers,' 4to, Paris, 1580 and 1586, translated into Latin, almost immediately after its publication, by Francis Junius, and into Italian by the Cavalier Hercole Cato, 4to, Venice, 1587 and 1592, a work which favours and fosters popular superstitions; and 'Universæ Naturæ Theatrum, in quo Rerum omnium Effectrices, Causæ, et Fines, contemplantur,' 8vo, Lyon, 1596, 8vo, Frankfurt, 1597, &c., a work of posthumous publication, which has been considered by some as a specimen of disguised Pantheism; and 'Heptaplomeres de abditis rerum sublimium Arcanis,' which, long suffered to remain in manuscript, was at length published for the first time by G. E. Guhrauer, 8vo, Berlin, 1841. But the most important of Bodin's productions, and that by which he is most favourably known, is that entitled 'Six Livres de la République,' folio, Paris, 1576, folio, Lyon, 1580, 8vo, Lyon, 1593, &c., in which the author has based his principles upon examples drawn from universal history, and of which he owes many of the most striking ideas, without thinking it necessary to acknowledge the obligation, to the 'Politics' of Aristotle. A Latin translation of this work was done by the author himself, and went through several editions, folio, Lyon, 1586, 8vo, Frankfurt, 1591 and 1594, &c. Italian and Spanish versions appeared respectively at Geneva, folio, 1588, and Turin, folio, 1590. An English translation by Richard Knolles was entitled 'The Six Bookes of a Common-Weale, out of the French and Latin copies,' folio, London, 1606. Amongst the works which have recently been published illustrative of Bodin and his times may be mentioned Colombel's 'Jean Bodin, suite des études sur le 16me Siècle,' Nantes, 1845; and 'Jean Bodin et son temps. Tableau des Théories politiques et des Idées économiques au seizième Siècle,' 8vo, Paris, 1853, by M. Henri Baudrillart.

* BODMER, GEORG, a skilful Swiss mechanic, was born at Zurich in December, 1786. At the age of 16 he was placed under a millwright at Hauptweil in Thurgau. In 1803 he invented an improvement in wheel-gearing, and in 1805 several improvements in cotton-spinning machinery. Soon after this

he established a machine factory at Küssnacht, in the canton Zurich. Here, in 1808, he constructed a 1-pounder breech-loading cannon, which discharged shells provided with some kind of percussion fuse. He next settled at St. Blasien in Baden, where he conducted an extensive manufacture of cannon and machinery for Baden, Switzerland, and France. In 1816 he was appointed captain of artillery, and was also much employed by the government of Baden till 1822. Returning to Switzerland, and remaining a short time there, he then came to England, where he established a factory for machines and machine-tools at Manchester. He made great improvements in cotton-spinning machines, which he grouped under the collective name of 'bandvereinigungs-system,' and for which he obtained patents in England, France, Austria, the Netherlands, and the United States of America. He also took out many patents for improvements in machine-tools, made locomotives, as well as land and marine steam-engines, and constructed a water-wheel at Bolton 61 feet in diameter. After remaining in England about a quarter of a century, Bodmer went in 1847 to Austria, where he was concerned in the construction of the government railways, especially the Sömmering incline over the Alps.

BÖCKH, AUGUST [E. C. vol. i. col. 737]. This distinguished scholar and archæologist died at Berlin on the 3rd of August, 1867, in his 82nd year.

BOETTCHER or BOETTGER. [BÖTTGER, E. C. S.]

BOFFRAND, GERMAIN, a celebrated French architect, was born at Nantes, May the 7th, 1667. The son of a sculptor, he was at a suitable age sent to Paris to study design with a view to following the profession of his father, but his own inclination was much stronger for architecture, and by the kindness of Mansard he was enabled to take his own course. Under Mansard he made rapid progress and was entrusted to supervise the erection of several of his great works. He began practice for himself with good prospects of success, and they were amply fulfilled. He erected many important buildings in Germany as well as in France, and executed some considerable engineering works. Of the chief of these he has given plans and elevations in his 'Livre d'Architecture contenant les principes généraux de cet art, et les plans, élévations et profils de quelques-uns des bâtimens faits en France et dans le pays étrangers,' folio, Paris, 1746. His architectural principles are founded, seemingly, on Horace's principles of poetry; his professional admiration is however wholly given to Palladio, in whose style most of his buildings are avowedly designed; but his Palladian is very French. Boffrand lived at a time when French taste was rapidly decaying. He protested against the corruptions which were gaining ground in architectural design, but he did not escape their influence. In Paris he built the hotels Guerchy, de Duras, de Tingry, and de Voyer, the houses of Le Brun, the painter, of M. de Montaran and the vast structure for the Enfants-Trouvés, in the rue Notre-Dame; and added to or embellished several others, particularly the interior of the Hôtel Soubise. Other works of his are the Palace of Nancy, the Hôtel de Craon, at Nancy, the Château de Harroué in Lorraine, the Château de Luneville erected as a summer residence for Leopold I. Duke of Lorraine; the famous Puits de Bicêtre; the gates of the Hôtel de Villars and the Petit Luxembourg; and the bridges of Sens and of Montereau. He also directed the construction of several canals and hydraulic works, and of various buildings in Germany and Flanders. He was elected member of the Academy in 1709. At his death, which occurred in Paris, on the 18th of March, 1754, he was dean of the Academy of Architecture, pensionnaire of the royal buildings, and chief engineer of the bridges and highways of France. Besides the 'Livre d'Architecture' mentioned above, M. Boffrand published a treatise written, like his larger work, in Latin and French, entitled 'Description de ce qui a été pratiqué pour fondre en bronze d'un seul jet la figure équestre de Louis XIV., élevée par la ville de Paris dans la place de Louis-le-grand en 1699,' with 19 plates, folio, Paris, 1699, a work now rare, the plates having been destroyed when 200 impressions were taken. M. Boffrand, who was of a lively disposition, also wrote some comedies which were acted in the Theatre of the Comédiens Italiens, and printed in the 'Theatre' of Gherardi, but though enjoyed at the time they have long been obsolete.

BOGDANOVICH, HIPPOLYTE, an eminent Russian author, was born at Perevolotchna, in Little Russia, December 28, 1743; and was in 1754 sent to Moscow to complete his education, with a view to the military service. By the time he had entered on his 15th year he had, however, imbibed so strong a taste for the stage, that he applied to Kheraskoff, then superin-

tendent of the theatre, for employment as an actor. Kheraskoff as wisely as kindly dissuaded him from his design, took him into his house, induced him to continue his attendance at the university, and undertook to guide his studies in poetry and general literature. He now made rapid progress; in 1761 was appointed class-inspector in the university, and in 1765 translator in the office of foreign affairs. The following year he went, as secretary of legation, to Dresden; where he commenced the poem which made him famous. He returned to St. Petersburg in 1768, and, whilst continuing in the civil service, edited a journal called 'Innocent Amusement,' and contributed to other periodicals. In 1780 he was nominated member, and in 1788 president, of the commission of the imperial archives. He was allowed to retire in 1796, when he returned to Little Russia, settling finally at Koursk, where he died, on the 6th of January, 1803. 'Dooshinka,' the Little Soul, the poem by which his fame was established, was founded partly on the fable of Apuleius, but mainly on the *Psyche* of La Fontaine; but much of it is original, and it displays considerable imagination and poetic feeling. Many critics assign it a higher place than the pieces from which it originated, and it is still one of the most esteemed and popular of the older Russian poems. Bogdanovich composed several dramatic pieces for the Empress Catharine, wrote various minor poems, and translated Voltaire's 'Ode on the Destruction of Lisbon;' but his fame rests on his 'Dooshinka.' His prose works comprise a 'Description of Russia,' 1777; a 'Selection of Russian Proverbs,' 1785; and a translation of Vertot's 'Histoire des Revolutions de la République Romaine,' 1771. His collected works were published in 6 vols. Moscow, 1809—10; 2nd ed. in 4 vols. 1818. Specimens of his poetry are given in Sir John Bowring's 'Russian Anthology.'

* BÖHTLINGK, OTTO, a distinguished Russian Orientalist, was born on the 30th of May, 1815, at St. Petersburg, and was descended from a German family of Lübeck. He was educated successively at St. Petersburg and at Dorpat; and in 1835 repaired to Germany in order to avail himself of the teaching of the learned Oriental scholars of Berlin and Bonn. After a stay of seven years in Germany he returned to Russia, where he presently obtained a chair in the Academy of Sciences of St. Petersburg, and the titular dignity of Councillor of State.

Böhtlingk has applied himself especially to the grammar of the Sanscrit language, and has published in connection therewith an edition of Panini's 'Eight Books of Grammatical Rules,' 2 vols. Bonn, 1840; Remarks on the Second Edition of Franz Bopp's Critical Grammar of the Sanscrit Language, 'Bemerkungen zur zweiten Ausgabe von Fr. Bopp's Kritischer Grammatik der Sanskritsprache in Kürzerer Fassung. Erster Artikel,' 8vo, St. Petersburg, 1845; Sanscrit Declension, 'Die Declination im Sanskrit,' 4to, St. Petersburg, 1844; A first Essay upon the Accent in Sanscrit, 'Ein erster Versuch über den Accent im Sanskrit,' 8vo, St. Petersburg, 1843; an edition of the Sanscrit text, with a German translation and commentary, of Sakuntala, 'Kālidāsa's Ring-Çakuntala,' 8vo, Bonn, 1842; 'Sanskrit-Chrestomathie,' 8vo, St. Petersburg, 1845; 'Hermakandra's Abhidānakintāmani,' 8vo, St. Petersburg, 1847, a systematic Lexicon of Synonyms, edited, translated, and annotated jointly by Böhtlingk and C. Rieu. Dr. Böhtlingk has likewise contributed to the 'Mémoires de l'Académie Impériale des Sciences de Saint-Petersbourg,' and especially a work which afterwards enjoyed a separate publication, 'Die Unādi-Affixe;' and a dissertation, afterwards separately published in 1851, on the Language of the Jakutes, 'Ueber die Sprache der Jakuten. Grammatik, Text und Wörterbuch,' to Alexander von Middendorff's Journey to Siberia, 'Reise in den äussersten Norden und Osten Sibiriens,' 4to, St. Petersburg, 1847, &c. Jointly with Rodolph Roth, Dr. Böhtlingk has compiled a Dictionary of the Sanscrit Language, 'Sanskrit-Wörterbuch,' 4to, St. Petersburg, 1853. His last contribution to Oriental science has taken the form of a work, in 3 parts, on Indian Aphorisms, 'Indische Sprüche. Sanskrit und Deutsch,' 8vo, St. Petersburg, 1863, 1864, and 1865.

BOHUN, EDMUND, a political writer of some notoriety in the latter part of the 17th century, was born on the 12th of March, 1645, at Ringsfield, near Beccles, Suffolk, of a family long settled at Westhall Hall, in that county. In 1663 he was admitted fellow-commoner of Queen's College, Cambridge, but left on account of the plague in 1666. He was sworn justice of the peace for Suffolk in 1675, and for some years led the life of a country gentleman, his leisure hours being given to literature; but monetary difficulties forced him to London, and no more profitable employment offering, he turned to literature as a regular pursuit. His writings were much read, admired, and

censured when they appeared, but they have no intrinsic value, and would have passed into oblivion long ago but for their connection with a singular phase of religious and political opinion. Bohun was one of the last and strongest supporters of the theory of passive obedience in Church and State, and he reprinted Sir Robert Filmer's 'Patriarcha,' and defended Filmer's position; but when James II. had abdicated his throne and quitted the kingdom, Bohun held that as a good citizen he was bound to transfer his allegiance to William and Mary, who were by right of conquest, as well as by the acceptance of the legislature, *de facto* king and queen. The writings he issued to this purpose did not convince his high-church friends, who had previously held him in much esteem, but procured for him, 1692, the office of licenser of the press in succession to Fraser. He held it, however, only five months, and the office ceased with his tenure of it. The circumstances which led to his dismissal are narrated under BLOUNT, CHARLES [E. C. S. col. 261]. Blount's treatise 'William and Mary Conqueror' was brought to Bohun on the 9th of January, 1693, by Bentley, the bookseller, who did not know the name of the author. "I read it over that day and the next with incredible satisfaction," wrote Bohun in his 'Autobiography,' "finding it well written, close argument, modest, full of reason; and which I believed could not fail to satisfy great numbers of the non-swearing, for whose sake only it was written." He gave his licence, and the book was published. Unluckily for Bohun, instead of satisfying anybody it raised a storm in which he was wrecked. On the 20th of January the notice of the House of Commons was called to the publication, and as the work was anonymous, the licenser was ordered into custody; the next day he was examined at the bar of the House; on the 23rd the Commons and on the 24th the Lords condemned the book and ordered it to be burned by the common hangman, and sent up an address to the Throne for the removal of the licenser from his office; and on the 28th the Chancellor of the Exchequer having signified to the Houses that his Majesty had given orders for his dismissal from his employment, Bohun was "upon his knees before the House" reprimanded by the Speaker and discharged out of custody. He had now nothing but his pen to depend upon, for his country property was deeply involved, but in 1698 he was, through what interest is unknown, made Chief Justice of South Carolina, with the munificent salary of 60*l.* a year. It would seem, however, that there were fees as well as salary, for not long after his installation he was officially warned not to take more than his dues. But he enjoyed neither long. An epidemic of small-pox and fever visited Charleston, and Bohun was one of its victims. He died on the 5th of October, 1699. Bohun's most noteworthy writings are:—'An Address to the Freeman and Freeholders of the Nation,' 1682; 'The Justice of the Peace and his Calling,' 1684, 2nd ed. 1693; 'A Defence of Sir Robert Filmer against Algernon Sidney's Paper delivered to the Sheriffs upon the Scaffold,' 8vo, 1684; Preface to Filmer's 'Patriarcha,' 1685; 'Life of Bishop Jewel,' prefixed to his 'Apology,' 1685; translation of Le Clerc's *Bibliothèque* (Jan.—March, 1687); 'Geographical Dictionary,' 1688, 2nd ed. 1691; translations of Sleidan's 'General History of the Reformation,' and of Puffendorf's 'De Statu Germanici Imperii,' 1690; 'The character of the Queen Elizabeth and of her principal Ministers of State,' 1693; 'Historical, Geographical, and Political Dictionary,' folio, 1694; and various tracts. After his death appeared an edition largely augmented and continued by Bohun of Heylin's 'Cosmogony,' folio, 1703; and in 1705 his 'Doctrine of Passive Obedience.' 'The Diary and Autobiography of Edmund Bohun, Esq.,' was published for the first time in 1853, with an Introductory Memoir, Notes, and Illustrations by S. W. Rix, which has supplied many of the dates and facts in this notice.

BOICEAU, JEAN, a French jurist, was born at the beginning of the 16th century at Poitiers, and died in the same city on the 14th of April, 1589. He practised as an advocate in the Presidial, a court which had the power of final judgment, without appeal, in civil causes involving no more than a specified sum of money. He acquired considerable reputation by the publication of a commentary on the ordinance of Moulins, which was passed in 1566, and had the effect of limiting to 100 livres the amount over which the Presidial courts had jurisdiction, with the title 'Ad Legem regiam Molinensis habitam de abrogatu testium, a libra centena Probatione Commentarius,' 8vo, Poitiers, 1582. This work is remarkable for the clearness and excellence of its method, and the additions which have been made to it in various issues have scarcely touched its general plan or its principles. The 'Commentarius' of Boiceau was translated into French by Gabriel Michel, and printed at the end of the 'Paraphrase de

Gilles Bourdin sur l'ordonnance de l'an 1539, traduite par Antoine Fontenon, 8vo, Paris, 1600, 1606, and 1615. The best edition of Boiceau is that of Danty, which gave both the Latin and French texts, and was published, with observations and additions, in 4to, Paris, 1696; and which was seven times reprinted in the course of the 18th century.

Boiceau had the misfortune to lose his sight, a deprivation which did not put a stop either to his consultations or his forensic practice. He sought to amuse himself by the composition of verses in Latin and French, but as a poet he never achieved a great reputation. His productions in this kind are an 'Eglogue pastorale sur le vol de l'Aigle en France, par le moyen de la Paix,' 16mo, Lyon, 1539; and 'Le Monologue de Robin qui a perdu son procès,' Poitiers, 1555. The last is a satire upon the litigious tendencies of the Poitevins, in whose dialect it was written.

* BOIS-DUVAL, JEAN ALPHONSE, French entomologist, was born June 17, 1801, at Ticheville, a small village in the department of Orne, and was educated first at Vimoutier, next at Rouen, and finally at Paris. In 1824 he won the prizes awarded at the École de Pharmacie for proficiency in botany and natural history, and in 1828 he was made a doctor of medicine. His first publication was a 'Notice sur cinq espèces nouvelles de Lepidoptères d'Europe,' which appeared in the *Memoirs of the Linnean Society of Paris* for 1827, and was indicative of his future line of study. From this time he seems to have been actively engaged in researches on butterflies, for in 1829 no fewer than three lepidopterological works in which he had a hand issued from the press. One was entirely by himself, viz., an 'Essai sur une Monographie des Zygenides suivi du tableau méthodique des Lepidoptères d'Europe'; another was executed in conjunction with Count Dejean, and was a work giving figures of the European beetles; and the third was the 'Histoire générale et Iconographie des Lepidoptères et des Chenilles de l'Amérique septentrionale,' in which his co-worker was J. Leconte, and the issuing of which in parts commenced in the above-mentioned year. His attention, however, was not confined to butterflies and beetles, for in 1828 there appeared a 'Flora française,' in 3 vols., 18mo, forming portion of the Roret encyclopædic series of manuals. In 1830 was commenced the publication of his 'Faune entomologique de l'Océan pacifique,' one of the series of works illustrative of Dumont D'Urville's scientific voyage in the *Astrolabe*. The second volume appeared in 1834, and in 1835 he received the Cross of the Legion of Honour for his services in connection with the *Astrolabe*, and for his efforts in repelling cholera. This work was only one of several which he was carrying on at the same time. Thus in 1832 appeared the first part of a large illustrated work on the caterpillars of Europe, in which he was aided by Rambur and Graslin; and which was finished in 1843. In 1832 also he commenced the publication of his 'Icones historique des Lepidoptères nouveaux ou peu connus, Collection des papillons d'Europe nouvellement découverte, ouvrages formant le complément de tous les auteurs iconographes,' of which the 42nd part was issued in 1834, and we believe it then stopped. In 1833 appeared his 'Faune entomologique de Madagascar, Bourbon, et Maurice Lepidoptères.' In 1836 we have his 'Histoire générale des Insectes. Espèces générales des Lepidoptères,' forming portion of the 'Suites à Buffon.' After this his literary efforts seem to have slackened, for little has issued from his pen, except occasional short papers in the 'Annales de la Société Entomologique de France' (his contributions to which extend from 1832 to 1868); a note or two in *Goumain-Cornille's* 'La Savoie,' of which the first edition appeared in 1864, and the third in 1866; a new edition of the 'Nouveau Manuel complet des destructeurs des animaux nuisibles,' 1847; and an 'Essai sur l'Entomologie horticole comprenant l'histoire des Insectes nuisibles à l'Horticulture,' &c., 1867; which is a thick octavo volume, containing a popular account of the gardener's insect foes and friends, and the best way of getting rid of the former.

BOISGELIN, JEAN DE DIEU RAYMOND DE CUCÉ DE, a French theologian and cardinal, a member of an ancient family of Bretagne, was born at Rennes on the 27th of February, 1732. He abandoned the birthright which fell to him by the death of his elder brother in order to devote himself unreservedly to the church. He was appointed successively to be grand-vicar of Pontoise, Bishop of Lavaur in 1765, and in 1770 Archbishop of Aix. The last-named city owes much to his skill and benevolence; and as deputy of the clergy of his province, in 1789, he had many opportunities, in his place in the States-General, of exhibiting his prudence and moderation. At the Session of the Constituent Assembly a constitutional archbishop was named to

the province of Aix, and M. de Boisgelin retired to England, from which he did not return to France until after the signature of the concordat. In 1802 he was raised to the archbishopric of Tours, and shortly after, 1803, was promoted to the cardinalate. He died on the 22nd of August, 1804. To his prelate and administrative ability, M. de Boisgelin added the culture of a man of letters. In 1776 he was appointed a member of the French Academy, in the place of the Abbé de Voisenon. In 1765 he delivered the funeral oration over the Dauphin, son of Louis XV.; in 1766 another on Stanislaus Leczinski, King of Poland; and a third on the Dauphine in 1769. His greatest oratorical effort, however, was the sermon he delivered at the coronation of Louis XVI., at Reims, when the popular applause broke through the rules of decorum. The works of Cardinal de Boisgelin comprise 'Art de juger par l'analyse des idées,' 8vo, Paris, 1789; 'Considérations sur la paix publique, adressées aux chefs de la Révolution,' 8vo, Paris, 1791; 'Discours à la Cérémonie de la Prestation du Serment des Archevêques et Evêques,' 4to, Paris, 1802; 'Exposition des principes sur la constitution du clergé, par les Evêques députés à l'Assemblée Nationale de France,' 8vo, Paris, 1791; an anonymous French translation, in verse, of the 'Héroïdes d'Ovide,' 8vo, Paris, 1786; 'Mémoires pour le Clergé de France, au sujet de la prestation de foi et d'hommage; avec la réponse de l'inspecteur du domaine,' 8vo, 1785; 'Précis des conférences des commissaires du clergé avec les commissaires du conseil,' 4to, and 8vo, Paris, 1786; 'Le Psalmiste: Traduction des Psaumes, en vers, précédée d'un discours sur la poésie sacrée des Hébreux,' 8vo, London, 1799; besides various poems. His Works were published by M. de Bausset, with the title of 'Œuvres du Cardinal de Boisgelin, précédées d'une Notice historique sur la Vie et les Écrits de ce Prélat,' 8vo, Paris, 1818; and his 'Œuvres oratoires complètes' find a place in the Abbé Migné's 'Collection Intégrale et Universelle des Orateurs Sacrés,' 4to, Paris, 1844, &c.

BOISGELIN, LOUIS BRUNO, COMTE DE, a French diplomatist, and brother of the cardinal, through whose self-abnegation he became head of his house, was born at Rennes in 1733. He embraced the profession of arms, and through successive grades became in 1762 colonel of the Lorraine Guards, and brigadier and field-marshal in 1780. He was also "Maitre de la garde-robe" and "Chevalier du Saint-Esprit," and was sent as minister plenipotentiary to the court of Parma. He was "baron des états de Bretagne," and in this position made himself remarkable for the energy he displayed in the assembly held under his presidency in 1789. He persistently refused a seat in the States-General, and during the revolution sought concealment and security. But in this object he was unsuccessful, for he was arrested, imprisoned in the Luxembourg, condemned, and executed on the 7th of July, 1794.

BOISSERÉE, SULPIS, [E. C. vol. i. col. 751] died on the 2nd of May, 1854. His brother, MELCHIOR BOISSERÉE, noticed in the above biography as having shared in all the labours of his brother, was born on the 23rd of April, 1786, and died on the 14th of May, 1851. His specialty was glass-painting, and to his example and influence the royal glass-painting establishment at Munich is largely indebted for its present high character. Their friend and coadjutor, JEAN BAPTISTE BERTRAM (born in 1776) died at Munich in 1841.

* BOISSIER, EDMOND, Swiss botanist. He was born at Geneva in 1810, and in 1837 commenced a series of tours through various parts of Europe for the purpose of studying and collecting plants, more especially those of which little had previously been known. The results obtained were embodied in papers contributed from time to time to the 'Annales des Sciences Naturelles (Bot.),' and in the separate works entitled 'Voyage botanique dans le Midi de l'Espagne pendant l'année 1837,' 2 vols. 1839—1845; 'Elenchus plantarum novarum minus cognitarum quasi in itinere Hispanico legit E. B.,' 1840; and 'Diagnoses plantarum Orientalium,' 1st series, 2 vols. 1842—1854; 2nd series, 1853, &c.

BOISSONADE, JEAN FRANÇOIS. [E. C. vol. i. col. 751.] M. Boissonade died on the 12th of September, 1857, at the ripe age of 83. Since 1840 he had held the rank of officer of the Legion of Honour. In 1863 was published a selection from his early contributions to the 'Journal des Débats,' in two volumes, 8vo, under the title 'Critique Littéraire sous le premier Empire,' with an historical introduction by M. Naudet.

BOISSY D'ANGLAS, COMTE FRANÇOIS-ANTOINE DE, one of the most active participants in the great French Revolution, was born of a Protestant family at St. Jean-Chambre, department of Ardèche, on the 8th of December, 1756. After studying at Annonay, he was admitted to the faculty of advo-

cates at Paris, but did not practise at the bar. For a time he was maître d'hôtel to Monsieur, afterwards Louis XVIII., and was on terms of intimacy with Malesherbes and with the two Montgolfiers. After publishing an 'Adresse au Peuple Languedocien' in 1789, he was elected to the States-General as deputy for Annonay. In 1790 he published 'Adresse à mes Concitoyens,' expressing hopes for a peaceful issue of liberal reforms, speaking well of the king, and deprecating violence. In 1791 appeared his 'Observations sur l'ouvrage de M. de Calonne, intitulé de l'état de la France présent et à venir, et, à son occasion, sur les principaux actes de l'Assemblée Nationale, avec un postscript sur les derniers écrits de MM. Mounier et Lally.' In the same year he was elected Secretary of the National Assembly. Next, during a temporary absence from the Legislature, he acted as procureur-syndic of Ardèche, in which office he displayed firmness and judgment. In 1792, after publishing a pamphlet, 'Boissy d'Anglas à Thomas Raynal,' refuting certain accusations, he manifested an increasing tendency towards revolutionary views, in an essay, 'Quelques idées sur la liberté, la révolution, le gouvernement républicain, et la constitution Française.' In the same year he was elected member of the National Convention for Ardèche. When on the war committee he wrote 'Rapport sur l'arrestation de Bidermann,' and several other papers on the army organisation of the period. In 1793 he voted for the safe keeping of the hapless king, but against his execution; nevertheless he soon afterwards published 'De Notre Situation présente et future,' a sort of apology for having differed from the majority. He voted with the Girondists against the Jacobins; and wrote 'Lettre au Citoyen Dumont' against the violence of the extreme party. During the Reign of Terror he remained nearly silent. In February, 1794, as member of the Committee of Public Instruction, he addressed to the Convention 'Quelques idées sur les Arts, sur la nécessité de les encourager, sur les institutions qui peuvent en assurer le perfectionnement, et sur divers établissements nécessaires à l'enseignement public;' this, with other addresses and reports, were ordered by the Convention to be printed. In October of the same year he became Secretary to the Convention; and in December a member of the Committee of Public Safety. In the last-named office one of his duties was to attend to the victualling of Paris during the dearth of the winter 1794—5, in which he displayed much energy and tact. He continued to publish numerous reports and letters. The influence of Boissy d'Anglas was much increased by the line of policy which he followed in 1795, bringing about the downfall of Robespierre and the Jacobins, and reconstituting more moderate measures. The Executive Directory, then founded, made him Secretary of the Council of Five Hundred, of which body he became president in 1796, writing and speaking very frequently on various public topics. He fell into disfavour with the Directory, however, in 1797, and did not take part again in public affairs till 1800, when the influence of Napoleon gave a new turn to his writings and speeches. He was made president of the tribunate in 1803, senator in 1804 (with the title of count), grand cordon of the Legion of Honour in 1811, and commissary extraordinary in providing for the defence of the south-west of France against the English in 1814. He kept in favour with the ruling powers during the changes of 1814—15, was made a peer, and was admitted into the Academy of Inscriptions in 1816. During all changes the writings of Boissy d'Anglas on public questions were numerous. His death took place on the 20th of October, 1826. He published many of his miscellaneous writings under the title 'Études littéraires et poétiques, d'un vieillard, ou Recueil de divers écrits en vers et en prose,' 6 vols. 12mo, Paris, 1825.

BOIVIN, or BOYVIN, RENÉ, known also as RENATUS, a celebrated early French engraver, was born at Angers in 1530. Having acquired an elementary knowledge of design, he went to Rome, where he appears to have resided for the greater part of his life; but he visited Germany and executed portraits of the more celebrated Reformers, and eventually returned to France, where he is believed to have died in 1598. The dates of his engravings extend, according to Passavant, between 1568 and 1580. His works are unequal, but the best of them have great spirit. Among the most prized are his prints after Primaticcio; 'Francis I. approaching the Temple of Immortality,' after Rossi; the portrait of Henry II.; the engravings to the 'Toison d'Or' of Prince Jason of Thessaly; 12 plates of the Ancient Philosophers and Poets; portrait of Clement Marot; Agar and Ishmael; and the Dutch Breakfast, after Metzsu.

* BOLCKOW, HENRY WILLIAM FERDINAND, closely connected with the development of the iron manufacture of the Cleveland district in Yorkshire, was born in Mecklenburg-

Schwerin in 1804. He arrived in England in 1827, and after some years became senior partner in the now eminent firm of Bolckow and Vaughan, who established iron-works at Middlesbrough in 1841. They took a keen interest in the discovery of good iron ore in the neighbouring Cleveland hills. Iron smelting is known to have been carried on in that district in early times; but early in the present century all records had been lost concerning the exact locality whence the ore had been obtained. At various times between 1800 and 1850 beds had been discovered, but not of such quality as to induce smelters to use the ironstone to any great extent. At length, in the last-named year, Mr. Vaughan discovered a bed 16 feet thick, exceedingly rich in protoxide of iron, close to the present busy town of Eston, near Middlesbrough; and between 1850 and 1870 the whole district has grown in wealth and population at a rate scarcely equalled in any other part of England. The chief firm, Messrs. Bolckow and Vaughan (whose partnership has recently been converted into a limited liability company), are the owners of smelting-works on a vast scale, together with collieries, limestone quarries, machine-works, gas-works, and brick-works. Mr. Bolckow, who became a naturalised British subject in 1841, has been closely connected with the rising prosperity of Middlesbrough. When the town received its charter of incorporation in 1853, he became its first mayor; when it received the parliamentary franchise in 1868, he became its first member of parliament. He is a magistrate of Middlesbrough, a county magistrate for Durham and the North Riding of Yorkshire, and deputy-lieutenant of the Riding. He has laid out 20,000*l.* in forming the Albert public park at Middlesbrough. This park was opened with great ceremonial on the 11th of August, 1868, by H.R.H. Prince Arthur, who slept at Marton Hall, the residence of Mr. Bolckow, on the preceding night. On the next day an iron rail, stamped in the rolling-mill with the inscription "His Royal Highness Prince Arthur. 1868," was made in his presence in the Bolckow mills, of iron obtained from the Bolckow mines, and smelted at the Bolckow furnaces.

* BOLINTINEANO, DEMETRIUS, a Roumanian poet, was born in 1826 at Bolintina, near Bucharest, in which city he studied at the college of St. Sava. He entered the service of the State, but his poems, several of which had appeared in the public journals, having attracted the interest of wealthy friends, he was sent in 1847 to complete his studies at Paris. The revolutionary movements of the following year recalled him to Bucharest, where for some months he edited the 'Populul Suverano,' a journal published in the interests of the national democratic party. The success of the reactionary party forced him to flight, and he sought refuge successively in France and in Turkey. Under Prince Couza, he was summoned, in May, 1861, to undertake the duties of Minister of Foreign Affairs in the Galesco cabinet. He is the author of volumes of Poems and Ballads, entitled respectively 'Cantece si Plangeri,' 'Cantarea romaniei,' 'Melodii romane,' 'Legende si basme nationale,' and 'Poesie vechi si nove.' A French version of his Roumanian Poems has been published with the title of 'Brises d'Orient; Poésies Roumaines, traduites par l'auteur lui-même, précédées d'une Préface de M. P. Chasles,' 8vo, Paris, 1866. Bolintineano has likewise attracted attention by a philosophical romance entitled 'Manilu,' in which he exposes the corruption of the Boyards; and by his brochure entitled 'Les Principautés Roumaines,' 8vo, Paris, 1854.

BOLZANO, BERNHARD, a German philosopher and theologian, was born at Prague on the 5th of October, 1781. His studies at first were chiefly mathematical, but he soon adopted those by which he afterwards acquired his reputation. He became in 1805 doctor of philosophy, took orders, and was appointed professor in the theological faculty of the High School at Prague. In this position he became obnoxious to the clerical party by the freedom of his speculations, and he was accused of adhering to the principles of Schelling. Nevertheless, finding a supporter in the Prince-Archbishop Salm Salm, he was enabled to continue for 15 years in the full enjoyment of his academic privileges. But in 1820 his enemies prevailed, and he was not only ejected from his chair, but was even subjected to annoyance in his domestic and personal relations. At this juncture the family of Count Leo von Thun afforded him an asylum, and in the refuge thus opened to him he continued the production or the revision of his works till his death on the 18th of December, 1848. His writings comprise a treatise on Scientific Instruction, &c., 'Wissenschaftslehre, oder Versuch einer neuen Darstellung der Logik,' 4 vols. Sulzbach, 1837; on Aesthetics, 'Abhandlungen zur Aesthetik,' 2 vols. Prague, 1843—49; What

is Philosophy? 'Was ist Philosophie?' Vienna, 1849; Paradoxes of the Infinite, 'Paradoxien des Unendlichen,' Leipzig, 1851; Proofs of the Immortality of the Soul, 'Athanasia, oder Gründe für die Unsterblichkeit der Seele,' 2nd edition, 8vo, Sulzbach, 1838; Manual of Theology, 'Lehrbuch der Religionswissenschaft,' 4 vols. Sulzbach, 1834; and a Succinct Manual of Catholic Christianity, 'Kurzgefasstes Lehrbuch der Katholischen Christlichen Religion als der wahren göttlichen Offenbarung,' Bautzen, 1840.

BONALD, LOUIS GABRIEL AMBROISE, VICOMTE DE, a philosopher and statesman, was born at Monna, near Milhau, in Rouergue, on the 2nd of October, 1754. He was educated at the college of Juilly, and afterwards entered the King's Mousketeers (mousquetaires de la maison du roi). Upon the abolition of this corps in 1776, he quitted the service, married, and was appointed to the mayoralty of his native place. In 1790 he was named president of the first departmental administration of Aveyron; but, dissatisfied with its proceedings with reference to the clergy, he resigned his office, and retired to his estate. In 1791 he quitted France and joined the "Armée des Princes," under the command of Louis Joseph de Bourbon, Prince de Condé. When this army was disbanded, De Bonald retired with his family to Heidelberg, where he wrote his 'Théorie du pouvoir politique et religieux dans la Société civile, démontrée par le raisonnement et l'histoire,' 3 vols. 8vo, Constance, 1796, reprinted in 3 vols. 8vo, Paris, 1843, and in 2 vols. 8vo, 1854, in which he prophesied, but without affixing a date, the return of the Bourbons to the throne of France. This work was proscribed by the Directory, and few copies in France escaped the vigilance of its agents; and when the author repaired to Paris in 1797 he found it expedient, in order to preserve his own personal liberty, to accept a modest retreat offered to him by an adherent of his political and ecclesiastical opinions. He now composed his 'Essai analytique sur les Lois naturelles de l'ordre social; ou, Du Pouvoir du Ministre et du Sujet dans la Société,' 8vo, Paris, 1800; 'Législation primitive, considérée dans les derniers temps, par les seules lumières de la raison, suivie de plusieurs traités et discours politiques,' 3 vols. 8vo, Paris, 1802, 2nd edition, 1821, a development, in another form, of the preceding work; and 'Du Divorce considéré au XIX^e siècle relativement à l'état domestique et politique de la Société,' 8vo, of which a second edition, revised, corrected, and enlarged by the author, was published in 8vo, Turin, 1824. Under the Consulate, De Bonald was allowed to return to his estate at Monna, where he devoted himself to the production of various articles which, contributed in the first instance to the journals of the time, were afterwards collected in two 8vo volumes with the title of 'Mélanges littéraires, politiques, et philosophiques.' In 1806 he became associated with M.M. de Chateaubriand and Fiévée in the editorship of the 'Mercure de France.' In 1808 he was named councillor of the Imperial University, an institution which had frequently been the object of his attacks, and with which he allowed himself to be connected only after the repeated entreaties, extending over two years, of various friends, and especially of M. De Fontanes, the principal of the university. Although it has been sharply said that De Bonald, with a salary of 12,000 francs, patiently awaited in the Imperial salons the predicted return of the Bourbons, he refused to accept any other office under Napoleon, and even declined the charge, offered to him in an autograph letter by Louis Bonaparte, King of Holland, of educating his son, the present Emperor of the French. Upon the return of Louis XVIII. to France, he appointed De Bonald a member of the Royal Council of Public Instruction, established by an ordinance of the 17th of June, 1814, under the presidency of M. (afterwards Cardinal) De Bausset. De Bonald also received from the king the Cross of St. Louis; and about the same time published a brochure entitled 'Réflexions sur l'intérêt général de l'Europe,' 8vo, Paris, 1814, 2nd edition, 8vo, Paris, 1815, in which he claimed the extension of the frontiers of France to the Rhine. In 1815 he was elected deputy for the department of Aveyron, and took his seat in the chamber called *introuvable*, where he spoke often, and chiefly in the ecclesiastical interest. In March, 1816, he was chosen a member of the French Academy, and closed his career as a deputy, to which office he had been elected in 1820 and 1823, by being named, at the end of the latter year, peer of France. He forfeited this dignity in 1830 by his refusal to take the oath, after the revolution of July. Some months before this event, which marks the termination of his political life, he had published his 'Démonstration philosophique du principe constitutif de la Société,' 8vo, Paris, 1830; and after it he retired to Monna, where he died somewhat suddenly on the 23rd of November, 1840. The 'Œuvres' of M. de Bonald were

published collectively in his lifetime, 12 vols. 8vo, Paris, 1817—19, &c.; and they have been re-issued with the title of 'Œuvres Complètes de M. de Bonald, précédées d'une Notice sur sa Vie et ses Œuvres,' &c., 3 vols. 8vo, Paris, 1859.

* BONALD, LOUIS JACQUES MAURICE DE, cardinal, primate of the French, and Archbishop of Lyon, third son of the Vicomte de Bonald, was born at Milhau on the 30th of October, 1787. He was placed successively at a school at Lyon for the pursuance of his classical studies, and at the Seminary of Saint Sulpice. Having entered holy orders, he was called upon to accompany Monseigneur de Pressigny, Archbishop of Besançon, to Rome, as secretary, when that prelate went thither charged by Louis XVIII. with the conclusion of the concordat. In 1817 De Bonald was appointed grand vicar and archdeacon to the Bishop of Chartres, and acquired a reputation for his Lent lectures in the cathedral church of that city in 1822. In 1823 he was preferred to the bishopric of Puy, then recently restored by an ordinance of the king, and enjoyed this incumbency for more than 16 years, at the end of which time he was appointed, by a royal ordinance of the 4th of December, 1839, to the archbishopric of Lyon. He was created cardinal on the 1st of March, 1841, and received the hat at the hands of the pope on the 22nd of May, 1843, with the title of Santissima Trinità al Monte Pincio. Monseigneur de Bonald distinguished himself by his zeal in upholding the dignity and privileges of the clergy, and occasioned a controversy of some magnitude and importance by his denunciation of a new edition of the 'Manuel de Droit Ecclésiastique,' by M. Dupin, procureur général of the Cour de Cassation:— 'Mandement de Monseigneur le Cardinal de Bonald portant condamnation d'une livre intitulée "Manuel de Droit Public Ecclésiastique" par Dupin, et d'un écrit du même auteur intitulé "Réfutation des assertions de M. le Comte de Montalembert dans son Manifeste Catholique,"' 8vo, Paris, 1845.

The Archbishop of Lyon was one of the first to hail the revolution of 1848, of which the watchwords "Liberté, Égalité, Fraternité," seemed favourable to the interests of the church. "Le Drapeau de la République," he said, in a circular addressed to his clergy, February 27th, 1848, "sera toujours pour la religion un drapeau protecteur;" and on the 2nd of March following he prescribed a solemn service for the victims of February. Subsequent events did not, however, fulfil his expectations as based upon a presumed republican piety. After the coup d'état of the 2nd of December, 1851, Cardinal de Bonald became a member of the Imperial Senate in virtue of his ecclesiastical dignity. His works are almost exclusively professional, and include 'Observations sur le projet de loi sur l'instruction secondaire, adressées à la Chambre des Pairs,' 4to, Lyon, 1844; 'Lettre Pastorale à l'occasion du Carême de 1844, sur l'éducation chrétienne,' 4to, Lyon, 1844; 'Instruction Pastorale à l'occasion du Carême de 1846, sur la Liberté de l'Église,' 12mo, Paris, 1846; 'Lettre Pastorale de son Eminence le Cardinal de Bonald, à l'occasion du Carême de 1857, sur la Nécessité et les Avantages de l'Instruction religieuse,' 4to, Lyon, 1857; and 'Mandement portant Condamnation du livre intitulé "La Vie de Jésus," par M. E. Renan,' 4to, Lyon, 1863.

* BONAPARTE. NAPOLEON III. [E. C. vol. i. col. 805: see NAPOLEON III., E. C. S.]

BONAPARTE, FAMILY of. JÉRÔME BONAPARTE [E. C. vol. i. col. 814.] The Prince Jérôme died on the 24th of June, 1860. The 'Journal des Opérations Militaires du Roi Jérôme en Silésie,' followed by his inedited correspondence with Napoleon I., appeared in 2 vols. 8vo, in 1854, and is a valuable addition to the historical materials of the time to which it refers.

CHARLES LUCIEN JULES LAWRENCE BONAPARTE, PRINCE of CANTINO [E. C. vol. i. col. 815]. The death of this eminent ornithologist occurred shortly after the former article was finished. For the last few years of his life he resided at Paris, suffering much from swellings and ulcerations in his legs. Notwithstanding this he frequently visited this country in order to attend the meetings of the British Association, in which he always took a hearty interest. No amount of illness or pain seemed to make him flag in his scientific zeal, or in his capacity for work, indeed the worse he became the harder he studied. His great ambition was to produce a complete classification of birds, and up to the very last hour he was labouring hard upon a large monograph of pigeons. The affection in his legs extended to his chest, and he was carried off by dropsy on July 29, 1857, in the 55th year of his age.

BOND, WILLIAM CRANCH, a distinguished American astronomer, was born at Portland, State of Maine, in September, 1789. He learned the trade of watch-making; but while living

at Dorchester, Massachusetts, he provided himself with astronomical instruments, and directed his attention to an eclipse which occurred in 1806. In 1811 his sedulous observations enabled him to be one of the earliest in America to see the comet of that year. After a long course of individual observations in astronomy, he was commissioned by the United States Navy Department in 1838 to prosecute a series of observations, preparatory to the fitting out of an exploratory expedition to the South Seas under Captain Wilkes. In 1840 he was appointed astronomical observer to Harvard University, Cambridge, Massachusetts, and director of the observatory at that place. With the great Fraunhofer equatorial Mr. Bond, assisted by his son, Mr. George Phillips Bond, made valuable astronomical observations. His knowledge of watchmaking, combined with his skill in astronomy, enabled him to construct an ingenious instrument for marking small fractions of a second of time: one part of a train of clock-work is regulated by a pendulum having a dead-beat escapement; another part, recording its own motion through the means of an elastic axis, is made to run uniformly by a balance or fly-wheel; while the whole is guided by a spring-governor. Mr. Bond was one of the first to perceive the possibility and the importance of celestial photography, and of the use of electric clocks in astronomical observations. He and his son, working sometimes together and sometimes separately, made observations embracing a wide range of phenomena—comets, occultations, eclipses, the planets Neptune and Saturn, nebulae, asteroids, moon-culminations, missing stars, solar parallax, photometry of the sun and moon, celestial photography, &c. These observations are described in a large number of papers, mostly printed originally in 'Silliman's Journal,' the 'Proceedings of the American Society of Arts and Sciences,' 'Gould's Astronomical Journal,' and the 'Cambridge (Massachusetts) Mathematical Monthly,' but afterwards reprinted in various European scientific journals. Professor Bond's 'History and Description of the Astronomical Observatory of Harvard College,' 4to, Cambridge (Mass.), 1856, is in the 1st vol. of the 'Annals' of that observatory; which Annals also contain the results of many of his scientific labours. He discovered the eighth satellite of Saturn on the 19th of September, 1848,—the same day and almost the same hour that marked the discovery of the same satellite in England by the Rev. W. R. Dawes and Mr. Lassell. Mr. G. P. Bond, at the same observatory, and with the same telescope, discovered an inner ring of Saturn, not before observed, on the 11th of November, 1850. Mr. G. P. Bond, in 1859, succeeded his father as director of the observatory and Phillips Professor of Astronomy at Harvard; and died in February, 1865.

BONIFAZIO, or BONIFACCIO, a distinguished Italian painter, was a native of Verona, and was born about 1491. Most of the biographies, following Vasari, say that he was born in Venice, but this is a mistake, as Morelli ('Notizia,' p. 196, &c.) has shown. He was a scholar of Palma, but studied closely the works of Titian, of whose style he was a close copyist. His works are distinguished rather by refinement than originality or vigour, and he is a good, though not grand, colourist. The most celebrated of his works are at Venice, in the Ducal Palace, in which is his great picture of the 'Expulsion of the Money-dealers from the Temple,' and the Academy, in which are 14 paintings collected from various churches and convents. The Louvre, Paris, possesses three pictures by him—The Resurrection of Lazarus, and two Holy Families. Bonifazio of Verona died in 1553. With him must not be confounded an earlier painter, BONIFAZIO OF CREMONA, who flourished about 1460, nor a later one, BONIFAZIO OF VITERBO (born 1637), a clever pupil and imitator of Pietro da Cortona.

* BONNECHOSE, FRANÇOIS-PAUL-EMILE BOISNORMAND DE, French historian, was born August 18, 1801, at Lyderdorp in North Holland, where his father, a French émigré, was then resident. M. Bonnechose was serving in the army when the revolution of 1830 afforded him a welcome opportunity of exchanging the sword for the pen. He obtained the post of librarian of St. Cloud, which he retained during the reign of Louis Philippe. He has since held similar appointments at Versailles and elsewhere. His early works include a tragedy, 'Rosemonde,' and a poem, 'La Morte de Bailly,' which obtained the prize of the French Academy; but his popularity was secured by his 'Histoire de France,' 2 vols. 8vo, 1834, of which ten or twelve editions have been published. M. Bonnechose has since produced several other historical publications, including a 'Histoire Sacrée,' 1838; a 'Histoire des quatre Conquêtes de l'Angleterre,' which was crowned by the Academy; and a 'Histoire d'Angleterre' (4 vols. 8vo, 1858—59), which has been

translated into English; but the only one of any real value is 'Les Réformateurs avant la Réforme du XVème Siècle,' &c., 2 vols. 8vo, 1844. He has, besides, written a kind of novel, 'Christophe Sauval, ou la Société Française sous la Réformation,' and contributed articles to periodicals.

BONNEVILLE, NICOLAS DE, a French political and socialistic writer, was born March 13th, 1760, at Evreux, and studied in the college of his native place and afterwards at Paris. Having paid particular attention to the modern languages, he began his literary career by translating dramatic pieces from the German, for Friedel, by which he obtained favourable notice from the Queen; and he assisted Tournour in rendering Shakspeare into French. In 1786 Bonneville paid a visit to England, where he formed a plan of translating Russell's 'History of Modern Europe,' then recently published; but finally determined to write an original history instead. Returning to Paris full of the revolutionary and perfectibility fervour then so rife in France, he founded the Cercle Social, a society which published a journal called 'La Bouche de Fer, ou les Tribunes du Peuple,' and later 'Le Chronique du jour' and 'La Bien-Informé,' and printed a number of patriotic and semi-philosophic publications, many of which were written by Bonneville himself. But as in his writings he advocated comparatively moderate measures, he failed to obtain much favour with the extreme revolutionists; and although he rendered useful service in a municipal office at Paris, he was baffled in an attempt to enter the legislature. He wrote boldly as a journalist during the terrible period of Jacobin power. As a Girondist he was arrested in 1793, and only liberated on the death of Robespierre. During the Empire, Bonneville was out of favour; among other causes of offence he had drawn an unwelcome comparison between Bonaparte and Cromwell. Once or twice he was arrested, and for a long time he was placed under the surveillance of the police. His last years were spent in poverty. He opened a second-hand book-shop in the Quartier Latin, where he was known to the learned men of that neighbourhood, and where he died November the 9th, 1828. Bonneville's chief works were the following:—(1) 'Le Nouveau Théâtre Allemand,' 12 vols. 8vo, Paris, 1782, of which the last 10 were translated by him; (2) 'Choix de petits romans imités de l'Allemand; suivis de quelques Essais de poésies lyriques,' 12mo, Paris, 1786; this work contains the best of his lyrical pieces; (3) 'Les Jésuites chassés de la Maçonnerie, et leurs poignards brisés par les Maçons,' 8vo, 1788, relating to the introduction of freemasonry into England; (4) 'Histoire de l'Europe Moderne, depuis l'irruption des peuples du Nord dans l'Empire Romain jusqu'à la paix de 1783,' Geneva and Paris, 1789—92, 3 vols. 8vo, only the first part of what was intended to be a very comprehensive work, and of little value; (5) 'Le Tribunal du Peuple, ou Recueil de lettres de quelques Électeurs de Paris avant la Révolution,' 8vo, 1789; (6) 'De l'Esprit des Religions, ouvrage promis et nécessaire à la confédération universelle des Amis de la Vérité,' 8vo, 1791, a dreamy scheme for a new social compact, in which freemasonry was to be combined with a theology not wholly unlike that which Auguste Comte afterwards propounded; (7) 'Le Nouveau Code conjugal, établi sur les bases de la Constitution,' 8vo, 1792, a volume still wilder; (8) 'Poésies,' 8vo, 1793. To Bonneville is attributed the proposal to form the Garde Bourgeoise, afterwards famous as the Garde National.

BONO FERRARESE, or BONO OF FERRARA, an excellent Italian painter of the 15th century, of whom nothing is really known, except that he was a pupil of Pisano (called Vittore Pisanello), of Verona, and that he was employed on pictures in the cathedral of Siena in 1461. He was, for his time, an admirable colourist; and his execution, though hard and somewhat dry, is precise and careful. The National Gallery possesses a very fine signed example of his pencil—No. 771, 'St. Jerome in the Desert.' It is painted in tempera, on panel. (Wornum, *Catalogue of the National Gallery*; Laderchi, *La Pittura Ferrarese*.)

BONONE, CARLO, an eminent Italian painter, was born at Ferrara, in 1569. He was a pupil of Bastaruolo; but on leaving him studied first at Rome, and afterwards at Bologna, where he modelled his style on that of the Carracci, whose bold contrasts of form, chiaroscuro, and colour he successfully imitated. Subsequent visits to Venice led him somewhat to modify his manner, but it is essentially that of the Carracci. His pictures were long greatly admired by the Italian connoisseurs, but the current of taste outside of Italy has of late set in a different direction. Bonone painted many large pictures of festive scenes, introducing numerous splendidly dressed figures, furniture, and decorative work, with architectural backgrounds, similar to the

compositions of Paolo Veronese, by which, indeed, they were no doubt suggested. Such are 'The Marriage at Cana,' in the Refectory of the Carthusians; and 'The Feast of Herod' in San Benedetto in Ferrara; 'The Feast of Ahasuerus' in the Refectory of San Giovanni at Ravenna; and many more. Bonone died at Ferrara in 1632, and was interred in the church of Santa Maria del Vado, the walls and vaults of which are decorated with a large number of his best works, and which, it is said, Guercino used to spend hours at a time in contemplating. His easel pictures were less esteemed by his contemporaries than his mural paintings.

BONPLAND, AIMÉ. [E. C. vol. i. col. 825.] There is little to be added respecting this eminent traveller. For the last few years of his life he resided at Santa Anna, ready to receive and help any scientific man who visited him, and died at that place on May 4, 1858, having nearly completed his 83th year.

BONSIGNORI, FRANCESCO, an eminent Italian painter of the 15th century, erroneously called Monsignori by Vasari and Lanzi, and consequently entered under that heading in most biographical dictionaries, was born at Verona in 1455. He learned painting under Andrea Mantegna at Mantua, and worked there with so much success as to attract the notice of Francesco, Marquis of Mantua, who employed him to decorate his palaces of San Sebastiano and Marmitolo and the Castello di Gonzago, as well as to take the portraits of various members of his family and court. The palatial decorations have been destroyed, and the portraits are dispersed and probably lost, but many of his larger works still remain in the churches of Mantua, and easel pictures and portraits are often met with in the public galleries. Bonsignori was famous both as an historical and a portrait painter. Vasari dwells on his skill in painting animals, and in confirmation relates anecdotes of living animals being deceived by his representations of them; whence it is said he was called 'the Modern Xeuixis.' Bonsignori passed the chief part of his life at the court of Mantua, where he continued in great esteem, but falling ill, he went to drink the waters at Caldiero, near Verona, and there died on the 2nd of July, 1519. His most famous extant works are SS. Ludovico and Bernardino, now in the Brera, Milan, a Madonna and Saints at Verona, and a St. Sebastian at Santa Maria delle Grazie, Mantua. In the National Gallery is a well painted 'Portrait of a Venetian Senator' (No. 736) by him. It is signed, like most of his works, FRANCISCU BONSIGNORIUS VERONENSIS P. 1487.

BONVICINO, ALESSANDRO [MORETTO, E. C. S.].

BOOLE, GEORGE, an eminent mathematician, was born at Lincoln, on the 4th of November, 1815. His father, a tradesman in that city, was unable to give him more than an ordinary school education; but imparted to him some of his own knowledge of mathematics and optical instruments. A neighbouring bookseller, Mr. Brooke, aided young Boole in studying the Latin language, to which he himself afterwards added a study of Greek. At the early age of 12, George Boole produced a metrical version of one of the odes of Horace, which excited much surprise among classical scholars in the county. At the age of 17 he commenced, unaided, the study of mathematics; and with the assistance of the Rev. G. S. Dickson, incumbent of St. Swithin's, Lincoln, he pursued that study to a high degree of development. After acting as assistant in a school at Doncaster, he opened a school on his own account at Lincoln, which had much success. He took great interest in the Mechanics' Institution of his native city, to which he delivered two addresses, afterwards printed, 'On the Genius and Discoveries of Sir Isaac Newton,' 1835; and 'On the Right Use of Leisure,' 1847. He became gradually known to mathematicians by his high-class papers on that science. He contributed to the Cambridge and Dublin Mathematical Journal, in 1847, a 'Mathematical Analysis of Logic, being an Essay towards a Calculus of Deductive Reasoning.' This and other articles led to his appointment (although he had not received a university education) as Professor of Mathematics at Queen's College, Cork, in 1849; a post which he filled during the remaining fifteen years of his life. The University of Dublin conferred on him the degree of LL.D.; the University of Oxford that of D.C.L.; the Royal Society elected him one of its Fellows; and he was a member or fellow of other learned bodies. Besides his labours as a professor, Dr. Boole wrote a large number of mathematical papers—11 of which were published in the 'Cambridge Mathematical Journal,' between 1841 and 1845; 10 in the 'Cambridge and Dublin Mathematical Journal,' between 1846 and 1852; others in the 'Transactions' of the Royal Society, the Edinburgh Royal Society, and the

Royal Irish Academy; and others in the 'Philosophical Magazine,' and in the 'Proceedings of the British Association for the Advancement of Science.' These papers were nearly 50 in number, and took a wide range of subjects, including the Analytical Transformation of Functions, the Calculus of Variations, Quaternions, Definite Integrals, the Theory of Probabilities, the Mathematics of Logic, &c. His 'Treatise on Differential Equations,' 1859, 2nd edition 1865, has become a class-book at Cambridge University. Dr. Boole's chief work was his 'Investigation into the Laws of Thought,' Dublin, 1854; it is an attempt to express the processes of reasoning by mathematical formulæ; and contains also a special application of his method to the Theory of Probabilities. Dr. Boole married, in 1855, a niece of Colonel Everest, the able conductor of the Trigonometrical Survey of India; this lady rendered her husband great assistance in his scientific labours. Working too hard for his bodily strength, he died of congestion of the lungs, on the 9th of December, 1864, at Ballintemple, near Cork. His acquirements took a very extensive range, including classics, modern languages, poetry, and mental philosophy; many of which studies contributed to the development of some of his more special mathematical researches. At a meeting of the Cork Cuvierian Society, in 1865, the President, adverting to the death of Dr. Boole, said:—"Probably in few individuals could a greater diversity of taste and talent be found combined than in him. No subject was ever brought under our notice that he was not only familiar with, but he illustrated it with the results of his own great experience, or the practical application of his reasoning mind."

BOONE, DANIEL, known in America as the "Pioneer of Kentucky," was born in February, 1735, in Bucks County, Pennsylvania, to which settlement his father, a native of Devonshire, had emigrated. Living near what was at that time the frontier between the settlers and the Indians, young Daniel's early days were passed amid a good deal of hunting, shooting, and backwood life. The family removed to North Carolina in 1753; and young Boone, after marrying, settled down as a farmer. Being, however, more prone to an adventurous life than to steady industry, he made one of a party of six in 1769 to explore and hunt in the wilds of Kentucky; and two more joined them in the following year, with a store of powder and shot. After many vicissitudes, the separation of the party, and the killing and scalping of some of them by the Indians, Boone and his brother found themselves alone, forced to trap animals, and collect peltry for a subsistence. They returned home in 1771; but not deterred by their experience of hardships, the two brothers converted their little property into stores for the backwoods, and removed with their families to Kentucky in 1773. The wives and daughters were the first white women ever seen on the Kentucky river. Boone passed his time in hunting, fighting, and exploring, and sometimes in surveying for the government. A stockade or frontier fort was entrusted to him for defence. In 1778 he was captured by a party of Shawnee Indians, carried off to Chillicothe, and exposed to much suffering; but by shrewdness and activity he effected his escape, walking 160 miles in 5 days with only one regular meal. Boonesborough, the name which he gave to his settlement, became a government post. During the American war of independence he was made successively captain, major, and colonel, for his services against the Indians who were in alliance with the British. Most of his brothers and sons were killed in the course of the fighting in which they were engaged. After the war was ended Boone settled down once more as a farmer and hunter.

When Kentucky was admitted as a State into the Union in 1792, he was pronounced to have no legal title to the land he had reclaimed and settled. In disgust, he went further west into the wilds, settling with a few followers on the Little Osage. In 1800 Boone and his associates explored the head waters of the Arkansas river. In 1804 he crossed the Mississippi, and lived at Femme Osage, 45 miles west of St. Louis. His title to the land he had acquired here being questioned, Boone, fearing that litigation would be of little service to him, sent in a memorial to the legislature of Kentucky, setting forth the straits to which he was reduced, and asking for a confirmation of the grant made to him by the governor of Louisiana prior to the territory having been ceded to the United States. A title to 2000 acres was voted to him by the Assembly, and the old man was thus saved from the necessity of seeking for a new home. It was thoroughly characteristic of the old pioneer and trapper that when Chester Harding, an artist, went to take a portrait of him in 1830, he found Daniel Boone, then 86 years old, reclining on a bunk in

his cabin cooking a venison-steak on a ramrod. He died on the 26th of September, 1820, surrounded by five generations of descendants. The annals of America do not present a better type than Daniel Boone of the class of character depicted by Fenimore Cooper in his *Leatherstocking*.

BOPP, FRANZ [E. C. vol. i. col. 826]. Notwithstanding his advanced age, and suffering severely from asthma, Bopp's last years were neither inactive nor unproductive. Between 1856 and 1861 he brought out an entirely re-written and greatly augmented edition of the noble work which won for him the title of the founder of the science of Comparative Philology, '*Vergleichende Grammatik des Sanskrit, Zend, Griechischen, Lateinischen, Litauischen, Altalawischen, Gothischen und Deutschen*,' in 3 stout volumes, the Armenian being now included for the first time; and this he followed by a third and revised edition of his '*Kritische Grammatik der Sanskritsprache*,' Berlin, 1861—63. He also contributed papers to academies and journals, and continued till within six months of his decease to perform his professorial duties. He died on the 23rd of October, 1867, having completed his 76th year on the 14th of the previous month.

BOR, PIETER (CHRISTIAENZON), a Dutch historian, was born in 1559 at Utrecht, where his father, Christiaan Bor, who descended from an ancient and reputable family, practised as an apothecary. From an early age he devoted himself to the study of history, especially to that of his native country, for the illustration of which he presently began to collect materials. The States of Holland and West Friesland appointed him their historiographer in 1615, with a yearly salary of 600 florins. He died at Haarlem, on the 16th of May, 1635. He wrote a *History of the Origin and Progress of the Wars in the Low Countries in the 16th Century*, which first appeared in an incomplete form as '*Oorspronck, Begin ende Aenvang der Nederlandtscher Oorlogen*,' folio, Utrecht, 1595, of which he wrote an epitome in verse, with the title of '*Den Oorspronck, Begin ende Aenvanck der Nederlandtscher Oorlogen, geduyrende de Regeringe vande Hertoginne van Parma, de Hertoge van Alba, ende eenseels vanden Groot Commandeur*,' 4to, Leyden, 1617. The *History*, in a fuller and more complete form, was published by instalments, in 5 massive volumes, with the title of '*Oorspronck, Begin ende Vervolgh*,' &c., folio, Leyden and Amsterdam, 1621—1630; and again, in the most prized edition, at Amsterdam, in 4 vols. folio, which were issued respectively in 1679, 1680, 1681, and 1684. Another less valued work of Bor's is his *History of Hertogenbosch (Bois-le-Duc)*, '*Gelegenthey van's Hertogen-Bosch, Vierde Hooft-Stadt van Brabant*,' 4to, the Hague, 1630. His principal remaining works are a *Continuation of the Chronicle of Carion*, beginning in 1576, and ending on the 20th of March, 1619, folio, Amsterdam, 1619; and two *Tragedies*—*Apollonius, Prince of Tyre*, and *Apollonius and his Daughter Tarsia*, '*Apollonius, Prins van Tyro*,' and '*Apollonius en zyne dogter Tarsia*,' 4to, the Hague, 1617.

BORDE, ANDREW, who, punning upon his name, called himself *Andreas Perforatus*, was born about 1500 in Sussex, probably at Borde Hill, near Cuckfield, and was educated successively at Winchester and Oxford. Before he had taken a degree he entered himself a brother of the Carthusian order, in a religious house in London or its neighbourhood. He left the society, however, in order to resume his studies at Oxford, where he especially devoted himself to the pursuit of medicine. Soon after he indulged his inclination for travel by wandering through most parts of Europe and a portion of Africa. Upon his return he settled at Winchester, where he acquired a reputation for his success in the practice of his profession. In 1541 and 1542 he was living at Montpellier, in France, where he seems to have taken his degree of M.D., in which he was soon afterwards incorporated at Oxford. He now resided successively at Pevensey and Winchester, where, as in other places, he practised the austerities of the Carthusians. He always professed celibacy, and wrote zealously against those of the clergy who had broken their vows by marriage at the dissolution of their respective houses under Henry VIII. This gave occasion to Bishop Poynt, himself a married man, to charge Borde with having, about the year 1547, kept three women of improper character in his chambers at Winchester, as well for his own convenience as for the comfort of the brethren of the order to which he had belonged; the more charitable explanation, and that offered by the friends of Borde against this posthumous libel, being that the three women were patients who occasionally resorted to him for medical advice. "At length," says Wood, "after many rambles to and fro in this world, he was made prisoner in the close wards of the Fleet in London, the reason

why, I cannot justly say; where he died in the month of April, in 1549 . . . I cannot otherwise but say that our author Borde was esteemed a noted poet, a witty and ingenious person, and an excellent physician of his time." Further, Wood mentions as a report, what Fuller affirms confidently, that Borde was physician to King Henry VIII., and a member of the College of Physicians in London, to whom he dedicated his '*Breviary of Healthe*; wherein are Remedies for all manner of Sicknesses and Diseases, the which may be in Man or Woman: expressing the obscure Termes of Greek, Araby, Latyn, and Barbary, in Englishe, concerning Phisicke and Chirurgie,' 4to, London, 1547, 1552, 1557, 1575, 1587, and 1598. The second part of this work, under the title of '*Extravagantes*,' was printed in the edition of 1575. Considering his creed, it was probably policy if not principle that inclined Borde so much to vagabondage and to a course of conduct which it is impossible to reconcile with the conventional gravity of his profession. It is from him that the designation of "*Merry Andrew*" is said to be derived; and Hearne says that "*Dr. Borde* was an ingenious man, and knew how to humour and please his patients, readers, and auditors. In his travels and visits he often appeared and spoke in public, and would often frequent markets and fairs, where a conflux of people used to get together, to whom he prescribed; and to induce them to flock thither the more readily he would make humorous speeches, couched in such language as caused mirth, and wonderfully propagated his fame, and it was for the same end that he made use of such expressions in his books as would otherwise, the circumstances not considered, be very justly pronounced bombast." The principal works of Dr. Borde, besides the '*Breviary of Healthe*,' are '*The Princyples of Astronomie, the whiche diligently perscrutyd is in a manner a Prognosticacyon to the Worlde's End*,' 8vo, London, 1540; '*A Boke of the Introduction of Knowledge, the which doth teach a man to speak part of all manner of Languages, and to know the usage and fashion of all manner of Countries, and for to know the most part of all manner of Coins of Money*,' 4to, London, 1542, dedicated, in an epistle dated from Montpellier, May 3rd, to the Princess (afterwards Queen) Mary: a reprint (of only 100 copies) was made in 1814 under the editorship of Mr. W. Upton; another, with fac-similes of all the curious wood-cuts, is about to be made (1870) by the Early English Text Society, under the editorial care of Mr. Furnivall; '*Compendyouse Regimente or Dietary of Healthe, made in Mounte Pyllor*,' 12mo, London, 1542, 8vo, 1567, 8vo, 1576. '*The Merry Tales of the Mad Men of Gotham*,' 8vo, London, "printed," says Wood, "in the time of King Henry VIII., in whose reign and after it was accounted a book full of wit and mirth by scholars and gentlemen," is also ascribed to Borde; and he is by some supposed, but with little reason, to be the author of '*A right pleasant and merry History of the Mylner of Abington, with his Wife and his fair Daughter, and of two poor Scholars of Cambridge*,' 4to, London; and of a collection of the '*Jests*' of John Scogan.

BORGHESI, COMTE BARTOLOMEO [E. C. vol. i. col. 829]. M. Borghesi died at San Marino on the 16th of April, 1860, without having obtained the aid which would have enabled him to carry out his long-cherished purpose of publishing in a '*Corpus universale*' his unrivalled collections. After his death, however, the French government appointed a commission to put in order for publication the whole or more important parts of his published writings and inedited documents. Under the general title of '*Œuvres Complètes*' several volumes, including his numismatic and epigraphic compositions, have already been issued from the Imperial press, and it is intended to comprise also his extensive archaeological correspondence.

BORGHINI, VINCENZIO, a learned Italian ecclesiastic and antiquary of the 16th century, was born at Florence, October 29, 1515; entered the order of Benedictines in 1532; in 1552 was made prior of his monastery; was placed by the Grand Duke Cosmo at the head of the Hospital of Santa Maria; served as suffragan to Alexander de' Medicis, Archbishop of Florence, during his absence at Rome; declined the archbishopric of Pisa, and died, universally esteemed, on the 15th of August, 1580. Borghini was a great authority in all literary and artistic matters. He was one of the committee appointed to correct the *Decameron* of Boccaccio according to the requirements of the Council of Trent, and to him are attributed the '*Annotazioni e Discorsi*,' published by them. By the Grand Duke Cosmo I. he was nominated vice-president of the Florence Academy of Art. His great work is entitled '*Discorsi di Monsignore V. B., parte prima, recarti a luce da' deputati per suo testamento*,' 4to, Florence, 1584; seconda parte, 1585, reprinted, with notes, by D. M. Manni, 2 vols. 4to,

Florence, 1755. The more important of the treatises are those on the origin and early history of the city of Florence, of the bishops, nobles, chief families, arms, antiquities, money, &c.; of Fiesole and other Tuscan cities; the Latin colonies and municipalities, &c. Of the same family was RAFFAELLO BORGHINI, who lived in the latter part of the 16th century, wrote three or four comedies (one 'Diana Pietosa,' being a pastoral in verse), and a much esteemed and often reprinted work on the fine arts, 'Il Riposo, in cui della Pittura e della Scultura si favella,' 8vo, Florence, 1584. Some of R. Borghini's inedited verses were published at Florence in 1822.

BORGOGNONE, AMBROGIO, called also AMBROGIO DA FOSSANO, an eminent Italian painter, was born at Fossano, in Piedmont, about 1455. He is said to have been a scholar of Vincenzio Foppa, but all the particulars related of him are uncertain. He attained distinction as an architect as well as a painter, and was engaged early in life on the façade of the Certosa, near Pavia: it is, however, only as a painter that he is remembered. His style is archaic, the forms are meagre; but there is always great refinement visible, and often a gentleness of expression verging on pathos. Some critics think they perceive traces of the influence of Da Vinci and Luini in his style. Borgognone appears to have been much occupied in painting at Pavia between 1475 and 1493; his famous picture of the 'Assumption,' in the Brera at Milan, is dated 1522; he probably died about 1535. His chief works are at Milan and Pavia. The National Gallery possesses some characteristic examples of his pencil—No. 298, 'The Marriage of St. Catherine of Alexandria,' a large altar piece, executed in tempera on wood, brought from the chapel of Rebecchino, near Pavia, in 1857; and Nos. 778—79, two groups of family portraits (9 men and 11 women), painted on silk, and originally portions of a processional standard.

BORRI, JOSEPH-FRANÇOIS, born at Milan, 4th May, 1627. He was educated at Rome in the Jesuits' seminary, and devoted himself to the study of medicine and chemistry. He became attached to the pontifical court, but his life was so irregular, that in order to avoid the pursuit of justice, he sought refuge in a church. This was in 1654. From this time he changed his mode of life, pretended to be inspired, and founded a new sect vowed to poverty, the wealth of the new devotees being given up to the master. The new sect fell under the censure of the Church, and in order to escape from the Inquisition, Borri went to Milan. He was condemned to be burnt by a decree of the 3rd of January, 1661. He sought refuge in Strasbourg, and afterwards in Holland, where, setting up as a physician and alchemist, he led away much people. His true character becoming known, he went to Hamburg, and placed himself under the protection of Queen Christina of Sweden, who advanced large sums of money to enable him to carry on his researches for the discovery of the philosopher's stone. He also persuaded Frederic III. of Denmark to patronise his alchemical pursuits, but on the death of this prince he had to leave Denmark, and proceeded towards Turkey. He was, however, arrested and given up to the papal authorities by the Emperor on condition that his life should be spared. He was sentenced to perpetual imprisonment in the dungeons of the Inquisition at Rome; but after some years, being consulted respecting the dangerous illness of the French ambassador at Rome, he cured him, and through his intercession his prison was rendered less irksome. He died at Rome on the 10th of August, 1695.

Bayle has a long and curious article on Borri, which is the source of the numerous biographical sketches of this quack, whose influence passed away with the belief in alchemy. Several works are attributed to Borri, the chief of which is 'La Chiave del Gabinetto,' 'The Key to the Cabinet,' a mixture of medical, chemical, and political secrets, together with spiritual details.

BORRON, ROBIERS (ROBERT) and HELIE, whose surname varies as Boiron, Bouron, Boaron, and Buron, writers of the 12th century, are commemorated as contributors to the cycle of poems and romances which gathered about the Arthurian Round Table and the Holy Graal. The two Borrons were either brothers or near relations. It is probable that Robert Borron was born about the year 1144, and that the birth of his relative, Helie, took place within a very few years after. That Robert was of the condition of a gentleman, is certain; and, even in his self-deprecatory preface, he promises to let his name, and life, and ancestry, "and birth-place, and a great part of his lineage," be known hereafter. In the prologue he speaks of himself as a monk, or rather as a hermit; but this has been ingeniously believed to have been a figure adopted as affording a more appro-

priate vehicle for the exhibition of his vision of heaven. Traces of the influence of the scenery and physical aspects of Nottinghamshire are to be detected in his work.

The two Borrons are reputed to have been employed by King Henry II., to put into prose the Romances of the Round Table, or to continue the translations of those different romances, of which a series has been published under the titles of 'Joseph d'Arimathie' and 'Saint-Graal,' Paris, 1516 and 1523; the 'Histoire de Merlin' having been printed at Paris in 1498. Helie de Borron published, separately, the Palamede of the Round Table; in the other works he was associated with Robert.

It may be interesting to give in this place the order of the Arthurian Romances, which, as given by Sir F. Madden in his preface to 'Sir Gawayne,' (Abbotsford Club, 1839), is as follows:—(1) 'The Roman du Saint Graal,' sometimes entitled the 'Roman de Joseph d'Arimathie,' composed by Robert de Borron. In the printed editions this is called the First Part of the Saint Graal. (2) The 'Roman de Merlin,' by the same. (3) The 'Roman de Lancelot du Lac,' composed by Walter Map. (4) The 'Roman du Quete du Saint Graal,' by the same. In the printed editions this forms the Second Part. (5) The 'Roman de la Mort Artus,' by the same, and originally distinct, but in the printed editions united to the Lancelot. (6) The first portion of the 'Roman de Tristam,' by Luces, Seigneur de Gast. (7) The conclusion of 'Tristam,' by Helie de Borron. (8) The 'Roman de Gyron le Courtois,' by the same. Of these the first six were written in the latter half of the 12th century, and the remainder in the first half of the 13th. To these must be added the metrical romances composed by Chrestien de Troyes, between the years 1170 and 1195; as also the later prose compilations of Rusticien de Pise and his followers, in the 13th and 14th centuries. Of these works editions have been published at various times, and in the principal capitals and languages of Europe. One of the most elaborate issues of any work of the series, is that which was undertaken by Mr. Furnivall, for the Roxburghe Club, and which was illustrated by several learned dissertations on matters calculated to throw light on the poems or their subjects. The title of Mr. Furnivall's volume, which was edited from MSS. in the libraries of Corpus Christi College, Cambridge, and the British Museum, is as follows:—'The History of the Holy Graal, Seynt Graal, or the Sank Ryal. The History of the Holy Graal, partly in English verse, by Henry Lonelich Skynner (Temp. Hen. VI. A.D. 1422—1461); and wholly in French prose, by Sires Robiers de Borron (about A.D. 1180—1200; MS. about 1320). From the Original Latin, written by Jesus Christ with his own hand (vol. i. p. 357). Being the only writing made by God since his uprising,' 2 vols. 4to, London, 1863.

The Holy Graal, as a symbol of Christian salvation to the romantic poets of the Middle Ages, was, like King Arthur and the Sorcerer Merlin, for nearly five centuries the central point of an extensive cycle of poems, wherein the knights of old found edification, and in writing on which the poets believed they should obtain final bliss. The Graal cycle is distinguished from the Arthurian and others by not owing its birth to recorded facts. A pious thought was the fruitful germ which, from poet to poet, from land to land, and from century to century, transplanted and carefully nursed, finally acquired an outward form and being, which the poets endeavoured to transmit to posterity as the developed history of a holy vessel. At the same time, it is difficult to discover the first traces of the formation of the legend of the Holy Graal, and of its cultus, and to give any certain foundation to the first history of its development; but it is fairly concluded that the idea of the Graal was originally distinct from the Histories of Percival and of the other Arthurian knights, and that it was first woven into them by North French poets—namely, in the second half of the 12th century.

BOSC, LOUIS AUGUSTIN GUILLAUME, a celebrated French naturalist, was born at Paris on January 29th, 1759. He studied at Dijon, and was allowed to attend the lectures on botany by Durande, which imbued him with a passion for the study of plants. He then proceeded to Paris, where he attended various courses of lectures, more especially those delivered at the 'Jardin des Plantes.' At eighteen he entered a government office, rose to be one of the chiefs of the posting department, and was subsequently entrusted with the charge of the prisons. In 1793 he was proscribed, but making his escape, he wandered, homeless, about the country, suffering from hunger, and barely subsisting upon snails, the roots of the common *Arum*, and an occasional loaf of bread. Soon after he went to America, and spent

two years in collecting the objects and facts which he liberally contributed to the works of Lacépède, Latreille, Daudin, Fabricius, and others. Under the Directory he was restored to his inspectorship of prisons, but the *coup d'état* of November, 1799, again left him destitute. This compelled him to have recourse to his literary abilities for the means of subsistence, and he set to work with astonishing vigour, contributing to the 'Supplément au Dictionnaire de Rozeau,' the 'Nouveau Dictionnaire d'histoire naturelle,' the 'Dictionnaire raisonné et universel d'agriculture,' a new edition of the 'Cours complet d'agriculture théorique et pratique,' the 'Encyclopédie méthodique,' editing the 'Annales de l'agriculture française,' writing memoirs and reports for various societies; attending scientific missions to the provinces and to Italy; and superintending the nursery Gardens at Versailles, as also those which were under the control of the Minister of the Interior. The later years of his life were mainly occupied in producing an immense work on the vine, for which purpose he visited almost every part of France, and described upwards of 450 different forms, but his labours were not completed when he died, on July 10th, 1828. His notes are said to be still in existence, and to be an immense mass of undigested material, the arrangement of which had only just been begun by him.

BOSCH, or BOSSCHE, BALTHASAR VAN DEN, an eminent Flemish painter, was born at Antwerp, January 6, 1681. He was a pupil of Gerard Thomas, and was admitted master by the guild of St. Luke in 1696; he then spent three years in France; returned home, painted small portraits, interiors of apothecaries' shops, laboratories, painters' studios, and subject pieces, for which he obtained very high prices; and died on the 8th of September, 1715, from an abscess, the consequence of what seemed at the time a slight blow. His masterpiece is in the Antwerp Museum (No. 448), 'Reception of the Burgo-master of Antwerp, J. B. del Campo, by the junior guild of Cross-bow men,' a large and sumptuous interior with forty portraits, signed and dated 1711. Bosch often obtained the assistance of other artists in parts of his pictures which were in their particular line; thus in the picture just noticed the architecture was painted by Verstraeten, and the glimpse of landscape by C. Huysmans; whilst in his celebrated portrait of the Duke of Marlborough on horseback, the horse was painted by P. van Bloemen.

BOSCH, GENERAL JAN VAN DEN, a distinguished Dutch soldier and statesman, was born February 2nd, 1780, at Herwigen, where his father was a physician. He joined the Corps of Engineers as lieutenant in 1797. He went to the Dutch East Indies in 1801, and so distinguished himself in various ways as to be promoted to the rank of captain and adjutant soon after his arrival, major in 1804, lieutenant-colonel and adjutant-general in 1807, and colonel in 1808. After an interval of cessation from military duties, he resumed active service in 1813, and was on the General Staff of General Constant de Villars at the battle of Waterloo in 1815. In 1816 he became major-general, and in 1823 Administrator of Militia. During this period his knowledge acquired in the East led him to write a work on the Dutch colonies generally—'Nederlandsche bezittingen in Azie, Amerika, en Afrika, in derzelver toestand en aangelegenheid voor dat Rijk, Wijsgeerig, Staatskundig, en Geographisch beschouwd; met bijvoeging der Noodige tabellen, en eenen Atlas nieuwe Kaarten,' Hague and Amsterdam, 1818—a work valued alike for the interest of its subject and the elegance and vivacity of its style. In 1828 he was appointed Commissioner for the West Indies, and a few years afterwards Governor-General of the Dutch East Indies. He was made Grand Cross of the Order of the Lion of the Netherlands in 1831, Member of the Society of Literature of Leyden in 1833, and Fellow of the Royal Netherlands Institute in 1838. He died at his estate of Boschlust, 28th of January, 1844. General Van Den Bosch was virtually the founder of the remarkable 'Agricultural Pauper Colonies of Holland.' When residing in Holland as a major-general, he noticed the severe distress which was occasioned to the poor by the famine or dearth in 1816 and 1817, and conceived the idea of applying some of the waste lands of North Holland for their benefit. He wrote an essay to show the practicability of establishing a system of poor-relief on a self-paying basis, by means of agricultural pauper colonies—'Verhandeling over de mogelijkheid, de beste wijze van invoering en de belangrijke voordelen eener algemeene armeninrigting in het rijk der Nederlanden, door het veltigen eener landbouwende Kolonie in deezelfe Noordelijk gedeelte,' Hague and Amsterdam, 1818.

This essay led to a suggestion from Van Den Bosch to Prince Frederick, second son of the king, who set on foot a Society of Beneficence, the 'Maatschappij van Weldadigheid.' A colony was formed near the eastern shore of the Zuider Zee, consisting of two villages, named after the king's sons, *Frederiksoord* and *Willemsoord*. Land was taken, houses built, instruments and stores of all kinds provided. The funds were supplied in part by subscriptions from shareholders, and in part by communes or parishes; the former believing that an adequate return would be obtained for the money, and the latter deeming it an economical mode of averting pauperism. Each village formed a complete community, growing crops, rearing live stock, spinning and weaving woollen cloth. As Van Den Bosch was not officially connected with the scheme after its initiation, we need not trace its history further here, except to say that the self-paying element languished from the first, as generally happens when commerce and charity are joined in the same project.

BOSCH, JEROME VAN. [AKEN, JEROME VAN, E. C. S. col. 40.]

BOSCHINI, MARCO, a celebrated Italian painter and writer, was born at Venice in 1613, and was a pupil of Palma, whose style he endeavoured to combine with that of Tintoretto. A Last Supper in the sacristy of San Girolamo, at Venice, is his most celebrated work, but others remain in the churches and palaces of Venice and Padua. He practised engraving equally with painting, and executed many plates from the designs of Tinelli, Liberi, and others. He was also distinguished as a writer on art. His various merits seem to have met with suitable recognition. It is related that in one year, 1661, he received chains of gold from the Emperor Leopold I., the Archduke of Austria, and the Duke of Modena; but it is added that he was fond of gaming, and dissipated his gains. He died in 1678. Boschini's most famous publication is *The Chart of Pictorial Navigation*, a dialogue on painting between a Venetian senator and a painter, 'La Carta del Navigar Pittoresco: Dialogo tra un Senator Venetian deletante e un Professor de Pittura soto nome d'Eccellenza e de Compare, Comparti in oto venti. Con i quali la Nave Venetiana vien condotta in l'alto mar de la Pittura, come assoluta dominante de quello a confusion de chi non intende el bossolo de la calamita,' 4to, Venice, 1660. This *Carta* is a poem in the homely Venetian dialect, in quatrains, as quaint, though not so verbose, as the title; eulogistic throughout of the Venetian school of painting, and particularly of Titian, whom he declares to be the greatest of all painters, but containing many interesting notices of pictures, biographical details, and curious anecdotes, related chiefly from his own experience. It is Boschini who records that Velasquez, when at Rome, being asked by Salvator Rosa his opinion of Raffaele, replied that Titian was the greatest painter and Venice the best school; Rubens and Vandyck, he says, always expressed the same opinion; Guido placed Veronese at the summit of art, whilst Pietro da Cortona was disposed to give the highest place to Tintoretto. The original edition contains 25 plates, engraved by Boschini, and his own portrait. Other works by him are 'Il Regno tutto di Candia, delineato e parte a parte intagliato,' fol. Venice, 1645; 'L'Arcipelago con tutte le isole,' &c., 1658; 'Le Ricche Minere della Pittura Veneziana,' &c., Venice, 1663, and several times reprinted; 'Gioielli Pittoreschi, cioè indice delle pubbliche pitture della città di Vicenza,' Venice, 1676.

BOSIO, ANTONIO, a learned Roman antiquary of the early part of the 17th century, was the nephew of Giacomo Bosio (author of the History of the Order of St. John of Jerusalem, and that of the Holy Cross), and succeeded his uncle as agent to the Knights of Malta at Rome. Bosio was deeply interested in the paintings and other vestiges of early Christian art brought to light in the newly opened catacombs, and during five-and-thirty years he patiently explored the subterranean tombs and alleys, and examined and annotated the various articles they contained; but he did not live to give to the world the result of his prolonged labours. He died in 1629, and it was not till 1632 that the goodly folio on which he had been working appeared under the title of 'Roma Sotteranea, opera postuma, compita e disposta da Giov. Severani da S. Severino, nella quale si tratta de' Sacri Cimiterii di Roma, del sito, forma, et uso antico di essi,' &c. This work, or Aringhi's enlarged Latin version of it [Aringhi, in E. C. S., col. 107], first made known to the learned world the marvels of Subterranean Rome, and was the precursor of the vast range of elaborate and costly works by which it has been illustrated.

BOSQUET, MARSHAL. [E. C. vol. i. col. 839.] Pierre François Joseph Bosquet was born at Mont-de-Marsan, depart-

ment of Landes, November 8, 1810. The principal events in his career are noticed in the above article, down to his promotion to the rank of marshal, in 1856. About the same time he was created Senator of France; and, shortly before, Queen Victoria had nominated him grand-cross of the order of the Bath, in recognition of the timely aid he rendered to the English troops at Inkermann. When hostilities were imminent with Austria, Marshal Bosquet was appointed to the command of the army of the south-west, but illness prevented him from taking part in the Italian campaign; and he died on the 3rd of February, 1861.

BOTTÉE DE TOULMON, AUGUSTE, a French writer on music, was born at Paris on the 15th of May, 1797. His original profession was the law, but his inclination was for music, and abandoning the bar, he studied harmony under Desvignes, Cherubini, and Reicha. Having paid much attention to the literature of music, he obtained the post of librarian to the Conservatoire in 1831, and made many journeys to Germany and other countries to collect MSS. of old music for the library. He was a member of the Society of Antiquities of France, and of the Historical Committee instituted by the Minister of the Interior, and wrote a considerable number of works relating to music. His own compositions, including an oratorio on the Passion and several *Messes*, did not make much impression; but he was more successful in commenting on the compositions of others. His principal works were the following:—*Discours sur l'histoire de l'Art Musical depuis l'ère Chrétienne jusqu'à nos jours*, 1835; *'De la Chanson en France au moyen âge'*, 1836; *'Notice biographique sur les travaux de Guido d'Arezzo'*, 1837; *'Des puits de Palinodes au moyen âge'*, 1838; *'Des Instruments de Musique en usage au moyen âge'*, 1838 (expanded to a larger work in 1844); *'Sur la restauration des anciens jeux d'Orgue'*, 1839; *'Observations sur les moyens de restaurer la Musique religieuse dans les Églises de Paris'*, 1841; *'Notice des Manuscrits autographes de la Musique composée par Cherubini'*, 1843. He collected many materials for a *'Recueil de documents inédits de l'Art Musical, depuis le treizième jusqu'au dix-septième Siècle'*, but did not live to produce the work. Bottée de Toulmon died at Paris on the 22nd of March, 1850. A notice of his life and works was published in 1851 by M. Vincent, member of the Institute of France.

* BÖTTGER (BÖTTCHER), ADOLF, a German poet and translator, was born at Leipzig, on the 21st of May, 1815; and was educated successively at the Thomasschule and the university of his native city. He applied himself with great assiduity to the acquisition of modern languages; and he has achieved a reputation by his translations into German of several English masterpieces. Thus he has published the Complete Works of Byron, *'Byrons Sämmtliche Werke'*, Leipzig, 1840, 12 volumes, 1841, 3rd edition, 1845, diamond edition, 12 vols., 1850, standard edition, 8 vols., 1856; Goldsmith's Poems, *'Gedichte'*, Leipzig, 1843; Milton's Poetical Works, *'Poetische Werke'*, Leipzig, 1846; Pope's Poetical Works, 4 vols., Leipzig, 1842; and *'Ossian'*, Leipzig, 1847; Shakespeare's Plays, *'As You Like It, Midsummer Night's Dream, Much ado about Nothing, 'Was ihr Wollt,' 'Sommernachts Traum,' 'Viel Lärmen um nichts,' 'Longfellow's 'Hiawatha,' Leipzig, 1856; Racine's 'Phädra,' Leipzig, 1853; and Ponsard's 'Odyssey,' Leipzig, 1853. As an original poet, Böttger occupies a place of his own in German literature. His talent is eminently descriptive, and his narrative varies as heroic and adventurous, and as imaginative and fanciful. Of the romantic kind of poem, which may be less or more referred to a Byronic model, he has produced *'Évil Stars, 'Düstere Sterne,' Leipzig, 1852; a lyrico-epic poem entitled 'Habana. Lyrisch-Epische Dichtung,' 16mo, Leipzig, 1853; the Fall of Babylon, 'Fall von Babylon,' Leipzig, 1855; and Cameos, 'Cameen,' Leipzig, 1856. The school of legend and fancy is represented by a Tale of Spring, 'Ein Frühlingsmärchen,' Leipzig, 1849, 3rd edition, 1850; and the Pilgrimage of the Flower-Spirits, 'Die Pilgerfahrt der Blumengeister,' Leipzig, 1851, 3rd edition, 1857. His mastery over the art of versification, and his poetical powers generally, are evidenced by his Tragedy, in five acts, entitled *'Agnes Bernauer,' 8vo, Leipzig, 1845, 2nd edition, 1847, and 3rd edition, 1850; Poems, 'Gedichte,' 2nd edition, 8vo, Leipzig, 1846, 7th edition, 1850; Poems on the Wartburg, 'Auf der Wartburg Dichtungen,' 16mo, Leipzig, 1847; a Mock Heroic Poem entitled 'Till Eulenspiegel,' Leipzig, 1850; the Book of the Saxons, &c., 'Das Buch der Sachsen. Originaldichtungen aus der Sächsischen Geschichte,' 4to, Leipzig, 1858; Love Stories, 'Historien der Liebe,' 16mo, Leipzig, 1860; Goethe's Youthful Love, 'Goethe's Jugendliebe,' 8vo, Leipzig,***

1862; a small volume entitled *Holy Days, 'Heilige Tage,' 16mo, Vienna, 1865. Böttger's Collected Works have been published under the title of 'Gesammelte Werke,' 6 vols., 16mo, Leipzig, 1865—66.*

BÖTTGER, JOHANN FRIEDRICH, was born at Schleiz, in Voigtland, on the 4th of February, 1682. The name being of difficult pronunciation in the mouth of a foreigner, has probably led to the various ways in which it is written, such as Böttcher, Böttcher, and Böttiger, with a view to catch the sound. In the documents drawn up by the Saxon Government he is invariably referred to as Böttger, and in this way, indeed, he wrote his own name. His father was master of the mint at Magdeburg, and was engaged, after the fashion of the time, in searching for the philosopher's stone, the secret of which Böttger is said to have thus acquired. He attached a superstitious importance to the day of his birth, Sunday, as enabling him to look into the future. The father died early, and the mother married again and settled in Berlin, where Böttger was apprenticed to an apothecary. He soon made known his pretensions to hermetic philosophy, and was laughed at; but his master having contributed 15 double groschen, Böttger undertook, in the presence of an adept, Von Haugwitz, and some members of the court, to convert them into gold. He is said to have been so successful that the king, Frederick William I., wished to secure him; but Böttger, probably mistrusting his own powers, stole away to Wittenberg, where he was welcomed by the metallurgist, Kirchmeier, who had a good laboratory and powerful wind furnaces. He was followed by an officer of the court, who had authority to arrest him on the ground of fraud; but Böttger, probably with perfect sincerity, declared he would rather be hanged than give up the secret. To avoid being taken back to Berlin, he appealed to Frederick Augustus I., King of Poland and Elector of Saxony, for protection, which was granted, and he was conveyed to Dresden under a military escort. There he was splendidly lodged, constantly watched, and encouraged to make experiments, and those about him were under oath not to reveal any secrets they might learn from him. After amusing his host (who was no other than the Elector himself) during four years, and getting tired of his captivity, he secretly escaped, but was overtaken at Ems, and brought back with so much violence that in the confusion he declared he had lost a tincture that had cost him years of labour to prepare, and which was worth millions of gold. He was now earnestly pressed to reveal his secret, which he consented to do under thirty-six conditions, one of which was that he should be set at liberty as soon as he had written out his *Arcana*. This was agreed to, and in the autumn of 1705 he described in writing his process for making gold. It is a long, tedious, mystical composition, still to be seen at Dresden. The Elector thought fit to have the *Arcana* tested before setting the writer at liberty.

But in the meantime the minister, Tschirnhauss, obtained Böttger's assistance in the solution of another problem of a less hopeless character, namely, how to produce from native materials the true hard porcelain of China and Japan, which it had been the fashion to admire during two centuries. In Böttger's first attempts, instead of a hard, white, transparent ware, he produced an opaque red one. At length a singular accident occurred, which Böttger was acute enough to take advantage of, and this is the grand service rendered by him to the world. An iron-master named Schnorr, in riding over his estate, noticed that at a particular spot his horse struck his hoofs in mud of a whitish character. On taking some of this home it dried into a white powder, and the idea occurred to Schnorr that this powder would serve as well as that prepared from corn flour for powdering wigs. Accordingly large quantities were sold for the purpose, and Böttger remarking that his wig was unusually heavy, examined it and found it to be true China clay or kaolin, with which the first true porcelain of Europe was manufactured. This was about 1710.

During the years that Böttger and his three or four skilled companions (two of them being potters by profession, and one a mineralogist) worked together they were sometimes in Dresden, and while Charles XII. of Sweden was in Saxony, for better security, in the fortress of Königstein on the Elbe above Dresden, and lastly at the castle of Albrechtsburg at Meissen below Dresden. The Elector took such interest in their work that he was sometimes present at the drawing of the kiln. Böttger is described as a witty, jovial companion, the delight of his fellow-workers. But when the porcelain factory was fully established and his services were no longer needed, they began to find fault with his administration as director. They accused him of getting drunk

with brandy three times a day, and also of negotiating with foreign courts for the sale of the porcelain secret. They would probably have succeeded in getting him discredited in the eyes of the Elector had not a stronger hand interposed and laid him quietly in the grave, March the 13th, 1719.

BOTTICELLI. [FILIPPI, SANDRO, E. C. vol. ii. col. 913.]

BÖTTIGER, CARL AUGUST, an eminent German archaeologist, was born on the 8th of June, 1760, at Reichenbach, in Saxony, and finished his education at Leipzig University. After acting for some time in Dresden as a private teacher, he was, in 1794, appointed rector of the academy at Guben; in 1790 removed to a like post at Bautzen; and in 1791, on the recommendation of Herder, was made director of the gymnasium at Weimar. Here he was brought into close connection with Goethe, Schiller, and Wieland; and through their influence, and association with the artists who formed a characteristic section of the remarkable society then collected in that little capital, his attention was strongly directed to the literature of art, which became more and more an absorbing pursuit. For some years, however, much of his spare time was taken up with the management of journals like the 'Journal des Luxus,' the 'Deutschen Mercur,' and 'London und Paris;' and he long continued to contribute critical and biographical papers to the 'Allgemeine Zeitung.' In 1804 he was invited to Dresden as director of studies at the court academy, and afterwards was appointed superintendent of the Museum of Antiquities. Here he remained occupied with his official duties, delivering courses of lectures on art and archaeology, and preparing his various works for the press, till his death, which occurred on the 17th of November, 1835. Herr Böttiger's earliest work, 'Sabina oder Morgenscenen einer reichen Römerin,' Leipzig, 1803, 2nd ed. in 2 vols., 1806, was a pleasing description of the habits and toilette of a Roman lady in the first century of the Christian era. His later publications were all on the archaeology of art. Of these the chief were—'Ideen zur Archäologie der Malerei,' and 'Kunstmythologie,' Dresden, 1811; 'Vorlesungen und Aufsätze zur Alterthumskunde,' Leipzig, 1817; 'Amalthea,' 3 vols. 1821—25; and 'Ideen zur Kunstmythologie,' 2 vols. Dresden, 1826—36. His academic dissertations and Latin poems were published in a collected form, by Julius Sillig, in 1837, under the title of 'Böttiger Opuscula et Carmina Latina,' Dresden, 1837; and his chief essays and antiquarian articles by the same editor, as 'Kleine Schriften archäologischen und antiquarischen Inhalts,' 3 vols. Dresden, 1837—38. Various inedited papers were printed under the title of 'Literarische Zustände und Zeitgenossen,' 2 vols. Leipzig, 1838, by his son, C. W. Böttiger, who also printed a biographical sketch of his father, 'Carl Aug. B., eine biographische Skizze,' Leipzig, 1857.

BOUCHARD (or BOUCHART), ALAIN, a Breton historian, was born in the 15th century, most probably at the manor of Kerbouchart, near Croisic. He was an advocate of the parliament of Bretagne, and councillor and master extraordinary of requests under the Duke Francis II. Encouraged by Queen Anne, who facilitated his researches amongst the archives of Bretagne, Bouchard compiled his 'Grandes Chroniques,' which were completed and on the point of being presented to that princess, when she died in January, 1514. Bouchard published the same year the first edition of his great work, the imputed faults of which are his plagiarism from antecedent chroniclers and his indiscriminating perpetuation of their fables. His local information is, however, valuable, and his style is picturesque. The title of the first edition is as follows:—'Les grandes croniques de Bretagne nouvellement imprimées à Paris: tant de la grande Bretagne depuis le roy Brutus qui la conquist et la appella Bretagne jusques au temps de Cadualadrus dernier roy breton dicelle grande Bretagne ensemble tous les aultres bretons y estans lors furent contrains de habandonner le pays pour les pestilences de maladie qui y survindrent que lors les anglois de Saxonie y vindrent habiter et la nommerent angleterre, que aussi de nostre bretagne de present depuis la conqueste du roy Conan meriadec breton qui lors estoit appelle le royaume darmorique jusques au temps et trespas de François II. de ce nom duc de Bretagne dernier trespasé pere de la feue royne de france nagueres decedee a qui dieu pardoint, esquelles croniques est mencion faicte daucuns notables faiz advenuz es royaumes de France Dangleterre Despaigne Descosse Darragon et de Navarre es Allemagnes es Itales en Lombardie en Tartarie en Jherusalem: & aillieurs en plusieurs aultres pays & contrees durant le regne dun chascun roy & prince desd. deux bretaignes,' folio, Paris, 1514, second edition, folio, Caen, 1518, third edition, folio, Paris, 1531, fourth edition, folio, Caen, 1532, fifth edition, folio, Caen, 1541. All

BIOG. DIV.—SUP.

the editions of Caen, as compared with those of Paris, present various readings and interpolations.

BOUCHER, FRANÇOIS, a celebrated French painter of the Pompadour period, was born at Paris the 29th of September, 1703. He studied painting under Le Moine, but about 1720 entered into an engagement with M. Cars, the engraver, to reside in his house, learn engraving, and make designs for various publications. Whilst here he made twenty-six designs for Daniel's 'Histoire de France,' which were engraved by Baquoy, and he himself engraved various plates after Watteau. In 1723 he won the first prize for painting at the Academy, and two years later went to Rome. The great works of Italy had no influence on his style, and if he learned anything from any of the Italian masters it was from Albani, whose Dianas and Cupids he adopted as themes for his pencil, and whose gay colour and polished manner his contemporaries thought he rivalled. On his return to Paris, Boucher became exceedingly popular. He was of a light, cheerful disposition, very fond of society, and he was admitted into the best circles; and he caught and reflected exactly the elegant but frivolous and flimsy taste of the day. The Painter of the Graces, as he was named, he drew his inspiration from the reigning mode of the court of Louis XV., and helped to give it a definite form. With Madame Pompadour he was an especial favourite; the loveliest portrait of her is from his pencil; and not only did she employ him to make for her numerous pictures and drawings, but she herself etched a large number of his designs—Leda, Loves, Nymphs, the Youthful Bacchus, 'Offrande au dieu Terme,' 'L'Amour sacrifiant à l'Amitié' (that is, the Pompadour offering her heart to Love), and the like; and it was noticed that though she etched some of Vien's and Vanloo's designs, she always succeeded best with Boucher's, and that her own designs were altogether in his manner. Boucher was in 1733 admitted into the Academy, of which he was afterwards director; and on the death of Vanloo in 1765 he was nominated principal painter to the king. He died at Paris on the 30th of May, 1770. Boucher designed and painted with amazing facility, and produced an enormous number of pictures and drawings. Sir Joshua Reynolds gives an instructive illustration of his manner of working (Discourse XII.): "When I visited him some years since in France I found him at work on a very large picture, without drawings or models of any kind. On my remarking this particular circumstance, he said when he was young, studying his art, he found it necessary to use models; but he had left them off for many years." Boucher is the representative painter of the style Pompadour, of mincing grace and modish elegance displayed alike in classic and pastoral prettinesses, very refined and well-bred, and with a certain naive yet courtly charm, but essentially false and meretricious. The influence of this style is still strong in French decorative art, though long banished from its higher branches. The Louvre has seven characteristic paintings by Boucher—'Diana and one of her Nymphs coming out of the Bath,' 'Venus (attended by Cupid and the Graces) ordering from Vulcan arms for Æneas,' 'Reynold and Armida' (the latter contemplating herself in a mirror which Cupid holds up to her), and four 'Pastoral Scenes,' with shepherds and shepherdesses of the true Parisian type.

BOUCHER DE CRÈVECEUR DE PERTHES, JACQUES, was born at Rethel, September 10, 1788. He was descended from a family which had been established in France for a long time, some of his ancestors having been men of note prior even to the crusades of the middle ages. In early life he received an official appointment, but he soon resigned it in order to devote himself entirely to literary and scientific pursuits. Possessed of an ample fortune, endowed with most exemplary industry, and gifted with an amount of enthusiasm and imagination which falls to the lot of few men, he poured forth work after work from his prolific pen, dealing with an immense range of subjects in a style peculiarly his own. A complete set of his works comprises upwards of thirty volumes. His literary activity does not seem to have commenced until he was more than thirty years of age, for the earliest work known to us is a play entitled 'La Marquise de Montalle,' 1820, which was followed by several tragedies, comedies, and dramatic compositions, of which three were received at the Odéon, the most noteworthy, perhaps, being a comedy, the 'Grande homme chez lui.' In 1830 he wrote 'Romances, Legends et Ballades,' of which a second edition was issued in 1849. His first work of any importance was the 'Opinion de M. Christophe sur les prohibition et la liberté de commerce,' 1831—34, in which he was one of the first persons to advocate free trade for France, and to demand a universal exhi-

bition at Paris, which last idea he urged again in 1833. Another work of his, 'De la Creation,' 1841, 5 vols., is a curious metaphysical and imaginative disquisition upon organisms. Amidst much mysticism, verbiage, and speculation, there are here and there a few bright sparks of thought. Towards the end of the work he has several chapters on the progression of life, in which he advocates to their utmost extent the evolutionary ideas now in vogue, and which Professor Huxley announces will be the accepted theory of the future geologist. He maintains the indestructibility of matter and force, and the gradual passage from one state to another, commencing in simplicity and passing on to complexity. The simple cell becomes the complex man, an observation which he deems equally true whether applied to the short period of life allotted to the individual or to the far longer duration of organisms in general. In one place he says that great fire, the sun, began with a spark, and it will go out with a spark; an idea which is in harmony with the most recent discoveries. In another place he says an animal is an imperfect man, man is an imperfect angel, and an angel is one degree below some higher and wiser creature. But the principal work with which Perthes's name will be associated is the 'Antiquités Celtiques et Antédiluviennes.' This was one of the many results of his untiring efforts to promote the study of the antiquity of man. The first nucleus of the work was a short paper read to the Société Royale d'Emulation at Abbeville in 1836, to which society other papers on the same subject were contributed from time to time. The first volume was printed in 1842, and presented to the Institute in 1844, but it was not published till 1846, when it appeared under the title of 'De l'Industrie primitive et des Arts à leur Origine.' This title did not attract attention, and in the following year it was re-issued under the title given above, which has been since retained. The work is a valuable contribution to the archaeology of his native province of Picardy, and so far as his statements concern the Celts, they have been generally accepted, but his conclusion as to the existence of antediluvian men met with much opposition, which, however, only induced him to renew his efforts to collect evidence. He spent his money and time freely in examining every available section that was made under his directions or in executing various engineering and building operations. He did not, however, confine himself to his own country, but searched all over Europe, and thus collected a magnificent museum of ancient implements, utensils, and rudimentary artistic fabrics, which at a later period he presented to the nation. Wherever he went he was received with hearty greetings, and assurances of help in his researches reached him from all quarters. His observations on these journeys are detailed in his 'Voyage à Constantinople,' 1855; 'Voyage en Danemark, en Suede, en Norwege,' 1858; 'Voyage en Espagne et en Algérie,' 1859; 'Voyage en Russie,' 1859; while those which more particularly appertain to archaeology were embodied in vol. ii. of his 'Antiquités Celtiques.' In 1864 appeared the third and concluding volume, in which he gives a full account of the finding of the famous human jaw of Moulin Quignon, which excited much discussion, as this fragment was supposed to be the oldest human relic discovered up to that time. Its authenticity has, however, been disputed, the evidence tending to show that the bone was not deposited along with the gravel in which it was found. Finding that his discovery was not generally accepted, Boucher de Perthes effected a series of new excavations and searches, which led to the discovery of many more human bones, some of which were at the very base of the gravel and resting on the chalk itself. The evidence connected with these would have convinced most anthropologists had they not been discovered after the first Moulin Quignon jaw bone, which there is strong reason to suspect was placed in the gravel fraudulently. It should be borne in mind that Boucher de Perthes had been in the habit of offering rewards for many years for objects connected with the antiquity of man, that he himself had frequently rejected spurious articles which had been offered him, and that he was fully aware of the possibility of deception. He lived long enough to see the position accepted which he had battled for so long and so arduously, viz., that men existed contemporaneously with various extinct mammals, and long before the so-called Celts, who were considered to be the earliest inhabitants of France. In addition to the above-mentioned works he wrote many others, amongst which we can only mention the 'Petit Glossaire,' 1835; 'Hommes et Choses,' 1851; 'Les Masques, biographies sans noms,' 1861—64, 5 vols.; and 'Sous dix Rois, souvenirs de 1791 à 1860,' 1864, 6 vols. His latest work was 'Des Idées innées de la Mémoire et de l'Instinct,' 1867. He died August 3,

1868, after having been for more than thirty years the president of the Emulation Society of Abbeville.

BOUCHET, JEAN, a voluminous French writer, was born at Poitiers on the 30th of January, 1476. Failing, by the death of King Charles VIII. at Amboise, on the 7th of April, 1498, of the appointment which that monarch had promised in recognition of his already declared talent, Bouchet adopted at his native city his paternal profession of procureur du roi, which does not appear to have ever completely won his affection. He was obliged frequently to withdraw into the country, where he could devote himself without distraction to study, by the ravages of the plague at Poitiers. Beyond this circumstance, and the incidental information that he had eight children, little is known of the events of his life. He died in some unascertained year between 1550 and 1555.

His works comprise 'L'Amoureux transi sans espoir,' 4to, Lyon, 1507, a collection of those juvenile poems by which he had won the regard of Charles VIII., and the production of the last of which dates from not later than 1500; 'Livret des Angloises et des remèdes d'amour du traverseur, en son adolescence,' 4to, Poitiers, 1537; a serious volume, in which he sought to make the amende for the frivolities of the preceding one, which he regretted, 'Les Cantiques de la sainte et dévote âme, amoureuse et épouse de Notre-Seigneur Jésus-Christ,' &c., 16mo, Lyon, 1540. The productions, however, for which Bouchet is alone regarded at present are of a memorial or historic kind, the chief of which are 'Le Panegyrique du Chevallier sans reproche, ou, La Vie et les Gestes de Louis de la Trémouille,' 4to, Poitiers, 1527; 'Les anciennes et modernes généalogies des Roys de France, et mesmement du Roy Pharamond, avec leurs epitaphes et effigies,' 4to, Poitiers, 1527, 1531, and 1535, 16mo, Paris, 1536, and 8vo, 1537; 'L'histoire et Cronique de Clotaire premier de ce nom. vij. roy des François, et Monarque des Gaules. Et de sa très illustre espouse, Madame Sainte Radegonde,' 4to, Poitiers, 1527; 'Les Annales d'Aquitaine, faits et gestes des rois de France et d'Angleterre, pays de Naples et de Milan,' &c., folio, Poitiers, 1524, 1535, 1557, 1644, &c. In addition to the foregoing, it may be mentioned that Bouchet is the author of a curious and very interesting volume of 'Épîtres Morales et Familières,' &c., folio, Poitiers, 1545.

Another JEAN BOUCHET, or DU BOUCHET, who was born in 1599 and died in 1684, is the author of several genealogical works of considerable local value and interest. They are 'Véritable Origine de la seconde et troisième lignées de la maison de France,' folio, Paris, 1646 and 1661; 'Histoire généalogique de la maison de Courtenay,' folio, Paris, 1661; 'Preuves de l'histoire généalogique de la maison de Coligny,' folio, Paris, 1662; 'Table généalogique des comtes d'Auvergne,' folio, 1665; 'Table généalogique des anciens vicomtes de la Marche,' folio, Paris, 1682; and an edition, with notes and additions, of Coustureau's 'Histoire de Louis de Bourbon, premier duc de Montpensier,' 4to, Rouen, 1642.

BOUDIN, JEAN CHRISTIAN MARC FRANÇOIS JOSEPH, anthropologist and hygienist, was born at Metz, in the department of Moselle, April 27, 1806. His father was a private soldier who had gradually worked his way up to official rank, and was during the first few years of his son's life in command of Mayence, at which place the subject of the present notice received his early education, and soon evinced an extraordinary ardour in the collection of facts and figures, a passion for music, and a strong faculty of acquiring languages. In 1824 he entered the hospital at Metz as a pupil; in 1826 he accompanied the military expedition to Spain; and in 1828 his services were transferred to the Morea. In 1830 he received the diploma of doctor, and in 1831 was appointed a regimental surgeon. In 1832 he was placed on the medical staff of the hospital at Marseille, and in this capacity he showed uncommon energy and skill in battling against the cholera epidemic which ravaged the town in 1835. About this time he established the 'Gazette Médicale de Marseille,' for which he wrote several papers, and in one of them he strongly urged the necessity of reform in sanitary regulations, and the abolition of quarantine imposed on travellers from Algeria. In 1837 he was entrusted with the medical direction of the second French expedition to Algeria. This army suffered much from cholera, and he himself was one of the persons seized by it. He ordered a horse, caused himself to be fixed to it, and rushed off on board a vessel to seek that change of air which he considered essential to his safety; the result was that he soon recovered his health. From 1838 to 1840 he resided at Algiers, and diligently studied the morbid influence of the marshy tract near that town; and in 1842

appeared his '*Traité des fièvres intermittentes, rémittentes et continues des pays chauds et des contrées marécageuses*,' which contains some original ideas as to the influence of miasms, and in which he advocated the use of arsenical preparations in certain fevers. This work led to much angry discussion, but the author's thoughts were thus turned to the subject of medical geography, on which he is one of the principal authorities. In 1842 he was appointed chief physician of the military hospital at Marseille, and to the Royal Society of that town he read a paper entitled '*Traité de géographie et de statistique médicales*,' published in the '*Bulletins*' of the Society in 1842, and separately in 1843, and which was subsequently expanded into a two volume work published in 1857. This last is his principal literary claim to notice, and embodies the fruit of some fifteen or more years of close observation and study, the results of which were announced from time to time in various scattered papers. It is an encyclopædic work on all that relates to the distribution of diseases, and the influence which climate, local peculiarities of physical geography, racial characters, &c., have in regulating such distribution. From 1843 onward he passed through various posts, such as chief physician to the hospitals at Roule, Vincennes, and St. Martin; to the Alpine army (1848-1849); and to the Italian army (1859), in succession to Larrey. In 1859 the French Anthropological Society was founded, and he at once joined its ranks as an active worker, and in 1862 he was elected its president. Amongst the papers which he contributed to this society may be mentioned, '*De non-cosmopolitisme des races humaines*,' '*Du croisement des familles, des races, et des espèces*,' and papers on food, water, cretinism, human hybridity, serpent worship, etc. Many of his literary productions, more especially those of a statistical nature, are illustrated with coloured or shaded maps and diagrams, which enable one to perceive at a glance the general state of the evidence. His aptitude for this kind of work is well displayed in his '*Carte physique et météorologique du globe terrestre*,' showing the distribution of temperature, winds, rain, and snow, which, we believe, was the only French work of its kind at the time of its publication. He was long engaged upon a '*Carte ethnographique du globe*,' but it was left unfinished, a circumstance the more to be regretted as it promised to be an exceedingly valuable addition to scientific cartography. Besides all this, he wrote many papers for the '*Annales d'hygiène*,' and the '*Recueil de Mémoires de Médecine Militaire*,' which he assisted in editing for more than twenty years, as also for various other journals; but a full list of these will be found in the under-cited article by Perier. He has also left a large collection of inedited materials bearing on the investigations to which he had applied himself. His death occurred at Paris, after a long illness, on March 9, 1867.

(Perier, *Notice historique et bibliographique sur le Dr. Boudin*, in *Mém. Soc. d'Anthropologie de Paris*, III. pp. 29-69, 1868.)

* BOUÉ, AMI, was born 16 March, 1794, at Hamburg, of a thriving commercial family descended from French refugees. His education was chiefly private, the war preventing his residence at Göttingen, as had been intended. In 1812 he commenced his travels in various parts of Europe, and acquired a taste for geological studies. After passing four summers in Scotland he took his doctor's degree in medicine at Edinburgh in 1817, and between this and 1839 he passed much of his time in travelling over Europe, including Turkey, which was new to the geologist. In 1820 he published at Paris a '*Geological Essay on Scotland*,' in 1829, '*Geognostic Pictures of Germany*,' in 1835, at Paris, '*Guide to the Geological Traveller*,' in 1840, '*Turkey in Europe*,' in 1850, '*An Itinerary of Turkey in Europe*.' He has also published many papers on geological science, and was the first secretary, then vice-president, and afterwards president of the Geological Society of Paris. He has since resided at Vienna.

BOUILLET, JEAN, was born at Servien, near Beziers, 6th March (or, as some say, 14th May), 1690. His father was a farmer. He received a good education at Montpellier, and practised as a physician at Beziers from 1715 up to the time of his death, 13th August, 1777. About this time there was considerable activity among the provincial scientific academies. Those of Montpellier and Bordeaux were accustomed to offer prizes for the best essays on certain subjects, and in 1719 Bouillet gained the prize for an essay on Fermentation, and in 1720 for one on Gravitation, or 'The Cause of Weight,' as it was called. He was a corresponding member of the Academy of Sciences at Paris, and, in conjunction with Von Mairan, Secretary to the Academy of Sciences and Belles Lettres at

Beziers, he took part in the celebrated discussion on Evaporation, which ended in the adoption of Le Roi's theory of solution of water in air, which retained its place in science until the time of Dalton, although in 1743 Bouillet approached the true theory by placing the particles of water in the interstices of those of air. Bouillet published several works on medicine, mineral waters, &c., and, in conjunction with his son, Jean Henri Nicolas (physician of Montpellier, born 1729), a number of articles in the *Cyclopædia* edited by D'Alembert and Diderot. At that time it was not difficult to attain distinction in a variety of sciences, so that we need not be surprised at Bouillet's wide range. He is even now sometimes quoted in astronomy, as having made a good observation in 1772 on the immersion of Saturn.

BOUILLET, MARIE-NICOLAS, a learned and industrious French compiler, was born at Paris, May 5, 1798. Having completed his educational course at the École Normale, under Cousin and Jouffroy, he was employed for some time as substitute professor of philosophy at Rouen and Paris; afterwards as teacher of philosophy in the colleges Charlemagne and Henri IV. (subsequently the Lycée Napoleon); and in 1840 he was made principal of the Collège Bourbon. The revolution of 1848 caused his retirement from the public employment, but he was nominated in 1851 inspector of the Academy of Paris, and in 1861 inspector general of public instruction. He died on the 28th of December, 1864. M. Bouillet was an excellent teacher, and he published some useful works in his own line of instruction; but he was more generally known as perhaps the most successful dictionary-maker of a time and country unusually abundant in that class of compilers. His first work of the kind was a classical dictionary designed to supersede Lemprière, which in a great measure it succeeded in doing: '*Dictionnaire Classique des Noms propres de l'antiquité, sacrée et profane*,' 2 vols. 8vo, Paris, 1826, 4th ed. 1841; and of which he published an abridgment in 1827, which has also passed through several editions. The success of a still larger work, the '*Dictionnaire Universel d'Histoire et de Géographie*,' 2 vols. large 8vo, double columns, 1842, was for a while in peril, for some passages in it called down the papal censure; but M. Bouillet, after a journey to Rome, cancelled all that was objected to, and his pliancy was rewarded not merely by the removal of his book from the Index, but by being permitted to prefix to it the approbation of the pope, as well as the imprimatur of the French prelates. As a consequence it met with an amount of success unparalleled in works of a like class, the 20th edition having been reached in 1864. His other great dictionary, '*Dictionnaire Universel des Sciences, des Lettres, et des Arts*,' 2 vols. large 8vo, 1854, reached a 7th edition in 1864, and has, we believe, been reprinted more than once since. M. Bouillet also contributed numerous articles to the '*Dictionnaire de la Conversation*,' the '*Dictionnaire des Sciences Philosophiques*,' the '*Biographie Universelle*,' the '*Encyclopédie Moderne*,' and to various periodicals. His philosophical works include the editing a French translation of Bacon's works; annotated editions of the philosophical works of Cicero and Seneca; and a translation of the '*Enneads of Plotinus*,' 3 vols. 8vo, 1857, &c.

BOUQUET, DOM MARTIN, a learned French Benedictine, was born at Amiens, August 6, 1685. Received at an early age into the order, he made his profession at the Abbey of St. Faron, Meaux, in 1706. Owing to his studious habits and unusual attainments, he was made librarian of the abbey of Saint-Germain-des-Prés, and called to assist Montfaucon in the preparation of his '*Antiquité expliquée*,' and other laborious compilations. But Dom Bouquet's great work was the *Collection of the Chronicles of France*, an enterprise projected by Colbert in 1676, but delayed, mainly from the difficulty of finding a competent and willing editor, until Bouquet undertook the duty, in 1721, on the recommendation of Denis de Sainte-Marthe, superior of the congregation of Saint-Maur. Some delay was caused by his removal to the abbey of St.-Jean-de-Laon, but he was recalled to Paris at the instance of the chancellor D'Agnesseau, and by 1728 had completed the first two volumes, which appeared in folio in Latin and French, with the title '*Rerum Gallicarum et Francicarum Scriptores; ou Recueil des Historiens des Gaules et de la France*.' To the continuance of this work Bouquet devoted every hour not demanded by his religious duties, and he had the happiness to witness the publication of the 8th volume in 1752. He was engaged on the 9th volume till his death, which occurred on the 6th of April, 1754. The work was continued by the Benedictines J.-B., and C. Haudiquier, Housseau, Précieux, Poirier, Clément, and Brial, the

19th volume being published in 1832. Its completion was then transferred to the Académie des Inscriptions et Belles-lettres, and, under the editorship of M.M. Daunou and Naudet, three more volumes have been issued, the 22nd in 1865. Of the value of this work to the student, not merely of French history, but of the history of Europe in the middle ages, it would be superfluous to speak. Dom Bouquet did not possess the higher qualities of a critic or commentator, but he was honest of purpose and unwearied in labour, and his progress forms a remarkable contrast to that of his successors.

BOURGEOIS, LOUIS, or LOYS, a French musical writer, the dates of whose birth and death are not known, but who composed between 1541 and 1561. Having embraced the principles of the Reformation under the teaching of Calvin, he accompanied the reformer to Geneva in 1541, and was chosen by the Consistory as cantor at that place; but, being frustrated in a plan of introducing harmonized psalms in many parts, he returned to Paris after some years. He was one of the first to propose the teaching of singing by solmisation, as an improvement on the method of Guido d'Arezzo, by a better mode of regulating the syllables *sol, fa, ré, mi*, &c. The French Protestants adopted Bourgeois's plan, from whence it gradually spread to all the French schools of music. One of his works was 'Pseaulmes Cinquante de David Roy et Prophète, traduits en vers Français, par Clement Maret, et mis en musique par Loys Bourgeois à quatre parties, à voix de contrepoint égal consonnante au verbe,' oblong 4to, Lyons, 1547. Another was 'Le droit chemin de Musique, composé par Loys Bourgeois, avec la Manière de chanter les Pseaulmes par usage ou ruse,' 8vo, Geneva, 1550.

BOURNON, JACQUES LOUIS, known as COUNT DE BOURNON, was born at Metz, January 21, 1751. He displayed early a decided taste for the study of natural objects, and after devoting some time to botany and other branches of natural history, selected mineralogy as the subject likely best to repay his toil. He was the more tempted to this choice by the fine collection of minerals which his father had made in his château at Fabert. He made frequent excursions in Dauphigny and elsewhere, in company with friends of similar tastes, and he cultivated the society of mineralogists of repute, and also corresponded with them. On the breaking out of the revolution he emigrated with his family, and ranged himself under the flag of Condé. When this army was disbanded, he sought refuge in England, where his mineralogical knowledge was highly esteemed, especially as the science was then immature. He was employed by Lord Granville, and also by Sir A. Hume and Sir J. Saint-Aubin, to arrange their mineralogical cabinets. In 1802 he was elected into the Royal Society. He had commenced some years before a general treatise on mineralogy, which he illustrated chiefly with reference to the carbonates of lime; and he found these so numerous that he had to content himself with a special instead of a general treatise. He described 616 varieties of forms, perfectly distinct, and belonging to 59 different modifications. Hence it will be seen what a length of time and how many observers were required to exhaust the subject of derived forms of which Häuy had opened up the knowledge. A single group belonging to any one of these varieties might form a cabinet, and yet, as the Count remarks, many might be wanting.

This fine work being sufficiently advanced for publication, including 72 quarto pages of figures, the poor refugee looked for some time in vain for a publisher; but, on talking the matter over with Dr. Babington and Mr. Allen of the Royal Institution, he was introduced to Messrs. W. & R. Phillips, the printers, when it was proposed to form a committee of scientific men to raise a guarantee fund for defraying the expenses of publication, and securing some profit to the author. This led to the publication of this celebrated treatise, under the title of 'Traité complet de la Chaux Carbonatée et de l'Arragonite, Londres, Chez W. Phillips, George Yard, Lombard Street, 1808.' The letter-press is in 2 vols. 4to, with a third volume of plates. The preliminary discourse contains a variety of personal details respecting the author and his scientific friends, and is written with that charming grace of style which distinguishes the *savans* of France. In a report to the Emperor Napoleon I., Cuvier, with his usual manliness of character, mentions Bournon by name, and states the value of his services to mineralogy. On the restoration of the Bourbons the Count returned to France, and was appointed mineralogist to the king, Louis XVIII. He published, 1815—18, a catalogue of his majesty's collection. He is also the author of a few other short treatises, the last of which, in 1824, is a description of a goniometer; and of a large number of papers,

between 1796 and 1815, in the 'Journal des Mines.' He died at Versailles, 24 August, 1825.

* BOUSSINGAULT, JEAN BAPTISTE JOSEPH DIEU-DONNÉ, was born at Paris, Feb. 2, 1802, and educated at the mining school of St. Étienne. He entered upon his public life as the superintendent of an English company, whose object was to reopen and work some old mines in South America. This gave him the opportunity of making many observations on the phenomena presented by the tropical regions of the New World; and that he availed himself of it is clear, since his remarks soon attracted the attention of Humboldt, who was at the time working in the same field of observation. By-and-by the insurrection in the Spanish colonies broke out, the mining enterprise was ruined, and Boussingault, joining the ranks of Bolívar, traversed nearly the whole of the country forming the basins of the Orinoco and Magdalene rivers (rendered classic ground by Humboldt), nominally as a soldier, but practically as a scientific observer. On returning to France he became successively professor of chemistry at Lyon, dean of the faculty at the same place, member of the Academy (1839), and professor of agriculture at the 'Conservatoire des Arts et des Métiers' in Paris. In 1848 he was elected to represent the department of Bas Rhin in the Constituent Assembly, but finding political life was not suited to his tastes, he resigned his seat after holding it for a few months only, and returned to the pursuits which were more congenial to him, such as the application of chemistry to agriculture, the breeding of animals, the qualities and value of manures, the properties of food given to domestic animals, etc. His principal works are 'Agronomie, chimie agricole et physiologie,' of which the second edition, in three volumes, was issued in 1860—1864; and 'Economie rurale considérée dans ses rapports avec la chimie, la physique et la météorologie,' 2 vols., of which the second edition appeared in 1851, and of which English and German translations have been prepared. He has also written a great number of papers, mostly for the 'Annales de Chimie' and 'Comptes Rendus,' nearly 150 are mentioned in the Royal Society's 'Catalogue of Scientific Papers.' That catalogue, however, does not come later than 1863, since which time he has been as active as ever; and at the present time he is engaged in studying the influence of various metalloids upon the properties of steel. One of his papers on this subject is contained in the 'Comptes Rendus' for March, 1870. In 1857 he was made a commander of the Legion of Honour.

BOUITS, DIERICK. [STUERBOUT, D., E. C.]

BOUVART, ALEXIS, a distinguished mathematician and astronomer, was born of poor parents in a small village in the Valley of Chamouni, on the 27th of June, 1767. He went to Paris in 1785, and attended gratuitous lectures at the College of France. Hesitating for a time between mathematical and medical studies, he at length chose the former, and made rapid progress. After bearing poverty with tranquillity, he obtained a post, with a small salary, at the Paris Observatory in 1793; and became one of the regular astronomical observers there in 1795. From his first visit to the observatory to the end of his days he manifested intense love of this study, and devoted himself zealously to the observation of phenomena. On one occasion, when watching for a comet from the top of the observatory, on an inclement night, he fell asleep, and became enveloped in snow; during a severe illness, which resulted from this imprudence, he amused himself with calculating logarithms. Bouvart assisted Laplace in making the calculations for the 'Mécanique Céleste,' and won the favour of that illustrious astronomer. He was appointed joint director of the Bureau des Longitudes in 1804. His appetite for work was enormous. The theory of the moon, and the tables of Jupiter, Saturn, and Uranus, involved calculations which were a positive pleasure to him in their variety and complexity. During many years he spent almost every clear night by the side of the great telescope at the observatory. He died on the 7th of June, 1843, calculating almost to the last hour. Bouvart discovered the comets of 1797, 1798, 1801, and 1805. He received from the Académie des Sciences, of which he was a member, a prize for his elaborate tables of 4000 lunar observations. Besides the tables and calculations regularly made at the observatory, and published at the expense of the French Government, Bouvart contributed about 20 papers to various scientific journals, including the 'Mémoires de l'Institut,' Bode's 'Astronomisches Jahrbuch,' Zach's 'Monatliche Correspondenz,' 'Astronomische Nachrichten,' 'Connaissances des Temps,' Schweigger's 'Journal,' Quételet's 'Correspondance Mathématique et Physique,' the Bulletin of the Société Géographique, Poggendorff's 'Annalen,' and the Memoirs

of the Academy of Dijon. These papers related to the tables of Jupiter and Saturn, comets, the moon, longitude, meteorology, the diurnal variations of the barometer, the influence of the moon on atmospheric pressure, the capillarity of the mercury in the barometer, and atmospheric waves. He also wrote three papers, in conjunction with Nicolle, on the moon and on comets. Bouvet, like many other mathematicians, was attracted by the curious problem of the knight's move in chess; concerning which he wrote a paper—'Marche du Cavalier des Echecs pour parcourir de 128 manières différentes les 64 cases sans jamais passer deux fois par la même case, et revenir à la case de départ,' Dijon, Acad. Mem., 1830.

BOUVET, JOACHIM, a scientific and indefatigable French Jesuit missionary, was born at Mans, about 1662. Colbert, the French minister, formed a scheme for establishing agents of the government in China, commissioned to send home information, from time to time, concerning the arts, sciences, products, and learning of the Chinese. Colbert's death interfered with the full development of the plan; but it was partially carried out by his successor Louvois. Six learned Jesuits—Bouvet, Fontanay, Tachard, Gerbillon, Lecomte, and Visdelou,—were sent out in 1685, with special recommendations from Louis XIV. to the Emperor of China. Being shipwrecked on the way, they did not reach their destination until 1687. They were well received; the Emperor entered into their plans, facilitated their researches, and availed himself of their services in various scientific matters. They were allowed to build a church and a residence, and to establish a Christian mission at Pekin. The Emperor sent Bouvet home to France in 1697, to bring out more Jesuits, and to present to Louis XIV., a collection of 49 works in the Chinese language. Bouvet returned to China in 1699, taking with him the Jesuits Premare and Regis, and being the bearer from the king to the Emperor of a magnificently bound collection of engravings. Bouvet and his companions prepared a chart of the Chinese Empire. During a useful and honorable career of nearly half a century in China, he collected materials for several publications. He published four narratives of journeys which he had made in the course of his mission. During his temporary visit to France he issued from the press 'Etat présent de la Chine, en figures gravées par P. Giffart, sur les dessins apportés au Roi,' with 43 coloured plates, folio, Paris, 1697. He also published several letters; of which one was to Leibnitz, pointing out a similarity between the *Kona*, or the symbolic figures which constitute the base of the Chinese system of arithmetic, and the binary arithmetic proposed by Leibnitz. Bouvet died at Pekin, June 28th, 1732. The library at Mans contains several unpublished manuscripts of his, comprising treatises and letters on the state of China, and a Dictionary of the Chinese Language.

BOWER, ARCHIBALD, the younger son of a respectable Catholic family which had for several centuries possessed an estate in Forfarshire, was born at or near Dundee, on the 17th of January, 1686. At the age of 16 he was sent to the Scots College at Douay, where he remained four years, after which, removing to Rome, he was there admitted to the novitiate of the Society of Jesus, on the 9th of December, 1706. After his novitiate he taught classical literature and philosophy for two years at Fano, and subsequently spent three years at Fermo. In 1717 he was recalled to Rome, to study divinity in the Roman College, where he remained until 1721, when he became reader of philosophy and consultant to the rector of the College of Arezzo. In 1723 he was sent for a short time to Florence; and in the same year was transferred to Macerata, where he became professor of rhetoric and secretary to the Court of Inquisition. In these offices he continued till 1726, having in the year 1722 or 1723 made his last vows alternatively at Arezzo or Florence. At Macerata, according to his own account, he became so disgusted with the scenes of torture which he was compelled to witness, that he determined upon effecting his escape. It is alleged, on the other hand, that he sought safety in flight from the consequences of an intrigue with a nun of the noble family of Buonacorsi, an inmate of the convent of St. Catherine at Macerata, to which he had been appointed confessor. He accordingly obtained leave from the Inquisitor to visit the Virgin at Loretto, about thirteen miles distant, when, finding a convenient opportunity, he diverged from the high road near Recenati, and succeeded, after various dangers and adventures, the particulars of which he himself relates in a manner that has never placed his narrative above suspicion, in reaching England, where he arrived about July, 1726. Coming to London, he

introduced himself to Dr. Aspinwall, who gave him a favourable reception, and who, like Bower, had formerly belonged to the Society of Jesus. Bower's conferences with Dr. Aspinwall, and with the more celebrated Dr. Clarke, and Dr. Berkeley, Bishop of Cloyne, at that time Dean of Londonderry, produced, or appeared to produce, such a change in his religious sentiments that he soon after, in November, 1726, abjured the Roman Catholic faith, quitted his order, and took leave of his provincial. For six years he continued a Protestant, but without joining any Protestant communion, until he at length adopted that of the Church of England. Meanwhile he was introduced to Lord Aylmer, who required a person to assist him in reading the classics, and through whom he made the acquaintance of Lord Lyttelton, who remained to the last his firm friend. In 1730 he instituted a monthly review or magazine under the title of 'Historia Literaria,' which was finished in eight volumes in 1734. After its conclusion he was engaged by the publishers of the 'Ancient Universal History,' to which he contributed for a space of nine years, and especially wrote the article on Roman History. He is said to have become reconciled to the Jesuits in 1744 or 1745, and to have separated from them a second time; and he fell into great disrepute when his correspondence with Father Shirburn, the provincial of the order in England, was published in 1756 by Dr. John Douglas, afterwards Bishop of Salisbury, along with a commentary in proof of its authenticity. A desperate attack was opened from all quarters upon Bower, who was described as a sensualist and a hypocrite; the truth of a narrative which he had published of his escape from Macerata was impugned; and everything was done to effect the ruin of his literary and private reputation. Yet no tangible accusation was brought against him; and if his replies did not carry with them general conviction, at least they were ingenious and spirited. In 1748 he published the first volume of his 'History of the Popes, from the foundation of the See of Rome to the Present Time,' 4to, London, the second, third, fourth, and fifth volumes being issued severally in 1751, 1753, 1757, and 1761. The seventh and last was published in 1766. The production of this work at its various stages invited attack, and involved the author in controversy. The most important of his opponents were the Rev. Alban Butler and Dr. Douglas, the former of whom published 'Letters on the first two volumes of the History of the Popes,' 1754; and the latter, at whose hands Bower's personal reputation had received its first shock in 1756, published 'Bower and Tillemont compared,' 1757, the object of which was to show that a great part of the 'History of the Popes' was nothing more than a translation from the French historian, following up the attack in 1758 by the publication of 'A full Confutation of Bower's Three Defences,' and 'The Complete and Final Detection of Bower.' The apologetic and defensive side of the controversy was represented from first to last by Bower's 'Faithful Account of his Motives for leaving his Office of Secretary to the Court of Inquisition,' 8vo, London, 1750; his 'Affidavit, in Answer to the False Accusations brought against him by the Papists,' 8vo, London, 1756; his 'Answer to a scurrilous Pamphlet, entitled "Six Letters,"' &c., 2 parts, 8vo, London, 1757; his 'Answer to a new Charge brought against him in a Libel entitled "Bower and Tillemont compared,"' 8vo, London, 1757; and his 'Reply to a scurrilous Libel, entitled "A Full Confutation,"' &c., 8vo, London, 1757. To these may be added the author's 'One very remarkable Fact more, relating to the conduct of the Jesuits,' 8vo, London, 1758; 'Summary View of the Controversy between the Papists and the Author,' 4to, 1761; and 'A Brief Refutation of the Principal Charges brought against Mr. Bower by his Enemies, extracted from the Summary View.'

In the year in which the first volume of the 'History of the Popes' was published, Bower was appointed librarian to Queen Caroline; and on the 4th of August, 1749, he married a niece of Bishop Nicholson. In April, 1754, Lord Lyttelton, who was Bower's staunchest friend, appointed him clerk of the buck warrants. In 1761 Bower published an octavo volume, entitled 'Authentic Memoirs concerning the Portuguese Inquisition, in a Series of Letters to a Friend,' and on the 3rd of September, 1766, the long and chequered life of the author came to an end at his house in Bond Street. He was buried in Marylebone churchyard. His wife, some time after his decease, attested to his dying in the Protestant faith, a point much disputed at the time.

BOXALL, WILLIAM, R.A., was born at Oxford in 1801, and entered as a student at the Royal Academy in 1819. One of his earliest exhibited pictures was 'Milton's reconciliation with his wife,' 1819, and for several years he continued to paint

subject-pieces of a poetical character, as 'Cordelia,' 'Geraldine,' 'Hope,' 'the Repose in Egypt,' &c., which appeared in the successive exhibitions of the Royal Academy. But by degrees Mr. Bozall's pencil became almost exclusively employed in portraiture. Wordsworth, Gibson, Walter Landor, and many more of our most eminent poets, artists, and men of science, as well as persons distinguished by rank and position have been painted by him. In 1851 Mr. Bozall was elected associate, in 1863, member of the Royal Academy. On the death of Sir Charles Eastlake, in December, 1865, Mr. Bozall was appointed to succeed him as Director of the National Gallery. Without departing materially from the course marked out by his predecessor, Mr. Bozall has displayed activity and intelligence in his new office and enriched the gallery with many admirable works: but his pencil has necessarily been comparatively idle.

* **BOYD, ANDREW KENNEDY HUTCHISON**, a Scottish essayist and divine, was born in November, 1825, at Auchinleck, in Ayrshire, of which parish his father was minister. He was educated at the University of Glasgow, and obtained the highest academic honours in philosophy and theology. He was likewise known as the author of several prize essays. In 1851 he received ordination, and became incumbent successively of the parishes of Newton-on-Ayr, and Kirkpatrick-Irongray, in Galloway, of St. Bernard's, Edinburgh, and St. Andrew's, to the last of which he was presented by the crown. The University of Edinburgh conferred upon him the degree of D.D. in 1864.

Dr. Boyd first achieved general reputation by papers which he contributed as A. K. H. B. to 'Fraser's Magazine,' the most important of which were reprinted in a substantive shape. His works comprise 'The Recreations of a Country Parson.' Reprinted from "Fraser's Magazine," first series, 8vo, London, 1859, 2nd edition, 8vo, London, 1866; a Second Series, which was published in 8vo, London, 1861, and a popular edition, 8vo, London and Edinburgh, 1863; 'Leisure Hours in Town, being Essays, Consolatory, Aesthetical, Moral, Social, and Domestic,' 8vo, London, 1862; 'The commonplace Philosopher in Town and Country,' 8vo., London, 1863; 'Counsel and Comfort spoken from a City Pulpit,' 8vo, London, 1863; 'The Graver Thoughts of a Country Parson,' 8vo, London, 1863; 'The Autumn Holidays of a Country Parson,' 8vo, London, 1864; 'The Critical Essays of a Country Parson,' 8vo, London, 1865; 'Sunday Afternoons at the Parish Church of a University City,' 8vo, London, 1866; 'Lessons of Middle Age; with some account of various Cities and Men,' 8vo, London, 1868; 'Changed Aspects of unchanged Truths. Memorials of St. Andrew's Sundays,' 8vo, London and Edinburgh, 1869.

BOYER, ABEL, was born at Castres, in 1664. Compelled to leave France in consequence of the persecution following the revocation of the Edict of Nantes, he removed to Geneva, thence to Holland, and a few years later to England. He became, in 1692, tutor to Sir Benjamin Bathurst's son (afterwards Alan, Earl of Bathurst) and for some time was engaged in tuition. His French and English Dictionary, 4to, 1699, &c., the abridgment of which was long in nearly exclusive use in English schools, was originally drawn up for the use of the Duke of Gloucester. His French and English Grammar was almost equally popular; and his French and English Companion had down to our own time a large sale. Boyer was a voluminous and indefatigable writer, but his writings have little permanent value, with the exception perhaps of the 'Political State of Great Britain,' 60 vols., 1711—40, which was a monthly publication giving not merely as the title implies a narrative of political events, but a review of the party literature, and is therefore convenient as a summary of facts. His other works include a 'History of the reign of Queen Anne digested into Annals,' 11 vols. 8vo, 1703—13, and folio, 1722, 1735; 'History of the reign of William III.,' 3 vols, 8vo, 1702, (which the 'Nouvelle Biographie Générale' renders "Histoire de Guillaume le Conquerant;") 'Life of Sir William Temple,' 8vo, 1714. For several years he was editor of the 'Postboy.' A translation by him of Racine's 'Iphigenia' was performed under the title of 'Achilles in Aulis.' He died on the 16th of November, 1729, in a house he had built for himself in the Five Fields, Chelsea.

BOZE, CLAUDE GROS DE, an eminent French antiquary and numismatist, was born at Lyon, January 28, 1680. He was educated for the bar, but he early gave much attention to the study of ancient coins; some papers he wrote on coins procured him admission into the Académie des Inscriptions et Belles-lettres, and on being elected its permanent secretary in 1706, he finally abandoned the law. In 1715 he was made member of the Académie Française, and in 1719 keeper of the royal

cabinet of antiques. On the removal of the collection in 1741 from Versailles to Paris he resigned the secretaryship of the Academy in order to devote himself exclusively to the rearrangement of the royal collection. He was elected F.R.S. of London, in 1749, and died September 10, 1753. Besides numerous papers on separate coins and medals full of erudition and discrimination, and in which he frequently took occasion to make the medal the text for a broader enquiry,—as to one of Hygieia he appends a 'dissertation on the cultus rendered by the ancients to the goddess of health,'—M. Boze published the edition of the first 4 vols. of 'Mémoires de l'Académie des Inscriptions et Belles-lettres,' 8vo, Paris, 1740; 'Traité Historiques sur le Jubilé des Juifs,' 12mo, Paris, 1702; 'Médailles du règne de Louis XIV.,' 2nd ed., fol. 1723; 'Le Livre Jaune, contenant quelques conversations sur les logomachies,' 1748, and a 'Catalogue des livres du Cabinet de M. de Boze,' 1745.

BRACONNOT, HENRI, was born 28th of May, 1781, at Commercy (Meuse). He studied medicine and chemistry at Paris, and obtained a prize in botany, which seems to have determined his taste for researches in vegetable chemistry. His numerous papers are printed in the 'Annales de Chimie et de Physique,' 'Le Bulletin de Pharmacie,' 'Le Journal de Chimie Médicale,' &c. He was pharmaceutical chemist at the military hospital at Strasburg. He afterwards practised at Nancy, and in 1807 became professor of natural history and director of the Jardin des Plantes. He retired in 1840, and died 23rd January, 1855. It is needless to add that he belonged to many scientific societies, and, except for the date, that he was decorated in 1828.

BRADWARDINE, or BRADWARDIN, THOMAS, one of the most illustrious of English schoolmen, was descended from an ancient family, who originally derived their surname from Bradwardine, in Herefordshire, but had been settled in Sussex for three generations. He was born at Hartfield, near East Grinstead, in Sussex, in the latter half of the reign of King Edward I., probably between the years 1290 and 1300. He was educated at Merton College, Oxford, of which society he became a fellow. In 1325 he acted as proctor of the university, in which he was renowned not only for his great scholastic and theological learning, but also as "a most exquisite mathematician." He was perhaps the first Englishman who applied a regular connected series of reasoning from principles or conclusions already established to theological subjects, and from this circumstance arose the honourable title by which he was commonly known of the Profound Doctor—"Doctor Profundus." He had the privilege of being at one time chaplain to Richard de Bury, Bishop of Durham, whose manner it was, according to Godwin, "at dinner and supper-time to have some good book read unto him, whereof he would discourse with his chaplains a great part of the next day, if business did not interrupt his course." Bradwardine was distinguished as much for strictness of life and conversation as for his erudition, and hence Archbishop Stratford recommended him for the direction of the king's conscience. In the capacity of chaplain and confessor to Edward III., he attended that monarch during his wars in France. Some writers of his day did not hesitate to ascribe the king's victories to the virtue and holiness of the chaplain, rather than to the courage and tactics of the sovereign. It is certain that Bradwardine discharged the difficult duties of his office with integrity, discretion, and loyalty. He exerted himself to bring his master under the influence of religion, compelling him to moderate his anger when provoked, and restrain his ambition when flushed with victory. Whilst he counselled his prince, he was laborious in preaching to the troops and restraining their excesses. So far was he from being ambitious of ecclesiastical promotion, that it was with difficulty that, being already Chancellor of St. Paul's, he could be brought to accept a prebend in Lincoln cathedral. On the death of Stratford, Archbishop of Canterbury, which took place on the 23rd of August, 1348, the chapter elected Bradwardine to the primacy; but the election did not meet with the royal approbation, and Bradwardine was as willing to decline the primacy as the king was unwilling to part with his confessor. But it was a question of conscience with Bradwardine whether he ought to decline so responsible an office when imposed upon him. The king in consequence wrote to Pope Clement VI., requesting him to take no notice of the election of Bradwardine, but to bestow the archbishopric upon John de Ufford, or Offord, son of the Earl of Suffolk, and Dean of Lincoln and Chancellor of England. The Pope was too ready to comply, and declared Ufford archbishop, making him at the same time an unusual grant of favour and privilege. But the plague was at this time raging

in England, and Ufford fell a victim to it before he had received either pall or consecration. Again the choice of the chapter fell upon Bradwardine, and this time the king interposed no difficulty; whilst the Pope, unaware of his second election, had spontaneously appointed him by a bull of provision, of date June 10th, 1349. Bradwardine was accordingly consecrated at Avignon early in July, and the temporalities were restored to him on the 22nd of August; on the 26th of which month, before he had been enthroned, he died at Lambeth, and was buried in the chapel of St. Anselm, in his own cathedral. Bradwardine's best known work is his '*De Causa Dei, contra Pelagium*,' &c., folio, London, 1618, edited by Sir Henry Savile, from a MS. in Merton College Library; in addition to which may be mentioned his '*Geometria speculativa, cum Arithmetica speculativa*,' folio, Paris, 1495 and 1504. The Arithmetic was printed separately in 1502, and other editions of both appeared in 1512 and 1530; '*De Proportionibus*,' folio, Paris, 1495, folio, Venice, 1505; '*De Quadratura Circuli*,' folio, Paris, 1495. Bradwardine also left some Astronomical Tables, which appear never to have been printed.

BRAIDWOOD, JAMES, originator of the London Fire Establishment, was born in 1800 at Edinburgh, where he was brought up as a cabinetmaker by his father. Acquiring a considerable knowledge of mechanism, he was appointed by the Edinburgh police to improve and systematize the mode of extinguishing fires. Before he had perfected the arrangements, there occurred, in 1824, the most devastating fire which ever took place in that city, destroying the greater part of the High Street and the steeple of the Tron Church. His determination, daring, and skilful management on that occasion brought him into repute, which was increased by his management of the Engine Corps. A book published by him in 1830, '*On the Construction of Fire Engines and Apparatus, the training of Firemen, and the method of proceeding in Case of Fire*,' attracted the attention of many municipal bodies, and led to his settlement in the metropolis. Down to the year 1833, the various London fire insurance companies had their own engines, but failed to work together on any good system. Mr. Braidwood undertook to organise the London Fire Brigade in 1833, with the support of the several companies. He succeeded in drilling the men into admirable efficiency. He made many improvements in fire-engines and fire-escapes, introduced floating fire-engines on the Thames, and at length, in 1860, induced the various companies to adopt powerful steam fire-engines; the last-named improvement was, however, not ready until just after his death. On all matters affecting the security of the several government and other public buildings he was consulted as an authority; and he acted as superintendent of the royal palaces in reference to accidents from fire. On June 22nd, 1861, there occurred in Tooley-street one of the largest fires which had happened in the metropolis for many years, destroying buildings and merchandise to the value of nearly 2,000,000*l*. On this occasion the falling of a wall killed Mr. Braidwood. His interment at Abney Park Cemetery, on June 29th, assumed nearly the character of a public funeral. Throughout his career he was distinguished for his care of the men under him, his courage in time of danger, and his fertility of resources. On one occasion he brought out two barrels of gunpowder in succession through a burning shop into the street. In 1866 the essay already noticed, and various papers read before the Institution of Civil Engineers and the Society of Arts, were published in a volume called '*Fire Prevention and Fire Extinction*,' 8vo. When the London Fire Brigade was transferred to the management of the Metropolitan Board of Works in 1866, Mr. Braidwood's system of organization was retained in its main features.

BRAINERD, DAVID, a zealous and successful preacher and missionary to the North American Indians, was born in 1718, at Haddam, in Connecticut. At the age of nine years he lost his father, who was an assistant of the colony, or a member of the council. In 1739 he entered Yale College, from which he was expelled for expressions reflecting on one of the professors, early in 1742; in the spring of which year he repaired to Ripton, in order to prosecute his theological studies under the direction of Mr. Mills. Shortly after, at the end of July, he received licence to preach the gospel from the association of ministers which met at Banbury. Being impelled by a desire to exercise his ministry amongst the heathen, he repaired to New York, where, after having passed an examination by the correspondents of the Scottish Society for the Propagation of Christian Knowledge, he was appointed a missionary to the Indians. On the

1st of April, 1743, he settled at a place called Kannameek, between Stockbridge, in the State of Massachusetts, and Albany, in the province of New York. Here he endured extreme hardships and privations; but he was at the same time cheered by observing the marked effects of his teaching. After he had laboured among the Indians about twelve months, he advised them to remove to Stockbridge, about twenty miles distant, and to place themselves under the care of Mr. Sergeant. As most of them complied with this advice, Brainerd was free to proceed to the Forks of the Delaware, in Pennsylvania, where he set up his head-quarters, from which he made several excursions amongst the various tribes in the neighbourhood, and especially paid two visits to the Indians on the river Susquehanna. On his return from the latter of these tours, during which he had encountered uncommon hardships and fatigue, he was so depressed in mind and body as to meditate the abandonment of his labours; but was presently incited to new efforts by the encouraging intelligence which he received concerning a number of Indians at Crossweeksung, in New Jersey, whom he resolved to visit. After spending about a fortnight with them, with the most promising results, Mr. Brainerd returned home; and from this time Crossweeksung and the Forks of the Delaware were the principal scenes of his labours. In the summer of 1746, he again visited the Indians on the Susquehanna; and the progress of the disorder with which he had long contended was accelerated by the toils and privations he underwent on this occasion. The most alarming symptoms appeared, and he was no longer equal to the exertions to which his zeal impelled him; so that in the spring of 1747, being advised to proceed to New England, he went as far as Boston, from which he returned, in July, to Northampton, where, in the family of Jonathan Edwards, he passed the remainder of his days. He gradually declined until his death, on the 9th of October, 1747. He was quick of discernment, and tenacious in memory; of sound judgment, of great amiability, and power of attracting confidence and affection. His preaching was clear, forcible, tender, and pathetic, and charming for the warmth and temper of his natural eloquence. His theological attainments were great, and his friend President Edwards declared that he "never knew his equal, of his age and standing, for clear, accurate notions of the nature and essence of true religion, and its distinctions from its various false appearances."

Mr. Brainerd wrote a Narrative of his Labours at Kannameek, which, with his '*Journal, or an Account of the Rise and Progress of a remarkable Work of Grace amongst a number of Indians in New Jersey and Pennsylvania, with some General Remarks*,' was published in 1746, by the commissioners of his society in Scotland. President Edwards published '*An Account of the Life of David Brainerd, chiefly taken from his own Diary, and other private writings, written for his own use*.' To which is annexed, (1) Mr. B.'s Journal while among the Indians; (2) Mr. Pemberton's Sermon at his ordination. With an appendix relative to the Indian affairs, 8vo, Edinburgh, 1765. A new edition of his Memoirs was published, in 1822, by Sereno Edwards Dwight, including his Journal. Mr. Edwards had omitted the already printed Journals, which had been published in two parts—the first from the 19th of June to the 4th of November, 1745, entitled '*Mirabilia Dei inter Indicos*,' the second from the 24th of November, 1745, to the 19th of June, 1746, under the title of '*Divine Grace Displayed*,' &c. Mr. Dwight has incorporated these Journals in a regular chronological series with the rest of the Diary as given by Edwards. It may be added that the work which David Brainerd died in performing was taken up by his younger brother, JOHN BRAINERD, under whose care religion, civilisation, and education advanced, until, in 1759, he settled his congregation upon a tract of land purchased on their account by the Government of New Jersey, and comprising about 4000 acres, well adapted for the purposes of general cultivation. Towards the close of the American war, Mr. John Brainerd died; and, in 1783, was succeeded in the charge of his congregation by an Indian named Daniel Simon, who had received ordination. To this man, who was presently suspended from his office for irregularity, no successor was appointed; but the congregation was occasionally visited and supplied by the neighbouring ministers.

BRAMANTINO. BARTOLOMMEO SUARDI, called Bramantino after his master Bramante, the famous architect and painter, was the son of Alberto Suardi, an opulent citizen of Milan. The year of his birth is unknown. It is usually stated that he accompanied Bramante to Rome in 1495, and was employed by Julius II. to paint a series of portraits in the Vatican, which

were afterwards removed to make way for the paintings of Raffaele; on the other hand, Vasari says that they were painted by order of Nicholas V. But Julius was not elected Pope till November, 1503, while Nicolas died in 1455; neither, therefore, will suit the chronology. They were, perhaps, painted for Pope Alexander VI. (1492—1503). We know that they were destroyed by command of Julius II., after Raffaele had caused copies of them to be made, which were subsequently deposited in the museum of Paul Jovius at Como. Bramantino in 1525 painted a Pieta for the sacristy at Clairvaux, which was greatly admired. He also executed numerous works at Milan, and notably an Entombment over the door of the church of S. Sepolcro, which was regarded as a marvel of art for the foreshortening of the body of Christ (the feet being towards the spectator), and was the parent of numerous imitations; it is still in existence, but has been so enclosed as to be hidden from distinct inspection. The finest of his extant works are considered to be the frescoes on the vaulted ceiling of the St. Bruno Chapel in the Carthusian convent at Padua, and a Madonna Enthroned, in the Brera, Milan. Bramantino was employed as an engineer by Duke Francesco II. in repairing the fortifications of Milan, 1525; and Vasari states that the church of St. Ercolino was constructed, and that of St. Ambrogio, Milan, rebuilt from his designs, but this is at least doubtful. His death occurred between 1529 and 1536. As a painter he was especially celebrated for his skill in foreshortening and his knowledge of perspective; and Lomazzo has inserted his 'Rules' in his great work. But he was also admirable for the modelling of his figures and his clearness and truth of colour. Vasari, in his quaint way, relates that at Porta Vercellina was a picture by him (then destroyed), in which one of the horses was represented in so lively a manner that a living horse mistook it for reality, and kicked it repeatedly. Genuine pictures by Bramantino are rarely met with in the great collections; one is in our National Gallery, a large and fine example, No. 729, 'The Adoration of the Kings,' on wood, 7 ft. 10 in. high and 6 ft. 11 in. wide.

BRAMBILLA, FRANCESCO, an eminent Italian sculptor, was a native of Milan, and flourished in the second half of the 16th century. Vasari, a contemporary, mentions several of his works in marble, but he was most famous for those executed in bronze. The gates of the Certosa at Pavia are among his most admired productions, but his chief labour was on the Cathedral of Milan, upon which forty years of his life were spent. The grand figures of the four Evangelists and the four Fathers of the Church which support the great pulpit bear his name and the date 1570. He also designed the series of bass-relievi in the choir representing the history of the Virgin, and the metal Tabernacle of the Sacrament. He was interred in the cathedral which he had done so much to adorn.

BRAND, JOHN, an eminent antiquary, was born at Newcastle-upon-Tyne about 1743; completed his education at Lincoln College, Oxford; and, before he took orders, was for a time a master in the grammar-school of his native town. His first publication was 'Illicit Love: a poem written among the ruins of Godstow Nunnery,' 4to, 1775; but he became known by a more congenial labour, 'Observations on Popular Antiquities: including Bourne's *Antiquitates Vulgares*, with copious Additions,' 8vo, Newcastle, 1777. He now removed to London; was elected in 1777 fellow, and in 1784 secretary, of the Society of Antiquaries, to whose 'Archæologia' he was a frequent contributor. He was librarian to the Duke of Northumberland, who, in 1784, presented him to the rectory of St. Mary-at-Hill, London. In 1789 he published 'The History and Antiquities of the Town and County of Newcastle-upon-Tyne: embellished with engraved views of the Public Buildings, &c.,' 2 vols. 4to, London. He died on the 10th of September, 1806. Mr. Brand's fame rests on his Popular Antiquities. Up to the time of his death he had been collecting materials and making preparations for a greatly enlarged edition, in which he proposed "to dissolve amicably the literary partnership under the firm of Bourne and Brand, and to adopt a very different plan." But he left his MS. in so chaotic a condition that entire revision was required; a task finally undertaken by Mr. (afterwards Sir) Henry Ellis. The remodelled work appeared in 1813 under the title 'Observations on Popular Antiquities: chiefly illustrating the origin of our vulgar customs, ceremonies, and superstitions. By J. B.: arranged and revised with additions by H. E.,' 2 vols. 4to, London. A new edition, with further additions by Sir Henry Ellis, was published in 3 vols. sq. 8vo, 1841; and another issue with additions, forming 3 vols. of Bohn's 'Antiquarian Library,' in 1848. An edition by Mr. W. C. Hazlitt, also in 3 vols., appeared in 1869, but in this

the text has been so altered that the book cannot be fairly quoted as 'Brand's Antiquities.'

BRANDE, WILLIAM THOMAS [E. C. vol. vi. col. 980]. Mr. Brande, who was born in or about 1786, died at Tunbridge Wells on the 11th of February, 1866. He was a Fellow of the Royal Society, and in 1853 received the honorary degree of D.C.L. from the University of Oxford.

BRANDER, GUSTAVUS, a native of Sweden, engaged in commercial pursuits in the City of London, and yet finding time to devote himself to the study of natural history. He was elected a Fellow of the Royal Society in 1754, and contributed three short papers to the Transactions. He had the merit of pointing out that the fossil shells of the south coast of England were either of unknown species, or of such as lived in distant latitudes. After publishing descriptions of them he presented the originals to the Museum, or "Repository," as it was called, of the Royal Society. When the Society removed to Somerset House the Repository was presented to the British Museum, in 1781. Some of the specimens, however, found their way to the Museum of the College of Surgeons. It is said to be impossible now to recognise Brander's specimens among the crowds of fossils that enrich the British Museum—a fact much to be regretted. Brander died 21 January, 1787.

Brander's papers in the Ph. Tr. are in vol. xliii. on Belemnites, and in vol. xlix. a few lines on a Remarkable Echinus, and also 'An Account of the Effects of Lightning in the Danish Church in Wellclose Square, Ratcliff Highway.' His 'Fossilia Hantoniensia—Hampshire Fossils' was published in 4to, London, 1766. The Royal Society's copy is marked "December, 1765." The Preface is in parallel columns, Latin and English, from which it appears that the specimens figured "were collected out of the cliffs by the sea-coast between Christchurch and Lymington, but more especially about the cliffs by the village of Hordwell." The specimens are charmingly and artistically engraved, and the scientific descriptions in Latin are by Dr. Solander. The originals are said to be in the Branderian collection of the British Museum, "but very few are known to be natives of our own, or, indeed, any of the European shores; but the far greater part of them upon a comparison with the recent are wholly unknown to us."

BRANDIS, CHRISTIAN AUGUST, a German philosopher, a Prussian privy councillor, and professor of philosophy at Bonn, the son of Joachim Dietrich Brandis, an able physician and medical writer, was born at Hildesheim on the 13th of February, 1790. He studied philology and philosophy at the universities of Kiel and Göttingen, and took his degree of Ph.D. at Copenhagen in 1812, when he produced a thesis entitled 'Commentationes Eleaticæ,' 8vo, Altona, 1813, of which only the first part was published. The works of Professor Brandis comprise an edition of the Metaphysics of Aristotle, 8vo, Berlin, 1823; 'Scholia in Aristotelem,' 4to, Berlin, 1836; and 'Scholia Græca in Aristotelis Metaphysicam,' 4to and 8vo, Berlin, 1837. From 1827 to 1830 Brandis was joint editor of the Rhine Museum of Philology, &c., 'Rheinisches Museum für Philologie, Geschichte und Griechische Philosophie.' In 1837 he was called to Greece to become a member of the council of King Otho; and as the result of several years' sojourn in that country he published his Communications on Greece, 'Mittheilungen über Griechenland,' 3 vols. 12mo, Leipzig, 1842. His more strictly academical works are his Manual of the History of Græco-Roman Philosophy, 'Handbuch der Geschichte der Griechisch-Römischen Philosophie,' vols. 1—3, Berlin, 1835—1860; and a History of the Development of Greek Philosophy, and its Influence upon the Roman Empire, 'Geschichte der Entwicklungen der Griechischen Philosophie, und ihrer Nachwirkungen im Römischen Reiche,' 2 vols. 8vo, Berlin, 1862—64. He died July 24, 1867.

BRANDOLINI, AURELIO, called LIPPO on account of his infirmity of sight when a child: while yet young he became quite blind. He was born of a noble family at Florence about 1440. His fame was so great as an orator and philosopher that when Mathias Corvino, King of Hungary, founded the University of Buda in 1484, he was summoned by that sovereign to undertake the professorship of rhetoric. On the death of King Mathias in 1490, Brandolini returned to Florence, and entered the congregation of the Eremitani Brothers of St. Augustine, in the convent of Santa Maria. The achievements of his eloquence as a preacher, as related by various contemporary writers, are almost incredible. He was equally remarkable as an improvisatore. He died of the plague at Rome in 1497 or 1498. Considering his blindness, the acquirements and the productions of Brandolini are equally surprising. His works comprise 'Libri duo Paradoxorum Christianorum,' Basel, 1498 and 1543, Rome 1531, and

Cologne, 1573; 'Dialogus de Humanæ Vitæ Conditione et toleranda Corporis Ægritudine,' Basel, 1498 and 1543, Vienna, 1541; and 'De Ratione Scribendi Epistolas,' Basel, 1498 and 1549, and Cologne, 1573.

BRANDOLINI, RAFFAELLE, a younger brother of Aurelio, and who, from the same cause of blindness, was also surnamed Lippo, was born at Florence about the year 1465. He was celebrated as an orator, a scholar, and antiquary, and was especially famous for his remarkable powers of improvisation. Being at Naples when Charles VIII. of France made himself master of that kingdom, he surprised the victorious monarch by an extempore panegyric, which he afterwards turned into Latin verse. About two years after, the retirement of the French from Naples, or the death of his brother at Rome, called Raffaele Brandolini to the latter city, where he taught literature and eloquence. He was patronised by Leo X., who assigned him apartments in the Vatican, and called him *Oculus Pontificis*. This favour was either earned or recognised by Brandolini in a Latin dialogue entitled 'Leo,' written in praise of his patron and other distinguished members of the house of Medici. Two or three other Discourses, in the shape of Panegyrics or Funeral Orations, are extant by Brandolini, who died in some unascertained year after 1514, a date which appears in some of his letters.

* BRANDT, JOHANN FRIEDRICH, an eminent biologist, and, for many years, the director of the zoological museum belonging to the Imperial Academy of Science at St. Petersburg. His writings are very numerous, but mostly contained in the publications of the Academy with which he is connected. They range over a wide field, from infusorians, annelids, and insects, to birds and mammals. Their general tendency is towards the anatomical and physiological branches of zoological inquiry, although there are not a few papers entirely devoted to diagnoses and classification. His papers are upwards of 150 in number, some of them being of considerable bulk; and to the more important of them we propose devoting a few lines. One of his earliest efforts in literature was a 'Prodrum descriptionis animalium ab H. Mertensio observatorum,' 1825, which deals with the hydrozoan forms collected by Mertens, and which was, in 1838, expanded into an elaborate memoir on the jelly-fishes or scaphophor stages of this class of animals. (Mém. Acad. Sci. St. Petersburg, 6th series, iv. pp. 237—412.) It is, in fact, a full report on the state of knowledge respecting these animals at that time, and is illustrated with 31 plates of coloured figures drawn from nature by Mertens. A group allied to these, the *Hyalochætitæ*, has been similarly treated by him in 'De Nova Polyporum classis familia Hyalochætidum nomine designanda,' and 'Symbolæ ad polypus hyalochætitides.' At an early period of his life he had drawn up a full account of the anatomy and physiology of the common medicinal leech, which is given in the 'Medicinische Zoologie,' 2 vols., 1829—1833, a work written by him, in conjunction with M. Ratzeburg. He discovered the presence of a stomato-gastric, or sympathetic, system of nerves, and several other features connected with this annelid. Somewhat later appeared his 'Bemerkungen über die Mundmagen oder Eingeweiden nerven,' in Mém. Acad. Sci. St. Petersb., iii., pp. 561—612, 1835, in which he brings together all the information previously acquired respecting these nerves in the invertebrate sub-kingdom, and adds much fresh matter on the subject. Other papers touch upon various points—physiological, anatomical, and diagnostic—connected with crustaceans, myriapods, the cochineal insects, the genus *Meloe*, ('Monographia generis Meloes,' in 'Nova Acta Acad. Caes. Leop. Nat. Cur.,' xvi., pp. 101—142, written in conjunction with Erichson), and spiders. His contributions to the literature bearing upon vertebrates are both more numerous and more important. As regards fishes, he has published remarks on the classification of the class, and an abstract of a paper on the development of ganoids; this latter, we believe, was intended to have formed a portion of a monograph of the sturgeons of Russia, which the author was engaged on in 1865, but, so far as we know, the monograph has not been issued yet. Birds have occupied a considerable share of his attention, as is witnessed by his 'Beiträge zur Kenntniss der Naturgeschichte der Vögel mit besonderer Beziehung auf Skeletbau und vergleichende Zoologie,' in 'Mém. Acad. Sci. St. Petersburg,' v. pp. 81—238 (1840), which, together with numerous minor papers in the 'Bulletins' of the same society, form valuable additions to our knowledge of the order *Natares*. His specialty, however, is in the mammalian class. Thus we have a paper, 'De Solenodonte,' 1833, describing and establishing a remarkable genus of shrew-like animals; a number of papers on *Rhytina borealis*, of which the most noteworthy

BIOG. DIV.—SUP.

is 'Symbolæ Sirenologicae,' in 'Mém. Acad. Sci. St. Petersburg,' 6th Series, vii. pp. 1—160 (1849); papers on the tichorhine rhinoceros, of which we may specially mention 'De Rhinocerotis Antiquitatis,' in 'Mém. Acad. Sci. St. Petersburg,' 6th Series, vii., pp. 161—419, as being the fullest account known of that extraordinary extinct pachyderm, and as containing details respecting some of the soft parts; papers on the mammoth, amongst which will be found a coloured partially ideal figure of this beast; and a group of communications upon other mammalia, amongst which we may refer to the 'Mammalium Rodentium exoticorum,' in 'Mém. Acad. Sci. St. Petersburg,' 6th Series, iii., pp. 357—442; and the 'Beiträge zur nähern Kenntniss der Säugethiere Russlands,' in 'Mém. Acad. Sci. St. Petersburg,' 6th Series, ix., pp. 2—365 (1855), as being an excellent account of the rodents, but more especially of the beaver. The last two papers are fully illustrated with figures.

BRANDT, or BRANT, SEBASTIAN, a lawyer and satiric poet, was born at Strasburg, about the year 1458. He prosecuted his legal and classical studies at Basel, where in 1484 he obtained licence to teach, and in 1489 took his doctor's degree. The administrative ability which he exhibited attracted general attention, and procured for him the appointment, in 1501, to the Syndicate, and two years after to the chancellorship, of his native city. He likewise received from the Emperor Maximilian the honour of being a councillor and Count Palatine. He died at Strasburg on the 10th of May, 1521.

Notwithstanding his able discharge of various public offices, he is chiefly known as the author of a work entitled the Ship of Fools, 'Narrenschiff, oder das Schiff von Narragonia,' 4to, Basel, about 1494, a German poem in iambic verse, in which he lashed the prevailing vices and follies of his time in a series of over a hundred chapters, each of which was devoted to the portrayal of a group of representative fools. The author describes a vessel laden with all sorts of absurd persons, though, it has been said, he seems to have no end in view but to bring them into one place, so that they might be described, as the beasts were marshalled before Adam in order to be named. The 'Narrenschiff' was neither brilliant in its poetic genius, nor scathing in its satire; yet as a book of sound morality and knowledge of human nature, it achieved an immense popularity, not only in its original German, but in the languages of France, Holland, and England. The English version, entitled the 'Ship of Fools,' which was published in folio, London, 1608 and 1670, was executed by the Rev. Alexander Barclay, who professedly translated it from the Latin version of James Locher, 'Navis Stultifera Mortalium, [e] vernaculo ac vulgari sermone in Latinum conversa,' 4to, Basel, 1488, a date which would be more correctly read as 1498. Before the end of the fifteenth century, the book was current in all the dialects of Germany; and Geiler von Kaiserberg, a friend of the author, made the 'Narrenschiff' the text or basis of a series of 'Sermons,' 4to, 1511. Among the most recent editions of the 'Narrenschiff' is that published, with a life of the author, by Strobel, 8vo, Quedlinburg and Leipzig, 1839, and that which is esteemed the best of all, 8vo, Leipzig, 1854. In addition to his great work, Brandt is more restrictedly known as the translator and editor of some of the classics; and as the author of various works in theology and devotion, in law, and in Latin verse.

BRASSAVOLA, ANTONIO MUSA, a physician, born in 1500 at Ferrara, then a celebrated school of science. Antonio studied under masters of repute, and became celebrated in public disputations at Ferrara, Padua, and Bologna. At the age of 25 he was appointed first physician to Hercules II., hereditary prince and afterwards duke of Ferrara. After visiting France and other countries in the service of the prince, he became professor of dialectics and natural philosophy in the university of his native town. He also studied botany with success, and established the first botanic garden of modern times. His 'Examen omnium Simplicium Medicamentorum,' published in 1536 (written in the Platonic form of dialogue), though based on the study of nature, has, according to Cuvier, the character of a commentary on the ancients. Brassavola was consulted by several sovereigns, and received permission from Francis I. of France to add the lilies to his arms. He died July 6, 1555.

BRATHWAITE, RICHARD, whose surname varies as Brathwait, Braithwaite, and Braithwaite, a pastoral poet of the reign of James I., was born in 1588, the second son of Thomas Brathwaite, of Warcop, near Appleby, the representative of a respectable landed family in Westmoreland. In 1604 he was entered a commoner of Oriel College, Oxford, and, according to Wood, "while he continued in that house, which

was at least three years, he avoided, as much as he could, the rough paths of logic and philosophy, and traced those smooth ones of poetry and Roman history, in which at length he did excel. Afterwards he removed to Cambridge, as it seems, where also he spent some time for the sake of dead and living authors, and then receding to the north parts of England, his father bestowed on him [the estate of] Barnside, where living many years, he became captain of a foot-company in the trained bands, a deputy-lieutenant in the county of Westmoreland, a justice of peace, and a noted wit and poet. . . . In his latter days he removed, upon an employment, or rather a second marriage, to Appleton, near Richmond, in Yorkshire, where dying on the 4th day of May, 1673, was buried in the parish church of Catherick, near that place; leaving then behind him the character of a well-bred gentleman and a good neighbour." Brathwaite was an exceedingly prolific writer. His works comprise 'The Golden Fleece, whereunto bee annexed two Elegies, entitled Narcissus' Change and Æson's Dotage,' 8vo, London, 1611; 'The Poet's Willow, or the Passionate Shepherd: with sundry delightful and no less Passionate Sonnets, describing the Passions of a discontented and perplexed Lover,' 8vo, London, 1614, written in lyric and Anacreontic measures; 'The Prodigal's Tears, or his Farewell to Vanity: a Treatise of Sovereign Cordials to the Disconsolate Soul,' &c., 8vo, London, 1614; 'The Scholar's Medley, or an intermixt Discourse upon historical and poetical relations,' 4to, London, 1614; 'A Strappado for the Devil; Epigrams and Satires alluding to the Time, with divers measures of no less delight,' 8vo, London, 1615, the second part of which is entitled 'Love's Labyrinth, or the True Lovers' Knot, including the disastrous Falls of two Star-crost Lovers, Pyramus and Thisbe. A subject heretofore handled, but now with much more Propriety of Passion, and variety of Invention; 'Solemn Jovial Disputation, theoreticke and practicke, briefly shadowing the Law of Drinking, &c., &c., Oenozythopolis, at the Sign of Red-Eyes, 1617, and 'The Smoking Age, or the Man in the Mist, with the Life and Death of Tobacco, &c. Oenozythopolis, at the Sign of Tear-nose,' 8vo, 1617, one of the scarcest books in England, the plates of which are the earliest production of Marshall, the engraver; 'The Good Wife, or a rare one amongst Women. Whereto is annexed an Exquisite Discourse of Epitaphs, including the Choicest thereof, Ancient or Modern,' 8vo, London, 1618, and in the same volume, with a fresh title-page, 'Remains after Death, including by way of Introduction divers memorable Observances occasioned upon Discourse of Epitaphs and Epycedes, their Distinction and Definition seconded by approved Authors,' a volume which, taken altogether, Dr. Bliss thinks "one of the most curious as well as one of the scarcest books of the period to which it belongs;" 'A New Spring shadowed in sundry Pithy Poems,' 4to, London, 1619; 'Essays upon the Five Senses, with a Pithy one upon Detraction,' 8vo, London, 1620, and 12mo, 1635; 'Shepherds' Tales,' 8vo, London, 1621, a continuation of which was printed with 'Nature's Embassy, or the Wild Man's Measures, danced naked by twelve Satyrs,' 8vo, London, 1621, with which were also incorporated 'Divine and Moral Essays,' 'Omphale, or the Inconstant Shepherdess,' and 'Odes, or Philomel's Tears; 'Time's Curtain Drawn, or the Anatomy of Vanity: with other choice Poems, entituled Health from Helicon,' London, 8vo, 1621; 'The English Gentleman: containing sundry excellent Rules or exquisite Observations, tending to Direction of every Gentleman of selecter Rank and Quality, how to demean, or accommodate himself in the Management of public or private Affairs,' 4to, London, 1630, 1633, a third edition in 1641, entitled 'The English Gentleman and Gentlewoman, with a Lady's Love-lecture, and a Supplement lately annexed, and entituled The Turtle's Triumph,' and a fourth edition which, with a new title-page and a few additions, was published under the title of 'Time's Treasury, or Academy for Gentry,' folio, London, 1652; 'The English Gentlewoman, drawn out to the full Body, expressing what Habiliments do best attire her, what Ornaments do best adorn her, what Complements do best accomplish her,' 4to, London, 1631 and 1633, and a third edition, incorporated, as already stated, with the 'English Gentlewoman,' folio, London, 1641; 'Whimzies, or a new Cast of Characters,' 12mo, London, 1631; 'Mercurius Britannicus, or the English Intelligencer,' 4to, and 2nd edition 4to, 1641, a political "tragic comedy," on the subject of ship-money; 'Anniversaries upon his Panarete' (Mrs. Frances Brathwaite), 8vo, London, 1634, of which a continuation appeared the following year; 'The Arcadian Princess, or the

Triumph of Justice,' 18mo, London, 1635, which is a translation from Mariano Silesio, a Florentine, interspersed with various Poesies; 'Lives of all the Roman Emperors,' being exactly collected, from Julius Cæsar unto the now reigning Ferdinand the Second,' 12mo, London, 1636; 'A Spiritual Spicery, containing sundry sweet Tractates of Devotion and Piety,' 12mo, London, 1638, a rendering of a work by Jacobus Gruythrodus, a German, with which was published 'A Christian Dial,' written by Joh. Justus Lanspergius, a Carthusian; 'Psalms of David, the King and Prophet, and of other holy Prophets, paraphrased in English,' 12mo, London, 1638; 'Ar't asleep, Husband! a Bolster Lecture, &c., 12mo, London, 1640, by "Philogenes Pandonius"; 'Muster Roll of the Evil Angels embattled against S. Michael,' 24mo, London, 1655, and in 1659, with a new title-page, 'Capital Hereticks,' &c.; 'Lignum Vitæ. Libellus in quatuor partes distinctus,' &c., 12mo, London, 1658; 'Honest Ghost, or a Voice from the Vault; an Age for Apes,' 12mo, London, 1658; 'Congratulatory Poem to his Majesty upon his happy Arrival in our late discomposed Albion,' 4to, London, 1660; and various others. But what is at present of the greatest interest with regard to Brathwaite's literary activity, is the fact that we are at length enabled to identify him as the author of 'Barnabee's Journal, and Bessy Bell, both in Latin and English, by Corymbæus,' London, about 1648 or 1650. A second edition, to which an index and some introductory matter were added, repeated in the numerous subsequent ones, was published as 'Drunken Barnaby's four Journeys to the North of England, in Latin and English verse, &c., to which is added Bessy Bell,' 8vo, London, 1716, third edition, 8vo, London, 1723, 8vo, Dublin, 1762, fourth edition, 8vo, London, 1776, fifth edition, 8vo, London, 1805, with seven new vignettes and tail-pieces, and having an advertisement prefixed relative to the then supposed author, Barnaby Harrington, and his Journal, sixth edition, 8vo, London, 1808, and seventh, 1818. A new edition with four lithographic prints appeared in 12mo, London, 1822. But the final touch to the Barnaby bibliography was given by the publication of an excellently edited reprint, of which only 125 copies were printed, entitled 'Barnabæ Itinerarium, or Barnabee's Journal, with a Life of the Author, a Bibliographical Introduction to the Itinerary, and a Catalogue of his Works. Edited from the first edition, by Joseph Haslewood,' 2 vols. 12mo, London, 1820. It is to Mr. Haslewood that we are indebted for the fact of having traced 'Barnaby's Journal' to its proper author.

*BRAUN, ALEXANDER, a celebrated German botanist, who has been long engaged in teaching his favourite science at the High Schools of Freiburg and Giessen, and as professor of botany at Berlin. His papers, which are seventy-two or more in number, and his separate works, are chiefly devoted to the cryptogams, to organogeny, or to philosophical observations on plants in general. One of the lines of study which he has done much to develop is the law which regulates the position of leaves on the branches, or phyllotaxis. The first great step was made by Schimper in 1829, and his observations directed Braun's attention more particularly to the subject, and led to his several papers on it, the most important being the 'Vergleichende Untersuchung über die Ordnung der Schuppen an den Tannenzapfen, als Einleitung zur Untersuchung der Blattstellung überhaupt,' in 'Nova Acta Acad. Cæs. Leop.' xv. pp. 199—401 (1831), and 33 plates; and 'Beschreibung der Symphytum Zeyheri,' in 'Geiger's Magazine,' xxviii. He has given special attention to the *Characeæ*, no fewer than eleven of his papers being devoted to this group alone. He took an active share in the discussion as to the possibility or rather actual occurrence of parthenogenesis in plants. Several examples have been adduced of the fertilisation of female flowers without the aid of pollen, but all, with the exception of those relating to *Celebogyne ilicifolia*, have been disproved or reasonably doubted. In the case of the plant just named, three plants, all female, were sent from Australia to Kew Gardens, where they flowered and ripened their seeds, although they were the only specimens known to exist in this country. This led to the case being thoroughly examined by Braun, Schenck, Regel, Baillon, and other eminent continental botanists. Braun's principal contribution to the subject is 'Ueber Polyembryonie und Keimung von *Celebogyne*,' in the 'Abhandlungen der Königlichen Akad. Wissen. Berlin,' p. 109—263 (1859), in which he made the important observation that a pollen grain was found on the stigma. His experiments were conducted with the scrupulous care and rigorous method which he is known to bring to all his inquiries, and these experiments, although not absolutely conclusive, still, so far as they

went, supported the view that parthenogenesis is possible in plants. Later, however, Karsten discovered that hermaphrodite flowers are developed during the early summer months, and as his observation seems to be trustworthy, it is almost certain that *Calebogyne* can only be fertilised by pollen, as is the case with all other flowers. The work by which Braun is best known in this country is the 'Betrachtungen über die Erscheinung der Verjungen in die Natur,' 1851, of which an English translation was issued by the Ray Society for the year 1853, and which Professor Hensley pronounces to be one of the most important contributions to the philosophy of botany. It consists chiefly of a clear outline of the morphology of plants, more especially as regards leaves; and of one of the best accounts we possess of the phenomena of cell structure and cell growth.

BRAUN, AUGUST EMIL, German archaeologist, was born April 19, 1809, and studied successively at the gymnasium of his native place, at Göttingen, and at Munich. His attention having been directed strongly to art and aesthetics, after staying some time at Dresden, where he had the benefit of Rumohr's guidance, he went to Berlin, and thence in 1833 to Rome. Here he was appointed librarian of the Archaeological Institute; later succeeded Gerhard as secretary; in 1834 became editor of its 'Bulletino,' and in 1837 of its 'Annali.' Constantly engaged in investigating the antiquities of the city, he came, from his wide range of knowledge and connection with the Institute, to be regarded as the leading authority on everything connected with the topography and archaeology of ancient Rome. He did not, however, confine his attention to the past. He was greatly interested in the novel applications of scientific processes to artistic purposes, and was the founder of a galvanoplastic establishment, which had for its object the reproduction of works of classic times, and which, as is said, mainly through Braun's persevering efforts, succeeded in producing metal statues (like that of Hahnenmann, erected at Leipzig in 1851) of heroic size. In addition to many monographs in Italian and German, illustrative of particular works of Greek and Roman antiquity, he wrote 'Antike Marmorwerke,' with 24 plates, fol. Leipzig, 1843; 'La Passione de Gesù Christo nella Cattedrale di Siena dipintura di Duccio di Bino della Buoninsegna,' &c., with 27 plates, oblong folio, Rome, 1847, with German text, Leipzig, 1850; 'Die Apotheose des Homer in Galvanoplastischer Nachbildung,' 4to, Leipzig, 1848; 'Specimens of Ornamental Art, selected from the best models of the classical epochs, 80 coloured plates by L. Gruner,' large folio, London, 1850; 'Die Ruinen,' &c., 'The Ruins and Museums of Rome: a Guide-book for travellers, artists, and lovers of antiquity,' German and English versions, 8vo, Brunswick, 1854, London, 1855, the best book of the kind that had then been published; 'Vorschule der Kunst Mythologie,' with 100 plates, 4to, Gotha, 1854; 'Introduction to the Study of Art Mythology,' an English translation, by J. Grant, Gotha, 1856. Dr. Braun died at Rome, September 12, 1866.

BRAY, THOMAS, celebrated for his labours in the propagation of the gospel, was born in 1656 at Marton in Shropshire, the residence of his parents, who were persons of good reputation, but of no considerable means. He was early sent to Oswestry school, whence, after completing his preparation for the university, he removed to Hart Hall, Oxford. Here he attained considerable proficiency in languages and divinity; and soon after taking his B.A. degree, was admitted into holy orders. He became successively curate of a parish near Bridgenorth and chaplain in the family of Sir Thomas Price, of Park Hall, Warwickshire, who gave him the donative of Lea Marston. Soon after he was presented by Lord Digby to the vicarage of Over-Whitacre; and in 1690, by the same patron, to the rectory of Sheldon, which last preferment he held until three months before his death, when his advanced age and infirmities induced him to resign. He took his M.A. degree on the 12th of December, 1693. Whilst at Sheldon he produced the first volume of his 'Course of Lectures on the Church Catechism,' folio, Oxford, 1696. The publication of these lectures, and the reputation he thereby acquired, recommended him to Dr. Compton, Bishop of London, as a proper person to be entrusted, as Commissary of Maryland, with the modelling and establishment of the church in that colony. Mr. Bray, yielding to the attractions of an arduous field of usefulness, postponed the fulfilment of a natural wish to complete the publication of his catechetical lectures, and threw all his energies into the duties of the office with which he charged himself, as a useful preliminary to which he proceeded to his degrees of B.D. and D.D. together by accumulation, December 17th, 1696. In conformity with his idea of forming

libraries, and of giving directions to missionaries for the prosecution of their theological studies, he published 'Bibliotheca Parochialis; or, a Scheme of such theological Heads, as are more peculiarly requisite to be well studied by every pastor of a parish. With a Catalogue of Books, which may be profitably read on each of those points,' part i. 4to, London, 1697; second edition, 8vo, London, 1707. He published also a sermon entitled 'Apostolic Charity, its Nature and Excellency considered, in a Discourse upon Daniel xii. 3; preached at St. Paul's, December 19th, 1697, at the Ordination of some Protestant Missionaries to be sent to the Plantations. To which is prefixed, A General View of the English Colonies in America, in order to show what provision is wanting for the Propagation of Christianity in those parts; together with proposals for promoting the same, to induce such of the Clergy of this Kingdom as are persons of sobriety and abilities to accept of a Mission,' 4to, London, 1699. Other publications of Dr. Bray's, about the time of his delivery of this sermon, were his 'Short Discourse on the Doctrine of our Baptismal Covenant,' 8vo, London, 1697; and 'An Essay towards promoting all necessary useful Knowledge, both divine and human,' 4to, London, 1697. After the acceptance of office as Commissary of Maryland, Dr. Bray waited for some time in the expectation of procuring a public fund for the propagation of the Gospel in foreign parts; failing of which he succeeded in forming a voluntary society, "both to carry on the service already begun for the Plantations, and to propagate Christian knowledge, at home and abroad." The first labours of this society were to send libraries abroad, to distribute books to soldiers and sailors, and to further the cause of education. Dr. Bray was also instrumental in founding lending libraries for the parochial clergy, in the various rural deaneries throughout the kingdom. About this time he refused two offers of preferment—as sub-almoner, and as incumbent of the donative of Aldgate, in the city, feeling reluctant to accept any office that was inconsistent with his going to Maryland, as soon as circumstances should render his visit expedient. The time at length came; and having already provided Maryland and many other colonies with a competent number of ministers, and furnished them with good libraries, he set sail from the Downs on the 20th of December, 1699, and, after a tedious and dangerous voyage, arrived in Maryland on the 12th of March, 1700. Before leaving this country he commenced his plan of instituting clerical libraries at our sea-ports, by establishing or reviving sea-port libraries for the use of missionaries, sea-chaplains, and others, at Gravesend, Deal, and Plymouth.

Arrived in Maryland, he addressed himself to the question of the settlement and maintenance of the parochial clergy, and preached sermons in various parts, calculated to incline the country to the establishment of the church and clergy; which, indeed, was voted by the colonial Assembly. Dr. Bray opened his first general visitation as commissary on the 22nd of May, 1700, at Annapolis: at the close of which it was judged expedient that he should proceed to England in order to procure the sanction of the Home Government for the Acts passed by the provincial Assembly in favour of an ecclesiastical establishment, as against "the expected opposition of Quakers and Papists." This opposition was not without effect, although the final action of the Home Government was in favour of the establishment and maintenance of the church in Maryland. Dr. Bray's literary activity about this time was represented by the 'Acts of his Visitation held at Annapolis, in Maryland, May 23rd, 24th, and 25th, anno 1700,' folio, London, 1700; 'Memorial of the Present State of Religion in North America,' folio, London, 1700; and 'Several Circular Letters to the Clergy of Maryland, subsequent to their late Visitation,' folio, London, 1701. On the 9th of June, 1701, Dr. Bray had the satisfaction, in answer to a petition presented in the preceding month to King William III., of laying before the members of his voluntary propagation society the royal letters patent by which they were incorporated as "The Society for the Propagation of the Gospel in Foreign Parts." The honour of the foundation of this useful and venerable society belongs, therefore, to Dr. Bray, whose agitation for the kindred object of supplying the literary wants of the parochial clergy received legislative sanction in an Act passed in the 7th year of Queen Anne "for the better preservation of parochial libraries in the part of Great Britain called England." Dr. Bray had the reputation of being well skilled in the Romish controversy; and in 1712 he published, in folio, his 'Martyrology, or Papal Usurpation,' a compilation of scarce treatises of various celebrated authors. He was prevented in his design of publishing a second volume, and at his death left his collection of 'Martyrological

Memoirs,' both printed and in manuscript, to Sion College. He devoted much time and property to the furtherance of a scheme for the evangelisation of the negroes, and assembled in his church of St. Botolph without Aldgate—the presentation to which he had accepted in 1706—the young divines who had offered themselves as missionaries, in order to give them advice and to put them through a special catechetical exercise. His own opinion was, that in missionary effort, civilisation should precede conversion. In 1726 Dr. Bray published his 'Directorium Missionarium,' and his 'Primordia Bibliothecaria,' in which are several schemes of parochial libraries, and some other tracts of a like kind. He also reprinted the 'Ecclesiastes' of Erasmus, a work on the pastoral office, which Dr. Bray valued very highly. In 1727 he began to busy himself for the secular and the spiritual advantage of persons confined in various prisons of the metropolis; but, feeling the infirmities of advancing age, was anxious to share the burden of his multifarious beneficence with a company of men of like mind with himself. These persons, who constituted a society by the name of the Associates of Dr. Bray, have given forth at intervals many Reports of their proceedings, of which the last that has come under our notice bears the date 1853, and is for the year 1851–52. Dr. Bray's universal philanthropy led him to take part in establishing the Society for Reformation of Manners, and the Society for the Relief of poor Proselytes. He also instituted several charity schools; and indeed most of the religious Societies in London in the 18th century owed grateful acknowledgments to his memory, and were in a large measure formed on the plans he projected. To his great objects he contributed the whole of his slender fortune, and closed a course of usefulness rarely equalled, on the 15th of February, 1730, in his 73rd year.

BRAYLEY, EDWARD WILLIAM, F.R.S. [E. C. vol. vi. col. 952]. This laborious investigator of physical phenomena, died of disease of the heart on the 1st of February, 1870. To the Biographical Division of the English Cyclopædia Mr. Brayley contributed the lives of several men of science; and to the Arts and Sciences Division the articles Meteors, Correlation of Physical Forces, Refrigeration of the Globe, Seismology, Waves and Tides, Winds, and others on cognate branches of physics. He also wrote the elaborate papers on the 'Physical Constitution and Functions of the Sun' in the Companion to the Almanac for the years 1864, 1865, and 1866, and that on 'the Periodical Meteors of November' in the volume for 1868.

BRÉGUET, ABRAHAM LOUIS, French horologist and philosophical instrument maker, was born at Neuchâtel, on the 10th of January, 1747. After the death of his father, in 1757, Bréguet's mother married a clockmaker, to whom the boy was soon afterwards apprenticed, but not much to his own satisfaction. He went to Paris in 1762, placed himself under a clockmaker at Versailles, and made a rapid advance at his trade, becoming widely known for his skill, and winning the good opinion and friendship of his employer. Devoting a portion of his time to the study of mathematics under the Abbé Marie, he soon commenced business on his own account, and then prosecuted an uninterrupted series of successful labours for the rest of his life. In 1780 he completed a so-called 'perpetual clock,' intended to wind itself up and keep perpetually going—an achievement now admitted to be impossible, but to which he applied mechanism more beautiful than had before been adopted for such attempts. He made watches to mark seconds, some of them so perfect that they did not require to be opened for cleaning or adjustment for eight years. It is related that the Duc d'Orléans on one occasion, when in London, showed one of Bréguet's watches to Arnold; the latter was so struck with admiration at its excellence, that he went to Paris to see Bréguet; the two eminent horologists became friends, and Bréguet consigned his son to Arnold for instruction. Driven into exile by the Revolution, Bréguet afterwards returned to Paris, and became the most noted of French horologists. He was appointed clockmaker to the Marine Department, member of the Bureau de Longitude, and member of the Academy of Sciences. Besides watches and clocks, he made exquisite instruments for navigation, astronomy, and the physical sciences. Repeating-watches, before his time, had openings left in the cases to render the sound audible, whereby dust speedily entered and disarranged the works; but he rendered the tone clear and sonorous within a perfectly close case. This led to an extensive and profitable manufacture, not only of repeating watches, but of musical snuff-boxes, &c. He made great improvements in the manufacture of chronometers and marine clocks; invented a new escapement; devised wholly new and beautiful tools for

watch-making; introduced a highly curious sympathetic pendulum for regulating watches; invented a 'comptoir militaire' for regulating the march or step of troops; contrived a 'comptoir astronomique,' which, introduced in the tube of a telescope, rendered one-hundredth part of a second of time appreciable and measurable; made double-cased ladies' watches only one-eighth of an inch in thickness, with the time-indications *tangible* on the edge as well as *visible* on the surface; invented metallic thermometers more sensitive to changes of temperature than the instruments before in use; constructed the mechanism for Chappe's government semaphores (now superseded by the electric telegraph); and greatly improved the jewellery of watches, by extending the use of rubies in pivot-holes. Bréguet, who was an estimable and much-respected man, died on the 17th of September, 1823.

BREHM, CHRISTIAN LUDWIG, German ornithologist, was born Jan. 24, 1787, at Schönaue near Gotha. He studied theology at Jena, and in 1813 became the minister of the small village of Renthendorf on the river Orla in Saxe-Weimar, where he remained till his death, which happened on the 23rd of June, 1864. The leisure time that was spared to him from his pastoral duties was devoted to the study of natural history, but more especially of the birds of Europe, and to the production of numerous books and papers. A full list of the latter is given in the Royal Society's 'Catalogue of Scientific Papers,' comprising 125 items. His principal separate works are—'Die Lehrbuch der naturgeschichte aller europäischen Vögel,' 1823, 1824; 'Handbuch der naturgeschichte aller Vögel Deutschlands, etc.' 1831, in which upwards of 900 species are noticed; 'Beiträge zur Vögelkunde in vollständigen Beschreibungen seltener . . . deutschen Vögel,' 1820–1822, which is perhaps his best work, containing a large amount of information as to the plumage of birds at different seasons and ages, derived from personal observation; it is in three volumes, and he had the assistance of W. Schelling, whose name, however, appears in the third volume only. Another group of his works is devoted to the description, treatment, and capture of domesticated and semi-domesticated birds. Amongst them may be cited the 'Handbuch für die Liebhaber der Stuben-Haus- und aller der Zahnung-werthen Vögel,' 1832, which is mainly based upon the experience of Count Gourcy Droitaumont, who kept 80 species of cage and domestic birds in the course of 18 years; 'Die Kunst, Vögel als Balge zu bereiten, aufzustopfen, aufzustellen, aufzubewahren, nebst einer kurzen Anleitung Schmetterlinge und Käfer zu fangen, zu präparieren,' 1842, a guide to bird preserving; 'Der vollständige Vögel-fang,' 1855, an amplified and remodelled form of a treatise he wrote in 1836: it is a synopsis of all the European birds, with indications as to how they may be caught—there are also notes on some new species obtained by his sons from Africa, and on the bird-catching contrivances of the Africans; and 'Die Wartung, Pflege, und Fortpflanzung der Canarien-vögel, Sprosser, Nachtigallen,' etc., 1855, which is a guide to the treatment of cage birds, and the modern substitute for Bechstein's well-known work. He was the editor of 'Ornis,' a periodical for facts connected with birds, but it ceased after a few parts only had been published. He also edited a 'Monographie der Papageien,' 1842–1855, which was discontinued after 34 species had been treated: if it had been carried to completion the work would have been bulky and costly, but not superior to Levaillant's monograph, with its continuations; the species noticed have 60 pages of press and 75 large coloured plates devoted to them; while in 1855 nearly 300 species were known. In conjunction with some other naturalists, he formed one of the best collections of German birds yet brought together. His brother, Alfred Edmund Brehm, has written largely on natural history, and many of his works are of a popular character. His sons, Oscar and Reinhold, have also published a few ornithological memoirs.

* BREITHAUP, JOHANN AUGUST FRIEDRICH, a German mineralogist, was born May 16, 1791, at Probstzella, near Saalfeld. His education was completed at Freiberg, in the mining academy of which town he became an assistant professor and inspector of precious stones, and in 1827 professor of oryctognosy in the same institution. He has written many papers for scientific periodicals, and several separate works. Amongst the latter the most important are his 'Vollständigen Handbuch der Mineralogie,' 1836–1847, 3 vols.; and "Vollständige Charakteristik der Mineral Systems," which reached a third edition in 1832. He was the first describer of many species of minerals, and he has in various other ways contributed to the advancement of mineralogical science.

BREITKOPF, JOHANN GOTTLOB IMMANUEL, an eminent printer and type-founder, and writer on these arts, was born at Leipzig, November 23, 1719. He was the son of Bernhard Christian Breitkopf, who had established a large printing office in that city. After studying languages, history, and philosophy, the young Johann became acquainted with Albert Dürer's attempts to improve the shapes of printing-type, and this led him to pursue a similar course with great ardour. He made many improvements, both in the forms of the letters and in the composition of the alloy. In 1755 he re-introduced, with many improvements in detail, the use of moveable metal types for music, in which the notes were cast in separate types, with ledger-lines attached to them. About 1720 those early forms of type had been superseded by engraved plates, printed at a copper-plate press; and afterwards by a kind of stereotype plate of notes cast in sand. Breitkopf revived the old plan, but with the ledger-lines cast by themselves in separate types. Reinhard afterwards devised a mode of combining Breitkopf's cast types with engraved plates of the ledger-lines. It may be added that both systems (plates printed at the copper-plate press, and types printed at the common press) are adopted at the present day. Breitkopf next made an attempt to introduce moveable types for printing geographical maps, and others for printing in the Chinese language; but these were not commercially successful. In 1774 appeared his *Essay on the History of the Invention of Printing*, 'Über die Geschichte der Erfindung der Buchdruckerkunst,' Leipzig. Several years later he wrote a work on the origin of playing cards, the introduction of linen-rag paper, and the adoption of wood engraving, 'Versuch den Ursprung der Spielkarten, die Einführung des Leinwandpapiers, und den Anfang der Holzschnidekunst in Europa zu erforschen,' Leipzig, 4to, 1784—1801. The first part of this work was published during the lifetime of Breitkopf; but the second part was posthumous. He commenced, but did not finish, a larger 'Geschichte der Buchdruckerkunst.' He established and carried on, in 1780—82, a 'Magazin für Kunst-und-Buchhandel.' Two other works of his were 'Exemplum typographiæ Sinicæ figuris characterum et typis mobilibus compositum,' Leipzig, 1789, 4to; and 'Über die Bibliographie und Bibliophilie,' 1793. Breitkopf, who became the most noted type-founder in Germany, and who was much respected both in his trade and among literary men, died on the 28th of January, 1794.

BREMER, FREDERIKA [E. C. vol. i. col. 914]. From the period at which the above brief biography had arrived, Miss Bremer continued actively engaged in the promotion of the various benevolent schemes on which she had fixed her thoughts, especially on those which had for their object the improvement of domestic life, and the social, moral, and intellectual elevation of her sex. She continued to write, and produced in succession 'Herttha,' in 1856, in which she made the story subservient to her philanthropic purpose; and 'Fathers and Daughters,' 1859, in which a similar intention was visible. She also travelled, and mostly alone, in Switzerland, Greece, and Palestine, and gave the results of her observations to the public in 'Two Years in Switzerland,' 1860; 'Travels in the Holy Land,' 1862; and 'Greece and the Greeks,' 1863, all of which have been translated into English. At length, wearied in body and depressed in spirit, she resolved to retire in the summer of 1865 to the quiet of Arta, and there seemed to gain strength and cheerfulness, when she took cold in going to church on Christmas Day, and died on the 31st of December, 1865, having shortly before completed her 64th year. Her 'Life, Letters, and Posthumous Works,' including a brief autobiography and some short poems, mostly pathetic in tone, have been published by her sister, Charlotte Bremer, and translated into English (8vo, 1868), the prose by Frederick Milow, the verse by Emily Nonnen.

BRENTANO, CLEMENT, a German author of considerable versatility, was born at Frankfurt-on-the-Main in 1777, and was the brother of the celebrated Elizabeth (Bettina) von Arnim, the friend of Goethe. After completing his studies at Jena he resided successively at that city, at Frankfurt, Heidelberg, Vienna, and Berlin. Later in life he embraced catholicism, and withdrew for purposes of seclusion to the abbey of Dülmen, in Münster. He died on the 28th of June, 1842. He is the author of romances, novels, satires, comedies, dramas, and miscellaneous poems, in the course of which he manifested talents and characteristics of such an order as to claim for him a prominent place amongst the writers of the romantic school. His principal works are satires and poetical diversions, 'Satiren und poetische Spiele,' 8vo, Leipzig, 1800, published under the pseudonym of Maria, a name which he also adopted in connec-

tion with his Godwi, &c., 'Godwi, oder das Steinerne Bild der Mutter,' 8vo, Bremen, 1801—2; an opera called the Jolly Musicians, 'Die Lustigen Musikanten,' 1803; 'Ponce de Leon,' a comedy, Göttingen, 1804; a humorous drama in two parts and in verse, entitled 'Viktoria und ihre Geschwister, mit fliegenden Fahnen und brennender Lunte,' 8vo, Berlin, 1817; 'Geschichte vom braven Kaspar und dem schönen Annerl,' which was translated into English by T. W. Appell, with the title of 'Honor; or the Story of the brave Caspar and the fair Annerl.' With an Introduction and a biographical notice of the Author, 16mo, London, 1847. The works of Clement Brentano were edited by Christian Brentano, with the title of 'Gesammelte Schriften,' 8vo, Frankfurt, 1852, &c.; and a volume of poems appeared two years later, 'Gedichte. In neuer Auswahl,' 16mo, Frankfurt, 1854. Portions of the correspondence of Clement Brentano with Elizabeth von Arnim were likewise published in 8vo, Charlottenburg, 1844.

BRENTZ, JOHANN, a German reformer, whose name varies as Brentius, Brentz, and Brentzen, was born at Weil, in Suabia, on the 30th of June, or the 24th of July, 1499. He was educated at the school and university of Heidelberg, and took his doctor's degree in 1518. Being admitted to orders a short time after, he became popular as a preacher, and in his parish of Hall, in Suabia, and in various other places, endeavoured to further the progress of the reformation. In 1530 he assisted at the peace conferences at Augsburg, and marrying soon after, was invited by Ulric, Duke of Wirtemberg, to undertake the joint direction of the University of Tübingen. He made himself obnoxious to the imperial displeasure by his refusal to subscribe the famous *Interim*; and when the Spanish troops were at Hall, in 1547, he was compelled to seek safety first in concealment and afterwards in flight. After many wanderings he found an asylum, in 1552, at Stuttgart, in the castle of Duke Christopher, the son and successor of Ulric, by whom he was charged to draw up the Confession of Wirtemberg, for presentation at the Council of Trent; and shortly after was appointed to the vacant pastorate of Stuttgart, which he held for the remainder of his life. He was one of the principal actors in the ecclesiastical events of his time. In 1557 he attended the conferences at Worms, and died at Stuttgart on the 11th of September, 1570. His opinions coincided in general with those of Luther; but on the subject of the Eucharist he held the doctrine of the absolute omnipresence, *ubiquitas absoluta*, of the body of Christ, on which account he and his followers were called Ubiquitarians. The works of Brenz, 'Brentii Opera,' most of which had been published separately during his life, and several of which had been translated into English, were published collectively in 8 vols. folio, Tübingen, 1576—1590, and Amsterdam, 1666. Recent publications conversant about Brenz are:—Johann Brenz. From printed and unprinted sources, 'Johann Brenz. Nach gedruckten und ungedruckten Quellen,' 2 vols. 8vo, Hamburg, 1840—42; Johann Brenz: his Life and Select Writings, 'Leben und ausgewählte Schriften,' Elberfeld, 1862; and Anecdotes of Brenz, &c., 'Anecdota Brentiana. Ungedruckte Briefe und Bedenken von J. Brenz,' 8vo, Tübingen, 1868.

BRÉQUIGNY, LOUIS-GEORGES OUDARD-FEUDRIX DE, a French historian and antiquary, was born at Granville, in 1716. His first literary production was an interesting memoir which he prepared for the Académie des Inscriptions, upon the 'Établissement de l'Empire et de la Religion de Mahomet,' which was some time after followed by other contributions to Arab history and chronology, and by dissertations which found a place in the 'Mémoires de l'Académie des Inscriptions,' to the membership of which he was admitted in 1759, whilst in 1772 he became a member of the Académie Française. At the peace of 1763, Bréquigny was commissioned by his Government to proceed to England for the purpose of investigating such records in the Tower of London and in other places as were conversant about the history and institutions of France. He spent about three years in this labour, the result of which was seen in his publication, jointly with F. J. G. de La Porte du Theil, of 'Diplomata, Chartæ, Epistolæ, et alia Monumenta ad Res Francicas spectantia, ex diversis regis archivis eruta,' 3 vols. folio, Paris, 1791, &c. Between the years 1769 and 1783, Bréquigny published three volumes of a work which he had prepared, jointly with G. J. Mouchet, and which he designed as a supplement to the Bibliothèque of P. Lelong, entitled 'Tables chronologiques des Diplomes, Chartres, Titres, et Actes imprimés, concernant l'Histoire de France,' folio, Paris. He was next commissioned, jointly with M. Mouchet, to continue the 'Mémoires concernant l'Histoire, les Sciences, les Arts, les Mœurs et les Usages des

Chinois,' 15 vols. 4to, Paris, 1776—91, which had been commenced by the missionaries to Pekin, MM. Amyot, Bourgeois, &c. Bréquigny, who died on the 3rd of July, 1795, is the author of several works of minor interest and importance, amongst which may be mentioned his 'Histoire des Révolutions de Gênes,' 3 vols. 12mo, 1750; 'Vies des anciens Orateurs grecs,' &c., 2 vols. 12mo, 1752, which proceeded no further, and embraced only the lives of Isocrates and Dio Chrysostom; 'Strabonis Rerum Geographicarum, Libri XVII.,' of which only one volume appeared, 4to, Paris, 1763; and 'Catalogus Manuscriptorum Codicum Collegii Claromontani,' 8vo, 1768.

BREWSTER, SIR DAVID [E. C. vol. i. col. 915]. In the obituary notice contributed by Dr. J. H. Gladstone to the Proceedings of the Royal Society, it is stated that Sir David made a telescope when he was only ten years of age, entered on his university course at twelve, "devoted one of the longest of lives to discoveries in optics, and at last, laden with academic and scientific honours, sank peacefully to rest on the 10th of February, 1868."

The notice in the E. C. gives a list of these honours, and also the titles of the separate works issued by Sir David; but few persons were aware, until after his death, how largely he contributed to scientific and periodical literature. The 'Catalogue of Scientific Papers' now in course of publication by the Royal Society records the titles of 299 papers by him, besides 5 in which his name is conjoined with the names of other inquirers. He has 30 papers in the Phil. Trans. He contributed 28 articles to the 'Edinburgh Review,' 5 to the 'Quarterly,' 2 each to 'Meliora' and the 'Foreign Review,' and no less than 76 to the first thirty-nine parts of the 'North British Review.' The subjects of this vast collection of papers are not always strictly scientific, for the author aspired to literary as well as scientific fame. Indeed, it has been remarked that Sir David felt a desire to write a review of every book that he read.

It may reasonably be supposed that so prolific a writer was neither very profound nor original. Dr. Gladstone's estimate of his scientific character is just. "It was as a laborious observer and ingenious experimenter that he excelled; he cared rather to collect a multitude of facts than to deduce from them general laws. Wonderful proofs of perseverance are his Tables of Refractive Indices, of dispersive powers, and of the polarizing angles of various reflecting bodies; and he seems to have submitted to optical examination every mineral that came in his way."

To this estimate we must add some further remarks. Sir David's name has been connected with all the great optical discoveries of the present century, and as he has often been the historian of his own fame, his share in those discoveries has not been underrated. During many years Sir David had a kind of monopoly in the scientific optics of this country. He contributed most of the optics to the 'Edinburgh Cyclopædia,' of which he was editor during the twenty-two years occupied in its publication; he performed the same service for the new editions of the 'Encyclopædia Britannica,' for 'Lardner's Cyclopædia,' and for the 'Library of Useful Knowledge,' to say nothing of the large number of essays and reviews on optical subjects contributed to various periodicals, to three of which, 'The Journal of Science,' 'The Edinburgh Journal of Science,' and the 'Philosophical Magazine,' he was wholly or partly editor. When, however, Whewell published his 'History of the Inductive Sciences,' the great optical discoveries of this century were given not to Brewster alone, but to Malus, Fresnel, Biot, and others. In reviewing Whewell's work in the 'Edinburgh,' Brewster entered some energetic protests against what he termed this "Lethæan method of writing history;" and in his communications to the Royal Society he accused Biot of plagiarism. Biot was a contributor to the 'Edinburgh Cyclopædia,' and Brewster, in writing to Biot on the subject of his articles, was, he says, in the habit of jotting down in a postscript any scientific results he had obtained in the course of his current researches. The hints thus given were, it is charged, improved upon by Biot, and published by him as original discoveries. The communications to the Royal Society became so controversial, that, instead of marking the progress of science, they referred too much to personal disputes; and the Society rejecting one of these papers, the author withdrew in 1841, and did not again communicate with the Royal Society except on one occasion, and that was in company with Dr. Gladstone on the lines of the solar spectrum.

It is not intended by these remarks to undervalue the great and important services rendered by Sir David to science during nearly three-quarters of a century. It is difficult to estimate a man's work with rigid justice, and if we incline to the opinion

that Sir David as a scientific optician has been somewhat over-estimated, his great influence on the science, education, and intellectual progress of the century will not soon pass away. In 1821 he founded the Scottish Society of Arts; from 1838 to 1859 he was principal of the United Colleges of St. Salvador and St. Leonards at the University of St. Andrews; and during the last eight years of his life he was Principal of the University of Edinburgh.

Sir David was twice married: first to the daughter of James Macpherson, M.P., of Belleville, the so-called translator of 'Ossian;' the second time, late in life, to Jane Kirk, second daughter of the late Thomas Purnell, Esq., of Scarborough. To this lady, upon the death of Sir David, a pension of 200*l.* per annum was granted from the civil list fund, "in recognition of her late husband's eminent services to science." Sir David Brewster had himself for some years enjoyed a pension of 300*l.* per annum.

* BRIGHT, SIR CHARLES TILSTON, civil and telegraphic engineer, was born in 1832. After professional study he became engineer to the English and Irish Magnetic Telegraph Company, and was employed in laying down the first cables which connected Great Britain with Ireland. In 1856 he was one of the original projectors of the Atlantic Telegraph, and was appointed electrical engineer to the company soon afterwards formed. The temporary success of the cable of 1858 led to the conferring of the honour of knighthood on Mr. Bright. Since that time Sir Charles Bright has been actively engaged in the construction or laying of many electric cables in various seas. When the Red Sea Cable failed in 1859—60, Sir Charles and Mr. Latimer Clark were called in as advisers concerning the best mode of laying another cable in that reef-beset sea. These two engineers, in 1864, superintended for the government of India the construction and laying of the Persian Gulf cable, from Bushire to the Indian Ocean, and thence to Kurrachee, at the westernmost mouth of the Indus. Sir C. Bright has since been engaged in laying other important telegraphic lines, and is at present (June, 1870) directing the submersion of the West Indian and South American (Panama) telegraph cable. Most submarine cables have the gutta percha sheathing laid on in three or four coatings, alternating with layers of a glutinous composition; one such composition is Bright and Clark's Compound, so named from the inventors. Among other professional papers, Sir Charles Bright has written 'On the Measurement of Electrical Insulation and Resistance,' published in the 'Electrician' in 1862; and 'Report of the Committee on Standards of Electrical Resistance,' published in the 'Proceedings of the British Association for the Advancement of Science' in 1863. He was member of parliament for Greenwich from 1865 to 1868.

* BRIGHT, RT. HON. JOHN [E. C. vol. i. col. 921]. Mr. Bright's persistent opposition to the policy which led to the war with Russia, and to the continuance of that war, lost him his seat for Manchester at the general election in April, 1857; but he was returned to the House of Commons as member for Birmingham in the following August, and he has sat for Birmingham ever since. During the life of Mr. Cobden, Mr. Bright was his closest and most steadfast associate and supporter, alike in parliament and on the platform, and perhaps his independent power was hardly adequately recognised by the general public. But his range of view was wider and his grasp of thought more comprehensive and statesmanlike than Mr. Cobden's, and year by year he was steadily making his way in the House, and beyond any other member he came to be sustained by the adherence of all grades of the more advanced Liberals throughout the country. The Earl of Derby hardly overrated his position when in the Electoral Reform debates he spoke of Mr. Bright as "the real leader of the Opposition." Within the House he never assumed that position, but his will governed the movement of the Opposition, and out of the House it was supreme. His early speeches, as was almost inevitable from the circumstances of his election, were very much directed to the questions of free-trade, finance, and peace; but as time wore on, their range widened so as to include nearly the entire field of national policy. Of electoral reform, the redistribution of seats, and the ballot, Mr. Bright was one of the most constant and strenuous advocates, and the Reform Bill by which Lord Derby "dished the Whigs," in 1867, was in the main adopted from Mr. Bright, though he would have accepted probably a less sweeping measure. Administrative reform; financial reform; the question of the distribution of land and its occupancy, have also been among the great matters of home politics on which he has dwelt often and earnestly in his speeches in Parliament and

in his public addresses; and in connection with the land question and that of the condition of the agricultural labourer, he has given a prominent place to the character and effects of game preservation and the game laws. The abolition of church rates, the admission of Jews to parliament, and generally all those measures which had for their avowed object the removal of all liabilities and disabilities on account of creed or religious distinctions, were earnestly supported by him, whilst in reference to education his reiterated demand has been that the State should not interfere with voluntary exertions, unless prepared "to offer this great boon to all classes of the people without favour or distinction." Colonial questions generally, but particularly matters connected with Canada and its relations with the mother country and the United States, have likewise occupied much of his attention; and some of his most elaborate and highly wrought disquisitions have related to our Indian empire and Indian policy. The other great matter which he seems to have most deeply considered, and one to which he has returned again and again in the House of Commons, is that of the condition of Ireland. He had often addressed the House on the subject and put forth propositions conducive, as he thought, to its pacification, and he was consequently prepared to give his warmest support to Mr. Gladstone when, in the session of 1868, he brought forward his resolution for dis-establishing the Irish Church. When Mr. Gladstone was called upon, December 4, 1868, to form an administration, it was generally felt that Mr. Bright's presence in it was essential to its stability. Mr. Gladstone fully recognised the necessity, and the proposition met with the cordial acquiescence of the Queen. Mr. Bright was offered the position of Secretary of State for India. But his health had suffered grievously from the exertions of previous years. For two years he had been "cut off from public labours," the duties of the Indian department if properly performed he knew to be exceedingly heavy, and he felt, as he stated, that he "was not justified in accepting it unless there were some great probability of some useful result which could not be accomplished under any other chief of that office." He felt, moreover, that it "would be unseemly in him, with the views which he had held from his youth upwards, to connect himself distinctly with the conduct of the military departments of the great Indian government." But "when the private and personal, came to be weighed against the apparent public reasons, then the private and personal yielded to the public," and whilst he "felt it his duty to decline the particular proposition," he added that "if he were to accept any seat in the Government he would prefer to take the office of President of the Board of Trade." This was of course agreed to; he became a member of the Cabinet, was sworn in of the Privy Council; and was able to render powerful service in the passing of the Irish Church Bill—in the discussions on which he gained the admiration of opponents as well as friends by the moderation and generous spirit, as well as earnestness and evident sincerity of his advocacy. Towards the end of the session his health again gave way, and he has since been entirely precluded from official and public labour. In these circumstances Mr. Bright wished to resign his post, but was induced to retain it in the hope that a season of rest may restore him to activity.

Mr. Bright's 'Speeches on Questions of Public Policy,' revised by himself, were published under the editorship of Prof. J. E. Thorold Rogers, in 2 vols. 8vo, 1868, and are, apart altogether from their political opinions, remarkable as compositions for clear and compact argument and purity and force of style. Conjointly with Prof. Rogers Mr. Bright undertook to edit 'Speeches on Questions of Public Policy,' by Richard Cobden, 2 vols. 8vo, 1870, but after he had "revised the speeches in the first volume . . . and given the same assistance to a few sheets in the second, he was unhappily seized with illness, and was unable to give his further supervision to the work." (Preface, vol. i. p. xv.)

BRIGHT, RICHARD, M.D., was born at Bristol in 1789; entered as a student at Edinburgh University in 1808, and in 1812 graduated in medicine. He then resided for some time at Cambridge; visited the Continent, and after the battle of Waterloo, hurried to the assistance of the overtasked military staff in the hope of at once alleviating suffering and being able to study the effects of the surgical treatment of wounds. Returning to England, he commenced practice as a physician in London; was in 1820 elected assistant physician to Guy's Hospital; acquired marked distinction as a teacher in the medical school there, and rapidly secured the confidence of the profession. Thenceforward his career was that of a successful

London physician; he came to be regarded as the leading authority in renal diseases, dropsy and the like; was appointed physician extraordinary to the Queen; was elected Fellow of the Royal Society in 1821, and later member of various learned societies on the Continent as well as in England. He died December 16, 1858. Dr. Bright's claim to permanent remembrance is derived from his 'Original Researches into the Pathology of Diseases of the Kidney,' one of the most valuable contributions to medical science of the age. A formidable series of these diseases, characterised by uniformity of structural change and the presence of albumen in the urine, and hence designated Albuminuria, or granular disease of the kidney, was first distinctly pointed out by him and its diagnosis and treatment indicated; and his memory is somewhat dubiously honoured by the appellation "Bright's Disease," now universally given to it. [E. C., ARTS AND SCIENCES DIV. vol. v. col. 53.]

BRILLAT-SAVARIN, ANTHELME, the Corypheus of gourmandism, was born at Bellay, on the 1st of April, 1755. He filled various secondary and departmental offices prior to 1793, when he quitted France on account of the revolutionary excesses, and travelled first in Switzerland and afterwards in America. In 1796 he returned to his native place, re-entered the court of cassation, obtained promotion, and thenceforth, laying aside all concern for politics, divided his days between the discharge of his magisterial functions, the gratifications of his tastes, and the preparation of his book—the true labour of his life. The 'Physiologie du Goût' was published in two small 8vo volumes, in 1825; and the author, his work accomplished, died on the 2nd of the following February. Brillat-Savarin was eminently the author of one book. He wrote, indeed, 'Vues et Projets d'Economie Politique,' 8vo, Paris, 1802; an 'Essai historique et critique sur le Duel,' 8vo, 1819; a dissertation, 'Sur l'Archéologie du département de l'Ain,' 1820, and one or two other trifles; but his one work remains the 'Physiologie du Goût,' a work that has rendered his name grateful to every cultivated lover of good living, and immortal in France. The book itself deserves its celebrity. It is charmingly written, accomplishes all that it professes, exactly meets the tastes and satisfies the capabilities of the wide circle to which it is addressed: is lively, genial, racy, and just sufficiently seasoned with well-told and timely anecdotes.

BRINKLEY, JOHN, Bishop of Cloyne, a distinguished mathematician and astronomer, was born at Woodbridge, in Suffolk, in 1763. After receiving a preparatory education at the grammar school of his native town, he entered Caius College, Cambridge, where, in 1788, he became senior wrangler and senior Smith's prizeman. He received the degree of M.A. in 1791. In 1792 he was appointed Andrews Professor of Astronomy at Trinity College, Dublin, and was placed at the head of a well-appointed observatory at Dunsink, near Dublin. In this office, which he held for twenty-four years, he made numerous astronomical observations, and meanwhile published many mathematical and astronomical papers. In 1806 the degree of D.D. was conferred upon him. Calculations which he made concerning the parallax of the fixed stars became the subject of controversy between him and Mr. Pond, the Astronomer Royal, in 1813–14, and conducted towards the completion of more rigorous determinations by later astronomers. In 1813 appeared his 'Elements of Astronomy,' 8vo, Dublin; a useful outline of the science, consisting of a summary of the lectures given by him at Trinity College. In 1826 Dr. Brinkley was appointed Bishop of Cloyne, not for any ecclesiastical or theological services which he had rendered, but on account of the high estimation in which he was held. This appointment was a loss to science; the bishop resigned his professorship, ceased to make observations and to write papers, and attended wholly to the duties of his diocese. He died on the 14th of September, 1835. His funeral was attended by the principal members of Dublin University and of the Royal Irish Academy. Bishop Brinkley was a fellow of many learned societies in the United Kingdom, and a corresponding member of the Institute of France. His chief mathematical papers, published in the 'Memoirs of the Royal Irish Academy,' and in the 'Philosophical Transactions,' are the following:—'General Demonstration of the Theorem of Cotes, deduced simply from the Properties of the Circle,' 1797; 'General Demonstration of the Theorems for the Sines and Cosines of Multiple Circular Arcs,' 1797; 'On the Expression of Variable Quantities,' 1798; 'On Orbital Revolutions,' 1801; 'On Spherical Superficies,' 1801; 'On Kepler's Problem,' 1802; 'On Oblique Cylindrical Superficies,' 1802; 'On Newton's Solution of the Relation between Resistance and Gravity,' 1807; 'On Finite

Differences,' 1807; 'On Arbitrary Constants,' 1817. His astronomical papers were more numerous; they were published, between 1808 and 1828, in the 'Memoirs of the Royal Irish Academy,' the 'Philosophical Transactions,' the 'Quarterly Journal of Science,' the 'Memoirs of the Astronomical Society,' and the 'Astron. Nachrichten.' They relate to the Apparent Distance of the Sun and Moon; the Parallax of α Lyrae; the North Polar Distances of 47 Fixed Stars; the Parallax of Fixed Stars; Astronomical Refractions; the Mean Motion of the Lunar Perigee; the Elements of Cometary Orbits; the Obliquity of the Ecliptic; the Aberration of Light; Lunar Nutation; the Modes of Finding Latitudes; Solar Nutation; the Paramatta Observations; Kater's Floating Collimator; Luni-Solar Precession; Culminations observed at Dublin; and the Precession of the Equinoxes.

BRINVILLIERS, MARIE MARGUERITE, MARQUISE DE, who obtained infamy as a poisoner in the time of Louis XIV., was the daughter of Dreux d'Aubrai, a lieutenant civil, or judge having a certain limited jurisdiction, at whose hands she received a careful education. In 1651, whilst still very young, she became the wife of the Marquis de Brinvilliers, with whom she resided at her father's house, in Paris. Her husband, who was colonel of the *Régiment de Normandie*, entertained at his house a young officer of cavalry of the *Régiment de Tracy*, named Gaudin de Sainte-Croix, a native of Montauban, and the illegitimate member of an illustrious family. He was unprincipled enough to encourage the unlawful passion which the marchioness conceived for him; and her father, in consequence, procured in 1663 a *lettre de cachet* against Sainte-Croix, who underwent a year's incarceration in the Bastille. During his confinement he learned from a fellow-prisoner, an Italian named Exili, the art of preparing subtle poisons; a secret which, upon his enlargement, he communicated to his mistress, who determined to poison her father and the other members of her family. Having first wantonly essayed her art upon the patients of the Hôtel-Dieu, she proceeded, with the aid of a servant named Jean Amelin, or La Chaussée, to take the lives of her father, her two brothers, and her sister. This feat she accomplished gradually between the years 1666 and 1670. More than once she poisoned her husband; but Sainte-Croix, whose prudence shrank from the obligation of marrying the terrible widow, each time preserved the life of the Marquis by the administration of an antidote. Sainte-Croix died suddenly in July, 1672, in the act, it is said, of compounding a subtle poison, against the effects of which he was left unprotected by the accidental fracture of a glass mask which he wore as a defence against the fumes of his deadly drugs. As no relative came forward to claim his property, it was taken possession of by the public authorities, who, instead of complying with the written instructions of Sainte-Croix, dated May 25th, 1672, that a particular casket should be delivered to Madame de Brinvilliers, examined it, together with above thirty letters which he had received from her. There was also found a promise on her part to pay Sainte-Croix a sum of 30,000 livres, bearing the date of June 20th, 1670, eight days after the poisoning of the "lieutenant civil," her father. The casket proved to be full of packets of various poisons, to each of which was affixed a label indicating the peculiar effects it was calculated to produce. The Marchioness, fatally compromised by these and other circumstances, sought safety in flight, repairing first to England, then to Germany, and finally to Liège, where she was apprehended. Being taken to Paris, she denied her guilt; but after her condemnation made a confession, in which, and in a kind of autobiography, she charged herself with more and greater horrors than had seemed possible to rumour or suspicion. She was executed at seven o'clock on the evening of the 16th of July, 1676, being first beheaded and afterwards burnt. As her application and use of poison, which went by the name of *poudre de succession*, seemed to be growing prevalent, Louis XIV. instituted a special court for the investigation and punishment of this species of crime.

The exploits of Madame de Brinvilliers have attracted a literature of their own; as, for instance, the 'Mémoire du procez extraordinaire contre la Dame de Brinvilliers, prisonnière en la Conciergerie du Palais, accusée,' &c., 4to, Paris, 1676, an English translation of which was published in 4to, London, 1676; the 'Factum pour Dame de Brinvilliers: avec le mémoire du procez extraordinaire contre la dite Dame de B.; et l'arrest de la cour de Parlement, contre la dite,' &c., by M. Nivelles, which finds a place in the 'Archives curieuses de l'Histoire de France, depuis Louis XI. jusqu'à Louis XVIII.' &c.; a manuscript of 150 pages folio, by Edme Pirot, entitled

'Les Vingt-quatre dernières heures de la Marquise de Brinvilliers, ou, la Relation de sa Mort;' and the story, by the late Albert Smith, which he describes as a "Romance of Old Paris," and entitles 'The Marchioness of Brinvilliers, the Poisoner of the Seventeenth Century.'

* BRISTOW, HENRY WILLIAM, geologist and mineralogist, was born in 1817, and educated at King's College, London, of which institution he was appointed a Fellow in 1863. In 1842 he joined the Geological Survey of Great Britain as assistant geologist, and was subsequently raised to the rank of geologist. He became an F.G.S. in 1843, and an F.R.S. in 1862. In connection with the geological survey he has had a hand in the preparation of various maps, sections, and memoirs; amongst the latter the most important is 'The Geology of the Isle of Wight,' &c., 1862. He assisted largely in drawing up 'A Descriptive Catalogue of the Rock Specimens in the Museum of Practical Geology,' of which a third edition appeared in 1862. He arranged and described most of the specimens illustrating the secondary and tertiary strata, as also most of the volcanic and plutonic rocks. He contributed mineralogical and lithological articles to Ure's 'Dictionary of Arts, Manufactures, and Mines,' 3rd edition; and to Brande's 'Dictionary of Literature, Science, and Art,' 4th edition. In 1861 he published 'A Glossary of Mineralogy,' which is in common use as a ready reference book; and in 1869 he translated Simonin's 'La Vie Souterraine.'

BRITTON, JOHN [E. C. vol. i. col. 928]. This industrious compiler and antiquary died on the 1st of January, 1857, in his 86th year.

* BROCA, PAUL, an eminent surgical operator, anatomist, and anthropologist, was born in 1824. He commenced his professional career as a student in the hospitals in 1843, and rapidly attained promotion from one post to another. In 1849 he obtained his degree of doctor of medicine, in 1861 he was appointed surgeon to the hospital of Bicêtre, and in 1863 surgeon to the hospital of the Salpêtrière. He is a member of various societies both French and foreign. In 1857 he became secretary to the Société de Chirurgie, general secretary in 1858, and honorary general secretary in 1863. From 1859 to 1863 he was also secretary to the Société d'Anthropologie, and from 1863 up to the present time he has been general secretary to the same society. He has contributed largely to scientific literature, but the greater proportion of his writings consists of papers in various journals and periodicals. Up to 1863 the items amounted to more than 170 in number. We will allude to a few of these, in order to indicate the range and character of his works. We are indebted to him for some valuable observations on the diseases of arteries. In 'Des anévrysmes et de leur traitement,' 1856, pp. 930, he gives an account of the phenomena presented by aneurisms, and describes all the methods which have been employed to remove them. In his 'Recherches thermométriques applicables au diagnostic des obliterations artérielles,' published in the 'Bulletins de la Soc. de Chirurgie,' 2nd series, vols. ii. and iii., he shows how the seat of the injury as well as its extent may be determined by observations on the temperature of the surrounding parts; and in another paper published in vol. ii. of the same 'Bulletins' he indicates how Marey's sphygmograph may be employed for the same purpose. Another subject which has much engaged his attention, and on which he has thrown much light, is cancer. His 'Mémoire sur l'anatomie pathologique du cancer,' which appeared in 'Mém. de l'Acad. de Médecine,' vol. xvi. pp. 453—820, 1852, won for him the Portal prize, awarded by that academy in 1850. In this memoir he follows out in great detail all the phases which cancer goes through, and demonstrates that all of them may be discriminated by the unassisted eye; he also shows that the classification which is based upon visual observation harmonizes with that which is founded upon the microscopical examination of the tissues. The same subject was treated in a large work—'Traité des tumeurs,' 2 vols. 1863, *et seq.* In his 'Recherches sur la pathologie des cartilages articulaires,' which appeared in the 'Bulletins de la Soc. Anat.' for the years 1848—1851, he opposes the notion, which had previously prevailed, that those cartilages and tissues which were not permeated by vessels were without vitality, and establishes the fact that, while vascularity is essential to the nutrition of the more complicated tissues, those of the simplest character receive the nutritive materials necessary for their maintenance by imbibition only. Another group of papers treats of rickets. In the most important of these a 'Mémoire sur l'anatomie pathologique du rachitisme,' published in the 'Bulletins de la Soc. Anat.' for 1852, he demonstrates that the affection is not due to any special morbid

influence, but results from imperfect ossification. Amongst his anthropological papers the more noteworthy are 'Recherches sur l'Ethnologie de la France,' in 'Mém. de la Soc. d'Anthropologie,' vol. i.; 'Mémoire sur l'hybridité et sur distinction des espèces animales,' in 'Journ. de Physiologie,' vols. i. and ii.; 'Mémoire sur les phénomènes d'hybridité dans le genre humain,' in 'Journ. de Physiologie,' vols. ii. and iii., both of which are incorporated in a separate volume entitled 'Recherches sur l'hybridité animale en général et sur l'hybridité humaine en particulier,' 1860; 'Sur des crânes, provenant d'un cimetière de la cité antérieure au xiii^e siècle,' in 'Bull. de la Soc. d'Anthropologie,' vol. ii. p. 501; 'Sur la capacité des crânes parisiens des diverses époques,' in the 3rd volume of the last-mentioned 'Bulletins'; this volume also contains his paper 'Sur les caractères du crâne des Basques,' and the fourth volume contains a second paper on the same subject. These 'Bulletins' also contain many remarks made by him in the course of discussion, his reports on the progress of anthropological science in France, and his instructions on general anthropology. His latest work is 'L'Ordre des Primates. Parallèle anatomique de l'Homme et des Singes,' 1870.

(*Exposé des Titres et Travaux Scientifiques de M. Paul Broca*, 1863.)

BRODERIP, WILLIAM JOHN [E. C. vol. i. col. 932], was born Nov. 21, 1789, and was stimulated to natural history pursuits in his earliest years by his familiarity with the conchological collection which his father had formed. Although in after life his avocations prevented his spending much time in the country, yet his papers indicate that one of the prominent features in his character was an intense interest in the habits of animals; and the few opportunities which were afforded him of indulging his taste in this respect indicate how well he could observe, and how graphically he could describe what he saw. His 'Account of the Manners of a Tame Beaver,' published in 'The Gardens and Menagerie of the Zoological Society,' vol. i. p. 167, is an illustration of his powers; and his frequent visits to the house of his friend Professor Owen, in Richmond Park, for the purpose of observing the habits of the tenants of the neighbouring rookery, or of some newly-arrived migrant, manifest his enthusiasm. His coadjutor in conducting the secretarial labours of the Geological Society from 1826 to 1830 was Sir Roderick Impey Murchison. He died February 27, 1859.

BRODIE, SIR BENJAMIN COLLINS, BART. [E. C. vol. i. col. 932]. In 1858 Sir Benjamin Brodie was elected President of the Royal Society in succession to Lord Wrottesley, and this honourable position he retained with the general esteem of the fellows till failing health compelled him to resign it shortly before his death, which occurred at his seat, Brome Park, Betchworth, Surrey, October 21, 1862. The 'Autobiography of Sir Benjamin C. Brodie, Bart.,' a very interesting little volume, with the memoir continued to his death, was published in 1865. His eldest son,

*SIR BENJAMIN COLLINS BRODIE, BART., was elected Fellow of the Royal Society in 1849 in consequence of his investigations as to the nature of wax, which he first satisfactorily explained ('Phil. Trans.,' 1848—9). He has also published many papers on chemistry, such as on the peroxides of the radicals of the organic acids, on the theory of the organic peroxides; and he has recently undertaken the herculean task of reforming chemical nomenclature and notation in an elaborate paper entitled 'The Calculus of Chemical Operations,' being a method for the investigation, by means of symbols, of the laws of the distribution of weight in chemical change; Part I., on the construction of chemical symbols, 'Phil. Trans.' part ii., 1866. Sir B. C. Brodie was appointed Professor of Chemistry at Oxford University in 1865.

BROECK, CRISPIN VAN DEN, a distinguished Flemish painter, was the son of Jean Van Den Broeck, an artist at Malines, where he was born about 1530. Many contrary dates are given for the leading occurrences of his life; those really ascertained are, that having served his apprenticeship with the elder Floris, he was in 1555 admitted master, and in 1575 full member of the Guild of St. Luke, Antwerp; in 1559 burgess of Antwerp; and he is known to have been engaged in his profession in 1593. He died in or about 1601. Broeck painted scriptural, devotional, and historical subjects. His pictures were greatly admired, and many of them were engraved by the best engravers of the time. His finest remaining work, 'The Last Judgment,' now in the Museum, Antwerp (No. 213), was engraved by his daughter BARBE (born 1560), who acquired considerable reputation as an engraver of her father's works. C. Van Den Broeck engraved several series

BIOG. DIV.—SUP.

of plates from his own designs. He is said to have been an architect also, but we know none of his buildings.

BROFFERIO, ANGELO, a celebrated Italian lawyer, politician, and author, was born at Castelnuovo d' Asti, in North Italy, December 6, 1802. At Turin, where he had been sent to complete his literary education and to study law, he was attracted by the theatre, and wrote a five-act tragedy, 'Eudoxia,' and other plays, some of which are still acted. After travelling awhile about Italy and France, he returned to Piedmont, was called to the bar, and commenced with success his career as an advocate. But like most Italians of his age, he had by this time become an ardent politician, and wrote and spoke with a freedom that drew upon him prosecution and an imprisonment of several months (1830), during which he occupied his enforced leisure in composing a volume of patriotic songs in the Piedmontese dialect, 'Canzone Piedmontero,' which had great popularity, a fifth edition having been reached in 1858. The accession of Carlo Alberto brought his release, and he started a journal advocating the entire enfranchisement of Italy. The king would have secured his services, but his views went beyond those which Carlo Alberto could venture to adopt, and he preferred to hold an independent position. His demand was for a constitution, freedom of the press, education, the suppression of the Jesuits: his ardent desire was to see Italy united and free. When, in 1848, a part of his programme was worked out, Brofferio was elected deputy to the Piedmontese Assembly, and at once took his place as the leader of the democratic constitutional party; and he rapidly attained the reputation he held to the end of his life, of being the most powerful and brilliant orator on his side of the house, if not the best parliamentary speaker in Italy. A strenuous Liberal, he yet steadily opposed the measures of Cavour, and this for a time lost him his popularity. When Italy obtained a parliament of her own, he became, as he had been in the parliament of Turin, the recognised leader of the Left, a position he occupied till his death in May, 1866. Brofferio had for some time before his death ceased to conduct a journal, but he had continued his literary labours, and throughout his career he had maintained his practice as an advocate, and conducted with success many important political and criminal cases. His principal literary works are his History of Piedmont from 1814 to the present time, in 5 volumes, 8vo, 1849—52; and a series of contemporary memoirs, 'I Miei Tempi,' 20 vols. 1857—61, in which he was assisted by various literary friends. He also wrote 'Tradizioni Italiani,' in 7 vols., and 'Antica e nuova Grecia,' a richly illustrated work in 2 vols. 4to, Turin, 1844—46. Not long before his death he composed a national battle song, 'Viva il Rè,' which as set to a stirring air by Brizzi, became immediately popular throughout Italy, under the name of Brofferio's Hymn.

BRONN, HEINRICH GEORGE, palæontologist, was born at Ziegelhausen, near Heidelberg, March 3, 1800. He was educated at the university of Heidelberg, and from it he obtained the doctorate of medicine in recognition of an excellent work on botany, 'De formis plantarum leguminosarum primitivis et derivatis,' which he published when only 22 years of age. In 1822 he became a teacher, and was connected with the mineral office at Heidelberg. In 1828 he was appointed extraordinary professor, and in 1835 ordinary professor, of zoology and applied natural history in the Heidelberg University. Before, however, he had attained full titular rank he had published several works of acknowledged merit, such as those entitled 'Ergebnisse der meiner naturhistorisch ökonomischen Reisen,' 1826—31; 'System der vorweltlichen Konchylien durch diagnosen,' 1824; and 'System der vorweltlichen Pflanzen,' &c., 1825. In 1835 his first great work, 'Lethæa Geognostica,' began to appear. It was written in conjunction with Ferd. Roemer, and had a marked influence in advancing geological science. This work attained a third edition in 1851—56. Encouraged by the reputation which the 'Lethæa' obtained for him, Bronn prepared for a greater effort, which resulted in the 'Geschichte der Natur,' a work manifesting the immense scope of his knowledge, an indefatigable industry in searching through books, and remarkable skill in arranging in a systematic order the facts so obtained. In this work he was assisted by H. von Meyer and Göppert, but by far the greater portion was executed by himself. In it he supported the view that species were specially created, and that the mutations they have undergone have only sufficed to originate races, varieties, and sub-species. The work is not without its defects, which are most noticeable in the numerical estimates of species. In 1858 he published a fuller development of his views on organic life in 'Untersuchungen über die Entwicklungs-gesetze

der organischen Welt während der Bildungszeit unserer Erdoberfläche,' a memoir which obtained for him the prize awarded by the Academy of France. The general purport of the paper will be found under PALEONTOLOGY, E. C. S. NAT. HIST. Div. cols. 693—700; but here we may state that he describes the general sequence of events in the organic and inorganic worlds, and attempts to prove how the increasing complexity of physical conditions on the earth's surface has proceeded harmoniously and in connection with the increasing complexity of organic structure. His views as to the amount of variation in species differ somewhat from those he had previously maintained, since in this later work he admits that it may have been so great as to amount to a generic difference. His last work, 'Die Klassen und Ordnungen der Thier-reichs,' 1859, *et seq.*, was another grand conception, and, although unfinished, is an excellent example of the highest compilatory skill. His part of the work embraces the first and second volumes, together with upwards of 800 pages of the third volume, the remaining 700 pages of which were executed by W. Keferstein. This brings the work in the ascending order to the end of the *Mollusca*. The *Articulata* and the *Vertebrata* have been undertaken by Drs. Keferstein, Gerstäcker, Steindachner, and others. His death occurred suddenly, July 5, 1862. He was a member of numerous scientific societies, and was co-editor with K. C. von Leonhard of the 'Jahrbuch für Mineralogie,' &c., 1830—32; and of the 'Neues Jahrbuch,' &c., 1833—62. He has also written several books and many papers, which we are unable to notice here.

BROOKE, SIR JAMES [E. C. vol. i. col. 937]. After having passed through the ordeal of adverse criticism, and rebutted the charges upon which it was sought to censure his conduct towards the Dyaks, he returned to Sarawak in 1853, and established the bishopric of Labuan. In 1857 his life and the peace of the settlement were endangered by an insurrection of the Chinese, who were offended at his efforts to suppress the smuggling of opium into Sarawak. His library was destroyed, his house ransacked, and he himself compelled to escape from Kuching, where he resided. He collected a small native force, retook the town, drove the Chinese out, but killing most of them in the process, and expelled them from the neighbouring villages. In 1858 he returned to England, but was soon after incapacitated by a stroke of paralysis. Public interest was excited in his favour, subscriptions were collected, and with the proceeds an estate was purchased for him at Bunator, in Devonshire. In 1861 he again went to Sarawak, suppressed a rebellion which had broken out on the north-west coast of Borneo, and returned to England. Soon after he was again called upon to quell some disturbance affecting his government, which he succeeded in doing. He obtained the recognition of his sovereignty by the British Government, and retired to his Devonshire estate, where he died June 11, 1868. He was succeeded as Rajah by his nephew, Charles Brooke. The general condition of the country is given under SARAWAK, GEOG. Div. E. C. S. cols. 1190—1195.

BROOME, WILLIAM, a poet and clergyman, the son of Randle Broome, a farmer at Haslington, in the parish of Barthomley, Cheshire, was baptized at Haslington chapel on the 3rd of May, 1689. He was sent to Eton, where he was educated upon the foundation; but after being captain of the school for a whole year, during which period it happened, most unusually, that no vacancy occurred by which he might have obtained a scholarship at King's College, Cambridge, he was superannuated, and at the age of 19 was sent to St. John's, in the same university, by the contributions of his friends. He was entered as a sub-sizar on the 3rd of July, 1708; matriculated as sizar on the 10th of the same month; took his B.A. degree in January, 1712, and his M.A. in 1716. He received the degree of LL.D. in 1728, on the occasion of the king's visit to the university, when a large number of complimentary degrees were conferred. While at Cambridge he was for some time a chamber-fellow of the well-known Ford, who spoke of him as being at that time a "contracted scholar and a mere versifier, unacquainted with life and unskilled in conversation." Subsequent intercourse with the world, however, cleared him, even in Ford's judgment, from great part of his scholastic rust. Having received holy orders, he became rector of Sturston, in Suffolk, where, on the 22nd of July, 1716, he married Mrs. Elizabeth Clarke, "a wealthy widow," by whom he had two sons and two daughters, all of whom were born at Sturston, and, with one exception, buried there. In 1728, Dr. Broome was presented by the crown to the rectory of Pulham, which, contrary to the erroneous informa-

tion of Dr. Johnson, he continued to hold until his death. It is in this rectory that he is said to have written the Notes to Pope's Homer; and from it addressed to Viscount Townshend the dedication of the second edition, "with large alterations and additions," of his 'Poems on Several Occasions,' 8vo, London, 1739. Broome was chaplain to Lord Cornwallis, Baron of Eye, by whom he was successively presented to the livings of Oakley Magna and Eye, both in Suffolk. He died "of an asthma" at Bath on the 16th of November, 1745, and his remains are deposited in the Abbey church of that city, but without a monument to mark the spot where he lies. As a divine, Broome is the author of a sermon preached on the 20th of October, 1722, being the anniversary of the king's coronation, which he published with the title of 'The Duty of Publick Intercession and Thanksgiving for Princes,' 8vo, London, 1723; and of a 'Sermon preached at the Assizes in Norwich,' 4to, Norwich, 1737. Dr. Johnson says of Broome that "he appeared early in the world as a translator of the Iliad into prose, in conjunction with Ozell and Oldisworth. How their several parts were distributed is not known. This is the translation of which Ozell boasted as superior, in Toland's opinion, to that of Pope: it has long since vanished, and is now in no danger from the critics.

When the success of the Iliad gave encouragement to a version of the Odyssey, Pope"—to whom Broome had been formerly introduced, whilst the former was on a visit to Sir John Cotton, at Madingley, near Cambridge—"weary of the toil, called Fenton and Broome to his assistance; and, taking only half the work upon himself, divided the other half between his partners, giving four books to Fenton and eight to Broome. To the lot of Broome fell the 2nd, 6th, 8th, 11th, 12th, 16th, 18th, and 23rd, together with the burthen of writing all the notes. . . . The price at which Pope purchased this assistance was, 300*l.* paid to Fenton, and 500*l.* to Broome, with as many copies as he wanted for his friends, which amounted to 100*l.* more. The payment made to Fenton I know not but by hearsay; Broome's is very distinctly told by Pope, in the notes to the Dunciad." Broome did not approve of this disproportionate scale of remuneration, and he charged his employer with avarice; which Pope avenged by abusing Broome in the 'Dunciad,' and by quoting him as a proficient in the 'Art of Sinking.' It would seem that a formal reconciliation, the heartiness of which was open to suspicion, afterwards took place. Broome took his leave of poetry by the translation in English verse of several of the Odes of Anacreon, which appeared in the 'Gentleman's Magazine,' where the first instalment occurs in the number for November, 1730. These Odes were professedly translated by "Charles Chester, M.D." Whatever is written above in supply of the omissions, or in correction of the mistakes, of previous biographers, is due to the minute researches of T. Worthington Barlow, F.L.S., &c., the author of a 'Memoir of William Broome, LL.D.: the Associate of Pope in the Translation of Homer's Odyssey, with Selections from his Works,' 8vo, Manchester and London, 1855.

BROSSARD, SEBASTIEN DE, a French musical writer, was born in 1660. He is supposed to have received his musical education at Paris, from whence he went in 1689 to Strasbourg, where he filled in succession the offices of prebend, deputy choir-master, and chapel-master, at the cathedral. In 1700 he went to Meaux, where he was appointed grand chaplain and maître de musique. He remained in this last-named city till his death, which took place August 10th, 1730. His most notable work was his 'Dictionnaire de Musique,' folio, Paris, 1703. An octavo edition appeared in 1705; and afterwards another at Amsterdam. The work gives explanations of all the musical terms in Greek, Latin, Italian, and French; treats of the history and theory of music, composition, playing, and vocalisation; and contains a list of 900 writers on music. It has been superseded by better dictionaries, but it was the first dictionary of music published in France, and was a work of learning and research. He also wrote a dissertation on the new manner of writing plain-chant; and collected extensive materials for a Bibliography of Music and a Biography of Musicians, which were deposited unfinished in the Imperial (then Royal) Library at Paris, where they now are. Some of his own compositions are included in his 'Prodromus Musicalis,' folio, Paris, 1702.

BROUGHAM, HENRY, LORD, [E. C. vol. i. col. 940]. When the memoir just cited was published Lord Brougham had already completed his 78th year, but his intellectual and physical activity was yet far from being exhausted. He collected and published his 'Essays contributed to the Edinburgh Review,' 3 vols. 8vo, 1857; and his 'Critical, Historical,

and Miscellaneous Works,' 10 vols. 8vo, 1855—58. In 1858 (May 17 and 31) he read before the Academy of Paris a long and elaborate paper in French on the Construction of the Cells of Bees, '*Recherches analytiques et expérimentales sur les Alvéoles des Abeilles*,' which was published in vol. xvi. of the '*Comptes Rendus*;' somewhat later he delivered an ample discourse on occasion of uncovering the statue of Sir Isaac Newton at Grantham, and in 1859 one of a more academical character on his election to the chancellorship of Edinburgh University; and in the course of the year, by a rearrangement of the old, and the addition of some new, chapters of his '*Political Philosophy*,' he transformed it into '*The British Constitution: its History, Structure, and Working*.' In 1860 he presided at the first congress of the Association for the Promotion of Social Science, and he not only gave a long opening address, but took a share in the proceedings; and he was re-elected president, and spoke at several of the succeeding annual sessions. He also, though with increasing rarity and brevity, attended and spoke in his place in the House of Lords. For several years his winters were spent at Cannes, and of late he mostly resided there, in a villa near the town, where he died on the 7th of May, 1868, in the 90th year of his age. A plain massive granite cross marks his grave in the cemetery of Cannes. Lord Brougham was undoubtedly one of the most remarkable men of an age rife in remarkable men: but his career is as much a warning as an example. No regular biography of him has been published or announced. Lord Campbell's posthumous life (in '*Lives of Lord Lyndhurst and Lord Brougham, Lord Chancellors and Keepers of the Great Seal of England*,' 8vo, 1869,) is a laboured effort to lower the moral and intellectual reputation of his former rival: reckless in statement and base in spirit, the book is in every way dishonourable to the writer.

BROWN, JOHN, D.D. [E. C. vol. i. col. 949]. Dr. Brown survived a little over two years the celebration of the 50th anniversary of his ministry; he died on the 13th of October, 1858.

BROWN, ROBERT [E. C. vol. i. col. 951], was born Dec. 21, 1773, and died June 10, 1858. A general sketch of his works has already been given. Fully to appreciate his influence in advancing our knowledge of plants would necessitate the writing the history of many botanical problems. Most of the eminent botanists of the present century have acknowledged how deeply they have been indebted to his observations and conclusions. It was observed of his works in the obituary notice of him in the presidential address delivered to the Royal Society in 1858—"In perusing them we are struck with the evident completeness of the investigation, and next with the wonderful sagacity with which the ascertained facts are brought to bear upon the question at issue. And these distinguishing qualities are equally obvious throughout the wide range of objects treated of, whether in the anatomy, the physiology, the classification, the description, the distribution, or the affinities of plants, and in the examination both of recent and fossil structures. Among the most important anatomical and physiological subjects of which they treat, particular mention is due to the discovery of the nucleus of the vegetable cell, and of the circumscribed circulation in the walls of particular cells; the development of the stamina, together with the mode of fecundation in *Asclepiadaceæ* and *Orchidaceæ*; the development of the pollen and of the ovulum in phænogamous plants, with the peculiarities of the latter in *Coniferae* and *Cycadeæ*, and the bearing of these facts upon the general subject of impregnation; the origin and development of the spore of mosses; and the discovery of the peculiar motions which take place in the 'active molecules' of matter when seen suspended in a fluid under the microscope. Of structural investigations, the most important are those which establish the relation of a flower to the axis from which it is derived, and of the parts of a flower to each other, as regards both position and number; the analogy between stamina and pistilla; the neurulation of the corolla of *Compositæ*, their æstivation and inflorescence; and the structure of the stems of *Cycadeæ* both recent and fossil."

A complete edition of his works has been recently published by the Ray Society.

BROWN-SÉQUARD, CHARLES ÉDOUARD [SÉQUARD, C. E. BROWN, E. C. S.].

BROWNING, ELIZABETH BARRETT [E. C. vol. i. col. 960]. In the autumn of 1856 Mrs. Browning published her longest and most ambitious poem, '*Aurora Leigh*,'—startling in its passion, power, and originality, full of noble feeling and earnestness; but wayward, unequal, incomplete as a design, imperfect in execution. '*Poems before Congress*,' 1860, seemed

to be a wild wail wrung from her by long brooding over the wrongs and hopes of Italy. Her sympathy with Italy, her yearnings for Italian freedom, appeared indeed to increase in fervour and intensity, as her feeble frame yielded slowly to the ceaseless growth of her fatal malady. She died on the 29th of June, 1861, at the Casa Guidi, Florence, where, owing to the state of her health, she had lived for some years in comparative seclusion. A marble tablet on the front of the house records that in it wrote and died Elizabeth Barrett Browning, who by her song created a golden link between Italy and England, and that in gratitude Florence has erected this memorial. Her '*Last Poems*,' 1862, include much noble verse both on English and Italian themes.

BRUCE, JOHN, F.S.A., was born in London in 1802, and completed his education at the Grammar School, Aberdeen. He was brought up to the law, but retired from practice about 1838, in order to give his undivided attention to historical and antiquarian inquiries. Mr. Bruce was one of the most active members, and for some years director, of the Society of Antiquaries, and contributed many valuable papers to the '*Archæologia*.' One of the founders, the original treasurer, and for the last 19 years of his life the director of the Camden Society, it was in a great measure to his exertions that the society owed and maintained its high position. Besides numerous contributions to its '*Miscellany*,' Mr. Bruce edited for the society no fewer than 13 volumes, including such works as '*The Annals of Elizabeth*,' '*The Leycester Correspondence*,' '*Letters of Elizabeth and James VI.*,' and '*Verney's Notes on the Long Parliament*,' and he enriched each of them with a valuable preface and notes. Mr. Bruce was also an active member of the Archæological Institute, and contributor to its journals. For the Parker Society he edited the '*Correspondence of Archbishop Parker*,' and the '*Works of Roger Hutchinson*;' '*Archbishop Laud's Benefactions to Berkshire*' for the Ashmolean Society; and he was for some time editor of the '*Gentleman's Magazine*.' His great work, however, was the '*Calendar of State Papers, Domestic Series, of the Reign of Charles I.*;' preserved in Her Majesty's Public Record Office, of which he edited 12 vols. 8vo, 1858—69, and of which the 13th vol., bringing down the series to 1638, was passing through the press at the time of Mr. Bruce's death. The great value of the work is not more generally recognised by historical students, than is the assistance rendered by the editor's comprehensive introductions and notes, the work, as all feel, not merely of a man of unusual learning and research, but of scrupulous accuracy. Mr. Bruce, whilst walking in Montague Square, October 28, 1869, fell as though in a fit, and was found to be dead when carried to St. Mary's Hospital. A '*Life of Prynne*,' on which he had been for some time engaged, remained unfinished.

*BRUGSCH, HEINRICH KARL, a distinguished Egyptologist, was born on the 18th of February, 1827, at Berlin, where he received his early education. Whilst still a student he published as the first result of his studies of the ancient Egyptian monuments, an essay entitled '*Scriptura Ægyptiorum Demotica*,' 4to, Berlin, 1843; which was soon followed by '*Numerorum apud veteres Ægyptos Demoticorum Doctrina*,' folio, Berlin, 1849; '*Sammlung Demotischer Urkunden*,' 4to, Berlin, 1850; and others which attracted the attention of the learned world, and particularly of Alexander von Humboldt and King Friedrich Wilhelm IV. of Prussia. In 1853 he undertook, at the expense of the latter, a scientific journey to Egypt, whence he returned in 1854, and was appointed Conservator of the Egyptian Museum. In 1857—8 he made a second journey to the Nile; and the literary and archæological results of the two appeared in an Account of a Journey to Egypt, '*Reiseberichte aus Ägypten*,' 8vo, Leipzig, 1855; '*Monuments de l'Égypte*,' Berlin, 1857; '*Recueil de Monuments égyptiens*,' 4to, Leipzig, 1862, &c. In 1860 he went to Persia with the Prussian Embassy, under Baron von Minutoli, upon whose death Brugsch assumed the direction of affairs. Returning home in June, 1861, he published his Journal of the Prussian Embassy to Persia, '*Reise der königlichen preussischen Gesandtschaft nach Persien*,' 2 vols., Leipzig, 1862—63. In 1863 he established a journal in the interests of Egyptian philology and archæology, '*Zeitschrift für ägyptische Sprach und Alterthumskunde*,' 4to, Leipzig, the editing of which was transferred to Lepsius, upon the appointment of Brugsch in the autumn of 1864, to be Prussian Consul at Cairo. Amongst other unmentioned works, Brugsch has published a translation of the '*Liber Metempsychosis veterum Ægyptiorum*,' 4to, Berlin, 1851; '*Nouvelles Recherches sur la division de l'Année chez les*

anciens Égyptiens,' 8vo, Berlin and Paris, 1856; 'Grammaire démotique, contenant les principes généraux de la Langue et de l'Écriture populaires des anciens Égyptiens,' 4to, Berlin, 1855; 'Geographical Inscriptions of the ancient Egyptian Monuments,' 'Geographische Inschriften altägyptischer Denkmäler,' 3 vols. 4to, Leipzig, 1857—60; 'Histoire de l'Égypte, dès les premiers temps de son existence jusqu'à nos jours,' 4to, Leipzig and Berlin, 1859, &c.; 'Matériaux pour servir à la reconstruction du Calendrier des anciens Égyptiens,' 8vo, Leipzig and Berlin, 1864, &c.; 'Aus dem Orient,' 2 vols. 8vo, Berlin, 1864; 'Wanderung nach den Türkis-Minen und der Sinai-Halbinsel. Mit drei Tafeln sinaitischer Inschriften,' 8vo, Leipzig, 1866; and 'Dictionnaire Hiéroglyphique et Démotique,' &c., 4 vols. Leipzig, 4to, 1867—8.

BRUNEL, ISAMBARD KINGDOM [E. C. vol. i. col. 976]. Mr. Brunel lived to complete the Great Eastern steamship mentioned in the original memoir as then in progress; but the exposure to inclement weather during the prolonged ineffectual attempts to launch it, and the great anxiety consequent on the various operations, brought on an illness from which he never recovered. He died on the 15th of September, 1859. Like other of Mr. Brunel's great engineering achievements, this vast vessel was perhaps conceived on too colossal a scale for commercial profit; but the manner in which it has behaved under the extraordinary trials to which it has been subjected has sufficiently justified Brunel's prescience and daring. The bridge over the Tamar, also mentioned in the memoir, the last great work he lived to finish, and one of the most remarkable, has proved to be in all respects successful.

* **BRUNLEES, JAMES**, civil engineer, was born in 1816 at Kelso, Roxburghshire. He studied engineering under Mr. Adie, of Edinburgh, and then assisted him in the engineering of the Bolton and Preston Railway. He afterwards served in a similar capacity under Messrs. Locke & Errington, in laying down the Caledonian Railway; and then for six years under Mr. Hawkshaw, for whom he was Acting Engineer of the Lancashire and Yorkshire Railway. Commencing as civil engineer on his own account in 1850, Mr. Brunlees constructed the Bangor and Carnarvon Railway, and half of the Londonderry and Coleraine line. In 1852 he undertook the Lancaster and Ulverstone Railway, a difficult work, seeing that the line had to cross a wide expanse of shifting sands under tidal influence, by a series of viaducts and sea embankments; this was finished in 1857. The Londonderry and Coleraine line had required some such management, in the construction of four miles in the tidal waters of Lough Foyle. Two of the works executed by Mr. Brunlees have involved the ascent of very steep gradients. One is the San Paolo Railway in Brazil, 86 miles long; comprising a special series of inclines to overcome a very abrupt ascent of 2600 feet—the difference between the sea-level and that of the general interior of the province. The viaducts are numerous, one having a height of 185 feet. Some of the inclines, up to Jundiahi, are as steep as 1 in 10. A centre-rail for a clip break was adopted, to prevent the too rapid descent of trains. These works were constructed between 1860 and 1866. A second railway for mountain use was the Mont Cenis Summit Railway, from Lanslebourg in Savoy to Susa in Piedmont. The centre-rail is here in like manner adopted; but the works generally are light, the line being carried up and down nearly on the surface of the mountain; the rails at the highest point are 6700 feet above the sea-level. A railway similar in some of its features to the Lancaster and Ulverstone and the Londonderry and Coleraine, though of less magnitude, has lately been constructed by Mr. Brunlees across the Solway Frith. Other railways constructed by him are the Spalding and Bourne, the Lynn and Sutton (across the tidal waters of the Nene and Ouse), and the Cleveland (including a viaduct 170 feet high). As government engineer, he is constructing the Honduras Inter-oceanic Railway, to connect the Atlantic and Pacific Oceans. The engineering works by Mr. Brunlees also comprise the Alexandra Dock at King's Lynn, 6½ acres, opened in 1869; the Avonmouth Dock near Bristol, 14 acres (not yet finished); a pier and landing-stage in the Severn at Avonmouth; a pier on the sands at Southport, nearly a mile long, and lately made available for steam-boat traffic; piers and landing-stages in the Mersey at New Ferry and New Brighton; and a system of sewerage and water supply at Kelso. Mr. Brunlees was elected Member of the Institution of Civil Engineers in 1852, and was Member of the Council in 1856. He has contributed several scientific and engineering papers to the Transactions of the Institution.

BUCHANAN, JAMES, fifteenth President of the United

States, was born at Stony Batter, Pennsylvania, in April, 1791. His father, who had emigrated from Ireland in 1783, had him educated at Dickinson College, where he graduated in 1809. After studying the law, young Buchanan was admitted to the bar in 1812; and, being successful as an advocate, acquired a fortune which enabled him to retire from the profession in comparatively early life. In 1812 he joined a volunteer corps, and made speeches against the English, with whom the States were at that time at war. In 1814 he was elected to the Pennsylvania legislature, and in 1820 to Congress, where he took a prominent part in the leading discussions, as later he did in calling for the acquisition of Cuba. When General Jackson became President, in 1828, Mr. Buchanan was chosen to succeed Daniel Webster as head of the Judiciary Committee of Congress. In 1831 he went as ambassador to St. Petersburg, where he negotiated the first commercial treaty between America and Russia. On his return, in 1834, he was elected to the Senate, and engaged eagerly in the slavery debates, taking the side of the South. From 1845 till 1849, under Polk's Presidency, Mr. Buchanan was Secretary of State, and was much engaged in the annexation of Texas, the war with Mexico, the annexation of California, and the endeavour to settle boundary disputes with England. Contending unsuccessfully with Pierce for the presidency in 1852, he was in 1853 appointed Ambassador to England, where he rendered himself somewhat unpopular by the part he took in the "Ostend Congress," a secret scheme for obtaining Cuba from Spain without the approval of England and France. In 1856 he became President, defeating Fremont. His four years term of office was marked by boundary disputes with England, and by the troubles in Kansas. His participation in the slavery question, in all its aspects, hastened the re-action which placed Abraham Lincoln in the presidential chair in 1860, and which led to the civil war. From his quitting the White House, Mr. Buchanan lived in retirement till his death, which occurred on the 1st of June, 1868.

BUCKLAND, THE VERY REV. WILLIAM [E. C. vol. i. col. 997]. This eminent geologist died August 14, 1856. His eldest son,

* **FRANCIS TREVELYAN BUCKLAND**, born in 1826, has attained distinction as a naturalist. Educated at Winchester College and at Christ College, Oxford, he adopted the medical profession, and served as house surgeon to St. George's Hospital, and as assistant surgeon to the 2nd Life Guards, from 1854 to 1863, when he retired from practice. For several years he has devoted himself to various natural history pursuits, and more particularly to the artificial cultivation of fishes. He is editor of 'Land and Water,' the author of 'Curiosities of Natural History,' and of 'Fish Hatching,' the founder and maintainer of the Museum of Economic Fish Culture in the gardens of the Royal Horticultural Society at South Kensington, and an inspector of the salmon fisheries of this country.

BUCKLE, HENRY THOMAS, known as the historian of civilization, the son of a wealthy merchant in Mark Lane, London, was born at Lee, in Kent, on the 24th of November, 1822. For a short time he attended Dr. Holloway's school, Gordon House, Kentish Town, but his health being delicate, he experienced neither the restraints nor the advantages of a regular education. In fact, from the age of 14, he was, at his own request, left to educate himself. Being an indefatigable reader, he stored up an immense mass of various information. By the death of his father, which took place in Mecklenburg Square, on the 24th of January, 1840, he was set free from the commercial career to which he seemed destined, and being in possession of an ample fortune, he was enabled to devote himself exclusively to literature. His great recreation was the game of chess, in which he became so skilful as to overcome, amongst others, the celebrated chess-player Löwenthal. He enjoyed the friendship of Hallam and Bunsen, who recognised his extraordinary talents, and exerted a great influence upon his mental development. About the age of 18 his multifarious studies began to converge towards one focus—to wit, the intellectual progress and civilization of mankind. As soon as the idea of such a work presented itself distinctly to him, its fulfilment became the object of his life. Twenty years of labour, at the stated rate of ten hours a day, with scarcely an interval of rest, were devoted to it; and at the end of this period he published the first volume of his 'History of Civilization in England,' 8vo, London, 1857; second edition, 1858; third, 1861; fourth, 1864, &c., of which a German translation was produced by Dr. Arnold Ruge, 'Geschichte der Civilisation in England,' 2 vols. 8vo, Leipzig, 1860—62. The

volume, which was in fact but a part of the preface or introduction to his work, the completion of which was contemplated in fourteen volumes, was received at first with indifference; but it speedily aroused curiosity, and next no small degree of indignation and alarm. In 1861 was published the second volume, in which the religious habits and the ecclesiastical history of Scotland were unreservedly attacked. Considerable bitterness was the result; and the storm had scarcely subsided when the effects of the unflagging toil of a sedentary kind to which Mr. Buckle had subjected himself, combined with the grief he felt at the painful illness and the death of his mother—to whom he dedicated his first volume, and to whose memory he inscribed the second—forced him abroad for the recovery of his shattered health. Accordingly, in October, 1861, he left England, and spent the winter in Egypt. Here he became so much better that in the beginning of March he left Cairo for Sinai and Petra; and in the course of a six weeks' journey in the Desert, his health seemed to himself to be perfectly re-established. He caught cold, however, whilst exploring the ruins of Palmyra, and died of typhus fever at Damascus, on the 29th of May, 1862, and was buried on the same day.

Mr. Buckle left great parts of the special 'History of Civilization in England' in manuscript, in a fit state for publication, as well as outlines of essays on the 'Ultimate Causes of the Interest of Money'; 'On Bacon,' chiefly on Method; 'On Shakspeare'; and 'On the Influence of Northern Palestine on the Origin of Christianity.' These essays, if he had lived to complete them, were intended by the author to be collectively published with the papers he had contributed to 'Fraser's Magazine,' one of which had appeared in April, 1858, after having been delivered as a lecture on the 19th of March previous, at the British Institution, on the 'Influence of Women on the Progress of Knowledge'; and the second of which had appeared in May, 1859, as a review of Mr. Mill's essay 'On Liberty.' Whatever the faults and shortcomings of the published instalments of the work which Mr. Buckle contemplated, it is allowed that they compose into a great and noble book; and it is possible that in the historical sequel, an experience more mature and a larger insight might have supplied or corrected much that in the Prolegomena is crude or rash, inaccurate or incomplete. There is no lack of dogmatism and bold inference, and from his excessive generalisation, the author labours under the charge of being a one-sided doctrinaire, who knew books rather than men; who forgot the humanity and good-citizenship of the clergy in his hatred of their professional anathemas; and who in his strictures on national character employs an intellectual standard only, ignoring or overlooking the moral compensations for imperfect knowledge. The three principal theses of Mr. Buckle's book were summed up as follows in a letter in the 'Times' of June 18th, 1862, written by his friend and fellow-traveller, Mr. J. S. Stuart Glennie:—(1) Political economy—the science of wealth—is the deductive science through which the investigation of natural is connected with that of social phenomena, and thus the way prepared for one universal science. (2) The laws of society are different from those of the individual; and the method of averages, with which has to be compared the mathematical theory of probabilities, is that by which the former is to be investigated. (3) In social phenomena the intellectual, in individual the moral, laws are chiefly or alone to be considered; all moral social changes are thus preceded by intellectual changes.

BULL, JOHN, DR., a musical composer of the Elizabethan times, was born in Somersetshire in 1563. When about eleven years old he began to study music; and afterwards Blitheman, organist of the Chapel Royal, taught him composition and organ-playing. He received the degree of bachelor of music, Oxford, in 1586, and that of doctor in 1592. He succeeded Blitheman as organist of the Chapel Royal in 1591. In 1597, when appointed professor of music at Gresham College, he published a Discourse entitled, 'Oration of Maister John Bull, Doctor of Musick, and one of the Gentlemen of Her Majestie's Royal Chappell,' &c.; it was in praise of music, coupled with a panegyric of Sir Thomas Gresham. In 1602, his health being bad, he went on a tour to Germany, France, and Spain, and was received with much distinction, having many musical posts offered him. Returning to England, he was appointed special organist to James I. in 1607. He went to the Netherlands in 1613, and spent the rest of his days there; succeeding Waelrant as organist of Antwerp Cathedral in 1617. He died at Antwerp on the 12th of March, 1628.

Dr. Bull was a voluminous composer. In Ward's 'Lives of the Gresham Professors' is given a list of no less than 120 com-

positions by him for the organ and virginal. Burney regarded him as inferior to Tallis and Bird; Hawkins took a higher estimate of his merit. A prolonged controversy has been carried on as to the part which Dr. Bull took in the composition of the National Anthem, 'God Save the King (Queen).' The tune was attributed to Purcell, Handel, and many other composers of note; when, towards the close of the last century, a claim was put in for Henry Carey, great-grandfather of Edmund Kean. Mr. Chappell ('Music in the Olden Time'), Dr. Fink ('Leipsic Musical Gazette'), and many writers in 'Notes and Queries,' have examined the subject closely in recent years; they have arrived at a conclusion that the tune *grew up gradually*. Mr. Clark, who published a pamphlet concerning the origin of the National Anthem early in the present century, offers reasons for the belief that Bull composed the music; but Mr. Chappell and other recent writers are not satisfied with the evidence, nor with the evidence in support of a theory that "the National Anthem is a mere transcript of a Scottish anthem preserved in a collection printed in 1682." Dr. Arne and Dr. Burney both believed that the tune was composed in the time of James II. The general conclusion now is, that the germ of the tune existed two, if not three centuries ago, and that Henry Carey gave it its modern form in 1740; but that no direct connection of Dr. John Bull with the composition can be traced.

BULLINGER, HEINRICH, a Swiss reformer, a friend and disciple of Zwingli, was born at Bremgarten, a village near Zurich, on the 18th of July, 1504. He was educated at the school of Emmerich, in the duchy of Cleves, and at Cologne, where he studied logic, and commenced B.A. at 16 years of age. He took his M.A. degree in 1522, and returning to his father's house, remained there for a year, pursuing his studies privately. Being called by the Abbot of Kappel, a Cistercian abbey near Zurich, to teach in that place, he did so with great reputation for four years. Many persons resorted to his lectures, and to them he read the New Testament, portions of Erasmus, and Melancthon's Common-places. In 1527 he was sent by his abbot to Zurich, where he attended for five months the preaching and lectures of Zwingli, while he prosecuted the study of Greek and Hebrew. On his return to Kappel he prevailed with the abbot and his monks to adopt the reformation of Zwingli, to which they had been before inclined. In 1528 he accompanied Zwingli to the religious conference at Berne, which resulted in the reformation of that canton. In the year following he was made pastor of the reformed church at his native place of Bremgarten; and married Anna Adlischwyler, who had been a nun, by whom he had a family of six sons and five daughters, and who died in 1564. Bullinger met with great opposition from the Papists and Anabaptists in his parish, but disputed publicly, and wrote several books against them. The victory of the Catholic party at the battle of Kappel forced him in 1531 to take refuge at Zurich, where in 1532 the great council chose him to be minister of the cathedral. In the disputes on the Lord's Supper with Luther he was remarkable for his fairness and moderation; and he hospitably received the German divines who took refuge in Switzerland from the effects of the *Interim*. He died on the 17th of September, 1575. His printed works are very numerous, doctrinal, practical, and controversial, and many of them were in his own time extremely popular in England, especially a volume entitled 'Fiftie Godlie Sermons, divided into five Decades, conteyning the chiefe Pointes of Christian Religion. Translated out of Latine,' &c., 4to, London, 1577, which was held in such high estimation in this country that in 1586 Archbishop Whitgift, in full convocation, procured an order to be made that every clergyman of a certain standing should obtain a copy of it, read one of the sermons contained in it every week, and make notes of the principal matters.

BUNNING, JAMES BUNSTONE, City architect, was born in London, October 6, 1802. He was articled to Mr. George Smith, and learnt from him the mechanical part of his profession. By his private connections he obtained an excellent business, being appointed successively surveyor to the Foundling Hospital, the Haberdashers' Company, the London and County Bank, the Chelsea Waterworks, the Thames Tunnel Company, and other corporate and commercial bodies; but he was first brought into public notice by his success in the competition for the City of London School. This building, which was completed early in 1837, was regarded as a wonderful example of Gothic architecture, and secured his fortune in the City. He had, however, some five or six years to wait before obtaining his civic appointment, during which time he built for the London

and County company several country banks, carried out extensive alterations and improvements on the New Cross and Hatcham estates of the Haberdashers' Company, and erected many semi-public and private buildings.

In 1843 he was elected Clerk of the City's Works, an ancient title exchanged in 1847 for that of City Architect. Holding this office for just upon twenty years, it fell to his lot to design and carry out many important metropolitan improvements, and though exception must be taken to their artistic character generally, it will be admitted by all who study them that they are for the most part well planned, and always executed in a thoroughly workman-like manner. One of his first great works was the formation of New Cannon-street, from King William-street, London-bridge, to St. Paul's-churchyard—a broad and handsome street, but so contrived as just to miss having St. Paul's as the western and the Monument as the eastern termination of the vista. Victoria-street, now called Farringdon-road, the broad street leading from Farringdon-street to Clerkenwell; the widening of Gresham-street; the opening of Bank-buildings, and several similar but minor improvements were carried out under his direction. A few of the principal buildings and markets designed by him for the City of London may be particularly noticed. The Coal Exchange, Lower Thames-street, completed in 1849, is a curiously decorated Italian edifice, the exterior feature being a semi-circular portico of the Roman Doric order, above which rises a tall tower, with Ionic columns and entablature, crowned with a conical roof and gilt ball; of the interior, a rotunda, 60 feet in diameter, having three tiers of projecting galleries, and covered by a glazed dome, the apex of which is 74 feet from the pavement. This building is of Portland stone. Billingsgate Market, opposite to it, completed in 1853, Mr. Bunning constructed chiefly of red brick. Like the Coal Exchange, the architect described the style as Italian, but it was even more anomalous and equally inappropriate: both buildings were, however, noteworthy for the ingenuity shown in economising space, and in the adaptation of subsidiary appliances. The City Prison, Holloway, completed in 1852, is an immense structure of what Mr. Bunning termed Castellated Gothic, chiefly remarkable externally for its extrayagant and curiously misplaced array of mediæval military arrangements, which would have been useless in any past or possible system of military attack, whilst they have no picturesque value or architectural propriety. Still, though artistically absurd, the building is said to be conveniently arranged. The City Lunatic Asylum, Stone, near Dartford, Kent, another enormous structure, was left incomplete at his death, and was, we believe, somewhat materially altered from his designs. His most successful City work was the Metropolitan Cattle Market, Pentonville, opened in 1855, of which the central architectural feature is an Italian clock-tower, or campanile, 100 feet high. In the Cattle Market more effect might perhaps have been obtained by a designer gifted with an artistic eye and hand; but the primary point was convenience, suitableness, and in this Mr. Bunning is allowed to have succeeded. It is the largest and costliest cattle market in the kingdom, but at the time of its construction it was also by far the most complete in its arrangements, and the best adapted to its purpose. Besides erecting new, Mr. Bunning had to alter several old buildings. Thus he entirely rebuilt the Courts of Law, Guildhall; remodelled the interior of Newgate; altered the state-rooms of the Mansion House, &c.; he had also to design the temporary structures and fittings required for extraordinary civic festivities or ceremonials. Although mainly engrossed during his later years by his official engagements, Mr. Bunning found time to erect a few other works of a partly public character, such as the Freemasons' Orphan Schools and Rogers' Almshouses, Brixton, and several private buildings. He died November 2, 1863.

BUNSEN, CHRISTIAN KARL JOSIAS, BARON. [E.C. vol. i. col. 1008.] Baron Bunsen survived, in very feeble health, his retirement to Germany, only till the 28th of November, 1860. The English version of his great work, 'Egypt's Place in Universal History,' 5 vols. 8vo, has been completed since the author's death by Mr. H. Cottrell, under the supervision of S. Birch, LL.D., who has largely added to the concluding volume. His other great work, 'God in History,' 3 vols. 8vo, has also appeared in an English version by Miss S. Winkworth, 1868—69. In 1868 was published 'A Memoir of Baron Bunsen . . . drawn chiefly from Family Papers. By his Widow, Frances Baroness Bunsen,' 2 vols. 8vo. A German translation, with some additional documents, by Prof. Friedrich Nippold, of Heidelberg, was issued a few months later. The

Baroness Bunsen, whose beautifully-written biography is the noblest memorial of her husband, was married, as Miss Frances Waddington, to Bunsen in 1817. Their second son, Ernest De Bunsen, born 1819, took orders in the English Church, and is the author of 'The Hidden Wisdom of Christ and the Key of Knowledge; or, the History of the Apocrypha,' 2 vols. 8vo, 1864; and 'The Keys of St. Peter; or the House of Rechab, connected with the History of Symbolism and Idolatry,' 8vo, 1867.

BUNSEN, ROBERT WILHELM, was born March 31, 1811, at Göttingen, where his father was professor of Oriental literature. He studied zoology, chemistry, and physics at the University of his native town, and also in Paris, Berlin, and Vienna. In 1836 he was appointed to the chair of chemistry at the Polytechnic Institute at Cassel, and in 1838 became Professor at the University of Marburg and in 1841, Director of the Chemical Institute of that town. In 1851 he became professor at Breslau, and next year at Heidelberg. He has published a large number of papers in various departments of physics, chemistry, and geology, but is popularly known for his association with Kirchhoff in researches on spectrum analysis, and also for his discovery of an antidote to arsenic in the hydrated oxide of iron.

BUONTALENTI, BERNARDO, distinguished as a painter, sculptor, architect, and engineer, was born at Florence in 1536. His father lived on the banks of the Arno, in a house which, in 1547, was destroyed in a sudden rising of the river, when all the family were drowned, except Bernardo. The Grand Duke, Cosmo I., adopted the child thus saved as by a miracle, and, as he showed a lively imagination and a liking for art, had him taught painting by Salviati and Bronzino, miniature by Clovio, sculpture by Michelangelo, and architectural design by Vasari; and the pupil of many masters succeeded so well as to become the favourite of princes and sovereigns, and win the reputation of being a universal genius. Of his skill in painting the best known examples are his own portrait in the famous Gallery of Painters at Florence, and a miniature, 'The Holy Family,' in the Royal Gallery. A marble crucifix at Borgo-San-Friano, and some other works, are cited as illustrations of his ability as a sculptor; but it is as an architect he is perhaps best known. Among his works at Florence were the Casino, behind St. Mark's, a very handsome and well-planned structure; the Acciajuoli palace, and the fronts of the Strozzi, Martelli, and Riccardi palaces; the Villa Bratonilo, which he erected for the Grand Duke Francis I.; a new front to the hospital of Sta. Maria Nuova, and alterations of the interior of the church of Santa Maria Maggiore. At Pisa he erected the Arsenal Mediceo, the Logge di Banchi, and the façade of the church of S. Stefano; at Pistoja the Sozzifanti; and at Siena the grand-ducal palace. Having been nominated engineer in chief of Tuscany, he constructed the celebrated fortress of the Belvedere at Florence; the new citadel at Livorno (Leghorn), the enceinte of Pistoja, and various other works. So celebrated did he become in this line, that he was called to design important works at Porto Ferrajo, in the Isle of Elba, and elsewhere. He also erected several bridges, constructed various extensive hydraulic works, and is said to have greatly improved military engineering, and to have been one of the first to suggest the use of bombs in warfare. His skill and tact in devising the arrangements, scenery, and theatrical machinery for the triumphal processions and other public fêtes then so much in vogue, obtained for him the cognomen Delle Girandole. He died, according to Bottari, in 1608; but some authorities say, in 1606.

BURCHELL, WILLIAM JOHN, traveller, was born about 1781 at Fulham, where his father pursued the occupation of a nurseryman. In 1810 he went to the Cape of Good Hope, and for the next four years prosecuted those explorations with which his name is associated, and of which a partial account has been given in his 'Travels in the Interior of Southern Africa,' 2 vols. 1822—24. He traversed more than 4500 miles, and collected upwards of 63,000 natural history objects. This work indicates a very observant and intelligent mind, anxious to record every noteworthy fact that passed within its ken. He kept a constant record of the temperature and other climatal phenomena, and records a great many observations on the natural history of the district. In his anxiety to be as accurate as possible he made his own sketches on the wood, and constructed his own map, for which latter purpose he made numerous astronomical observations. From 1825 to 1830 he made a similar exploration of Brazil, and formed an immense collection of objects belonging to almost every branch of natural history. A short account of this

journey appeared in volume ii. of Hooker's 'Botanical Miscellany,' in which he says he had gathered 15,000 species of plants. He died at Fulham, March 23, 1863.

BUREN, MARTIN VAN, 8th President of the United States, was born at Kinderhook, in the State of New York, December 5th, 1782. The son of a farmer, he received a plain education in his native village, began in 1796 to study the law, and was admitted to the American bar in 1803. In 1808 he filled the office of Governor Surrogate in Colombia County, New York State. In 1812 he was elected representative to the Senate in the New York State legislature; and in 1815 Attorney-General of that State. His political career may be dated from 1818, when he commenced a new organisation of the party known at that time as the Democrats of New York State. He entered the Senate of the United States in 1821, a position he resigned in 1827, when elected to the Governorship of New York. He was appointed Secretary of State in 1829 by President Jackson; in 1831 he exchanged this post for that of American ambassador at the Court of St. James's; but, owing to an excited state of feeling at the time concerning Anglo-American disputes, the appointment was disallowed by the Senate of the United States, and annulled. In the following year he was elected Vice-President of the Republic, and, as a consequence, President of the Senate. On the termination of the presidency of General Jackson in 1836, Mr. Van Buren was elected to succeed him, defeating Harrison and Daniel Webster. His term of office was, however, a troubled one; it was a period of great financial difficulty, and the measures which he took to maintain the credit and improve the position of the country brought him into disfavour with a large body of his former supporters. Consequently, when he again competed for the presidency, in 1840, he was defeated by Mr. Harrison. Mr. Van Buren then retired for a time to his estate at Kinderhook. In 1844 he made one more attempt to regain his high office; but the Democratic National Convention of Baltimore, with whom the nomination on his side in party politics rested, selected Mr. Polk as their candidate. In 1848, when an attempt was made by the Southern interest to introduce slavery into the territories won from Mexico during the war, Mr. Van Buren refused to aid the democratic party in the manoeuvre, and assisted to bring in Taylor instead of Cass as President. In 1853—55 Mr. Van Buren made a prolonged tour in Europe, and then settled down permanently into private life. He died at Kinderhook, July 24, 1862, in the midst of the Civil War between North and South.

BURETTE, PIERRE JEAN, who combined in a remarkable degree the knowledge of a physician with a large amount of learning on musical subjects, was born at Paris on the 21st of November, 1665. He commenced life as a teacher of music; but out of the money thereby acquired he purchased books and paid for instruction in Latin, Greek, philosophy, and medicine, and he received the degree of doctor of medicine at the age of twenty-five. He was nominated physician to the *Charité des Hommes* in 1692; professor of *materia medica* in 1698; Latin professor of surgery in 1701; member of the *Académie des Inscriptions* in 1705; and professor of medicine at the *Collège Royal* in 1710. For about a third of a century, from 1706 to 1739, he was one of the editors of the '*Journal des Savans*,' in which he wrote largely. His medical papers, on various matters relating to the treatment of disease, were mostly published in this work; but those relating to the ancient literature of music, and allied subjects, appeared in the '*Mémoires de l'Académie des Inscriptions*.' Among them were thirteen papers on the Gymnastics of the Greeks, in relation to art and to amusement, as well as to health. Other papers by him, in the *Mémoires*, were on '*La Symphonie des Anciens*,' '*Le Rhythme des Anciens*,' '*La Mélodie de l'Ancienne Musique*,' and '*Les Ouvrages Modernes touchant l'ancienne Musique*.' He wrote a series of seven critical papers on Plutarch's *Dialogue on Music*; and others on the relative characteristics of ancient and modern music—all of which display much erudition. Burette died on the 19th of May, 1747.

BURKE, ROBERT O'HARA, who lost his life during an exploring journey in Australia, was born at St. Clerans, in Ireland, in 1812. He was educated partly in Belgium, and obtained a captaincy in the Radetzky regiment in the Austrian service, which he relinquished in 1848. For some time he had a command in the Irish mounted constabulary, which he resigned in 1853, and emigrated to Australia, where he became acting inspector of police at Melbourne and other places. In 1860, a donation of 1000*l.* was anonymously offered, through the Melbourne *Argus* newspaper—to be made up to 3000*l.* from

other sources—for defraying the expenses of an exploratory journey into the interior of Australia, to complete the researches commenced by Leichardt, Sturt, Eyre, Mitchell, and Oxley. The money being promptly subscribed, the expedition was placed under the command of Mr. Burke, who took with him Mr. Wills and about a dozen other persons. Well provided with camels, horses, stores, and instruments, the expedition started from Melbourne on the 20th of August, 1860. A difference of opinion led to the early return of all the men except Burke, Wills, King, and Grey, who, with six camels, a horse, and three months' provisions, recommenced the journey northward. Disappointment in meeting with supply parties, the death of the camels through exhaustion, and the loss of provisions, placed the party in great peril; nevertheless, they succeeded in reaching the Gulf of Carpentaria, on the north coast of Australia, and three of them found their way back to Cooper's Creek on April 21, 1861—Grey having died on the way. For months these men were entirely dependent on friendly natives for scanty supplies of food, having neither animals nor bodily strength sufficient to travel far from the Creek. At length Burke died through hunger, illness, and exhaustion, and Wills a few days afterwards, but King had no exact record of the dates. An exploring party, headed by Mr. A. W. Howitt (son of William and Mary Howitt) met with King on the 15th of September, living with some friendly natives. After burying the bodies of Burke and Wills, the party returned south, taking King with them. From the field-books of Burke and Wills, recovered by Mr. Howitt's party, it appears that they really crossed Australia from south to north, from Melbourne to the Gulf of Carpentaria, but that their scanty resources and weakened condition rendered them unable to make many scientific observations.

BURKITT, WILLIAM, who has a considerable reputation as a popular commentator on the New Testament, was born on the 25th of July, 1650, at Hitcham, in Suffolk. His father was the Rev. Miles Burkitt, of Edmund Hall, Oxford, who at that time held the living of Hitcham, of which he was deprived at the Restoration in favour of the former incumbent. He was ejected for nonconformity from the united benefices of Netishead and Irstead, to which Bishop Reynolds subsequently presented him, and afterwards lived privately at Monks Ely, upon an estate which he had purchased there. His son William received his earliest education with Mr. Gosse, of Bilston; afterwards successively at schools at Stow-Market and Cambridge, and was admitted, at 14 years of age, at Pembroke Hall. Having taken his degree, and received ordination from Dr. Edward Reynolds, Bishop of Norwich, he became domestic chaplain at Bilston Hall, and so continued for several years. With the duties of this position, it would seem that he at first combined those of a schoolmaster and curate of Milden, and that he subsequently held the living. He interested himself greatly for the relief of the French Protestants in Suffolk and Essex, and in the six years, 1687—1692, collected between two and three hundred pounds in their behalf. In December, 1692, Burkitt was appointed to be vicar and lecturer of Dedham, in Essex, where he continued until his death on Sunday, the 24th of October, 1703. Burkitt's conduct seems to have been in every respect estimable. His works comprise a *Funeral Sermon* on the death of the Rev. William Gurnall, entitled, '*The People's Zeal provoked to an holy emulation by the pious and instructive example of their dead Minister*,' 4to, 1680; '*An Argumentative and Practical Discourse of Infant Baptism* : in which (1) the Lawfulness of Infant Baptism is demonstrated; (2) the Objections against it are answered; (3) the usefulness of the Ordinance is asserted; (4) the sinfulness of Re-baptizing manifested; (5) the non-necessity of Dipping evidenced; (6) the Practical Use of Infant Baptism urged and enforced,' 8vo, London, 1695, 3rd edition, 1703; '*The Poor Man's Help*, and the *Young Man's Guide*,' a small but pious and useful book, which serves as a guide and incentive to godliness; '*Family Instruction* ; or, the Principles of Religion necessary to be known by family governors,' &c.; and last, and most important of all, his '*Expository Notes, with Practical Observations on the New Testament of our Lord and Saviour Jesus Christ* ; wherein the Sacred Text is at large recited, the sense explained, and the instructive example of the Blessed Jesus and his holy Apostles to our imitation recommended. The whole designed to encourage the Reading of the Scriptures in Private Families, and to render the daily perusal of them profitable and delightful.' The nature of this work, which has gone through many editions, is sufficiently indicated in the title; it is popular, perspicuous, and of great practical utility, but it is not critical, scholarly, or learned.

*BURMEISTER, HERMANN, zoologist, was born at Stralsund in 1807, and is the son of a tax-collector. He was educated at Stralsund, Griefswalde, and Halle. At the last-mentioned town he became acquainted with Nitzsch, who stimulated him to the study of zoology. In 1829 he was made a doctor of science, and in 1830 published his first work, a 'Lehrbuch der Naturgeschichte.' He then made a short stay at Hamburg, and proceeded to Berlin, where he gave lectures up to 1842, in which year he succeeded Nitzsch as professor of zoology at Halle. In 1848 he took a part in the political proceedings of the day, but his health failing, he travelled for two years in Brazil, and then resumed his post at Halle. In a subsequent visit to South America he gave his attention more particularly to the Argentine Confederation. These two journeys have given rise to many of his most important papers and works. Amongst the latter may be mentioned, 'Reise nach Brasilien,' 1853; 'Reise durch die La Plata Staaten,' 1861, and 'Erläuterungen zur Fauna Brasilien,' &c., 1856. His writings are numerous, and refer to all classes of the animal kingdom. Among the most prominent may be mentioned—'Die Organization der Trilobiten,' 1843, which was translated for the Ray Society; a 'Handbuch der Entomologie,' 1832, &c.; 'Grundriss der Naturgeschichte,' of which an 8th edition appeared in 1852. The list of his articles in the Royal Society's 'Catalogue of Scientific Papers' is 71.

BURNELL, GEORGE ROWDEN, born in 1814, was educated as a civil engineer. He was for some years employed in various branches of his profession in America, Belgium, and Holland, in the latter countries studying closely the great works connected with river engineering, sea defences, and the reclamation of land, in which the genius of the engineers of the Netherlands has been so conspicuous, and in which he attained an extent and accuracy of information possessed by few English engineers. Later he spent six or seven years in France, occupied as assistant engineer on the Paris and Rouen Railway, and as superintending engineer in the construction of the Havre Docks. Returning to England in 1848, and not finding readily an opening for active professional practice, he was led to turn his attention to the literature of his profession, to which he made in the course of the following years many valuable contributions, mainly, however, in the form of essays in the journals. One of his first independent works was 'The Rudiments of Hydraulic Engineering,' 8vo, London, 1852. For 'Weale's Rudimentary Series,' he wrote Treatises on 'Acoustics: the Elements, Practice, and Distribution of Sound in Public and Private Buildings;' 'On Well-sinking, Boring, and Pump-work;' 'On Hydraulic engineering;' 'On River Engineering;' 'On Fluids;' and 'On Limes, Mortars, Concrete, &c.' Having been called in as consulting engineer by some of the great gas-companies, he was led to pay particular attention to the manufacture of gas, and was for several years closely connected with the 'Journal of Gas-lighting,' which contains many valuable papers by him. He also contributed to the 'Builder,' and edited for several years the 'Engineer and Architect's Pocket Book,' and the 'Builder's and Contractor's Price Book.' As an active member of the Institute of British Architects, he contributed to its proceedings numerous sessional papers, some of a practical kind, as those on 'Building Materials employed at Paris and the Valley of the Lower Seine' (1852), on the 'Influence of some External Agents on the Durability of Materials' (1854); 'Observations on Pile Driving' (1855), &c.; and some of a more general order as 'Notes of an Excursion in the South-West of Galicia, Spain' (1852); 'Sixty Years Since, or Improvements in Building Materials and Construction during the Present Century' (1860); 'Operations lately carried on at Bayeux and Chichester Cathedrals' (1861); and 'Present Tendencies of Architecture and Architectural Education in France' (1865); as well as some articles to the 'Architectural Dictionary' of the Institute. To the Arts and Sciences Division of the ENGLISH CYCLOPEDIA he was a valued contributor. The elaborate articles on constructive architecture, on canals, river engineering and sea defences, tidal harbours, coffer-dams, the strength of materials, roads, drainage, sewers, reservoirs, water-supply, tunnels, gas-engineering, and the like, were written by him, and are admirable examples of special knowledge, conscientious accuracy, and terseness of expression. Of late his professional practice had been drawing more and more towards architecture, and he constructed several buildings of more or less importance. Perhaps the most noteworthy was the Equity and Law Life Office, on the north side of Lincoln's-inn-fields—a good English Renaissance edifice, remarkable for its structural character and the rare knowledge shown in the selection of materials. This knowledge led to Mr. Burnell's appointment as

a member of the Royal Commission of inquiry into the best means of preserving the stone of the Houses of Parliament. The earnest labour of so many years seemed to be bringing its reward, when his overtasked brain yielded, and he died on the 23rd of July, 1868, in his 54th year.

BURNET, JOHN [E. C. vol. i. col. 1042]. In his 75th year, being in feeble health and reduced circumstances, the services rendered to art by this eminent engraver and writer were rewarded by the Government of Lord Palmerston by a pension of 75*l.* from the Civil List. He lived to enjoy it just seven years, dying on the 29th of April, 1868.

*BURNOUT, EMILE LOUIS, was born at Valognes on the 25th of August, 1821. He studied successively at the Lycée St. Louis and the École Normale; became docteur-es-lettres in 1850, and was afterwards appointed professor of Ancient Literature to the faculty of Nancy. He is the author of theses entitled 'Des Principes de l'Art d'après la Méthode et les Doctrines de Platon,' and 'De Neptuno, ejusque cultu, præsertim in Peloponneso,' 8vo, Paris, 1850; 'Extraits du Novum Organum,' 12mo, Paris, 1850; 'Méthode pour étudier la langue sanscrite, sur le plan des Méthodes de J. L. Burnout,' 8vo, Paris and Nancy, 1859, the joint production of MM. Emile Burnout and L. Leupol; 'De la Nécessité des Études Orientales,' 8vo, Nancy, 1861; a translation of the 'Bhagavad-Gîtâ,' 8vo, Paris and Nancy, 1861; 'Essai sur le Véda, ou études sur les Religions, la Littérature, et la Constitution Sociale de l'Inde,' &c., 8vo, Paris, 1863; and a work in which he was also assisted by M. Leupol, 'Dictionnaire Classique Sanscrit-Français,' 8vo, Paris and Nancy, 1863—64. He has contributed some excellent papers to the 'Revue des Deux-Mondes' and other important journals.

BURNOUT, JEAN LOUIS, a celebrated French philologist, was born at Urville, in the department De la Manche, on the 14th of September, 1775. He was for a short time a pupil at the Collège d'Harcourt, which he left to enter a house of business, first at Dieppe and afterwards at Paris. In his leisure hours he studied Greek and Latin, with so much success that he was appointed in 1808 an assistant-professor at the Lycée Charlemagne. This institution he soon afterwards quitted in order to fill the chair of rhetoric at the Lycée Imperial, which he vacated in 1826 on being appointed inspector of the Academy of Paris. He acted as president of the École Normale from 1811 to 1822, and was named professor of Latin Eloquence at the Collège de France in 1817. One of the results of his labours in comparative philology is his 'Méthode pour étudier la langue grecque,' 8vo, Paris, 1814, which tended all over France to facilitate and to popularise the study of Greek, and which has by this time gone through more than fifty editions. M. Burnout passed the last years of his life in attempting to do for Latin what he had already done for Greek; and during his various avocations found time to edit and to translate several classical authors, especially Sallust, portions of Cicero, and, between 1828 and 1833, the whole works of Tacitus. In 1830 he was appointed inspector-general of studies; and on his resignation of this post in 1836, was made librarian to the university. He died suddenly on the 8th of May, 1844.

BURNOUT, EUGENE, son of the above, was born at Paris on the 12th of August, 1801. He was at first devoted to the study of law, and upon taking his degree in 1824, produced a remarkable thesis, entitled 'De Re Judicata.' Soon, however, he began to give undivided attention to the Oriental languages, which he studied under MM. de Chézy and Abel Rémusat, and in which he achieved distinction almost from the first. In 1826 he published an 'Essai sur le Pali, ou Langue Sacrée de la presqu'île au delà du Gange,' 8vo, Paris, 1826; and in the following year 'Observations grammaticales sur quelques passages de l'Essai sur le Pali,' 8vo, Paris, 1827. His researches in Sanskrit, carried on at the same time, resulted in numerous contributions to the 'Journal Asiatique' and the 'Journal des Savans.' His greatest distinction is his recovery of the knowledge of the Zend language, which he effected by means of the MS. which Anquetil-Duperron had brought from the east and deposited in the Bibliothèque-Royale. He caused one of the books of Zoroaster, the 'Vendidad-Sadé,' with a Sanskrit commentary, to be faithfully lithographed, and published in folio, Paris, 1829—1843. On the death of M. Champollion the younger, in 1832, he was elected to his place as a member of the Académie des Inscriptions et Belle-lettres, and in the same year he succeeded M. de Chézy in the chair of Sanskrit in the Collège de France. The principal works contributed by M. Burnout to the various departments of Oriental learning are, besides those already mentioned, 'Commentaires sur le Yaçna, l'un des

Livres liturgiques des Perses, 4to, Paris, 1833—35; a Sanskrit text, with a French translation of the 'Bhagavata Purāna, ou Histoire Poétique de Krichna,' 3 vols. folio, Paris, 1840—47; 'Introduction à l'Histoire du Bouddhisme Indien,' 2 vols. 4to, Paris, 1844, &c., a work explaining the dogmas and the origin of Buddhism, and which was followed by a translation from the Sanskrit of 'Le Lotus de la bonne Loi,' 4to, Paris, 1852, one of the most important of the canonical books of the Buddhists of India, which the translator accompanied with a 'Commentaire et vingt et un Mémoires relatifs au Bouddhisme.' Whilst this volume was in the press, its author was prematurely cut off on the 28th of May, 1852, and it was brought out by M. Théodore Pavie at the end of the year. During his short and fatal illness M. Burnouf was elected, fourteen days before his death, by the Académie des Inscriptions to be their perpetual secretary.

* BURNSIDE, AMBROSE EVERETT, one of the generals engaged in the American civil war, was born at Liberty, State of Indiana, May 23rd, 1824. He entered as a cadet at West Point Military Academy when about eighteen. After being second lieutenant in the 2nd Artillery, he filled the same post in the 3rd, with which he served in Mexico in Paterson's column. He was next engaged as first lieutenant in Captain Bragg's battery on frontier service in New Mexico. Quitting the service in 1853, he attended to the manufacture of a breech-loading rifle invented by himself; but the enterprise proving unsuccessful, he entered the service of the Illinois Central Railway Company, in which he remained till the breaking out of the civil war. When President Lincoln called for volunteers in April, 1861, Burnside was placed in command of the 1st Rhode Island Regiment. This was one of the first volunteer regiments to reach Washington. An army of North-Eastern Virginia being quickly organised under General McDowell, Burnside, with the rank of colonel, was appointed to the command of one of the brigades. This post was soon afterwards exchanged for that of brigadier-general of volunteers. General McClellan selected him to command the expedition to Pamlico Sound, known as the Burnside Expedition; he defeated the Confederates at Beaufort and Fort Macon; and his success won for him the rank of major-general of volunteers, and the presentation of a sword from the State of Rhode Island. He next commanded the 9th Army Corps in the army of the Potomac; then joined the forces near Washington; afterwards served in Maryland, where he distinguished himself at the battle of Antietam; and then commanded one half of McClellan's army in Virginia. In November, 1862, Burnside succeeded McClellan in command of the army of the Potomac, and made a forced march upon Fredericksburg. A crushing defeat in an attempt to take that place by storm in the following month led him to resign his post. In 1863 he was mostly engaged with the army under Rosencranz, and farther to the west; and in 1864 he commanded a corps of reserve under General Grant. He had a large number of negro troops under him; and a failure in some of the operations which he conducted led to his being superseded in the command. General Burnside was appointed Governor of Rhode Island in 1865.

* BURTON, RICHARD FRANCIS, a distinguished explorer and geographer, the son of Colonel Joseph Netterville Burton, was born in 1820 at Tuam, in Galway, Ireland. Entering the service of the East India Company, he obtained a lieutenancy in a native regiment, in the Bombay Presidency. In 1843 he served in Sindh, under Sir Charles Napier; and was employed in that country for some years in the survey conducted by Colonel Walter Scott, of the Bombay Engineers. Gifted with a remarkable facility for acquiring languages and accommodating himself to the manners of various countries, he took advantage of his stay in this province to study its geography and populations, and published his observations in three works—'Sindh, or the Unhappy Valley,' 2 vols. 8vo, London, 1850; 'Falconry in the Valley of the Indus,' 8vo, London, 1850; and 'Sindh and the Races that inhabit the Valley of the Indus,' 8vo, London, 1851. He published also 'Goa and the Blue Mountains; or Six Months of Sick Leave,' 8vo, London, 1851; but before this he had contributed to comparative philology his 'Grammar of the Mooltanee Language,' and 'Critical remarks on Dr. Dorn's Chrestomathy of the Pushtoo, or Affghan Dialect.' His minute and colloquial knowledge of Arabic now suggested to him the possibility of visiting Medina and Mecca, where no European had penetrated since Burckhardt. With this view he visited England in the latter end of 1851, in order to receive the instructions of the Geographical Society, under whose auspices he proposed to make the journey. He embarked at Southampton in April, 1853, and having, after his arrival at Suez, adopted the habits of an Affghan

BIOG. DIV.—SUP.

pilgrim, succeeded in penetrating to the two holy cities and in accomplishing a safe return to Cairo. The particulars of this expedition are recorded in a 'Personal Narrative of a Pilgrimage to El Medinah and Meccah,' 3 vols. 8vo, London, 1855—57. Lieutenant Burton's next adventure was the expedition to the Somanli country, the first attempt to penetrate Eastern Africa in that quarter, which led the way indirectly to the Nile expeditions which lasted from 1856 to 1859. In this exploration, which it was impossible to prosecute beyond Harar, he was accompanied by Lieutenants Stroyan, Speke, and Hern, the first of whom was killed, whilst Burton himself was severely wounded. The account of this expedition was published under the title of 'First Footsteps in East Africa; or, an Exploration of Harar,' 8vo, London, 1856, a volume which contained a grammar of the language of Harar. At the end of 1856 Lieutenants Burton and Speke set out on a mission to verify the existence of an inland sea announced by the Arabs and the missionaries of the coast of Zanzibar. The result was the discovery of the vast lake of Tanganyika, of which an account is given in a work entitled 'The Lake Regions of Central Africa,' 2 vols. 8vo, London, 1860. Speke penetrated to the Lake Nyanza. Burton returned to England in May, 1859, and was immediately promoted to the rank of captain. Finding his health impaired by the African climate, he embarked for the United States, which he traversed from the Atlantic to the Pacific, but especially devoted himself to an investigation of the phenomena of Mormon life and character, which he defended with an eccentric and paradoxical vivacity in a volume entitled 'The City of the Saints, and across the Rocky Mountains to California,' 8vo, London, 1861. In 1861 Captain Burton was appointed British Consul for Fernando Po and the Bight of Biafra, and volunteered to visit Agbome; but as the measure did not seem at that time advisable, his journey thither was deferred till the latter part of 1863, when he received instructions to proceed as commissioner to Dahomy. From his residence at Fernando Po as a base, Captain Burton conducted several explorations, as is indicated by the titles of the following works which belong to this period of his life:—'Abeokuta and the Camaroons Mountains,' 2 vols. 8vo, London, 1863; 'A Mission to Gelele, King of Dahome. With notices of the so-called "Amazons," the Grand Customs, the Yearly Customs, the Human Sacrifices, the present State of the Slave Trade, and the Negro's Place in Nature,' 2 vols. 8vo, London, 1864; and 'Wit and Wisdom from West Africa; or a Book of Proverbial Philosophy, Idioms, Enigmas, and Laconisms,' 8vo, London, 1865. On the 4th of April, 1865, Captain Burton was entertained, previous to his departure for the duties of the consulate in Brazil, at a farewell dinner given by the Anthropological Society, London, of which he was senior vice-president. Lord Stanley presided at this banquet; and it was to this nobleman, as an anthropologist and Secretary of State for Foreign Affairs, that Captain Burton dedicated from Santos, São Paulo, July 23, 1868, his 'Explorations of the Highlands of the Brazil,' 2 vols. 8vo, London, 1869. To see this book through the press was one of the principal reasons which induced Mrs. Burton, who had resided with her husband for three years in Brazil, to pay a visit to England. After a residence of three years and a half in Brazil, Captain Burton has been lately transferred to the consulate of Damascus. His last work, the result of his Brazilian experience, is entitled 'Letters from the Battle-Fields of Paraguay,' 8vo, London, 1870. Captain Burton is a gold medallist of the Geographical Societies of London and Paris, and a member of various learned and scientific corporations.

BURY, RICHARD DE. [RICHARD DE BURY, E. C. vol. v. col. 90.]

BUSBY, THOMAS, a voluminous writer on music, was born in Westminster, in December, 1755. After studying five years under Jonathan Battishill, he was appointed organist to St. Mary's, Newington, in 1780. In 1800 he was admitted Doctor of Music at Cambridge; and, in the same year, received the appointment of organist to St. Mary's, Woolnoth. Works relating to music proceeded rapidly from his pen. In 1786, he contributed the historical portion to Arnold's 'Musical Dictionary.' In 1788 he began the publication of the 'Divine Harmonist,' a collection of sacred music. In 1790 appeared his 'Melodia Britannica, or the Beauties of British Sacred Song.' In 1792, he commenced the 'Monthly Musical Journal.' In 1800, was published his 'Musical Dictionary,' 1 vol. 12mo (a work distinct from that which he wrote in conjunction with Dr. Arnold). In 1809, appeared the 'Musical Grammar,' 8vo; and, in 1820, a second work on the same subject, the 'Grammar of Music,' 12mo. In 1819, appeared a 'General History of Music,' 2 vols. 8vo,

mostly condensed from the larger works by Burney and Hawkins; this was translated and published in German, in 1820. In 1828 he added to his other works, a 'Musical Manual,' 12mo. There also appeared from his pen a 'Life of Mozart,' and numerous musical papers in the 'Monthly Magazine,' of which he was for some time musical editor. Dr. Busby's original compositions were not of much note. They comprised (1) 'The Prophecy,' an oratorio, 1799; (2) 'Comala,' an opera founded on Ossian, 1800; (3) 'Joanna,' another opera, in the same year; (4) 'Britannia,' an oratorio, 1801; (5) 'The Tale of Mystery,' a musical melodrama, 1802; (6) the 'Fugitive Fairies,' an opera, 1803; (7) 'Rugantino,' a musical melodrama, 1805; besides a musical setting of 'Gray's Ode to Poesy,' and 'Pope's Ode for St. Cecilia's Day.' Dr. Busby died at Islington on the 28th of May, 1838.

BUSNOIS, BUSNOYS, or BUSNE, ANTOINE DE, a French or Belgian musical composer in the 15th century, whose year of birth is not known, entered the service of Charles the Bold, Duke of Burgundy, as a singer, in 1467. In 1470, he became demi-chaplain at the ducal palace, and soon afterwards chaplain. He often accompanied the Duke on his travels; and when the Duchess Mary succeeded Charles as the ruler of Burgundy, Busnois retained his post at court. He filled various appointments of trust at Maastricht and Mons, and died in the last-named town either in 1480 or 1481. There are extant many 'Chansons Françaises à quatre parties,' and 'Motets à trois voix,' by Busnois, interesting to composers as denoting the state of musical composition in France and Belgium four centuries ago. Some of them are contained in a collection by Fossambrone; and others, translated into modern notation, in a collection by Kiesewetter. It is believed that one or more foreign libraries contain MS. music by Busnois, at present unknown; as well as a 'Treatise on Music for the Use of his Pupils.' The Bibliothèque Royale at Brussels contains a great quantity of MS. ecclesiastical music by him, characteristic of the rules of harmony and composition known in his day.

BUTLER, ALBAN, a learned hagiographer, second son of Simon Butler, Esq., of Appletree, in Northamptonshire, was born in 1710. When about eight years of age, he lost his father and mother, and was sent to the English college at Douay, where, after he had completed the usual course, he was admitted an alumnus of the college, and appointed successively professor of philosophy and of divinity. His goodness was eminent, and his practical charity exhibited itself especially in the solicitude he displayed for the English soldiers who were brought wounded and maimed to Douay, to be quartered there as prisoners, after the battle of Fontenoy, April 30, 1745. In this year he accompanied the Earl of Shrewsbury and his brothers, on their travels in various parts of the continent, of which he wrote an interesting account, published posthumously, under the editorial care of Charles Butler, his nephew and biographer, with the title of 'Travels through France and Italy, and part of Austrian, French, and Dutch Netherlands, during the years 1745 and 1746,' 8vo, Edinburgh and London, 1803. He now commenced the publication of his great work, 'The Lives of the Fathers, Martyrs, and other principal Saints, compiled from original Monuments and other authentic Records, illustrated with the Remarks of judicious modern Critics and Historians,' 5 vols. 8vo, London, 1745, &c. The first edition was published without the notes by which subsequent ones were enriched, on the advice of Mr. Challoner, the vicar-apostolic of the London district, who counselled their omission on the ground of greater economy and usefulness. The work has been extremely popular; and edition has followed edition, both in English and French, that published in 12 vols. 8vo, London, 1847, being considered the best and most complete. On his return from his travels, Mr. Butler was appointed a missionary in Staffordshire. He did not, however, long continue there, being invited to become chaplain to the Duke of Norfolk, and to superintend the education of Mr. Edward Howard, his nephew and presumptive heir, whom he accompanied to Paris, and it was during his stay in this city, that the 'Lives of the Saints,' a work on which the author had been engaged for thirty years, was completed. It is known as a curious storehouse of pious meditation and exhortation, and of ecclesiastical and secular learning; and even Gibbon allows it to be "a work of merit:—the sense and learning belong to the author; the prejudices are those of his profession."

Some time after Mr. Butler's return to England, he was chosen president of the English college at St. Omer, an office which, after some hesitation, he accepted, and the duties of which he accordingly assumed and discharged until his death, on the 17th of May, 1773, combining with them the functions of vicar-general

to the Bishops of Arras, St. Omer, Ypres, and Boulogne, and probably those of vice-president and professor of divinity in the English college at Douay. Butler's other works are, 'Remarks on the two first volumes of the late "Lives of the Popes" [by Archibald Bower], in Letters from a Gentleman to a Friend in the Country,' 8vo, Douay, 1754. This small production is most unaccountably said, by Mr. Charles Butler, to have been the first result of his uncle's literary activity; and in this assertion he has been followed by every biographer who has noticed the Letters on Bower's 'History of the Popes' at all. The absurdity is to be understood from the fact that the 'Lives of the Saints,' began to be published in 1745, whilst Bower's work, in 7 vols., began to be issued in 1748, and was completed in 1766, and could have been animadverted on by Butler only after, at least, partial publication. A volume on 'The Moveable Feasts, Fasts, and other Annual Observances of the Catholic Church,' which was left unfinished by the author, was published 'with a Continuation by a Catholic Priest,' and an edition was printed at Dublin, in 8vo, 1839. Mr. Charles Butler superintended the issue of his deceased uncle's 'Life of Sir Tobie Matthews,' 8vo, London, 1795; as the Rev. Mr. Jones did his 'Meditations and Discourses on the Sublime Truths and Important Duties of Christianity,' 3 vols. 8vo, London, 1791, 1792, and 1793. Of this last work, a new edition was brought out at Dublin, 1840, by Dr. Lanigan. Alban Butler made collections for the 'Lives of Bishop Fisher and Sir Thomas More;' and he aided Cardinal Quirini in his edition of 'Cardinal Pole's Letters.'

BUTLER, WILLIAM ARCHER, the first Professor of Moral Philosophy in the University of Dublin, was born in or about the year 1814, at Annerville, near Clonmel, in Tipperary, of an ancient family, and was brought up in the religion of his mother, who was a Roman Catholic. At nine years of age he was sent to the endowed school of Clonmel, where he soon attracted the attention of the principal, the Rev. Dr. Bell, for the sprightliness and amiability of his temper and the force of his genius. Although not a hard student in the ordinary course, he was a constant and discursive reader; and he applied himself to poetry and music with uncommon ardour and success. His studies in philosophy, principally that of Lord Bacon and of the Scottish school, were close and spontaneous. It was during his pupilage at Clonmel, that, after an examination of the questions at issue between Papists and Protestants, he elected to abide by the faith of the latter; and two years afterwards, entered Trinity College, Dublin, where he presently achieved a reputation as a wit and a versatile and accomplished scholar. Whilst still an undergraduate, he distinguished himself by his contributions to the 'Dublin University Magazine,' in poetry, speculation, and criticism. Butler was celebrated, also, for his rhetorical ability as a speaker at the College Historical Society, of which he was President in the year 1835; having in November, 1834, been the first to win, at his degree examination, the prize of the Ethical Moderatorship, then just instituted by Dr. Lloyd, the Provost of Trinity. For two years subsequent to his baccalaureate, Butler continued in residence as a scholar, when his connexion with the University—which reserved its fellowships as the rewards of excellence in the mathematical and physical sciences—must have determined, but for the intervention of Dr. Lloyd, through whose exertions a Professorship of Moral Philosophy was founded in 1837; and to this arduous post Butler was appointed on the expiration of his scholarship. The youthful Professor was now upon a field worthy of his endowments, and his lectures were as remarkable for their eloquence as for their solidity. Simultaneously with his academical appointment, Mr. Butler was presented by the Board of Trinity College to the prebend of Clondelhorky, in the diocese of Raphoe, and county of Donegal, and held it along with his Professorship till 1842, when he was re-elected to the chair of Moral Philosophy, and promoted by the Board of Trinity College to the rectory of Raymochy, in the diocese of Raphoe. In the summer of 1844, he visited Westmoreland as the guest of his friend, the Rev. Robert Perceval Graves, curate of Windermere, where he made the acquaintance of Mr. Wordsworth, Archdeacon Hare, and Sir William R. Hamilton.

During the year 1845, the Roman Catholic controversy seems to have much engaged the attention of Professor Butler; and he filled several manuscript volumes with collections on the subject. In December of that year he published in the 'Irish Ecclesiastical Journal,' to which he was a constant contributor, the first of his valuable series of 'Letters on Mr. Newman's Theory of Development,' collected and published under the editorial care of Mr. Woodward, with the title of 'Letters on the

Development of Christian Doctrine; a reply to John Henry Newman, D.D., 8vo, Dublin, 1850; 8vo, 1854; 8vo, 1856. During the famine of 1846-47, which raged with appalling intensity in the neighbourhood of Professor Butler's parish, his exertions were ceaseless; and for a time the duties of a relieving officer prevented his habitual devotion to literature, philosophy, and divinity. In the latter part of 1847, and for the first half of 1848, Professor Butler was mainly occupied with the preparation of a work on Faith; and in illustration of his subject had collected a vast mass of materials from the Fathers, the Schoolmen, the Continental Reformers, and the Anglican divines. Death came in suddenly in bar of his project, and no indication is left of the method to which the intended work would have been conformed. On Trinity Sunday, 1848, Butler assisted and preached the sermon at an ordination held in the church of Dunboe by the Bishop of Derry; and on the Friday after, whilst on his return to his home, which was only a few miles distant, he was stricken with a sickness which resulted in his death on Wednesday, the 5th of July.

Butler's most important works were of posthumous publication. The Rev. Thomas Woodward, who was appointed in 1856 to the Deanery of Down, edited a first series of 'Sermons, Doctrinal and Practical,' 8vo, Dublin, 1849; 3rd edition, 8vo, London, 1855; Philadelphia, 12mo, 1856. A second series appeared under the editorial care of Dr. Jeremie, Subdean and Canon of Lincoln, and Regius Professor of Divinity at Cambridge, 8vo, Cambridge, 1855; 8vo, Philadelphia, 1857. Finally, Butler's 'Lectures on the History of Ancient Philosophy,' 2 vols. 8vo, Cambridge, 1856; 2 vols. 8vo, Philadelphia, 1857, were edited from the author's MS., with Notes by the Rev. William Hepworth Thompson, M.A., Fellow of Trinity College, and Regius Professor of Greek in the University of Cambridge.

* BUTTERFIELD, WILLIAM, Gothic architect, was born in 1814. Having gone through the usual professional training, Mr. Butterfield made himself known from the commencement of his practice as an architect, by his decided mediævalism. Without being a follower of Pugin he seemed to have accepted Pugin's principles, and he has carried them out with remarkable consistency. In the active practice of over twenty years, he has necessarily designed and erected a variety of buildings, but those which are distinctive are his churches and collegiate buildings, and in both the employment by preference of brick instead of stone as the material. Of his churches, the best known are All Saints, Margaret Street, and St. Alban's, Baldwin's Gardens, London. Each of these comprises a group of ecclesiastical buildings, of which the church is the centre, but priests' houses, in the former schools, and other accessories, form an essential part of the composition. Yet in both the exterior, of ordinary stock bricks with stone dressings sparingly employed, is comparatively plain, the decoration being reserved for the interior of the church, which in each instance was more costly and richer in character than was then usual—fresco paintings forming in both the conspicuous decoration of the chancel, along with, especially in St. Alban's, coloured marbles and alabaster. St. Alban's church was further noteworthy as an attempt to produce a city church in which a large congregation might see as well as hear the service unobstructed by massive piers, the building at the same time being in accordance with the strictest ecclesiastical principles. Among Mr. Butterfield's other churches are those of Baldersby, near Ripon, Yorkshire, 1859; St. John the Evangelist, Hammersmith, 1860; St. John the Baptist, Bamford, Derbyshire; Newbury, Berkshire; Emery Down, Hampshire, 1864; the Holy Saviour, Hitchin, Hertfordshire, 1865; the fine cruciform church of Penarth, Glamorganshire, 1867; St. Mary the Virgin, Strathfieldsaye; and All Saints, Babbicombe, Devonshire, resplendent with the various marbles of the district. All these are more or less what is called ritualistic in character, and studiously symbolical in the arrangements and details, and all are, or are intended to be, splendid in the internal decorations and fittings. But we ought not to pass from his churches without mentioning that he has also erected a number of village and district churches of an inexpensive kind, in which he has sought to show how much effect can be imparted to such structures at little additional cost, by the employment of artistic taste and ingenuity: St. Ann's, Littleworth Common, Dropmore, a picturesque little building of timber, flint, and brick, may be cited as a type of the class. It was, however, not as a church-architect that Mr. Butterfield made his mark. The work by which he first became known was the Missionary College of St. Augustine, Canterbury,

erected and endowed by the munificence of Mr. A. J. Beresford Hope, in 1848. Mr. Butterfield took the desecrated remains of St. Augustine's Abbey as his model, but he executed the work with a thoroughness then rare in Gothic work, and not since surpassed. He has since erected at Oxford the new chapel of Balliol College, and the New Buildings of Merton, 1864, and his latest great work, Keble's College, opened in 1870. In this last, and the rarest of all opportunities which fall to the lot of an architect is that of building a new college in one of our University towns, Mr. Butterfield has entirely disregarded the traditions of the place. The building is of parti-coloured bricks, while all the old colleges are of stone, and the style is a Gothic quite unlike the Gothic of any other building in Oxford. Whether he has been as successful as he has been venturesome, it is not for us to decide.

BYRON, LADY. Anne Isabelle Noel, Baroness Wentworth, born May the 17th, 1792, was the daughter and heiress of Sir Ralph Milbanke, Bart., and Lady Judith Noel, sister and co-heir of Thomas Noel, Viscount Wentworth. She married Lord Byron on the 2nd of January, 1815; a daughter, Augusta Ada, was born to them on the 12th of the following December, and six weeks later, January, 1816, they parted never again to meet. Lady Byron (she became Baroness Wentworth in 1856, but continued to be addressed by the more familiar title) survived the separation forty-four, and the death of her husband thirty-six, years, dying at her residence, St. George's Terrace, Regent's Park, on the 16th of May, 1860, the eve of the completion of her 68th year. The earlier years of her widowhood were devoted to the education of her daughter; the rest of her life was passed in the active promotion of various benevolent purposes, especially such as were of an educational character. She founded in 1834 an industrial school for boys at Ealing, on the system of Fellenberg, and another at Leicester, a reformatory for girls, and some village schools. During her later years she was much concerned in the promulgation of her peculiar theological and spiritualistic views.

Here the record ought properly to cease. But though it is said by her friends, that her love for her husband endured to the end, and that ever before her during those last years was the image of her husband purified and ennobled, she has been made the means of inflicting a darker stain on his memory than his worst enemy could have imagined or desired. The hideous story can now, unhappily, hardly be left without distinct reference in a biographical cyclopædia, but it may be most fitly noticed, as far as notice is requisite, in connection with the lady who first made it known, who has since set forth the revolting details in all their amplitude, and with whose name it must henceforth be indelibly associated. [STOWE, HARRIET ELIZABETH BECHER, E. C. S.]

BYSTRÖM, JOHANN NIKOLAUS, an eminent Swedish sculptor, was born at Philipsteden in the province of Wermland, December 18, 1783; studied sculpture under Sergell at Stockholm; in 1809 gained the prize of the Stockholm Academy, and in the following year went to Rome, where he remained till 1815. A marble figure of an Inebriated Bacchante, and a colossal statue of the Prince Royal were much admired, and secured him the patronage of the Swedish court. He was nominated professor, and received commissions for colossal marble statues of the Kings Charles X., XI., XII., XIII., and XIV. From this time he continued to produce portrait-statues, busts, and imaginative pieces, chiefly classical in subject as well as style, and all found ready purchasers when they had not been previously commissioned. Byström's tastes were for the old classical subjects and the old manner of executing them, and he had a strong predilection for Rome, where the prevalent taste was so entirely in accordance with his own. Though esteemed and honoured at home, he constantly turned to Rome, removed there finally in 1844, and there died on the 13th of March, 1848. Byström is regarded as one of the greatest sculptors of Sweden, but his works are cosmopolitan rather than national. Besides those already named, he executed statues of Linnæus, and one or two other of his eminent countrymen, and many busts, but his chief works are representations of Juno, Apollo, Hercules, Loves, Nymphs, Bacchantes, and the like.

BZOVIUS, or BZOWSKY, ABRAHAM, was born at Proszowitz, in Poland, in 1567. He studied at Cracow, and became a Dominican, and the principal of a college of that order. He founded a fraternity of the Rosaria; consecrated a chapel to the image of St. Mary the Great, which he brought from Rome to Cracow; added a large number of books to the library of the Dominicans; pacified Poland; caused the Church of St.

Hyacinthus to be built in Warsaw, and rendered other services to his country, but especially to the Dominican order, to the interests of which he was attached with such exclusive devotion as to call up against him the bitter opposition of the Franciscans and the Jesuits. Bzovius is known as a singularly fertile writer; so that it has been seriously maintained that he composed more books than others have read. His chief work is his continuation of the 'Annals' of Baronius; a work extending to 9 folio volumes, of which the first eight appeared at Cologne, between 1616 and 1635. These brought down the history of the church from the end of the pontificate of Celestine III., when Baronius

concluded, to the year 1564. Another volume appeared in 1672, several years after the author's death, which continued the history to 1572. In his history, which is that of the Dominicans rather than that of the church, Bzovius is remarkable for his servile attachment to the court of Rome; so that when he visited Rome, he was received with distinction by the Pope, and lodged in the Vatican. A short time before his death, which took place in 1637, he retired from his residence in the Vatican to the convent of Minerva at Rome, having been terrified by the murder of one of his servants, and mortified by the loss of a large sum of money which the murderer carried off.

C

* CABANEL, ALEXANDRE, a distinguished French painter, was born at Montpellier, September 28, 1823; studied in the atelier of M. Picot, and won the grand prize of Rome in 1845. A large picture of the 'Death of Moses,' a 'St. John,' and 'Velleda,' exhibited on his return to Paris in 1850, attracted much notice, and secured him numerous commissions. Among other works, he executed a series of twelve medallions of the Months at the Hôtel de Ville. Other commissions and purchases for the State followed; M. Cabanel was honoured with the especial patronage of the Emperor, and rose steadily in popularity till, by common consent, he took rank among the foremost painters of France. The range of his art is shown by the titles of the pictures already quoted, and such others as his 'Christian Martyr,' one of his most celebrated works; the 'Soir d'Automne,' 'Aglæa,' 'Othello Racontant ses Batailles,' and 'Michaelangelo.' But M. Cabanel has also painted many portraits, generally of persons of high social position, and he has succeeded in giving them an air of ease and distinction the mere portrait-painter seldom attains.

† The International Exhibition of 1862 contained two large and very famous paintings by M. Cabanel, which admirably illustrated his style, the 'Glorification de St. Louis,' the property of the State, a vast pompous theatrical composition; and a 'Nymph enlevée par un Faune,' the property of the Emperor, a life-size naked woman struggling in the arms of a brawny satyr, painted with surprising force and mastery, but meretricious to the verge of voluptuousness in design and treatment, and utterly unreal, though brilliant in colour; a picture bearing in it all the marks of a corrupt and declining school. To the Salon of 1870, M. Cabanel contributed another very large and very powerful picture, but equally unhealthy in subject and treatment, 'Mort de Francesca de Rimini et de Paolo Malatesta.' M. Cabanel received a medal of the 2nd class in 1852, and of the 1st in 1855. He was decorated in 1855, and made officer of the Legion of Honour in 1864. In 1863 he was elected member of the Academy in succession to Horace Vernet, and appointed professor at the École des Beaux-Arts.

CABET, ETIENNE [E. C. vol. ii. col. 2.] M. Cabet returned to Paris about the end of 1850, and seemed to be in a fair way of regaining his popularity with the working population, but the Coup d'État put an end to his hopes, and he rejoined his friends in Nauvoo. There he was for awhile again placed at the head of his partisans, but eventually his opponents gained the mastery, and he was forced to take refuge in St. Louis, Missouri, where he died on the 9th of December, 1856.

CÆSALPINUS, ANDREAS, was born in 1519 at Arezzo. Unfavourable accounts are given of the early years of this distinguished scientific reformer, owing to his great distaste for methodical study. His original and independent mind led him to put embarrassing questions to the Professors whose lectures he attended. He studied medicine and took his degree, and then, free from the trammels of the schools, he entered upon a career of philosophical observation which he continued to the age of 84. Taking the philosophical doctrines of Aristotle according to their true sense, he freed them from the pedantry of the schools, made science attractive by directly appealing to nature, and marked by his labours the first great epoch in botanical science. While treating the peripatetic with respect, he was constantly looking onwards towards a better philosophy. His 'Quæstiones Peripateticæ,' published at Florence in 4to, 1569,

produced a great sensation, raising up for him a host of friends and some enemies, the latter, in the true spirit of intolerance, seeking the aid of the Holy Inquisition in quenching the new light. Happily they did not succeed in putting down a man who was superior to the leading ideas of his time. In his 'Dæmonum Investigatio Peripatetica,' Florence, 1580, 4to, he fights against the follies of magic and sorcery. His friends also claim for him the discovery of the circulation of the blood, and the proofs of this anticipation of Harvey are, according to the friendly criticism of Bayle, quite clear, reference being made to the 'Quæstiones Peripateticæ,' lib. v. ch. 4, fol. 125; 'Quæstiones Medicæ,' lib. ii. ch. 17, fol. 234. See also, 'De Plantis,' lib. i. ch. 2.

The last named work is his "magnum opus"; it was published at Florence in 1583, and contains 16 books, 47 sections, and 940 chapters. After referring to the splendid multiplicity of the productions of nature, and the confusion hitherto prevailing among writers on the growing treasures of the botanical world, he says: "In this immense multitude of plants, I see that want which is most felt in any other unordered crowd. If such an assemblage be not arranged into brigades, like an army, all must be tumult and fluctuation, and this accordingly happens in the treatment of plants; for the mind is overwhelmed by the confused accumulation of things, and thus we have endless mistake and angry altercation." He then states his general view, which was adopted by his successors. "Since all science consists in the collection of similar and the distinction of dissimilar things, and since the consequence of this is a distribution into genera and species, which are to be natural classes governed by real differences, I have attempted to execute this task in the whole range of plants." He then goes on to mark the kind of plants by essential circumstances in the fructification. In the constitution of organs three things are insisted on; the number, the position, and the figure: for example—"some have under one flower one seed, as Amygdala; or one seed-receptacle, as Rosa; or two seeds, as Ferularia; or two seed-receptacles, as Nasturtium; or three, as the Tithymalum kind have three seeds; the Bulbaceæ, three receptacles; or four, as Murrubium, four seeds, Siler, four receptacles: or more, as Cicoraceæ and Acanaceæ have more seeds, Pinus, more receptacles."

"It will be observed," says Dr. Whewell (Hist. of the Inductive Sciences, 3rd edition, 1857, iii. 239), "that we have here ten classes made out by means of number alone, added to the consideration of whether the seed is alone in its covering, as in a cherry, or contained in a receptacle with several others, as in a berry, pod, or capsule. Several of these divisions are, however, further subdivided according to other circumstances, and especially according as the vital part of the seed, which he called the heart (cor), is situated in the upper or lower part of the seed."

Cæsalpinus was not a writer only, but a laborious collector of plants. His herbal is still preserved with veneration at Florence. It contains 768 dried species, to which are attached the names given by the collector, and also the names common to several parts of Italy. "During many years," he says, "I have been pursuing my researches in various regions, habitually visiting the places in which grew the various kinds of herbs, shrubs, and trees. I have been assisted by the labours of many friends, and by gardens established for the public benefit, and containing foreign plants collected from the most remote regions." He here refers to the Botanic Garden of Pisa, established in 1543, by order

of the Grand Duke, Cosmo I., the management of which was confided first to Lucas Ghini, and afterwards to Cæsalpinus.

Many botanists, especially Morison, took advantage of the labours of Cæsalpinus without acknowledgment, but so much was this great man in advance of his time, that before his method was generally adopted, there occurred a stationary interval, an interesting account of which is given by Whewell (loc. cit. 243).

What Cæsalpinus did for plants he also attempted for metals, but not with such happy effect. In his work, 'De Metallicis,' published at Rome, 1596 (and again at Nürnberg, in 1602), he was led by some of his general views to disbelieve in the fixity of the form of crystals. He says: "To ascribe to inanimate bodies a definite form, does not appear reasonable; for it is the office of organisation to produce a definite form;" "an opinion," says Dr. Whewell, "very natural in one who had been immersed in the general analogies of the forms of plants." Still, however, there are some striking views in this work. He defines metals as vapours condensed by cold, and distinguishes them from vegetables in not putrifying, and supplying no aliment for the development of animal structure. He accounts for the existence of fossil shells in rocks, by supposing that the sea formerly occupied the land, and in retiring, left traces of its presence. He even anticipated the discovery of oxygen, by noticing that the film which covers molten lead, by exposure to air, is due to an aerial body which increases the weight of the metal. He terms lead a soap which cleanses silver and gold by cupellation, and he also describes graphite.

Bayle remarks that the works of Cæsalpinus are not free from heresy, and expresses surprise that he escaped the censures of the Church; but possibly his office of first physician to Pope Clement VIII. proved his safeguard, although, according to Bayle, his principles scarcely differ from those of Spinoza.

Teissier, in his 'Eloge,' places Cæsalpinus among the greatest men of genius that have ever lived. He is said to have passed a sober active life, free from illness, and to have died at Rome, February 23rd, 1603.

CÆSAR, SIR JULIUS, was the eldest son of Dr. Cæsar Adelmare, a member of a noble family of Treviso, a city near Venice, who, having studied medicine at Padua, came over to England, where he received letters of naturalization, August 28th, 1558, and became physician successively to Queens Mary and Elizabeth. Julius was born at Tottenham, near London, in 1557, and enjoyed royal patronage from his infancy, Queen Mary being one of his sponsors. At his baptism he received the names of Julius Cæsar, the latter of which he seems very early, though not quite uniformly, to have substituted for that of his ancestors. He entered at Magdalen Hall, Oxford, and took his B.A. and M.A. degrees respectively in 1575 and 1578. He became a member of the Inner Temple in October, 1580; and, proceeding to Paris, graduated as doctor in both laws in 1581, in which degree he was incorporated at Oxford in 1583. He was appointed in October, 1581, to be "Justice of the peace in all cases of piracy," and Chancellor of the Master of St. Katherine's near the Tower. In 1583 he became counsellor to the city of London, and commissary of Essex, Herts, and Middlesex; and on the last day of April, 1584, was made Judge of the Admiralty Court. Thus preferred at an early age, he was still discontented; and the petitions he presented to the Queen for advancement and emolument were partially answered by his admission in October, 1588, to be one of the Masters in Chancery. On the 10th of January, 1591, he was appointed a Master Extraordinary, and on the 17th of August, 1595, one of the ordinary Masters of the Court of Requests. In 1593, without having passed through the grade of Reader, he was elected Treasurer of the Inner Temple; on the 8th of December in the same year, governor of the mine and battery works throughout England and Wales; and on the 17th of June, 1596, he succeeded to the Mastership of St. Katherine's, the reversion of which he had already secured by a bribe. In September, 1598, Queen Elizabeth paid him the expensive honour of a visit to his house at Mitcham; and on the 20th of May, 1603, he received knighthood from James I., who in the same year reappointed him Master of the Court of Requests, and Master of St. Katherine's. On the 11th of April, 1606, the important office of Chancellor and Under-Treasurer of the Exchequer was conferred upon him; and in the year following, he was sworn of the Privy Council. He became Master of the Rolls in 1614; a place which he continued to hold until his death on the 18th of April, 1636. The name of Sir Julius Cæsar is of very frequent occurrence in contemporary memoirs and historical documents, but he is now rather remarkable as a pluralist and

placeholder, than eminent on account of his legal or judicial superiority.

CAGNIARD DE LATOUR, CHARLES, BARON, physicist, was born at Paris, March 31, 1777. In 1794, he entered the Polytechnic School, and on leaving this two years afterwards, he joined the corps of Hydrographic Engineers, but soon left it again, in order that he might devote himself exclusively to scientific investigations. His labours relate to subjects connected with general physics and chemistry, but he is best known for his researches on sound. In 1809 he constructed a simple method of conveying gases beneath liquids. The machine became known as the *Cagniardelle*, and is nothing more than an Archimedean screw, in which the direction of revolution is from right to left. In 1818 he gave much attention to gas illumination, and materially assisted in bringing about its introduction into France. In the following year he invented the Syren, which is an instrument for propelling waves of air through holes in a disc, revolving at an ascertainable speed. A series of wheels and some dials indicate the number of vibrations corresponding to any given sound. By its means he discovered that peculiar quality of a note known as timbre, which causes the difference in notes of the same intensity and pitch, when produced by different instruments. He also made some lengthy investigations into the mechanism of the human voice, and, amongst other things, determined the pressure of the air during phonation, by experiments on a man with a tracheal fistula. As an engineer, his chief work is the Aqueduct of Crouzal, erected in 1826, which has a span of 650 feet between the points of suspension. He was the first to establish that fermentation is not a purely chemical phenomenon, but is mainly due to the influence of certain congeneric plants. A list of his papers is given in the Royal Society's Catalogue of Scientific Papers. His death occurred July 15, 1859.

CAHEN, SAMUEL [E. C. vol. ii. col. 23]. M. Cahen died on the 8th of January, 1862.

CAILLÉ, RENÉ, French traveller, was born Sept. 19, 1790, at Mauzé, in the department of Deux Sèvres. His education was of the simplest character, and when a mere youth, the perusal of 'The Adventures of Robinson Crusoe,' roused in him a strong desire to explore Africa. Accordingly, he started for Senegal when in his seventeenth year, and with only a few pounds in his pocket. Soon after his arrival, an expedition, under Major Gray, proceeded to explore the centre of Africa, but met with difficulties, owing to the exhaustion of the stock of merchandise. M. Partarieu was then sent back to Senegal to obtain further supplies, and Caillé offered to join him unconditionally. The offer was accepted, but before long the hard marching during the rainy season caused him to contract a severe fever, which compelled him to leave the expedition. In 1824 he returned to Senegal, and obtained a sufficient quantity of goods from the Governor of Senegal, to enable him to live with the Arabs, acquire their tongue, and prepare himself for his future work. Eight months were spent among the Braknabs, and he then endeavoured to obtain the means of making a voyage to Timbuctoo; but wherever he applied his requests were refused. His enthusiasm, however, was increased rather than diminished by the obstacles he met with, and in order to raise the funds required, he worked on an indigo plantation until he had saved about £80. With this sum he bought goods, and made the necessary preparations for his journey. In order to avert the suspicions of the natives, as well as to secure his own safety as far as possible, he assumed the dress of an Arab, and pretended that he was a young Egyptian about to return to his native country. He started from Kakundy on the 29th of April, 1827, and proceeded, first in an easterly direction, by Cambaya, Kankan, Timi, and Tangrera, and afterwards in a north-easterly direction, by Donasso to Galla, where he struck upon Park's tracks, through a country which had never previously been visited by Europeans. From Galla he passed over the same country as Mungo Park to Timbuctoo, which town was entered by him, April 20, 1828. During this part of his travels he had suffered great hardship from sore feet and fever; and when he left Timbuctoo, it was as a despised, ill-treated mendicant. He returned from Timbuctoo across the Sahara desert to Fez, and arrived in Toulon, September 27, 1828. He became for a while the lion of the day, and was especially noticed by the Geographical Society of Paris, who awarded him the special prize of £400 to the first traveller who could obtain exact information of Timbuctoo, in confirmation of Park's observations. He was further decorated with the Legion of Honour; his work, 'Journal d'un Voyage à Tombouctou et Jenné dans l'Afrique centrale, etc.,' 3 vols. 1830, was published at the public expense; and he himself was rewarded with a state

pension. He did not, however, live long to enjoy this, for he died on May 17, 1838, while still comparatively young.

* **CAIRD, REV. JOHN**, a minister of the Established Church of Scotland, celebrated for his pulpit eloquence, was born at Greenock in 1823, and educated at the University of Glasgow. In 1844, having taken his M.A. degree, and completed his theological studies, he received licence to preach, the canonical age being anticipated on account of the number of ministers who had left the Establishment in 1843, as adherents of the Free Church. At the end of his year of probation, he was ordained minister of the parish of Newton or Newtown-upon-Ayr, separated from the town of Ayr only by the river of that name. In the same year, 1845, he was transferred to Lady Yeater's Church, in Edinburgh; and in 1850, in order to avail himself of the comparative seclusion of a country charge, he became minister of Errol, in the county of Perth. It was whilst holding this living that he was called upon to preach before the Queen and Prince Consort, at the parish church of Crathie, upon which occasion he acquitted himself with so much ability, that the sermon was immediately published by royal command, with the title of 'Religion in Common Life,' 8vo, Edinburgh and London, 1855; reprinted at Hobart Town, 12mo, 1856; and translated into Gaelic, 8vo, Edinburgh, 1856. Besides a few minor literary labours, he has produced a volume of 'Sermons,' 8vo, Edinburgh, 1858; in which year he removed to Glasgow, to undertake the charge of West Park, where a handsome church was erected for him. In 1860 he received the degree of D.D., and was appointed Professor of Divinity in the University of Glasgow in 1862, soon after which he resigned his pastoral charge of West Park church.

* **CAIRNS, HUGH MAC CALMONT, BARON**, a lawyer and statesman, second son of the late William Cairns, Esq., of Cultra, co. Down, Ireland, was born in 1819, and educated at Trinity College, Dublin, where he was first class in classics, and obtained other honours. He became a member of the Middle Temple, and was called to the bar by that Society in 1844. He rose to considerable practice in the Court of Chancery, and was early regarded as a promising candidate for the higher honours of his profession. In 1852 he was returned for Belfast in the Conservative interest. He continued to represent this constituency until he became a judge, in 1866. In 1856, he was made a Queen's Counsel, and elected a bencher of Lincoln's Inn; and in March, 1858, on the return of Lord Derby to power, became Solicitor-general, receiving at the same time the honour of knighthood. When next the formation of a ministry fell to Lord Derby, in 1866, Sir Hugh Cairns was appointed Attorney-general; and on the 18th of October in the same year, was promoted to be one of the Lords Justices of Appeal. It was on the occasion of this preferment that his 14 years' connection with the electors of Belfast terminated. His elevation to the peerage as Baron Cairns of Garmoyne, in co. Antrim, appeared in the 'London Gazette' of the 23rd of February, 1867; and in the following year he achieved the highest professional honour of being made Lord Chancellor, a post which he vacated on the downfall of his party, and the accession of Mr. Gladstone to the Premiership. Lord Cairns is now an active member of the Judicial Committee of the Privy Council. His university distinctions embrace the honorary degrees of LL.D. of the University of Cambridge, in 1862; D.C.L. of Oxford, 1863; and the Chancellorship of the University of Dublin, 1867. His judgments, and his speeches, in Parliament and elsewhere, have been characterised by a masterly eloquence, and are largely conversant with ecclesiastical questions. His advocacy is understood to have been of so great an advantage to his party, that it was probably nothing but a state of health unequal to the position, which prevented him from retaining the leadership of the Conservative party in the House of Peers, which he held temporarily upon the demise of the late Lord Derby.

* **CALDERON, PHILIP, R.A.**, was born at Poitiers in 1833, the son of the Rev. Juan Calderon, and studied painting in the atelier of Picot, at Paris. A picture of 'The Jailer's Daughter,' exhibited at the Royal Academy in 1858, attracted notice by its force and freshness of style, and technical skill. He continued to send to each successive exhibition one or two such paintings, as 'Man goeth forth to his Labour,' 1859; 'Liberating Prisoners on the young Heir's Birthday,' 'Queen Katherine of Aragon and her Women at Work,' 1861; 'The British Embassy at Paris on the Day of the Massacre of St. Bartholomew,' 1863; and 'The Burial of Hampden,' 1864; and the evidence they afforded of originality of thought and sustained artistic power was recognised in the latter year by his election as A.R.A. 'Her most High, Noble, and Puissant Grace,' and 'Home after the Victory,' were

his chief contributions to the Exhibitions of 1866-67. In 1868 he was elected R.A. In that year he exhibited 'Enone,' and 'The Young Lord Hamlet'; in 1869, 'The Duchesse de Montpensier urging Jacques Clément to assassinate Henri III.'; and in 1870, 'The Orphans,' and 'Spring driving away Winter.'

CALVISIUS, SETHUS, a German writer on music and chronology, adopted this as the Latin form of his German name, **SETH KALLWITZ**. He was born at Groschleben, in Thuringia, on the 20th of February, 1556. Being the son of a peasant, he had but little early school education; nevertheless, he studied music for three years at Frankfurt, and was then admitted gratuitously to the public school at Magdeburg. Earning a little money as a music-teacher, he continued to support himself while studying ancient languages and the arts at Helmstadt and Leipzig. In 1582, he filled the post of cantor in the school at Pforte; and in 1592, he was appointed to a similar office at Leipzig, where he was nominated professor of music in 1594. He died at Leipzig; but there is a discordance of opinion as to the date of his death. Mattheson places it on the 23rd of November, 1615; Cöttinger on the 24th instead of the 23rd; while Walther and Forkel give the 23rd of November, 1617. The chief musical works written by Calvisius were the following:—(1) 'Melopœia seu Melodiæ condensæ ratio, quam vulgo musicam poeticam vocant, ex veris fundamentis extracta et explicata,' Erfurt, 8vo, 1582; this is a treatise on Counterpoint and Harmony, good for the period in which it was written; (2) 'Compendium Musicæ Practicæ,' Leipzig, 8vo, 1594; (3) 'Exercitationes Musicæ Duæ,' Leipzig, 8vo, 1600; the first part didactic, the second an abridged history of music; (4) 'Exercitatio Musica Tertia,' Leipzig, 8vo, 1611; a third portion of the same work, relating to solmisation; (5) 'Musicæ Artis Præcepta nova et facillima,' &c., Jena, 8vo, 1816; a work in which he recommends the syllables *bo, ce, di, ga, lo, ma, ni*, in solmisation, instead of *ut, re, mi, fa, sol, la, si*. The musical compositions by Calvisius comprise harmonised versions of old German hymns for four voices; sacred songs for three voices, to German words, mostly taken from the Psalms of David, with instrumental accompaniments; an arrangement of the 150th Psalm, for twelve voices, in three choirs; and a musical arrangement of the Psalter for four voices. Calvisius also paid some attention to the study of chronology and the Calendar, on which subjects he wrote the following and other works:—'Opus Chronologicum,' Leipzig, 4to, 1605, the best work on Chronology that had up to that time appeared; 'Elenchus Calendarii Gregoriani,' *ibid.*, 1612; and 'Formula Calendarii Novi,' *ibid.*, 1613, written to urge and assist in the reformation of the Calendar; 'Enodatio duorum questionum circa annum nativitatis et tempus ministerii Christi,' Erfurt, 4to, 1610.

CAMBINI, GIOVANNI GIUSEPPE, musical composer, was born at Leghorn, February 13th, 1740. He early acquired great proficiency in violin playing, especially in quartettes and other kinds of chamber music. In 1763 he went to Bologna, where he studied counterpoint under Martini. In 1766, while on a voyage to Naples, he was captured by corsairs, and underwent much insult and misery before he could be liberated by ransom. Settling at Paris in 1770, he gave lessons in music, and wrote symphonies, motetts, oratorios, and other musical works, far too rapidly for the attainment of excellence; but being intemperate and improvident, he wrote literally for his bread, without bestowing time and thought enough upon his compositions. He sank into an old age of penury, and is supposed to have died a pauper in the Bicêtre about 1825; but this is uncertain. Between the years 1776 and 1793, Cambini produced 'Les Romans,' a ballet; 'Rose d'Amour,' a second ballet; various operas and ballets, under the names of 'La Croisée,' 'Cora, prêtresse du Soleil,' 'Les Deux Frères,' 'Adèle et Edina,' 'Nantilde et Dagobert,' 'Trois Gascons,' 'Alcmæon,' 'Alcide,' 'Anide,' 'Fêtes Venitiennes,' &c., besides two oratorios, 'Joab,' and the 'Sacrifice of Abraham.' His best compositions were his violin quartettes.

CAMERARIUS, JOACHIM, botanist, was born at Nürnberg, November 5, 1534. After receiving instructions from the best professors of the time in Germany and Italy, he acquired a doctorate in 1562, and soon formed a more or less intimate acquaintance with Fallopius, Aldrovandus, and many other eminent cultivators of science. In the practice of medicine he was so successful, that several royal personages offered him great inducements to join their court, but he declined all offers of the kind. He was the principal promoter of the Academy of Medicine, which was founded at Nürnberg in 1592, and he established an excellent botanical garden, in maintaining which he was assisted by Prosper Alpin, Clusius, and others. His principal works are 'Hortus Medicus,' 1588, which is a catalogue of the plants

in his garden, with descriptions of the more interesting species ; 'Symbolorum et Emblematum ex Herbis et Animalibus centuriæ iii. &c.,' 1590-1597, which is a collection of anecdotes relating to all branches of natural history ; 'Plantarum tum indigenarum quam exoticarum icones,' 1591. He has also written many other works, and in some of them he made considerable use of the engravings which Gesner had prepared for a 'History of Plants,' and which he had intended should form a sequel to his 'History of Animals.' These drawings, about 1500 in number, together with Gesner's botanical library, were purchased by Camerarius after Gesner's death. He died at Nürnberg, October 11, 1598.

CAMERARIUS, RODOLF JACOB, botanist, was born at Tübingen, February 17, 1655. His education was carried out in his native town, and was completed by a tour through Europe, in the course of which he visited all the most celebrated professors of the time. In 1687 he graduated as doctor of medicine, and in the following year was appointed an assistant professor and inspector at the botanical garden at Tübingen. Shortly afterwards he became professor of medicine. He died, September 11, 1721, of pulmonary phthisis. His principal works are, 'De Sexu Plantarum Epistola,' 4to, 1694 ; a work in which some writers find the germ of the Linnean system of classification ; and 'De Convénientia Plantarum in fructificatione et vicibus,' 8vo, Tübingen, 1699.

CAMPBELL, LORD. [E. C. vol. ii. col. 54.] On the formation of the ministry of Lord Palmerston, June, 1859, Lord Campbell was made Lord Chancellor, with a seat in the Cabinet, thus attaining the crowning dignity for which he had all his life been struggling. He held the office till his death, which occurred on the 23rd of June, 1861 ; but it had not been expected that he would confer any new lustre on the title, either in the Court or the Parliament, and the anticipations were not exceeded. More than seven years after his death, appeared a work on which he was known to have been occupied during the dull years preceding his elevation to the Chancellorship, and the publication of which had been looked for with some curiosity, 'Lives of Lord Lyndhurst and Lord Brougham, Lord Chancellors and Keepers of the Great Seal of England,' 8vo, London, 1869. As a biography, the work is no more trustworthy than the 'Lives of the Lord Chancellors,' of which it is a continuation, though as a contribution to contemporary history it may have its use. In it is recorded whatever enmity had invented and gossip collected or whispered, to the detriment of the two distinguished men whose lives it professes to narrate. But the aspersion is not confined to Lords Lyndhurst and Brougham. The object of the author seemed to be to show that all, or almost all, his immediate predecessors in the office, however superior in learning, eloquence, and fame, were as intrinsically mean, unscrupulous, and malignant as himself. Happily the misstatements in the book met with speedy exposure, and its tenor with general condemnation.

CAMPBELL, SIR COLIN. [CLYDE, LORD, E. C. S.]

CAMPBELL, JOHN, D.D., a journalist and Nonconformist divine, the son of Alexander Campbell, a surgeon, of Kirriemuir, in Forfarshire, was born on the 5th of October, 1795. From October, 1817, he was a student in the faculty of arts successively at the universities of St. Andrews and Glasgow ; and prosecuted his theological studies in the latter city at the Divinity Hall of the Independent denomination, then under the presidency of Dr. Wardlaw and the Rev. Greville Ewing. He became minister of an Independent church in Kilmarnock, in 1827 ; and in the following year, accepted an invitation to undertake the pastorate of the congregation assembling in the Tabernacle, Moorfields, which had been erected by Whitefield. Here, with constant popularity, he laboured for twenty years, until the failure of his health warned him to a change of employment ; and he accordingly undertook the editorial management of a popular religious newspaper, called the 'British Banner,' which met with a surprising success. When he had conducted this journal for a period of nine years, he relinquished it, and established, on his own account, the 'British Standard,' to which, two years afterwards, he added the 'British Ensign.' In 1844, in compliance with a vote of the Assembly of the Congregational Union of England and Wales, he undertook the editorship of a popular religious magazine, called the 'Christian Witness,' which circulated so successfully—30,000 a month—that, after two years, he added the 'Christian's Penny Magazine,' which attained a monthly circulation of 100,000. Dr. Campbell entered largely into the ecclesiastical and theological controversies of the day—not always without acrimony. His death took place at his residence, Manor House, St. John's Wood Park, on the 26th of March, 1867 ; and he was interred at Abney Park Cemetery, on the 2nd of April following.

Dr. Campbell was a voluminous author, and among his more important productions may be mentioned his 'Maritime Discovery and Christian Missions, considered in their Mutual Relations,' 8vo, London, 1840 ; 'Jethro,' an essay which obtained a prize of 100 guineas, on the employment of lay agency in the propagation of religion ; 'The Martyr of Erromango : or the Philosophy of Missions, illustrated from the Labours, Death, and Character of the late Rev. John Williams,' 8vo, London, 1842 ; 'Memoirs of David Nasmyth [the Founder of City Missions] ; his Labours and Travels in Great Britain, France, the United States, and Canada,' 8vo, London, 1844 ; 'Popery and Puseyism illustrated : a Series of Essays,' 12mo, London, 1851 ; 'John Angell James, a Review of his History, Character, Eloquence, and Literary Labours ; with Dissertations on the Pulpit and the Press, Academic Preaching, College Reform,' &c., 8vo, London, 1860 ; 'Popery, Ancient and Modern : its Spirit, Principles, Character, &c., with Warnings and Counsels to the People of England,' 8vo, London, 1865. In his later years, we are informed by his somewhat diffuse biographers, Drs. Ferguson and Morton Brown, he meditated a Life of Whitefield, his great predecessor at the Moorfields Tabernacle.

CAMPION, EDMUND, was born in London on the 25th of January, 1540, the year in which the Society of Jesus, of which he afterwards became a member, was established. He was educated, first at Christ's Hospital ; whence he was received on the foundation of St. John's College, Oxford, then recently founded by Sir Thomas White, over whose remains, when they were brought, in February, 1566, to the College Chapel for interment, Campian was selected to pronounce a Latin funeral oration before the members of the University. His appearance on two or three occasions before Queen Elizabeth, was so scholarly and successful, that Sir William Cecil, afterwards Lord Burleigh, is said to have pronounced him one of the "diamonds" of England. Unsatisfied with his ecclesiastical position as a member of the Anglican Church, Campian yet complied with the prayers of his friends so far as to be ordained deacon by Dr. Richard Cheyney, Bishop of Gloucester. This step seems to have immediately added remorse to his former mental disquiet ; he proceeded to throw up his fellowship, and on the 1st of August, 1569, to quit the University, and to betake himself to Dublin. Abjuring Protestantism, he repaired to the English seminary at Douay, which he quitted for Rome, where he was admitted a Jesuit in 1573. After his novitiate, he passed some time at Vienna and Prague ; and on his return to Rome, was sent by Pope Gregory XIII., with other Jesuits, as "missioners" to England, where they arrived in 1580. Campian's zeal and activity attracted the notice of the government of Queen Elizabeth ; he was arrested at Lyford, in Berkshire, and committed, with some others, to the Tower of London, on the charge of conspiracy and exciting the people to rebellion. They were put to the rack, but though they asserted their loyalty to the queen, they refused to renounce the pope's deposing powers ; they were, consequently, condemned to death ; and, in accordance with their sentence, were executed at Tyburn, on the 28th of November, 1581. The literary works of Campian are chiefly polemical, the most celebrated being his 'Decem Rationes,' addressed to the Privy Council, in 1581. One of his works is a 'Chronologia Universalis ;' another is a history in Latin of 'The Divorce of Henry VIII. and Queen Catherine.' His 'History of Ireland,' was published by Sir James Ware, in 1633, from a MS. in the Cotton Library.

CAMPION, THOMAS, a poet and musician, lived and wrote in the 17th century ; but nothing is recorded of his personal history. He wrote 'A New Way of Making Fowre Parts in Counterpoint, by a most familiar and infallible rule,' of which the first edition is without date, but the second edition, with the title, 'The Art of Setting or Composing Music in Parts,' appeared in 1660. Another work is 'The Art of Discant, with annotations, by Christopher Sympson,' London, 8vo, 1672 ; this is incorporated in Playford's 'Introduction to the Knowledge of Music,' London, 8vo, 1679. These works are ascribed to a Thomas Campion who lived much earlier in the century, and was the author of 'Observations in the Art of English Poesie,' 12mo, 1602 ; Words adapted to Airs, by Ferabosco, London, 1609 ; verses on the Death of Prince Henry, set to music by Cooper, or Coperario, 1619 ; descriptions of three or four Masques, published between 1607 and 1614 ; and 'Epigrammatum Libri ii. Umbra,' 12mo, 1619. There is, however, reason to believe that there were two persons named Thomas Campion, connected with Oxford University, at different periods in the 17th century.

CAMUS, ARMAND GASTON, one of the active partici-

pators in the great French Revolution, was born at Paris, April 2nd, 1740. Having directed his studies towards ecclesiastical law, he became advocate for the clergy of France; the Elector of Treves and the Prince of Salm-Salm also employed him as their counsellor. The publication of Buffon's 'Histoire Naturelle,' led Camus to translate Aristotle's 'History of Animals.' This, however, did not turn the general current of his studies; he continued to be an ecclesiastical lawyer. When the revolutionary times arrived, Camus was chosen one of the deputies for Paris to the States-General. He denounced the 'Red Book,' in which the pensions made out of the National Treasury were inscribed; maintained the civil constitution of the clergy; and rendered much service while filling the post of archivist, in preventing the destruction of the books and papers that had belonged to the various suppressed corporations. When the National Convention was formed in 1792, Camus entered it as deputy for Haute-Loire. He was sent on a political mission to Flanders, and on his return was chosen a member of the Committee of Public Safety. He was then thrown out of the current of French politics, during the worst period of the Reign of Terror, by an unexpected occurrence. Having been appointed in 1793 commissioner to accompany the army of Dumouriez, the latter, who did not relish the espionage, arrested him, and delivered him over to the enemy, by whom he was imprisoned successively at Maastricht, Coblenz, Königgrätz, and Olmütz. Camus occupied a portion of his enforced leisure in translating from Epictetus, and in writing a Journal; the latter has not been published, but Toulougeon made citations from it in his 'Éloge Historique' on Camus, Paris, 1806. On regaining his liberty, Camus entered the Council of Five Hundred, of which body he was afterwards elected president. In 1797, he abandoned senatorial and political functions, and employed the remaining seven years of his life in collecting MSS. relating to the history of France, for which purpose he made numerous exploratory journeys. He was one of the first members of the Institute, to whose Memoirs he contributed many papers. Camus died of apoplexy on the 2nd November, 1804, leaving behind him the reputation of a pious and honest man, but vain and obstinate. His chief literary works were:—(1) 'Code Matrimoniel,' Paris, 4to, 1770; 'Lettre sur la profession d'Avocat, et Bibliothèque choisie des livres de droit,' Paris, 12mo, 1772; of which the third and best edition is dated 1805; (3) 'Histoire des Animaux,' Paris, 2 vols. 4to, 1783; this is the translation from Aristotle; (4) 'Manuel d'Épictète et Tableau de Cébès,' 18mo, Paris, 1796; (5) 'Mémoires sur la collection des grands et petits Voyages,' 4to, Paris, 1802; (6) 'Histoire et Procédés de Polytypage, et de Stéréotypage,' 8vo, Paris, 1802; a useful contribution to the history of printing; (7) 'Voyage dans les Départements,' 8vo, Paris, 1803; interesting for its bibliographical and literary history.

CANINA, CAV. LUIGI, an eminent Italian archæologist, was born at Casale in Piedmont, October 23rd, 1795, and after completing his literary course, studied architecture. He resided many years in Rome, directed various excavations of ancient edifices, &c., and there produced the works which established his fame. Some of these were brought out at the cost of his patroness, the Queen of Sardinia, and are sumptuous in paper, printing, and embellishments. His works secured him admission into the Institute of France and many other learned societies, as well foreign as Italian, and the post of professor of architecture in Turin Academy. He died whilst on a visit to Florence, October 17, 1856. The following are his more important publications: 'L'Architettura Romana,' 2 vols. fol. Rome, 1830; 'L'Architettura Græca,' fol., Rome, 1833; 'Descrizione storica del Foro Romano e sua adiacente,' 8vo, Rome, 1834; 'L'Architettura antica descritta e dimostrata coi Monumenti, &c. Opera divisa in tre sezioni riguardanti la Storia, la Teorica, e le Pratiche dell'Architettura Egiziana, Greca, Romana,' 6 vols. fol. Rome, 1830-44; 2nd edition, text, 9 vols. 8vo, plates, 3 vols. fol. Rome, 1839-46; 'Descrizione dell'Antico Tuscolo,' 43 plates, fol. (privately printed), Rome, 1841; 'Esposizione Topografica di Roma antica,' fol. Rome, 1842, 8vo, 1855; 'Indicazione Topografica di Roma antica in corrispondenza dell'Epoca Imperiale,' 4th edition, 8vo, Rome, 1850; 'Pianta Topografica di Roma antica, con i principali Monumenti, ideati nel loro primitivo stato, secondo le ultime scoperte, e con i Frammenti della Marmorea pianta Capitolina disposti nel suo d'intorno,' 8vo, 1850; 'Gli Edifizj di Roma Antica, cogniti per alcune reliquie,' 6 vols. 312 plates, fol. 1848-56; 'La Prima Parte della Via Appia dalla Porta Capena a Boville,' 2 vols. 52 plates, 4to, 1853; 'L'Antica Città di Veii,' 44 plates, fol. (privately printed), Rome, 1847; 'Ricerche sull'Architettura più propria dei tempi Cristiani,'

plates, fol. 1843; second edition, plates, fol. 1846; 'Antica Etruria Marittima, compresa nella dizione Ponteficia,' 2 vols. plates, fol. 1846-51; 'Particolare genere di Architettura domestica,' 40 plates, fol. Rome, 1852; 'Illustrations Architectural and Pictorial of the genius of M. A. Buonarroti. With descriptions of the plates by the Commendatore Canina, C. R. Cockerell, R.A., and J. S. Harford,' with 15 plates, fol. London, 1857. Cav. Canina also wrote a great number of short monographs.

CANNING, CHARLES JOHN, VISCOUNT. [E. C. vol. vi. col. 985.] Lord Canning commenced his course as Governor-General of India, with the resolution to maintain a policy of peace with the native princes, and to devote his attention and influence mainly to the amelioration of the social condition of the people, the extension of roads, railways, and canals, and the general improvement of the country. His plans were rudely thrust aside by the outbreak of the Sepoy insurrection, May, 1857. But Lord Canning proved himself equal to the altered requirements of his position. His measures were prompt, decided, and made with a clear appreciation of the gravity of the crisis, and of his own means of meeting it. The European population, especially in Calcutta, in their passionate excitement against the native population, regarded his calmness and moderation as signs of feebleness and apathy, and he was for a time extremely unpopular. Something of the same feeling influenced partisans in this country. Whilst Oude was in open rebellion, Lord Canning placed in the hands of the Chief Commissioner in Oude, a proclamation, not necessarily for issue, but to be used in his discretion, and only so far as might seem advisable, addressed to the inhabitants of Lucknow, in which, whilst rewards were promised to those who remained faithful, it declared that the proprietary right in the soil of the province had been forfeited by the revolt and contumacy of the bulk of the landowners. At home the consideration of the proclamation, undoubtedly unusual in its terms, fell to the lot of a ministry selected from a different party to that which made Viscount Canning Governor-General of India. The Earl of Derby was premier, the Earl of Ellenborough had the control of Indian affairs. Lord Ellenborough addressed a "secret despatch" to Viscount Canning, but at the moment of sending it, published the tenor of its contents in England, in which, asserting that the hostilities in Oude had rather the character of legitimate war than rebellion, he condemned in the most unqualified and arrogant terms, Lord Canning's conduct and policy. When the text of the despatch was published, the feeling of its impolicy, as well as discourtesy, was so strong and general, that Lord Ellenborough was constrained to an immediate resignation. The reply of Viscount Canning did not reach England till some months later, but then produced a deep impression by its calm and statesmanlike explanation and vindication of his policy, and the dignified reference to the ungenerous treatment he had received. After the complete suppression of the rebellion, Lord Canning was as distinguished by the moderation and consideration with which he dealt with the native population as he had previously been by his energy. Peace restored, he addressed himself to the task of reviving the trade, and developing the agricultural and industrial resources of the country. But climate, anxiety, and toil had broken his strength. It was hoped that rest in England might restore it, but the experiment was made too late. He reached London in April, 1862, and died there on the 17th of the following June.

*CANNING, SIR SAMUEL, civil and electrical engineer, was born at Ogbourne St. Andrew, Wilts, on the 21st of July, 1823. His attention had been particularly directed to telegraphic engineering, and in 1852 he was engaged in superintending the laying down of submarine electric cables. This requires such a delicate handling of the mechanism on ship-board for uncoiling, gripping, paying out, and registering the movements of the cable, and especially for finding and raising a sunken cable when snapped, that it is becoming a distinctly recognised branch of engineering. Mr. Canning mainly conducted the extensive series of experiments, instituted by the Atlantic Telegraph Company, to determine the form and arrangement for the cables of 1857 and 1858; and the experience thus acquired has led to his being employed in the construction and laying of a larger number of important submarine cables than any other engineer. The embarrassing and apparently hopeless work of groping for the end of a cable at a depth of 12,000 feet in the ocean, was rendered possible by him and Mr. Clifford through the invention of new paying out and grappling machinery. Mr. Canning has been long associated in these matters with Messrs. Glass and Elliott, the manufacturers of the wire-work of electric cables, and with the Gutta Percha Company in regard to the gutta percha insulators,

both before and since the coalescence of the two establishments in the Telegraph Construction and Maintenance Company. The success which attended the submersion of the Atlantic cable of 1866, and the recovery of that which had been broken and sunk in 1865, led to the conferring of two baronetcies and four knighthoods on those who had been concerned in the enterprise; Mr. Canning was one of the four who were knighted. In 1867 he was awarded the gold medal of the American Chamber of Commerce at Liverpool. In 1869 Sir Samuel Canning conducted the laying of the French Atlantic Cable, from a point on the French coast near Brest, to the French Isle of St. Pierre, near Newfoundland; the whole cable, except a short shore-end, being carried by the 'Great Eastern.' In 1870 he superintended the laying of the Suez, Aden, and Bombay, and the Falmouth, Gibraltar, and Malta submarine cables, thus affording better telegraphic communication with India than had before existed.

CAPELLA, MARTIANUS MINEUS FELIX, was a learned writer in the second half of the 5th century, concerning whose personal history nothing is known, except that he was probably born at Medaura, in Africa, went to Carthage in the service of a Roman pro-consul, and afterwards went to Rome. About 470, A.D., he wrote, in rather debased Latin, in mingled prose and verse, a work called 'Satiricon,' a sort of encyclopædia of the learning of the time, which was much read and studied in the middle ages. It consists of nine books. The first two are devoted to 'De Nuptiis Philologiæ et Mercurii,' a sort of mystical allegory. The other seven books relate to the seven liberal arts—grammar, dialectics, rhetoric, geometry, arithmetic, astronomy, and music, treated mythologically. Copernicus is believed to have derived from Capella's Astronomy, the first idea of the sun, instead of the earth, being the centre of our system. The first edition of the *Satiricon* was published at Vicenza, folio, 1499; there have been many since, of which the best is by Kopp, Frankfurt, 1836. A translation by Notker into old high German, was published at Berlin in 1837. There have also been many commentaries on the *Satiricon*.

CAPELLI, ANGELO, Italian astronomer, lived in the first half of the 18th century. Little more is known of his personal history, than that he was a canon and a professor of astronomy at Parma. Weidler ('*Bibliographia Astronomica*,' and '*Historia Astronomiæ*,') speaks favourably of two works by Capelli; (1) '*Astrosophia Numerica, sive Astronomica Supputandi Ratio*,' 2 vols. 4to, Venice, 1733-46: this work is in four parts, treating severally of the longitudes and latitudes of the celestial bodies; the calculation of eclipses, astronomical problems, and the construction of ephemerides; (2) '*Novissimæ Novissimarum Saturni, Jovis, Martis, Veneris, et Mercurii Tabulæ*,' 4to, Venice, 1733.

CAPGRAVE, JOHN, an old English historian, was born at Bishop's Lynn (now King's Lynn), Norfolk, April 21, 1393; entered early the Augustinian convent in his native town; was distinguished by his devotion to study; sent to Cambridge to complete his education, and afterwards to Oxford, where he took the degree of doctor of divinity, and in 1427, entered the priesthood. He speaks of himself as having been in London, "studying there in the fourth and fifth year after being raised to the priesthood;" he then spent some time, engaged in literary composition, in the Austin Friary, Lynn; was in 1445 elected provincial of his order in England; appears to have assisted at the formal foundation of the College, Eton, and King's College, Cambridge; and died at Lynn on the 12th of August, 1464. Capgrave had the reputation of being one of the most learned men of his order then living in England. He was a very voluminous writer. The titles are known of thirty-seven distinct works written by him, but of these only eight are extant. His lost writings include commentaries on nearly all the books of Scripture, a Manual of Christian Doctrine, Sermons, and other strictly theological works, Lives of St. Augustine, of certain of the illustrious men of the Order of St. Augustine, of St. Gilbert, and of Humphrey Duke of Gloucester. The MSS. are extant of a 'Commentary on the Book of Genesis;' 'On the Acts of the Apostles;' 'On the Creeds;' 'The Life of St. Katherine;' 'The Nova Legenda Angliæ;' 'A Chronicle of England;' and 'Liber de Illustribus Henricis.' The two last were published under the direction of the Master of the Rolls, in 1858. 'The Chronicle of England,' extends from the Creation to the year 1417. It is not a work of much historical importance, but it has considerable value as an example of the Norfolk dialect of the middle of the 15th century. A translation of the 'Liber de Illustribus Henricis,' by the Rev. F. C. Hingeston, the editor of the Rolls editions of that book, and the Chronicle, was published simultaneously with the original text.

BIOG. DIV.—SUP.

The book was dedicated to Henry VI., greatest of all the Henries. The first part contains Lives of the Henries, Emperors of Germany; the second part, of the Henries, Kings of England; the third, of sovereigns of that name in various parts of Europe. The author has read much, but is sadly deficient in judgment. He approves the derivation of the name of England "from *En*, which is 'in,' and *cleos*, which is 'glory,' as though she were all glorious within."

CAPOCCI DE BELMONTE, ERNESTO, Italian astronomer, was born at Picinisco, in the kingdom of Naples, 28th of March, 1798. He was placed early as a pupil at the Observatory of Capo di Monte, under his uncle, Zuccari, who was the director. While yet in his 18th year, he wrote on astronomical subjects in the '*Giornale Enciclopedico di Napoli*.' He became assistant astronomer at Capo di Monte, under various directors, and eventually himself director. During a long series of years he made valuable observations on the orbits of newly-discovered comets, the spots on the sun, the periodicity of meteors, the variations in the sea-level, &c.; the results of which appeared in '*Zach's Correspondenz*,' and other scientific journals. In 1839, the Berlin Academy, engaged in the preparation of the elaborate star-map which has since so greatly aided in the discovery of new planets, &c., invited Capocci to undertake the section known as *hora 18*; it was a work of great labour, on account of the large portion of the Milky Way comprised within the area, and occupied him three years. Capocci, after suffering by the revolutionary changes in Italy, was, on the erection of the kingdom of Italy, placed at the head of the Observatory of Naples. He died in 1864.

CAPPELLER, MAURIZIO ANTONIO, was born at Lucerne in 1685. He studied medicine at Milan and elsewhere, and in 1707, was attached as surgeon to the Imperial Army in the invasion of the kingdom of Naples. He afterwards became captain of engineers in the province of Abruzzo. He again served in 1712, after which he followed his profession at Lucerne, whence, in 1730, he removed to Freiburg, and afterwards, in 1744, to Soleure. In 1747, he returned to Lucerne, where, in addition to the practice of medicine, he gave lessons in geometry and mathematics as applied to military engineering. In 1754, he went to reside with his son, who was a pastor near Lucerne, and continued to practise medicine until his death, 16th September, 1769.

Capeller was elected a Fellow of the Royal Society in 1725, and the services rendered by him to science, which procured him this honour, related to crystallography. His '*Prodromus Crystallographiæ*,' appeared at Lucerne in 1723, the design of which was to carry out the idea started by Dominic Gulielmi, in 1707, that in crystals "nature does not employ all figures, but only certain ones of those which are possible; and of these the determination is not to be fetched from the brain, or proved *à priori*, but obtained by experiments and observations. Nevertheless, since there is here a principle of crystallisation, the inclination of the planes and of the angles is always constant."

Capeller left behind him a complete MSS. treatise on crystallography in the German language, the figures for which were engraved in 1788; but the publication of the letterpress was interrupted. A Natural History of Lucerne, sometimes said to have been first published after his death by his friend, Felix Balthazar, really appeared in 1757, 4to, Basel, under the title, '*Pilati Montis Historia*.'

CARAFÀ DE COLOBRANO, MICHELE ENRICO FRANCESCO VINCENZO PAOLO, musical composer, was born at Naples, 17th of November, 1787, or (according to Fétis) 28th of November, 1785. He commenced the study of music at an early age, learning harmony, accompaniment, counterpoint, and fugue successively under Fazzi, Ruggi, Fenaroli, and Cherubini. He was for some years, however, before being known as a composer, in the army of Murat, where he served as a cavalry officer, terminating his military career in the Russian campaign of 1812. In 1814, his opera, '*Il Vascello l'Occidente*,' was produced at Naples; and for more than twenty years similar productions flowed from his pen, brought out at Naples, Milan, Venice, Rome, and Paris, in which last-named city he settled permanently in 1827. In 1837 he succeeded Lesueur as member of the Académie des Beaux Arts, and was director of the Gymnase Musical Militaire. At the Conservatoire, he was member of the Committee of Musical Studies, and professor of composition, counterpoint, and fugue. Carafà's best opera, out of about thirty, is '*Abufar*,' which came out with the support of Donzelli and Lablache; but the most successful is '*Le Solitaire*,' which has been several times revived.

CARAMUEL LOBKOWITZ, JUAN, a Spanish divine and

▲ ▲

man of science, was born at Madrid on the 23rd of May, 1606. It has been said of him that he was endowed with genius to the eighth degree, with eloquence to the fifth, and with judgment to the second. He became a member of the Cistercian order, and was for some time professor of divinity in the University of Alcalá. He afterwards made a great reputation as a preacher in the Low Countries, and graduated at Louvain, as doctor in theology, on the 22nd of September, 1638. His winning address, his great learning, and his eloquence, both in the pulpit and in conversation, everywhere commanded preferment. He was made Abbot of Melrose, and Vicar-general of his order in Great Britain, without being called upon to visit these islands. When political events forced him from his residence as Abbot of Disenburgh, the Emperor Ferdinand III., to whose court he was accredited as agent of the King of Spain, conferred two abbeys upon him, one at Vienna and the other at Prague. He bravely assisted, at the head of a body of churchmen, in the defence of the latter city, when it was besieged by the Swedes in 1648. In 1655 he was invited to Rome by Pope Alexander VII., who gave him the united bishoprics of Campagna and Satriano, in the kingdom of Naples, which he resigned in 1673, on his nomination by the King of Spain to the See of Vigevano. Here he died on the 8th of September, 1682, and was buried in his cathedral church.

Caramuel was a very voluminous author, and a complete list of his works, canonical, theological, political, and scientific, is to be found in 'Nicéron's Mémoires des Hommes Illustres.' The following may be mentioned as illustrating the various directions of his literary and learned activity:—*Thanatosophia*, 4to, Brussels, 1637; *Theologia Regularis Sanctorum Benedicti*, Augustini, Francisci Regulas Commentariis dilucidans, folio, Bruges, 1638, and Lyon, 1665; 4to, Frankfurt, 1644, and Venice, 1651; *Theologia Moralis ad prima eaque clarissima Principia reducta*, folio, Louvain, 1643; *Philippus Prudens, Lusitanus, Algarvius, Indus, Brasilius, &c., legitimus Rex demonstratus*, folio, Antwerp, 1638; *Declaracion Mystica de las Armas de España*, folio, Brussels, 1639; *Cælestes Metamorphoses, sive circulares Planetarum Theoricæ in alias formas transfiguratas*, 8vo, Brussels, 1639; *Mathesis Audax: rationalem, naturalem, supernaturalem, divinamque sapientiam Arithmeticiis, Geometricis, Catoptriciis, Staticis, Dioptriciis, Astronomicis, Musicis, Chronicis, et Architectonicis fundamentis substruens exponensque*, 4to, Louvain, 1642 and 1644; *De Novem Sideribus circa Jovem visis*, 12mo, Louvain, 1643; and *Severa Argumentandi Methodus*, folio, Louvain, 1644.

CAREY, WILLIAM, D.D. [E. C. vol. vi. col. 985.]

CARISSIMI, GIOVANNI GIACOMO, Italian composer, is known more by his works than by his life. Venice and Padua have been named by different authorities as the place of his birth, and 1582 as the year; but Pitoni, in his 'Historical Sketch of the Roman Masters of Music,' has more recently stated that Carissimi was born at Marino, near Rome, in 1604. After filling the post of maestro di capella at Assisi, when only twenty years of age, he went to Rome in 1628, and for the remainder of his life occupied a similar position in the Church of St. Apollinaris, belonging to the Germanic college. As a composer, he greatly improved recitative, introduced the style of cantata combination of voices and instruments, substituted grace and variety for monotony in bass accompaniments, and introduced orchestral instruments in church music. His masses, oratorios, cantatas, motetts, &c., are very numerous, but only a few of them have been published. A large quantity of his MS. music was sold as waste paper, when the Jesuit Colleges were suppressed. He founded a newschool of music, which was further developed by his pupils, Bassani, Cesti, Bononcini, and Scarlatti. His short treatise on singing, the '*Arte Cantandi*,' has appeared in several editions in Germany. A comic piece by him is preserved, harmonising the declination of the Latin pronoun, '*Hic, hæc, hoc*,' for four voices. Carissimi died in 1674.

CARLETON, WILLIAM, a popular novelist and delineator of Irish life and character, was born at Prillisk, Antrim, in 1798. His father was poor, but well versed in the traditions of Ireland, and William Carleton, while suffering many of the privations of a peasant's lot, grew up with a strong sympathy with the feelings and superstitions of his native country. He learned under a hedge-schoolmaster; served as tutor to a school at Glasslough, and then started for Dublin to seek his fortune. He wrote in the '*Christian Examiner*,' next, in 1830, appeared his '*Traits and Stories of the Irish Peasantry*,' a work which attracted much attention by its freshness of style and graphic touches. In 1832 he published a second series of the same work; in 1839, 'Far-

dorougha the Miser;' in 1841, a series of tales, including '*Misfortunes of Barney Branagan*;' in 1845, '*Valentine M'Clutchy*;' in 1846, '*Rody the Rover*;' in 1847, the '*Black Prophet*;' in 1849, '*The Tithe Proctor*;' in 1855, '*Willy Reilly*;' in 1860, '*The Evil Eye*,' all remarkable as pictures of Irish character and sentiment. Many of these works appeared in the '*Dublin University Magazine*.' Mr. Carleton, who for some years had a pension of £200 from the Crown, died January 30, 1869.

CARLINI, FRANCESCO, Italian astronomer, born 1785, produced, during more than half a century, a series of valuable papers on the science to which his attention was mainly directed, mostly relating to observations and researches conducted by himself. These papers, upwards of seventy in number, appeared at various dates between 1807 and 1863, in the Milan '*Effemeridi Astronomiche*,' *Zach's Monat. Corresp.*, *Brugnatelli's Giornale*, *Lindenau's Zeitschriften*, the '*Memoirs of the Italian Society of Modena*,' the '*Biblio. Ital.*,' the '*Nuovo Cincento*,' &c. They take a wide range in astronomical phenomena; including refraction, the asteroids, solar tables, zenith observations, lunar inequalities, lunar parallax, Kepler's problem, the pole star, solar eclipses, comets, astronomical clocks, hourly variations of the barometer, solstitial observations, lunar perturbations, the zodiacal light, the distribution of heat, the constants of the barometer, &c. Carlini made many valuable contributions in 1823-4-5, towards the measurement of an arc of the meridian in Italy, by determining the longitudes of several Italian towns, and by ascertaining the length of the seconds' pendulum at various elevations in the Alps. He also wrote on the barometrical determination of the relative levels of the Black and Caspian Seas. One of his earlier papers was published separately, '*Esposizione di un Nuovo Metodo di Costruire le Tavole Astronomiche applicato alle Tavole del Sole*,' Milan, 8vo, 1810. He died August 29, 1862, aged 77.

CARLISLE, GEORGE WILLIAM FREDERICK HOWARD, EARL OF, a statesman and man of letters, the eldest son of George, sixth Earl of Carlisle, by Lady Georgiana Dorothy Cavendish, eldest daughter of William, fifth Duke of Devonshire, was born in Hill-street, Berkeley-square, on the 18th of April, 1802. He was educated at Eton and at Christ Church, Oxford, where, and until the death of his father in 1848, he was known as Lord Morpeth. At Oxford he distinguished himself especially as a writer of verse, both English and Latin. In 1821 he won the Chancellor's prize for a Latin poem, '*Eleusis*,' and the Newdegate prize for English verse, '*Pæstum*;' a Prize Poem, &c., 8vo, Oxford, 1821. He graduated first class in classics in 1823; and two years after, accompanied his uncle, the Duke of Devonshire, to assist at the coronation of the Emperor Nicolas of Russia, whom, in his place in the House of Commons, as member for Morpeth, he defended, in one of his earliest speeches, against the attacks which were made upon the imperial policy on the suppression of the Polish insurrection of 1830. After a short Parliamentary connection with the borough of Morpeth, the passing of the Reform Act found him member for Yorkshire, the West Riding of which he subsequently represented from 1833 to 1841, when he lost his election. He retook his seat for this constituency, however, in 1846, and held it until his call to the House of Peers in 1848.

He turned to account the leisure he enjoyed as the rejected of the West Riding, by paying a lengthened visit to the United States of America; and he made this tour the subject of a Lecture, which he delivered before the members of the Leeds Mechanics' Institution, in December, 1850. He also lectured before the same body on the '*Life and Writings of Pope*,' and the Lectures he here delivered, and repeated at various places about the same time, were severally published in 8vo, London, 1851. His lordship was Chief Secretary of State for Ireland from 1835 to 1841; was appointed Lord-lieutenant of the East Riding of Yorkshire in 1847; Chancellor of the Duchy of Lancaster from 1849 to 1851; Lord Rector of Marischal College and University, Aberdeen, in 1853; and in 1863 was admitted to the freedom of the City of Derry. The great public event of Lord Carlisle's life, however, was his appointment, in 1855, to be Lord-lieutenant of Ireland, an office which, with the exception of a short interval upon the second accession of Lord Derby to power in 1858, he continued to fill, with great popularity, until his failing health compelled his resignation in August, 1864. He died at Castle Howard on the 5th of the following December.

The Earl of Carlisle was a man of great kindness, amiability, and beneficence of disposition, of high moral character, and of large and graceful literary culture. His works comprise a tragedy in five acts, and in verse, entitled '*The Last of the Greeks*;' or

the Fall of Constantinople,' 8vo, London, 1828; 'Lines on Yorkshire,' privately printed, which, written in 1832, were edited by Lady Caroline Georgiana Lascelles, 4to, London, 1866; a Speech on 'Sanitary Reform,' 8vo, London, 1847, delivered in the House of Commons on the 30th of March, in that year; a 'Diary in Turkish and Greek Waters,' 8vo, London, 1854; 8vo, Boston, U.S., 1855, the careful and impartial result of travels in the East, commenced in June, 1853. Two other volumes have been published posthumously, 'The Viceregal Speeches of the late Earl of Carlisle, K.G.,' 8vo, Dublin, 1866, collected and edited by J. J. Gaskin; and 'Poems,' by George Howard, Earl of Carlisle, selected by his Sisters, 8vo, London, 1869.

CARNE, JOSEPH, the son of a banker, and a representative of a family which has been established in Cornwall for three centuries, and in Glamorganshire for a still longer period, was born in 1776. From an early period in his life he devoted his attention to the mineral resources of Cornwall. He succeeded to his father's business as banker, and in that capacity took a considerable share in promoting the principal fiscal operations connected with Cornish mines. As a scientific man, he wrote several excellent papers on the rocks and minerals of his native county, nearly all of which were contributed to the Geological Society of Cornwall, in whose 'Transactions' they may be found. The more important are: 'On the relative age of the Veins of Cornwall,' vol. ii. pp. 119—128; 'On the Mineral Productions and the Geology of the parish of St. Just,' vol. ii. pp. 290—358; vi. pp. 47—50; 'On the Granite of the Western part of Cornwall,' vol. iii. pp. 208—246; and 'An account of the discovery of some varieties of Tin Ore in a vein, which have been considered peculiar to streams, with remarks on Diluvial Tin in general,' vol. iv. pp. 95—112. He was for several years justice of the peace for Cornwall, and was a Fellow of the Royal Society and other learned institutions. He died Oct. 12, 1858.

CARNOVALE, FRA, known also as BARTOLOMEO CORRADINI, an Italian painter, in his day the chief of the Umbrian school, and the reputed master of Bramante, was about 1460-1488 a Dominican friar, and curate of San Cassiano, near Urbino. Nothing further is known about him. A picture attributed to him is in the National Gallery, No. 769, 'St. Michael and the Dragon,' the figures nearly life-size and, for the period, well painted. In the Brera, Milan, is a 'Virgin and Child, with Saints,' by him. Pungileoni supposes that Giovanni Santi, the father of Raffaella, learnt painting of Fra Carnovale.

CARO, ANNIBALE, an Italian poet of the 16th century, was born at Città Nuova in 1507. He commenced life as tutor in the family of a rich Florentine, named Ludovico Gaddi, to whose brother, Giovanni, he afterwards became secretary. With this patron he visited Rome, where, in conjunction with the brothers Molza, he established the "Accademia della Virtù." After Gaddi's death, in 1543, Caro entered the service of Pietro Ludovico Farnese, a natural son of Pope Paul III., and first Duke of Parma and Piacenza, who employed him in various important negotiations. After the assassination of the duke, the favour he had shown to Caro was continued by his three sons; and through the ease and competency which the kindness of such powerful friends secured him, he was enabled to amass a valuable collection of antiquities, and especially of medals, as well as to devote himself to the study of the Tuscan language, of which his various works offer so pure and forcible an example. In his old age he fixed his residence at Rome, occupying, in the summer months, a country house at Frascati. He died at Rome in the year 1566. Caro's principal work, which he had scarcely finished at the time of his death, is his excellent translation of the 'Æneid' of Virgil, which was posthumously published, in 4to, Venice, 1581, 2 vols., Paris, 1760. Besides translations of the 'Rhetoric' of Aristotle, and of two 'Orations' of Gregory Nazianzen, and various humorous writings, Caro is the author of 'Le Reine,' 4to, Venice, 1569, a volume of elegant poems which have been frequently reprinted; and 'Le Lettere,' 2 vols., Venice, 1573-1574, &c. New editions of his works were published in 6 vols., Venice, 1757, and in 8 vols., Milan, 1806.

CAROLAN, TURLOUGH O', the most genuine modern representative of the ancient Irish bards, was born in the county of Westmeath in 1670. Being poor, and having lost his sight by small-pox in early youth, he was thrown upon his own resources for a livelihood. His musical genius was the leading feature of his character. Not only could he repeat an elaborate composition after once hearing it, but his facility for composing new tunes was very great. On one occasion he composed a lengthened piece for the harp *impromptu*, since known as 'Carolan's Concerto.' He combined something of the German and Italian styles of

music with that of the native Irish. He travelled about Ireland, composing as he went, and was always welcome as a bard at the hospitable houses of the gentry. Writing the words of his songs, as well as composing the tunes, he indulged in rather exaggerated flattery of the beauty and virtues of those who befriended him. Carolan died in 1738, leaving six daughters and one son. The son, a harpist, published a collection of his father's music in 1747, with a very laudatory preface.

CARPOCCI, VITTORE, called SCARPUCCIA by Vasari, an eminent Venetian painter, was born about 1450. He is believed to have been a scholar of Luigi Vivarini; was one of the first of the Venetians who painted in oil; was one of the three artists called in to report on the works of Giorgione in the Fondaco dei Tedeschi, Venice, in 1508, and was still living in 1522. Carpocci was among the best painters of his day. His drawing was bold, firm, and correct; his colouring rich, harmonious, and true; he designed well, and worked with great freedom and facility. His most celebrated extant work is the series of eight pictures in the Gallery of the Academy, Venice, illustrating the legend of St. Ursula. In the National Gallery is a fine painting by him, No. 750, 'The Madonna and Child enthroned: the Doge Giovanni Mocenigo in adoration,' it was purchased at Venice in 1865, from Count Mocenigo, the Doge's descendant, for 3,400*l*.

CARRADORI, GIACOMO, was born at Prato, 7th June, 1758, and died November, 1818. He practised medicine, and studied physics and chemistry, in connection with which he has published a number of works which were of interest at the time. His fame rests on his papers on the superficial attraction of liquids ('Sull' Attrazione di Superficie'), embodied in two memoirs in the *Memor. di Matem. e di Fisica della Soc. Ital. delle Scienze* (vols. xi. and xii.), and the discussions consequent thereon, inserted in the French 'Annales de Chimie,' for 1800, 1803, and in the 'Giornale di Fisica di Brugnatelli' from 1807 to 1816, and which have supplied a large amount of material in support of the theory of the surface tension of liquids, which is now occupying the attention of the scientific world.

CARTIER, JACQUES, the discoverer of the river St. Lawrence, was born at St. Malo, December 31, 1494. Brought up as a sailor, and excited by the discoveries of Columbus and Vasco de Gama, he made an offer to Philippe de Chabot, Admiral of France, to explore the coast of America, and extend the discoveries recently made in that region. His offer being accepted, he was placed in command of an expedition by Francis I., and started from St. Malo, 20th April, 1534. Until then, Newfoundland was believed to be part of the mainland or continent, but Cartier found it to be an island, and discovered the Gulf of St. Lawrence behind it. Returning to France in September, his report excited interest, and he was placed in command of another expedition, larger and better equipped, which set sail from St. Malo, 19th May, 1535. On this occasion he not only discovered the great river St. Lawrence, by following the coasts of the Gulf westward, but penetrated as far as what is now called Montreal. His crew suffered, however, severely from scurvy, and returned in a very shattered condition to St. Malo, which he reached 16th July, 1536. He made a third voyage in 1540-42, extending his discoveries in that region, the narrative of which is included in Hakluyt's Collection. Charges of malversation were brought against him, and an inquiry was instituted, when he was not merely acquitted, but declared to have appropriated a portion of his own property to defray the expenses of the expedition. Francis conferred on him letters of nobility, and he retired to an estate he owned at Limoilin. The year of his death is not known. He was living in 1552.

* CARUS, JULIUS VICTOR, the son of Ernst August Carus, professor of surgery at Dorpat, was born August 25, 1823, at Leipzig. After having passed through the University of his native town, he became an assistant medical attendant at the George Hospital. In 1849 he commenced a sort of educational tour, making stays of varying duration at Wurzburg, Freiburg, and at Oxford, where he was the custodian of the Museum of Comparative Anatomy, and finally settled down at Leipzig, in 1851, as professor of comparative anatomy and director of the anatomical museum in the University. His principal works are: 'Zur naheren Kenntniss des Generations-wechsels,' 1849; 'System der thierischen Morphologie,' 1853; and 'Ueber die Leptocephaliden,' 1861. He was the editor of 'Icones Zootomicæ,' 1857, &c.; and in conjunction with Engelmann he produced the 'Bibliotheca Zoologica,' 1862, an admirable work, the execution of which demanded immense labour and research. This last work added considerably to his reputation, and we believe he is now engaged in drawing up the classified index to scientific papers published

from about 1800 to 1863, which the Royal Society propose issuing. In connection with Gerstaecker, he is bringing out a 'Handbuch der Zoologie,' of which the vertebrates has been undertaken by Carus. The first half of the first volume appeared in 1868. The second volume is devoted to the invertebrates, and appeared in 1869; about a third of this volume, or that part which relates to the annelids, echinoderms, coelenterates, and protozoans, was done by Carus. When completed, the work will form perhaps the most complete guide to systematic zoology yet published.

CARUS, KARL GUSTAV, an eminent biologist, was born January 3, 1789, at Leipzig, in which town his father carried on the business of a dyer. His education was received at Leipzig. In 1804 he commenced his studies at the University, and at first devoted himself more especially to chemistry, in order to be able to assist in his father's works, but he soon abandoned this idea, and determined upon giving his attention mainly to anatomy, and upon qualifying himself for the medical profession. In 1812 he graduated as M.D., and soon after commenced his career as teacher, by delivering the first special course of lectures given at Leipzig on comparative anatomy. He then became an enthusiastic student of midwifery and of painting. In the war of 1813, he was entrusted with the direction of the French hospital at Pfaffendorf, and in 1814 he removed to Dresden, where he had accepted the posts of professor of midwifery and director of the lying-in hospital in connection with the newly established Medico-chirurgical Academy. In 1827 he added to his reputation by a course of lectures on anthropology, which was succeeded by a course on psychology in 1829. In 1827 he was appointed physician to Prince Frederick August, afterwards King of Saxony, and in 1828 he accompanied him on a tour through Germany, Switzerland, and Italy. In 1862 he was elected president of the Imperial Leopold Caroli Academy of Natural Marvels. His writings are exceedingly numerous, and are remarkable for the immense extent of their range, their methodical arrangement, and lucidity of exposition. Many of them have taken their place as standard works of reference or as text books. They relate to anatomy, physiology, psychology, geography, and painting. As an artist he is best known for his landscapes. The following are a few of his more important works, but in addition, he has written numerous papers, a list of which is given in the Royal Society's 'Catalogue of Scientific Papers.' 'Versuch einer Darstellung des Nervensystems und insbesondere der Gehirns,' 1814; 'Lehrbuch der Zootomie,' 1818, 2nd edition, 1834; 'Lehrbuch der Gynakologie,' 3rd edition, 1838; 'Erläuterungstafeln zur vergleichenden Anatomie,' 1826-1855; 'Entdeckung einer einfachen vom Herzen aus beschleunigten Blutkreislaufes in den Larvennetzflügeligen Insekten,' 1827; 'Grundzüge der vergleichenden Anatomie und Physiologie,' 1828. 'Briefe über Landschaftsmalerei,' 2nd edition, 1835; 'England und Schottland im Jahr. 1844, 1845,' of which an English version appeared in 1846; 'Grundzüge einer neuen und wissenschaftlich begründeten Cranioscopie (Schädel-lehre),' 1841; 'Die Proportions-lehre der menschlichen Gestalt,' 1854; 'Symbolik der menschlichen Gestalt,' 1853; 'Ueber die typisch gewordener Abbildungen menschlichen Kopfformen, etc.,' 1863; 'Lebenserinnerungen und Denkwürdigkeiten,' 1865; and 'Vergleichende Psychologie,' 1866. He died in June, 1870.

* CASELLI, GIOVANNI, one of the improvers of the electric telegraph, was born at Sienna, 25th of May, 1815. He studied the physical sciences under Nobili, of whom he published a Memoir in 1837. He took holy orders in 1836, and attended to ecclesiastical duties for several years; but having been driven into exile from Tuscany, during the troubles of 1849, he was induced to adopt science as an occupation after his return. In 1854 he started a scientific journal, 'La Recreazione, Giornale de Scienze Fisiche e di Arte.' About 1856 he introduced his system of *pantelegraphy*, or *auto-telegraphy*, by which a telegram preserves its original character or alphabetic form when re-produced for the receiver. The message is written on a slip of metallized paper, or foil, coiled on a barrel rotated by clockwork; and it is received on a strip of chemically prepared paper, also coiled on a rotating barrel; the one writing is a counterpart of the other, in size, shape, and character. After years of experiments and improvements, Caselli succeeded in having his plan taken up by the French and Russian Governments in 1865, for use on certain railways. He has also invented an electro-motive machine.

CASENTINO, JACOPO DI, an eminent Italian painter, whose real name was JACOPO LANDINI, was born about 1310, at Prato Vecchio, in the Casentino. He was a scholar of Taddeo Gaddi, whose manner is very evident in his earlier works. He settled in Florence, assisted in the foundation of the Florentine

Academy, 1350, and was admitted to the Guild of Painters in 1351. He is said to have been an architect as well as a painter. He died at Prato Vecchio about 1390. Casentino was especially distinguished as a painter in fresco. His works are now very rare. Portions of his frescoes remain in the Church of Or San Michele, Florence, and in the Cathedral of Arezzo. The National Gallery possesses a large altar-piece by him, No. 580, brought from the church of San Giovanni, Prato Vecchio. It is painted in tempera on wood, and consists of a central picture representing 'St. John the Evangelist lifted up into Heaven,' among patriarchs, evangelists, and fathers of the Church; and on the other principal panels, 'The Ascension of Christ;' the 'Casting down of the Gates of Hell;' the 'Donor with his family and patron saints.' Over these are the 'Archangels Michael and Tobias.' The three upper panels represent the Trinity, the Virgin, and the Angel of the Annunciation; while in the predella below, are St. John baptizing catechumens, distributing alms, in the Isle of Patmos, and liberated from the boiling cauldron.

CASLON, WILLIAM, eminent for his skill in type-founding, was born at Halesowen, Worcestershire, in 1692. After serving an apprenticeship to an engraver of gun-locks and barrels, he established himself in business on his own account. The delicacy of his workmanship led him also to be employed in engraving or cutting stamps and punches for ornamental bookbinding. In the early part of the 18th century, the types for book-printing being coarse and ill-shaped, Mr. Bowyer, and other printers, invited Caslon to turn his attention to that subject; and, by the aid of capital supplied by them, he entirely changed the art of type-founding in England. Arabic types for the Christian Knowledge Society's use, Coptic types for a new edition of the Pentateuch, beautiful new types for standard English works, and especially, a new fount of the type called Roman pica, raised his name to great eminence. Caslon, after acquiring a handsome fortune, died 23rd of January, 1766. The typefoundry of Messrs. Caslon is still kept up.

CASS, GENERAL LEWIS. [E. C. vol. ii. col. 104.] Under President Buchanan, General Cass was made Secretary of State in 1857, and he held this position until the breaking out of the Civil War, when he retired into private life. He died at Detroit, Michigan, on the 17th of June, 1866.

* CASSIN, JOHN, American ornithologist, was born near Chester, in Pennsylvania, September 6, 1813. Since 1834 he has resided at Philadelphia, engaged in studying birds, and in publishing memoirs relating to them, chiefly of a diagnostic character. Up to 1863 these numbered fifty-six, to which about a dozen have since been added; most of them have appeared in the 'Proceedings' and 'Journal' of the Academy of Natural Sciences of Philadelphia. He has also written 'Birds of California and Texas;' 'Synopsis of the Birds of North America;' 'Ornithology of the United States Exploring Expedition;' the ornithological portion of Gillies's 'Astronomical Expedition to Chili,' and some of the chapters on birds in the 'Pacific Railroad Explorations and Surveys.'

CATALANI, ANGELICA, a celebrated singer, was born at Sinigaglia, Papal States, in October, 1779. Having, when in a convent in early life, attracted much attention by the range and beauty of her voice she began to study for public singing in 1794, and made her first appearance at Naples, in opera, in 1795. After going the round of the chief Italian cities between that year and 1803, she went in 1804 to Lisbon, where she married M. Valabrégue, an officer attached to the French embassy. After a brief engagement at Paris, she came in 1806 to London, where her success eclipsed everything until then known. In four months she received 10,000*l.* for singing in operas and concerts in London, and afterwards reaped an enormous harvest in the provinces. Her public performances were mostly in England until 1814. An opera management speculation in Paris in 1816-17 failed; after which she sang in most of the chief cities of Europe for some years. Her last public appearance was in 1827, but she survived until June 13th, 1849. Catalani's voice had a wonderful range and power, reaching up to the note called in French *contre sol*; but she had never been really well trained as a vocalist, and her dramatic powers as an actress in opera were but small.

CATTERMOLE, GEORGE. [E. C. vol. ii. col. 123.] This very clever painter died at his residence, Cedars-road, Clapham Common, on the 24th of July, 1868, in his 68th year.

CAUCHY, AUGUSTIN LOUIS. [E. C. vol. ii. col. 125.] Baron Cauchy died on the 23rd of May, 1857, at his country-seat, Sceaux, after a short illness.

* CAUMONT, ARCISSE DE, an eminent French archaeologist, was born at Bayeux, in Calvados, August 28, 1802. Having completed the ordinary educational course, and possessing a sufficient fortune, he studied geology with M. Lamouroux; founded with him the Société Linnéenne de Normandie, and published memoirs, accompanied with geological maps, on the geology of the Arrondissement de Bayeux, 1824; the Département de la Manche, 1825; and the Département du Calvados, 1828. But his attention had been strongly directed to the archaeology of his native district, and gradually this became his absorbing pursuit. He had delivered in 1825-30, courses of lectures at Caen, on archaeology, which formed the basis of his first important publication in this line, 'Cours d'Antiquités Monumentales,' 10 vols. 8vo, with 100 plates, 1830-39. The volume on mediæval architecture exciting much attention, he afterwards remodelled and published it separately, under the title 'Histoire sommaire de l'Architecture religieuse, militaire, et civile,' 8vo, with atlas of plates, 4to, Caen, 1837. This work, in which the author gave a careful chronological arrangement of French Gothic architecture, met with great success, and has done more than any in the language to popularise the study of the mediæval architecture of France. Under the title of 'Abécédaire ou Rudiment d'Archéologie (Architecture religieuse, civile, militaire),' 3 vols. 8vo, Paris and Caen, 1853, &c., the work, in a more compact and convenient form, and illustrated with an abundance of vigorous and characteristic woodcuts, has passed through several editions, has been adopted as a text-book in the colleges and upper schools of France, and forms by far the clearest and most instructive hand-book of mediæval architecture yet published. The fifth edition of the 'Architecture religieuse,' 1867, was enlarged to 2 vols. 8vo. His 'Histoire de l'Art dans l'ouest de la France, depuis les temps les plus reculés jusqu'au xvii^e siècle,' 6 vols. 8vo, 1831-40, secured his nomination as corresponding member of the Académie des Inscriptions. His investigation of the antiquities of Normandy brought him into connection with a great number of persons of similar tastes, and in the hope of inducing them to co-operate in studying and preserving the remaining monuments, he founded the Société des Antiquaires de Normandie, and later, the Congrès Scientifiques de la France, and the Société Française pour la Conservation et la Description des Monuments historiques. This last society, of which M. De Caumont is director, has, under his management, well fulfilled both parts of its title. Its 'Bulletin Monumental,' 30 vols. 8vo, Caen, 1834, &c., edited from the first by M. De Caumont, contains a large number of monographs by him, some on subjects of historical interest, like the Bayeux tapestry (vol. viii.), of considerable length, and largely illustrated. M. De Caumont has also contributed many papers to the 'Annales de Normandie,' and to the 'Journal de l'Institut des Provinces,' of which institute he is director. He has likewise edited the 'Statistique Monumentale du Calvados,' 3 vols. 8vo, Caen, 1847-58, for the most part republished from the 'Bulletin Monumental.'

CAUS, SOLOMON DE. The idea of employing steam as a mechanical agent for the purpose of raising water, heavy weights, &c., is given to the Marquis of Worcester, and the subsequent improvements are assigned exclusively to Englishmen. It was therefore with some surprise that in 1829, and again with more force in 1857, a statement was received from the powerful pen of M. Arago to the effect that the steam engine is not an English, but a French invention. Arago's paper appeared in the *Annuaire* of the Bureau des Longitudes for 1837, from which it appears that in the *Annuaire* for 1829, at the request of the students of the École Polytechnique, he had endeavoured to trace in a chronological series the improvements which the steam engine had been subjected to, from its origin to the time of the inquiry. And he expressed his belief that he should have to refer to English mechanicians only; but on a closer examination he was led to the conclusion that Solomon De Caus (Caus or Caux) preceded the Marquis of Worcester by forty-eight years. In order to transfer the glory from Britain to France it was necessary to prove De Caus to be a Frenchman. Montucla, in his 'History of Mathematics,' refers to him only as the author of a treatise on Perspective. Later works on biography state that he began and ended his life in Normandy. What little is known of him is derived from the prefaces to his works, and the confusion respecting his country seems to have arisen from the fact, that being of the reformed religion, he entered the service of several Protestant princes as engineer. In 1612 he was in the service of the Prince of Wales, afterwards Charles I. In his work entitled 'Les Raisons des Forces mouvantes,' published at Frankfurt in 1615, he styles himself

"Ingenieur et Architecte de S. Altesse Palatine Electorale." From this it has been supposed that Caus was a German, but as Arago remarks, it is not probable that a German would write in French in his own country. Moreover, in the dedication to the Most Christian King (Louis XIII.), these words precede the signature:—"de Votre Majesté le très obéissant Subject;" and lastly, in the licence, the word *subject* is again used. "Nostre bien aimé Solomon de Caus, maistre ingénieur, estant de présent au service de nostre cher et bien aimé cousin le prince Electeur Palatin, nous a fait dir, &c., désirant gratifier le dict de Caus, comme estant Nostre *subject*," &c.

In this work Caus gives a theorem that water will ascend, by the assistance of fire, higher than its level. The apparatus by which this is proved consists of a copper ball, with a vent pipe attached to the side, by which water is introduced, and the tube is then closed. There is also another pipe, passing nearly to the bottom of the ball and rising to some height above it. When the ball is placed on the fire, the elasticity of the steam acting on the surface of the water forces it up the tube and out in the form of a jet.

Arago was somewhat feebly replied to by Mr. Ainger in two lectures delivered at the Royal Institution, and published in its *Journal*. M. Arago's reply to this criticism will be found in the *Annuaire* for 1837, p. 310.

The discussion as to whether Caus or the Marquis of Worcester invented a machine of little or no practical value, even though worked by steam, is of small consequence, and does not affect the fact that the steam engine and the locomotive have emerged at the hands of Englishmen from rudimentary forms to their present power and usefulness.

De Caus had correct notions as to the important principle of the lever, known as the principle of virtual velocities; the effects of toothed wheels and of the screw being determined by its aid.

Among his other works may be mentioned 'Institution harmonique,' Frankfurt, 1615. 'Hortus Palatinus,' 1620, folio, giving an account of the Garden at Heidelberg, which was laid out under the direction of Caus, and finished in six months. 'La Pratique et Demonstration des Horloges solaires,' Paris, 1624, folio, dedicated to the Cardinal de Richelieu. In this year also appeared a second edition of the 'Raisons des Forces mouvantes,' Paris, in which the author styles himself engineer and architect to the King. After this he is lost sight of, but he is supposed to have died in 1635.

CAVAIGNAC, GENERAL LOUIS EUGÈNE. [E. C. vol. ii. col. 126.] General Cavaignac remained quietly in retirement at his villa, near Mans, till 1857, when he was elected member of the Corps Législatif for the fourth arrondissement of Paris. A few weeks later he was seized with a sudden illness, and died on the 28th October, 1857.

CAVOUR, CAMILLO BENSO, CONTE DI, a statesman celebrated as the first Premier of the new kingdom of Italy, was born at Turin on the 10th of August, 1810. He was the younger son of the Marchese Michele di Cavour, the representative of a noble Piedmontese family, which had been long settled in the neighbouring town of Chieri, and which is said to have accompanied the Emperor Barbarossa from Germany. His godmother was the Princess Borghese, sister of the Emperor Napoleon I. When ten years old he became a pupil in the Accademia Militare of Turin, where he distinguished himself so much in mathematics as to be made at the age of 16 an officer of engineers, in which capacity he assisted in the construction of various fortifications. In 1831, partly from an impatience of garrison life, and partly from the disfavour with which certain liberal expressions were received by the King, he resigned his commission, and for the next four or five years devoted himself to the improvement of his father's estates by the application to their culture of modern scientific methods. He took, however, the greatest interest in the political events of the time, and advocated a peaceable reform in society and government, to the exclusion of violence and revolution. He paid repeated visits to Switzerland; and in 1835 and during the following years made himself personally acquainted with the agricultural, industrial, social, and political institutions of France, and especially of England. Returning to his native country in 1842, he endeavoured to establish useful and benevolent corporations there, but was to a great extent baffled through the influence of the priests with the Government. Yet he joined with other able men in founding the Agricultural Society, an association which soon became powerful for good upon the prosperity of the country. For the next five years there is little trace of the direction of his activity, except in a few literary productions.

Soon after his return from Great Britain he published his 'Considerations on the Present State and Future Prospects of Ireland' in the 'Bibliothèque Universelle' of Geneva, which were subsequently translated into English; and it is known that he wrote an article on Piedmontese railways in a French periodical. In the year 1847 he established a first-class political daily newspaper, 'Il Risorgimento,' in partnership with his friend, Count Cesare Balbo, and with Count Santa Rosa, the Chevalier Carlo Buoncompagni, and one of the d'Azeglios as associates. This journal became one of the most influential organs of the middle classes; and there are to be found in it the germs of the "Cavourian Ideas," the theories of political and administrative reform, the sober aspirations after Italian unity, or "unification," as it was then called, the belief, at that time strong, in the possibility of combining Naples, Rome, and Piedmont in a Liberal crusade, and the bold views respecting the temporalities of the Church which have since become identified with the name of Cavour.

During the stormy period which followed the cession of the constitution by Carlo Alberto, Count Cavour redoubled his exertions. But the turning-point of his life was the fatal campaign that ended with Novara, after which he appeared as the expounder of a policy of compromise, as the occupant of a place between the "moderates" and the party of action, reconciling the practical aims of the one with the comprehensive patriotism of the other. His success in forming a party which stood between reaction and revolution was what first gave him real position as a statesman. In 1849 he entered the Chamber of Deputies as member for the first electoral college of Turin; and in the following year succeeded Santa Rosa as Minister of Commerce and Agriculture, and was also, in 1851, entrusted with the Ministry of Finance. The principal measures which characterised his home policy were the inauguration of free-trade, the promotion of education, the appropriation of monastic property to State purposes, the development of the material resources of the country by means of railways, the improvement of postal communication, the reform of finances, and the entire reorganisation of the army and national fortifications. During the parliamentary recess of 1852 he took the opportunity of once more visiting England, where he remained until recalled by the King in November, on the occurrence of a ministerial crisis, which left Cavour, as the successor of M. d'Azeglio, in the position of President of the Council. From this period the "unification" of Italy and the consolidation of her liberty were the professed objects of all Cavour's exertions; and everything that followed, including the futile attempt to obtain a liberal Concordat from Rome, and even the part taken by Piedmont in the Crimean war, seemed but the legitimate development of these preconceived ideas. The alliance formed with England and France against Russia, and the despatch to the Crimea of a contingent, which reflected credit on itself and on the military abilities of its leader, General della Marmora, was a great step towards the admission of Sardinia, as if by anticipation of an Italian monarchy, into the councils of Europe as a sixth great Power. At the peace, Cavour accompanied King Victor Emmanuel to London and Paris, and took an active part in the congress of the latter city, where he officially called the attention of the representatives of the Great Powers of Europe to the cause of Italy. In 1858 he was the guest of the Emperor of the French at the baths of Plombières, and the result of this visit, co-operating with the assumed and understood community of interests and antipathies, was recognised in the Franco-Sardinian alliance, which had for its object the deliverance of the Peninsula from the domination of Austria. On the 29th of January, 1859, the 'Moniteur' of Paris announced that "the mutual interests of France and Sardinia had influenced the two sovereigns to draw more closely the bonds between them by a family alliance;" and on the 30th of the same month the marriage of Prince Napoleon with the Princess Clotilde of Savoy was solemnized at Turin. On the 25th of March, Count Cavour, at the invitation of the French Emperor, paid a visit to Paris, where he omitted nothing that might be necessary to secure the interests of his country, whether the decision of Napoleon III. should be for peace or war with Austria. The voting of large sums in the Sardinian Chamber on the 12th of April for the fortifications of Alessandria was regarded by Austria as a menace, and eleven days afterwards Count Buol's ultimatum was presented at Turin. Fortunately for Count Cavour, this ultimatum was insulting enough to rally round him the whole country, and in rejecting it, which he did on the 26th of April, he seemed to throw upon Austria all the responsibility of the war. The

passage of the Ticino by the Austrians on the 29th initiated a campaign of 70 days, during which were fought the sanguinary battles of Magenta and Solferino. At the end of July, in consequence of the disappointment of his hopes by the strange and sudden peace of Villafranca, Cavour retired from office; to which, however, on the breaking down of the Rattazzi ministry, he was recalled, nominally by the King, but really by the people, on the 21st of January, 1860. He now contrived, by the treaty of Zurich, to put a new reading on Villafranca. Lombardy, surrendered by Austria to France, was transferred to Sardinia; the duchies and the legations were "annexed;" and Savoy and Nice were "re-annexed to France" as the avowed price of the Emperor Napoleon's support in the formation of the Italian kingdom, or at least his armed neutrality. At the same time the success of General Garibaldi seemed to prepare the way for the application of Count Cavour's principles to the whole of Italy: Garibaldi landed in Sicily, and soon drove out the Bourbons. His expedition was fitted out in the Sardinian ports, but all knowledge of it was officially denied. When, however, it succeeded almost beyond expectation, and King Francis was obliged to leave Naples, Cavour accepted the situation, and came forward to appropriate the spoil; and Victor Emmanuel made his entry into Naples on the 7th of November, 1860. The reduction of Gaeta by the Sardinian forces, and the defeat of the Papal troops under De la Moricière, caused Victor Emmanuel to be received as King, *de facto*, at least, of all Italy, except Venice and a remnant of the Papal States. These exceptions were enough to mar the absolute completeness of the design, so far as Count Cavour himself was concerned, and he died at Turin on the 6th of June, 1861, leaving the full accomplishment of his purpose to the efforts of his successors.

He was of a full habit of body, and so neglectful of health that he made one inordinate and luxurious meal serve for the whole day, quietly assuring his physician that he "could not spare time for more." When he at last fell ill, he was treated according to the Sangrado method, still prevalent in Italy, though abandoned in most other civilised countries, and was, it is said, literally bled to death. Within the short period of five days his physicians attempted to cure him of four or more different complaints—congestion of the brain, typhus fever, intermittent pernicious fever, brain fever, dropsy, and, lastly, gout; and for all these diseases they could exhibit but one sovereign remedy, the lancet. Count Cavour suffered and died, to the intense grief and despair of Turin and of Italy; personally, he had the power of attracting love, but it is not known that any one could boast of having enjoyed his friendship. "He stood," said the 'Times' of June 10th, 1861, "alone in his greatness."

For him politics was no more than agriculture, trade, or industry. It was a sphere of activity he looked for—work for his restless spirit, for his colossal faculties, for his undaunted energies. In early youth he was an ardent student; in his prime of manhood a deep speculator; in mature age an earnest, eager statesman. By turns he stored his mind, he enriched his family, he made his country. Foresight and steadiness chained fortune to his chariot; he met with no failure. He loved politics for exertion's sake. Power had become a necessity for him; he pined and fretted at Chieri in 1859, during those few months of comparative inaction; he would have died of weariness if, upon the Roman and Venetian question being solved, prudence had suggested a retirement under the shade of his laurels.

CENNINI, CENNINO, a Florentine painter and writer on art, was born probably about 1360 at Colle di Valdelsa. He was a pupil of Agnolo Gaddi, and practised chiefly in fresco, but never attained much distinction as a painter. A series of frescoes by him, representing the history of the Cross, are still extant in the Croce di Giorno Chapel in the church of the Franciscan convent, Volterra. His title to remembrance is, however, his 'Treatise on Painting,' which is of exceeding value, as giving a clear and tolerably minute account of the processes of the best artists of the 14th century in fresco, distemper, and oil painting, the painting of miniatures in MSS., and mosaic. In this treatise Cennini mentions that he was for twelve years the pupil of Agnolo Gaddi (who died about 1387); now Agnolo was the son and pupil of Taddeo Gaddi, the godson, and for twenty-four years the pupil and assistant of Giotto: we have thus through few hands the traditions of the fathers of modern painting, and from Cennini's evident care and conscientiousness, we may be certain that we have in his work an accurate account of the materials and practice of the chief painters of the 14th century; whilst Vasari, the scholar of Michelangelo and the companion of most of the painters

of the grandest period of the art in Italy, in his life of Agnolo Gaddi has noticed Cennini's treatise, and pointed out what additional pigments were in use in his day. The treatise was published for the first time from a MS. in the Vatican, under the title, 'Trattato della Pittura, messo in luce con annotazione del Cav. G. Tambroni,' 8vo, Rome, 1821. From the statement at the end of this MS. that it was written in 1437, "*ex Stincharum*," i.e., in the prison for debtors at Florence called "Le Stinche," it was rather hastily concluded that Cennini was confined there in his old age, and beguiled the tediousness of his imprisonment by writing his treatise. But no reference is made by Vasari or any other early authority to such an event; the records of the prison have been searched, and show no entry of his name, whilst it is known that the prisoners in Le Stinche were in those days permitted to earn money by copying MSS.; and, finally, other and better MSS. in the Laurenzian and Riccardian Libraries (which contain the description of mosaic, and much besides, omitted in the Vatican MS.) have no such date or statement. It seems, indeed, probable that the work was composed not later than the end of the 14th century, and the usual statement that "Cennini was living in 1437," must be regarded as unauthorised. Another edition of the treatise, enlarged and corrected from the Florentine MSS., was published under the care of G. de C. Milanesi, 8vo, Florence, 1859. The portion referring to oil-painting was given, with a translation, in Sir C. L. Eastlake's 'Memorial for a History of Oil-Painting,' vol. i. pp 65-73; and a translation of the entire work, by Mrs. M. P. Merrifield, appeared in 1844, with the title, 'A Treatise on Painting, by Cennino Cennini in the year 1437, and first published in Italian in 1821, with an Introduction and Notes by Signor Tambroni,' &c. A French translation, by M. V. Mottez, was published in 1858.

CHABERT, JOSEPH BERNARD, MARQUIS DE, a distinguished hydrographer, was born at Toulon, 28th of February, 1724. He entered the naval service of France in 1741, and gradually rose through the various ranks to that of admiral, and was also ennobled as a peer. His services were especially in surveying coasts and ports, to assist in the production of more correct charts than those previously in existence. His first paper on this subject was read before the Academy of Sciences in 1748, and his first volume published in 1753, 'Voyage fait par ordre du Roi en 1750 et 1751, dans l'Amérique Septentrionale, pour rectifier les Cartes de l'Acadie, de l'île Royale, et de l'île de Terre Neuve, et pour en fixer les principaux points par des Observations Astronomiques.' After making similar researches in the Mediterranean, he was appointed to the Chart Department at Versailles to arrange the materials he had collected. During several voyages to the Levant between 1762 and 1776, he added greatly to his accumulated facts, and was appointed, in 1773, inspector of marine charts and plans. During the American revolution he served in the war against England; and during the French revolution he was an exile in England, sheltered and succoured by Maskelyne, the Astronomer Royal. Returning to France in 1802, he was well received by the First Consul. Although he had lost his sight in 1800 by too close application, he continued to labour steadily at hydrography till his death, which took place on the 1st of December, 1805. The Marquis de Chabert was greatly influential in completing and perfecting the naval museums at the Louvre and at Brest.

* CHAILLU, PAUL BELLONI DU, an explorer of Western Africa, was born in New York about 1820. His father carried on trading operations with the natives in the neighbourhood of the Gaboon river, and during his early years he himself had numerous opportunities of becoming acquainted with the natives and natural productions in the vicinity. In 1855 he was sent out by the Academy of Natural Sciences at Philadelphia to explore Western Africa and to obtain information as to its natural history. His journeys extended from 1856 to 1859, and resulted in numerous discoveries, of which a brief account will be found under AFRICA, GEOG. DIV., E. C. S., and a full account in his 'Explorations and Adventures in Equatorial Africa,' 1861. In 1863 he resumed his researches in the same district, mainly with the view of confirming those of his observations which had been impugned or doubted. His account of this journey is given in 'A Journey to Ashango Land, &c.,' 1867, and the numerous astronomical observations which he made so added to our accurate knowledge of the geography of districts hitherto scarcely known that a testimonial was awarded to him in 1866 by the Royal Geographical Society of London.

CHALON, ALFRED EDWARD, R.A., was born at Geneva in 1781. He was brought early to England by his father (who

obtained the post of French professor in the Military College, Sandhurst); entered the Royal Academy as a student in 1797; was elected A.R.A. in 1812; R.A. in 1816, and died October the 3rd, 1860. Mr. A. Chalon painted a few subject pieces in oil, but his specialty was the painting of female portraits in water-colours, the heads highly finished, the dresses in a light sketchy style, but with extreme attention to mode and ornament. In this style he was without a rival, at least in popularity. For a long series of years he was the painter of ladies of rank and fashion; indeed, it was almost a mark of distinction to be painted by him. He was portrait painter to the Queen, and shortly after her accession he made the full-length portrait of her so well known by the large engraving.

CHALON, JOHN JAMES, R.A., elder brother of Alfred E. Chalon, R.A., was born in 1780; and became a student of the Royal Academy in 1816. He was professedly a landscape painter, but he also painted marine subjects, figures, and animals. His representations of Swiss scenery were most admired, but he was never popular, and though he was elected A.R.A. in 1827 and R.A. in 1841, even this slow measure of academical success was probably due rather to his brother's position and his own social qualities than to his standing as a painter. He had, however, some warm admirers. Like his brother, he was one of the original members of the Sketching Club; and on his death, which occurred November 14, 1854, the friends of the brothers organised an exhibition of their works at the Society of Arts in the spring of 1855. Mr. J. J. Chalon published in 1820 a series of humorous sketches of Parisian life.

* CHAM, a celebrated French caricaturist, the pseudonym of AMÉDÉE DE NOË, son of Comte de Noë ("Cham était le second fils de Noë."—'Fr. Dict.'). He was born at Paris, January 29, 1819; passed through the usual courses at the École Polytechnique; studied painting in the atelier of Paul Delaroche, and afterwards in that of Charlet. But his passion for caricature developed rapidly; his early published efforts had an unexpected success; he became identified with the 'Charivari,' and he and the journal have together enjoyed a long course of prosperity. Many of his designs have been collected and republished in the form of albums, and had a wide circulation. Among these are the 'Impressions de Voyage de M. Boniface'; 'P. J. Proudhon en Voyage'; 'Melanges Comiques'; 'Croquis en Noir'; 'Croquis de Printemps'; 'Croquis d'Automne,' and many more. Cham's caricatures are the purest Parisian. He has something light and airy in his manner, even when at his coarsest. His satire has sufficient malice to impart sharpness and pungency, and you feel that it is done, as well as enjoyed, with a relish. The style and treatment are always artistic.

CHAMBERLAYNE, EDWARD, a political and general writer, descended from the Counts of Tanquerville, in Normandy, was born on the 13th of December, 1616, at Oddington, near Stow-on-the-Wold, in Gloucestershire. He received his early education at Gloucester, and was admitted a commoner of St. Edmund Hall, Oxford, in Michaelmas term, 1634. He took his B.A. and M.A. degrees respectively in 1638 and 1641; and for a portion of the latter year and the year following was rhetoric reader of the university. During the civil war he travelled in France, Spain, Italy, Hungary, Bohemia, Germany, the Low Countries, Denmark, and Sweden. In 1668 he became Fellow of the Royal Society, and in 1669 was appointed secretary to Charles, Earl of Carlisle, whom he accompanied on his mission to Stockholm as bearer of the Order of the Garter to the King of Sweden. In 1670, by the King's mandate, dated February 6th, he received from the University of Cambridge the degree of doctor of laws, and was, on the 22nd of June, 1672, incorporated of the same standing at his own university. About 1679 he became tutor to Henry, Duke of Grafton, one of the natural sons of King Charles II., and was afterwards chosen instructor in English to Prince George of Denmark. He spent the latter part of his life at Chelsea; and, dying there in May, 1703, was buried in a vault in the church-yard of that parish, where a monument was erected to his memory, with a Latin inscription which declares that he "was so very desirous of doing good to all, and even to posterity, that he ordered some of the books of which he was the author to be covered over with wax and buried with him, in the hope that they might be of service to future ages." His works comprise a small treatise, entitled, 'The Late Warre Parallel'd, or a Brief Relation of the five years' Civil Warres of Henry the Third, King of England, with the Event and Issue and unnatural Warre, and by what Course the Kingdom was then Settled again,' 4to, London, 1680; a reprint, with a modified title, of a work which had first ap-

peared in 1647; 'England's Wants, or Several Proposals probably beneficial for England, offered to the consideration of both Houses of Parliament,' 4to, London, 1667; with considerable additions, 4to, London, 1668; and with further additions, 4to, London, 1685 and 1689; 'The Converted Presbyterian, or the Church of England justified in some Practices,' &c., London, 1668; 'Angliæ Notitia, or the Present State of England, together with Divers Reflections upon the Ancient State thereof,' 12mo, London, 1668, 1669, &c., of which the Second Part was published in 1671. This work, which gradually received many additions and amendments, went through numerous editions, the 18th of which, 8vo, London, 1694, incorporated a Third Part, and of which all up to and including the 20th, 8vo, London, 1702, were published by Dr. Edward Chamberlayne. The 21st edition, 8vo, London, 1704, was announced as being continued by his son, John Chamberlayne, F.R.S., who in the 22nd edition, with which the statistics of Scotland were for the first time incorporated, enlarged the title to 'Magnæ Britanniæ Notitia,' &c., under which it reached its 38th edition in the year 1755. The work, of which a Latin epitome was published by Thomas Wood, with the title of 'Angliæ Notitia; sive Præsens Status Angliæ succincte Enucleatus,' 12mo, Oxford, 1686, was also circulated in the languages of France, Germany, and Spain. Dr. Chamberlayne was in addition the author of some translations, and of several productions in political and polemical literature.

CHAMBERLAYNE, JOHN, the son of Dr. Edward Chamberlayne, received his education at Trinity College, Oxford, and was of considerable reputation as a linguist, being, as was said, a master of ten languages. He translated various treatises into English from the Dutch, French, Spanish, and Italian; but is chiefly remarkable at present for his continuation of his father's 'Angliæ Notitia,' the particulars of which are given in the preceding article. He was elected a fellow of the Royal Society in 1702, and contributed to its 'Philosophical Transactions.' He died in November, 1723.

CHAMFORT, or CHAMPFORT, SEBASTIAN ROCH NICOLAS, was born near Clermont, Auvergne, in 1741. He studied for awhile at the Collège des Grassins, but was expelled for irregularities. After serving some time as a private tutor, he went to Paris, and became connected with the 'Révue Encyclopédique.' In 1764 appeared his first comedy, 'Le Jeune Indienne,' at the Comédie Française. He attracted the notice of the French Academy by his 'Épître d'un père à son fils sur la naissance de son petit fils,' 1764; 'Homme de Lettres,' 1766; 'Combien le génie des grands hommes influe sur l'esprit de leur siècle,' 1768; 'Eloge de Molière,' 1769; and 'Eloge de La Fontaine,' 1774. Two dramas by him, the 'Marchand de Smyrne,' 1770, and 'Mustapha et Zéangir,' 1776, brought him into favour at Court; and he served for some time as secretary, first to the Prince de Condé, and then to Madame Elizabeth. He entered warmly at first into the French Revolution, and was appointed jointly with Carra, keeper of the Bibliothèque Nationale. To Chamfort is attributed the cry of 'Guerre aux châteaux, paix aux Chaumières;' but he became alarmed at the violence which ensued, and greatly exasperated the Jacobins by his sarcastic and biting epigrams. He died 13th April, 1794, after having attempted to commit suicide as a means of avoiding imprisonment. His collected works were published in a more or less complete form by Guinguenê, 4 vols. 8vo, Paris, 1795; by Colnet, 5 vols. 8vo, 1808, and several times reprinted; by Collin de Plancy, 2 vols. 32mo, 1825; by Auguis, 5 vols. 8vo, 1824-5; and by A. Houssaye, large 18mo, 1867.

CHAMPLAIN, SAMUEL DE, was born at Brouage, in the second half of the 16th century. After having served Henry IV. in the wars of the League, he travelled for two or three years in the East Indies, and then joined an expedition under M. Pont Gravé, fitted out to extend the exploration of Canada, which had been commenced by Cartier. They reached the St. Lawrence in the early summer of 1603, pushed far up into the interior, and collected such information as enabled Champlain to prepare a rough map of portions of the country. During the next thirty years he made frequent voyages to Canada, at first under other commanders, but afterwards holding the chief command. He founded the city of Quebec, travelled so far west as to discover Lakes Huron and Ontario, and ascended the river Ottawa under a mistaken idea that it might possibly solve the problem of a north-west passage to China. In 1629 he was forced to surrender Quebec to the English; but it was restored two or three years afterwards. At his death, in December, 1635, he was Governor of Canada. His valuable

explorations in that country were described in 'Des Sauvages, ou Voyage de S. Champlain,' 1603; and in two later works, the volumes of which were published at various dates between 1619 and 1631.

CHAMPOLLION-FIGEAC, JEAN-JACQUES. [E. C. vol. ii. col. 159.] In 1861 appeared the first part of a splendidly illustrated work in folio, intended to embrace a description of the older imperial palaces of France, the text written by, or under the direction of, M. Champollion-Figeac, as Imperial Librarian, entitled 'Châteaux de la Renaissance. Monographie du Palais de Fontainebleau, dessinée et gravée par R. Pfnor, accompagnée d'une texte historique et descriptif par M. C.-F.,' but the full plan appears to have been abandoned or deferred, and the account of Fontainebleau was issued as a complete work, with the title 'Le Palais de Fontainebleau, ses origines, son histoire artistique et politique, son état actuel. Publié d'après les ordres de l'Empereur,' 2 vols. folio, with atlas of plates, Paris, 1866. M. Champollion-Figeac died at Fontainebleau, May 9, 1867. His son, AIMÉ CHAMPOLLION, principal of the secretariat of the departmental archives of the minister of the interior, has published some good editions of historical works, including the 'Mémoires du Cardinal de Retz,' 8vo, 1837; 'Poésies du Duc d'Orléans,' 8vo, 1842; 'Poésies du Roi François I^{er}, de Louis de Savoie et Marguerite reines de Navarre, suivies de la Correspondance intime du Roi avec Diane de Poitiers,' 4to, 1847. He has also written 'Louis et Charles d'Orléans, leur influence sur les Arts, la Littérature et l'Esprit de leur Siècle,' 2 vols. 8vo, 1844; and 'Droits et Usages concernant les travaux de construction, publics ou privés, sous la troisième race des Rois de France, palais, châteaux, cathédrales, églises, fortresses, hospices, prisons, halles, &c. . . . de l'an 987 à l'an 1830. D'après les chartes et autres documents originaux,' 8vo, Paris, 1860.

* CHANDLESS, WILLIAM, one of the explorers of the Amazon basin, was born in November, 1829. His first extensive journey was a trip across the United States to the Mormons at Utah, amongst whom he resided for a time. The results of his experience are given in a 'Visit to the Salt Lake,' published in 1857. In 1860 he made a hasty canoe voyage from the diamond district of Matto Grosso to the Amazon down the river Tapajoz; but he managed to fix the positions of several places by means of astronomical observations. In 1864 and 1865 he ascended the Purús, one of the tributaries of the Amazon, but of which very little was known in this country. Several expeditions, organised by the Brazilian Government, had attempted the ascent, but not one succeeded in travelling more than 800 miles up, and no arrangements were made for ascertaining the course either by compass or by observations for latitude and longitude. Mr. Chandless, relying solely on his own resources, traced the whole course of the river up to within a few miles of its source (or about 1640 miles), and projected a map of it executed with great minuteness of detail. For this survey the Royal Geographical Society awarded him the patron's medal in 1866. In 1865 he followed up the Aquiry, the principal tributary of the Purús, and surveyed it as carefully as he had done the main stream. These explorations added much to our knowledge of a vast tract of country hitherto unexplored by Europeans, and necessitated great alterations in the maps of this part of South America. One of the points which he settled was that the Madre de Dios, which rises in the Caravayan Andes, is not the upper portion of the Purús, as was generally supposed. The question had, however, been previously solved by Don Faustino Maldonado, who embarked on the Madre de Dios in 1861 with a crew which reached Manao on the Amazon, he himself having been drowned in passing a rapid. This journey showed that the Madre de Dios is one of the head waters of the Madera. Further details are given under AMERICA, GEOG. DIV. E. C. S. In 1867 Mr. Chandless explored and mapped the Jurua for nearly 1000 miles, and found that its course is given wrongly on most maps, the general direction of the upper portion of the stream being west, not south.

CHAPONE, HESTER, daughter of Thomas Mulso, Esq., was born at Twywell, in Northamptonshire, on the 27th of October, 1727. Her literary taste exhibited itself at an early age; and she cultivated the study of French, Italian, and, to a less degree, of Latin, with a strong tendency to ethics and philosophy. She passed much of her time in London, and about 1748 made the acquaintance of Miss Elizabeth Carter, who was a few years her senior, with whom she contracted a friendship which continued for fifty years. At the house of her friend Richardson, the novelist, she met Mr. Chapone, a solicitor, of Clement's Inn, to whom she was united in 1760, but was left a

widow in less than ten months after her marriage. Mrs. Chapone, at that time Miss Mulso, contributed four billets to the 10th number of the 'Rambler' (1750—52); and in 1753 her story of 'Fidelia,' written with the intention of exposing the sophistry of scepticism, appeared in three successive numbers (77, 78, and 79) of the 'Adventurer.' Amongst her earlier productions were an 'Ode to Peace,' and an 'Ode' prefixed to Miss Carter's translation of Epictetus. In 1766, Mrs. Chapone staid for some months at the parsonage of her second brother, at Thornhill, near Wakefield, where she contracted that affectionate partiality for his eldest daughter which resulted in the writing, and finally, in the publication of the well-known 'Letters on the Improvement of the Mind, addressed to a Young Lady,' 2 vols. 12mo, London, 1773, and many times reprinted. These were followed by 'Miscellanies, in Prose and Verse,' 12mo, London, 1775; and a 'Letter to a newly-married Lady,' 12mo, London, 1777. Mrs. Chapone varied her habitual residence in London by frequent visits to friends in the country; but after severe family bereavements, which she experienced about 1790, her mind became affected, and she was removed to Hadley, by Barnet, where she expired on Christmas Day, 1801, being then in her 75th year. Her works were posthumously published, with a memoir, &c., by her nephew, Mr. Mulso, under the title of 'The Works of Mrs. Chapone: now first collected. Containing (I.) Letters on the Improvement of the Mind; (II.) Miscellanies; (III.) Correspondence with Mr. Richardson; (IV.) Letters to Miss Carter; (V.) Fugitive Pieces. To which is prefixed an Account of her Life and Character, drawn up by her own Family,' 4 vols. 8vo, London, 1807, &c.

CHARRON, PIERRE, French ethical writer, was born at Paris in 1541. After having practised as an advocate for six years, he took a dislike to the law, entered the church, and became eminent as a missionary preacher. During his temporary sojourn in various parts of France he made the acquaintance of Montaigne at Bordeaux, and formed with him a lasting friendship. For some time he was preacher in ordinary to Queen Marguerite. In 1588 he wished to take monastic vows, and to devote his leisure to philosophical speculation; but he was refused admission by the Chartreux and the Celestins of Paris on account of age. He resumed his occupation as a preacher, and continued it till his death, which took place November 16th, 1603. Charron's essay, 'De trois Vérités,' 1594, is a confutation of Atheists, Idolaters (including Jews and Mohammedans), and Schismatics or Protestants, as three classes of offenders against the truth. Soon after his appointment as secretary to the Assembly of the Clergy, in 1595, he produced his 'Traité de la Sagesse,' 1595, a broader and deeper work, sound in morality, though dry and inelegant in style. It was too free in tone, however, for his orthodox contemporaries, and brought him into some discredit, which was not (as he had hoped) wholly removed by the publication of a third work, 'Refutation des Hérétiques,' 1600. The 'Traité de la Sagesse' has been many times reprinted; perhaps the most prized is the little Elzevir ed. 12mo, Leyden, n. d., but after 1656. There are two English versions, one by Sampson Lennard, 4to, 1658; the other by George Stanhope, D.D., 3 vols. 8vo, 1697, 2nd ed. 1707. Charron's works were published in a collected form, 'Œuvres Diverses,' 4to, Paris, 1635.

CHARTIER, ALAIN, a celebrated French poet, was born at Bayeux between the years 1380 and 1390. After studying at the University of Paris, he obtained various ecclesiastical appointments, and rose into favour at court. He was at different times secretary to Charles VI. and Charles VII. (1420), and was sent on embassies to Scotland and to Bohemia; but few dates are recorded in reference to him. The date of his death is variously stated at 1449, 1457, and 1458. Chartier wrote many essays and short poems, intensely national in spirit, and which being circulated at court and from hand to hand, rendered the author extremely popular. Few of them were, however, given to the public till after his death. The names of some of them are 'Sur la Sortie de Paris par le Dauphin;' 'Harangue aux Hussites;' 'Sur les Maux de la Guerre;' 'Le Livre des Quatre Dames;' 'Le Quadrilogue Invectif;' 'L'Espérance, ou Consolation des trois Vertues;' 'Le Curial;' 'Le Paix de Pays;' 'La Ballade de Fongières.' He was an elegant writer for the period in which he lived, and he contributed, by his 'Quadrilogue Invectif' and other occasional pieces, to maintain a patriotic spirit among his countrymen at a time when the English successes in France had produced some despondency. 'Joan of Arc' was the heroine of one of his minor pieces. The first edition of his "dictes et ballades" appears to be that of Paris, 1 vol. folio, BIOG. DIV.—SUP.

1489, but some think an edition in two thin folio volumes is the earlier: both have for title 'Les Faiz Maistre Alain Chartier.' Many subsequent editions were published; that most esteemed by collectors is by Galliot du Pre, 'Les Œuvres feu Maistre A. C.,' &c., 8vo, Paris, 1529.

CHATELAIN, GEORGES, French chronicler and essayist, was born at Alost, in Flanders, 1403. When a young man he followed the profession of arms, and afterwards travelled in various parts of France and England. In 1443 he entered the service of Charles the Good, Duke of Burgundy, to whom he acted as chronicler and secretary, and to some extent as director of Court pageants. Under the patronage of the next duke, Charles the Bold, he settled permanently at Valenciennes, and devoted most of his time to writing till his death, which took place 20th March, 1475. Chastelain's chief work is 'La Grande Chronique, ou livre de tous les hauts et grands faits de la Chrétienté, souverainement de ce noble royaume de France, et de ces dépendances, depuis l'an vingt (1420) jusques à maintenant,' (1474). It was a valuable and much prized history at the time of its production. Only the first and third portions, from 1419 to 1422, and from 1461 to 1474 appear to be now extant. They were edited by M. Buchon in the collection of 'Chroniques Nationales,' 8vo, 1827; and in the 'Pantheon Littéraire,' 1837. He wrote other but less important histories, and several essays, among which were 'Les Epitaphs de Hector et d'Achille;' 'Louanges de la très glorieuse Vierge;' 'Les douze dames de Rhétoric.'

CHATELAIN, JOHN, a clever designer and engraver, was born in England of French parents about 1710. He designed and etched landscapes with rare ability, but his habits were irregular, and his application fitful. He died about 1770. The engravings by him most prized by collectors, are three grand landscapes after N. Poussin, F. Bolognese, and P. Da Cortona, and those executed for Boydell's collection of Landscapes after the great masters, including nine after Gaspar Poussin, whose manner he rendered very happily. He also engraved eight Views in the Lake District, after Bellers; several after M. Ricci; and 'Fifty Views of Churches, Buildings, Villages, and Rural Scenes adjacent to London,' 8vo, 1750, as well as other landscapes from his own designs.

CHÂTELET, GABRIELLE ÉMILIE LE TONNELIER DE BRETEUIL, MARQUISE DU, was born at Paris, December 17, 1706. The daughter of the Baron de Breteuil, her education was carefully attended to; her early studies embraced a wide range, including Latin and the modern languages, classics, poetry, and science; and after her marriage with the Marquis du Châtelet, she combined in a singular way a taste for abstruse scientific research, with an indulgence in the frivolity and moral laxity of the French court. In 1733 she formed an acquaintance with Voltaire, arising out of her admiration for his poetry; and the relations which she maintained with him at Paris, Cirey, and Lunéville, were such as to furnish ample scope for the chroniclers of scandal. Madame Du Deffand and Madame Delaunay spoke of her in disparaging terms; but men greatly marvelled at the mingled depth and frivolity of her character. Voltaire himself said of her:—

"Son esprit est très philosophe,
Mais son cœur aime les pouspous."

She died on the 10th of August, 1749, a few days after giving birth to a daughter, under circumstances which afforded as much occasion for scandal and epigram as any previous event in her career. Her published writings are chiefly the following: (1) 'Institutions de Physique,' 8vo, Paris, 1740; (2) 'Réponse à la lettre de Mairan . . . sur la question des forces vives,' 8vo, Brussels, 1741; (3) 'Dissertation sur la Nature de feu,' 8vo, Paris, 1744; this was an essay which she had sent to the Academy of Sciences in 1738, in competition for a prize; it did not gain the prize, but was afterwards published separately. Other works from her pen were published posthumously; (4) 'Principes Mathématiques de la Philosophie Naturelle, traduit de Newton,' 8vo, Paris, 1792; (5) 'Doutes sur les religions révélées adressés à Voltaire,' 8vo, Paris, 1792; (6) 'Lettres inédites de la Marquise du Châtelet à M. le Comte d'Argental,' 8vo, Paris, 1806.

* CHATIN, ADOLPHE, a French botanist and physician, was born at Tullins, in the Isère department. His special studies were pursued at Paris, in which city he became a hospital boarding student in 1835, and shortly after carried off prizes for efficiency in several branches of natural history science. In 1837 he wrote a paper, in which he showed that the law of symmetry and equilibrium discovered by Serres and Geoffroy St. Hilaire in animals was also applicable to plants. In 1842, and several subsequent

years, he acted as substitute for Professors Guiart and Clarion, who were conducting botanical classes in the École de Pharmacie, and when their chairs were amalgamated in 1848, he was appointed their successor as professor of botany. Prior to this appointment he had delivered several courses of lectures in other branches of natural history. Thus from 1845 to 1847 he lectured on comparative anatomy, anthropology, and general zoology; and in 1848 he gave a course on physical geography, geology, and metallurgy. His contributions to literature have been numerous, his papers in scientific journals exceeding one hundred in number; but we can here allude to a few only of his lines of research. One group of his papers relates to the presence of arsenic, copper, and iodine in water, air, and organisms. His attention has been mainly given to iodine, which, he says, exists in all plants, and is to be found in greater or less quantity in the soil, rivers, and air of most localities. The proportion present varies according to circumstances, being greater when the temperature is highest, and vice versa; and more abundant in rain water than in river water, according to the amount which has been intercepted by the soil. It varies from one locality to another; and from his researches it would seem that there is some connection between the distribution of cretinism and goitre, and of iodine. The diseases prevail where the water, soil, and food are least impregnated with iodine, while they are rare or absent where this element is most abundant. His researches on plants have led to important conclusions, relating mainly to their physiology and anatomical structure, the development of their organs, and their classification. An account of his investigations was first published in papers contributed to the 'Comptes Rendus,' the 'Bulletin' of the Botanical Society of Paris, and one or two other publications; but most of the results are brought together in his most important work, entitled 'Anatomie comparée des Végétaux,' etc., which commenced issuing in parts in 1856, and is still being published. It is embellished with hundreds of well executed plates.

CHAUDON, DOM LOUIS MAYEUL, French biographer, was born at Valensoles in the Basses-Alpes, May 20, 1737. On the completion of his educational course in the colleges of Marseille and Avignon, he resolved to become an ecclesiastic, and was admitted to the order of St. Benedict at Cluny. Here his literary tastes received ample encouragement, and he had the use of a noble library. His earliest essays were poetical, but after the publication of an 'Ode sur la Calomnie,' (1756), and another addressed to the 'Échevins de Marseille' (1757), he perceived that his forte lay in history and biography. He published in 1766 a biographical dictionary in 4 vols. 8vo, with the imprint of Amsterdam, and professing to be the production of a "société de gens de lettres," but which, in fact, proceeded exclusively from the pen of Chaudon, and was published at Paris. The reason for the adoption of this pseudonymous character is said to have been the doubt felt by the author how far the impartiality with which all classes of men, even those under ban of the church, were spoken of, would be acceptable to his superiors. However that may be, the value of the book was recognised by the public, and as edition after edition was called for, the author addressed himself to the duty of rendering it more worthy of the favour with which it was received. The 'Nouveau Dictionnaire Historique,' in the form it ultimately assumed, was by far the best biographical dictionary produced in France down to the close of the last century, and it has formed the basis of most of those produced there since. The lives are brief, but the essential facts and distinctive opinions are usually noted. The remarks are judicious, spirited, occasionally witty, and almost always impartial. It has its faults of course; is necessarily imperfect; contains many errors in dates and facts, and has been in a great measure superseded by later compilations, but is still a handy book of reference. The best edition is the 8th, in 13 vols. 8vo, Lyon, An xii. (1804), in which Chaudon, who had been for some time blind, was assisted by F. A. Delandine, who wrote the lives of the revolutionists, the two names being associated on the title page. In this edition, the 13th volume consists of a series of carefully compiled chronological tables of ancient and modern history. The 9th and last edition, by Prudhomme, 20 vols. 8vo, Paris, 1810-12, is full of errors, and comparatively worthless. Dom Chaudon is also the author of a pseudonymous 'Dictionnaire Historique des Auteurs Ecclésiastiques, avec le catalogue de leurs ouvrages,' 4 vols. 12mo, Lyon, 1767; a work directed against the Encyclopédistes; 'Dictionnaire anti-philosophique,' 2 vols. 8vo, 1767-69, of which a second edition appeared in 1783, under the title of 'Anti-Dictionnaire Philosophique'; 'Chronologiste Manuel,' 12mo, 1766, &c.; 'Leçons d'Histoire et de

Chronologie,' 2 vols. 12mo, Caen, 1785; 'Nouveau Manuel Epistolaire,' Caen, 1785, 2 vols. 12mo, Paris, 1786; 'Mémoires pour servir à la Histoire de Voltaire,' 2 vols. 12mo, Amsterdam (Paris), 1785. These were his latest literary labours. Already there were symptoms of the coming revolution. The congregation of Cluny was suppressed in 1787. Chaudon took refuge in the little village of Mezin. Old age was drawing on; his sight was failing, his health was feeble, but he secured the esteem of his new neighbours, who begged permission to place his portrait in the hall of the mairie. He lived at Mezin through all the revolutionary changes, for the last ten or twelve years blind and in much suffering, till the 28th of May, 1817.

* CHAUVÉAU, ALEXANDRE PIERRE, French anatomist and physiologist, who holds the position of principal anatomical demonstrator at the Imperial Veterinary School at Lyon. In 1834 he published his thesis, entitled 'Considerations générales sur la folie partielle, ou Monomania'; in 1857 appeared his 'Traité d'Anatomie comparée des Animaux domestiques,' an octavo volume of 828 pages, comprising a concise and methodical resumé of the subject it relates to; and in 1860 a small pamphlet entitled 'Théorie des Effets physiologique de l'Electricité,' in which he condenses his views on this matter, which had been previously scattered through a series of papers published in Brown Séquard's 'Journal de la Physiologie, etc.,' and in the 'Comptes Rendus.' He has made original investigations into the formation of sugar in the animal economy, the various sounds produced by the heart, on the rate of flow of the blood in the arteries, and on the properties of the spinal chord.

* CHELMSFORD, FREDERICK THESIGER, LORD. [E. C. vol. v. col. 1018.] On the formation of the second administration of the Earl of Derby in 1858, Sir Frederick Thesiger was appointed Lord Chancellor, with, of course, a seat in the Cabinet, and raised to the peerage with the title of Baron Chelmsford. He retained the chancellorship on this occasion but a very short time, resigning with the rest of the ministry in 1859. On Lord Derby's return to office in July 1866, Lord Chelmsford was reappointed Lord Chancellor, and he continued to hold the seals till 1868, when, under the premiership of Mr. Disraeli, they were transferred to Lord Cairns.

* CHENU, JEAN CHARLES, naturalist and surgeon, was born at Metz, August 30, 1808. After passing through a course of medical study at Paris, he joined the army as military surgeon, and was stationed for some years at Carcassonne. On one occasion he was called upon to give his professional assistance to Gabriel Delessert, the préfet of the department of Aude. This led to his becoming acquainted with the Delessert family, and to his being entrusted with the care of the fine collection of plants and shells formed by Benjamin Delessert. His works may be classified in four groups, according as they relate to medical matters, general natural history, shells, and mineral springs. His experience as a medical man in the south of France, and in the Crimea, where he served as one of the principal physicians, led to his writing a 'Rapport sur le Cholera Morbus,' in 1835; a 'Rapport' to the Army Council for Health, on some of the medical aspects of the Crimean war in 1854-1856; a paper on a similar subject, entitled 'Recrutement de l'Armée et population de la France,' 1867; 'Statistique medico-chirurgicale de la campagne d'Italie en 1859, 1869, for which the Academy of Sciences awarded him the Monthyon statistical prize in 1870; and a general summary of the last mentioned works, entitled 'De la Mortalité dans l'Armée et des moyens d'économiser la vie humaine,' 1870. In these he discusses several important points, and amongst others, the immense waste of life and wealth incurred by France by the enlistment of young men, before they have acquired sufficient stamina to bear up against the wear and tear of military service. He attempts to show by statistics that the expenditure in life and money, especially during war, is chiefly due to the invaliding of young soldiers, while the loss from the ordinary contingencies of war, such as wounds, &c., forms a small proportion only of the total expense. In general natural history, he has written 'Leçons élémentaires d'Histoire Naturelle,' 1846; 'La Fauconnerie Ancienne et Moderne,' 1862, in conjunction with Des Murs; and has edited 'Les Trois Règnes de la Nature,' 1864; and an 'Encyclopédie d'Histoire Naturelle,' 1850-1860. His contributions to the literature of shells include 'Illustrations Conchyliologiques,' 1842-1850, an unfinished work, which was to have given a figure of every species; a 'Manuel de Conchyliologie et de Paléontologie Conchyliologique,' 1860-1862, which is his most popular work; and a 'Notice sur le Musée Conchyliologique de M. le Baron B. Delessert,' 1844. He has also written an 'Essai sur les eaux Minérales,'

1840; and one or two other works on mineral springs. He retired from the service in 1868, but rejoined in 1870.

CHETWOOD, WILLIAM RUFUS, a dramatic author and historian, born towards the end of the 17th century, was for some time a bookseller and publisher in Covent Garden, and for twenty years, probably from 1720 to 1740, acted as prompter at Drury Lane Theatre. At the time of his benefit at Covent Garden, January 12, 1741, he was a prisoner in the King's Bench; and about twelve months after went to Ireland, which he had first visited in 1715, having been engaged by Duval as prompter to the theatre in Orange-street (*vulgariter*, Smock Alley), Dublin. To the advice and experience of Chetwood the Irish stage owed many improvements, especially of a mechanical kind; and although no actor himself, his knowledge of the stage and of the various manners of different eminent performers, made him a valuable theatrical instructor. Barry and Mrs. Gregory are said to have received the first rudiments of acting from him; and in a note to the prologue spoken on the occasion of a benefit which he took in 1760, it was asserted that his old pupil, Barry, had, in his greatest distress—at the time of this benefit, as of the one already mentioned, Chetwood was a prisoner for debt—refused him any assistance. He died on the 3rd of March, 1766.

Chetwood wrote, *inter alia*, two farces, designed not so much for the stage as in ridicule of the South Sea Scheme, entitled respectively, 'The Stock-Jobbers; or the Humours of Exchange Alley,' and 'South Sea; or the Bitters Bit, a tragi-comi-pastoral Farce,' 8vo, London, 1720; 'The Lover's Opera,' 8vo, London, 1729, third edition, with alterations, 8vo, London, 1730, and 8vo, London, 1781; 'The Voyages, dangerous Adventures, and imminent Escapes of Captain Richard Falconer,' 12mo, London, 1724, a fictitious narrative purporting to be written by Falconer himself; 'The Generous Freemason; or the Constant Lady. With the Humours of Squire Noodle and his man Doodle, a tragi-comi-farcical ballad Opera, in three acts,' 8vo, London, 1731; 'Memoirs of the Life and Writings of B. Jonson, Poet Laureat to James the First and Charles the First, &c.,' 12mo, Dublin, 1756. Chetwood's most important work, however, and one which enjoys a certain reputation as containing "some good anecdotes and some useful information," and which he dedicated to the several managers under whom he had served, Garrick, Lacey, Rich, and Sheridan, is that entitled 'A General History of the Stage, from its origin in Greece down to the present Time. With the Memoirs of most of the principal Performers that have appeared on the English and Irish Stage for the last fifty years,' 8vo, London, 1749, and with a modification of title to adapt or to recommend it to Irish readers, 8vo, Dublin, 1749. This work was supplemented by 'The British Theatre; containing the Lives of the English Dramatic Poets, with an Account of all their Plays,' &c., 8vo, Dublin, 1750, a production not famous for its accuracy, in the preface of which Chetwood is spoken of as being at that time in prison for debt, with "the melancholy prospect of ending the residue of life within the walls of a prison."

* CHEVALIER, MICHEL, a French political economist, was born at Limoges, on the 13th of January, 1806. His father, who was a shopkeeper, procured his admission at 18 years of age to the École Polytechnique, which he left, after two years, for the École des Mines. The revolution of 1830 found him attached as engineer to the Département du Nord. He had adopted the principles of Saint-Simon, and became their advocate in the 'Globe,' a journal of which he not long after assumed the management. As the director of a paper in which articles had appeared that were condemned as outrages on public morals, M. Chevalier was sentenced, in July, 1832, to a year's imprisonment. Having upon his enlargement, which took place when a moiety of his term of confinement had expired, repudiated the doctrines of which he had formerly been the apostle, M. Chevalier was sent by M. Thiers on an extraordinary mission to the United States of America, in order to study the river, lake, and general water communications, together with the railway system of the country. His letters, recording the results of his observations, not only in these, but in industrial affairs generally, were published from time to time in the 'Journal des Débats,' in a series of letters which were afterwards collected under the title of 'Lettres sur l'Amérique du Nord,' 2 vols. 8vo, Paris, 1836; fourth edition, 1842. This work, which attracted lively attention, was translated by T. G. Bradford, from the third edition, and published under the title of 'Society, Manners, and Politics in the United States; being a Series of Letters on North America,' 8vo, Boston, U.S., 1839. In 1836 he was commissioned to England to watch the progress and effects of the commercial crisis from which this country was then suffer-

ing; but shortly after his arrival received such injuries from a carriage accident, that he was obliged to repair to the Pyrenees before his health was completely re-established. In 1838 he published a work entitled 'Des Intérêts Matériels en France; Travaux publics, Routes, Canaux, Chemins de Fer, &c.,' 8vo, Paris; seventh edition, 1843; a programme of industrial progress to be followed by his country, which was translated into German by Lindner, 8vo, Stuttgart, 1838. The reputation acquired by these works caused M. Chevalier to be named a member extraordinary of the Council of State in 1838, and of the Upper Council of Agriculture and Commerce. In 1840 he succeeded M. Rossi in the chair of political economy in the Collège de France, and next year he was appointed Ingénieur en chef des Mines. In 1836 he had been named Chevalier de la Légion d'Honneur, in which he finally attained the rank of grand officier on the 4th of January, 1861. In 1845 he was elected to the Chamber of Deputies for the department of Aveyron; and, while generally confining his speeches to his special subjects, advocated his various commercial and industrial projects in the 'Journal des Débats,' in the conduct of which he had taken part since the close of the year 1835. This advocacy was, however, displeasing to his constituents, and in the election of 1846 he found himself superseded. Before this he had analysed very completely and methodically the various industries, means of communication, and capabilities of America, in his 'Histoire et Description des Voies de Communication des États-Unis, et des Travaux d'Art qui en dépendent,' 2 vols. 4to, Paris, 1840-1, to which was afterwards added an atlas in folio, and a 'Table Analytique et Alphabétique des Matières.' The lectures delivered by M. Chevalier as a professor, which were enthusiastically received by numerous students, were issued under the title of 'Cours d'Économie Politique fait au Collège de France,' 3 vols. 8vo, Paris—the first volume being published in 1842, the second in 1844, and the third, which bears 'La Monnaie' as a sub-title, in 1850. The first volume of a second edition, improved and enlarged, was commenced in 8vo, Paris, 1855. Freed from his duties as a deputy, M. Chevalier threw himself enthusiastically into the advocacy of free trade, and endeavoured, although in vain, in co-operation with M. Frédéric Bastiat, to organise in France a league similar to the then triumphant Anti-Corn Law League of England. After the revolution of February, 1848, he boldly combated the socialistic theories of M. Louis Blanc, in articles first published severally in the 'Revue des Deux Mondes' and the 'Journal des Débats,' and afterwards issued with the titles of 'Question des Travailleurs,' &c., 16mo, Paris, 1848, and 'Lettres sur l'Organisation du Travail,' &c., 12mo, Paris, 1848. On the 7th of April the Provisional Government deprived him of his chair in the Collège de France; but he was subsequently re-appointed. In 1851 he became a member of the Institute (Académie des Sciences Morales et Politiques), and in 1852 was named "Conseiller d'État en service extraordinaire." He was one of the commissioners for organising the Exposition Universelle of 1855, and one of the foremost promoters of the Treaty of Commerce between England and France in 1860. On the 14th of March of this year he became a senator; and in 1862 was elected president of the international jury for awarding the prizes at the second great Exhibition of London. The works of M. Chevalier, besides those which have been already mentioned, comprise 'L'Isthme de Panama, &c., suivi d'un aperçu sur l'Isthme de Suez,' 8vo, Paris, 1844; 'La Liberté aux États-Unis,' 8vo, Paris, 1849; 'Examen du Système Commercial connu sous le nom de Système Protecteur,' 8vo, Paris, 1852; 'De la Baisse probable de l'Or,' &c., 8vo, Paris, 1859, of which an English translation, with notes, was published by the author's friend, Richard Cobden, 'On the probable Fall of the Value of Gold,' 8vo, Manchester, 1859; 'L'Expédition du Mexique,' 8vo, Paris, 1862, a pamphlet; 'Le Mexique ancien et moderne,' 12mo, Paris, 1863; 'L'Industrie et l'Octroi de Paris,' 8vo, 1867, a series of letters collected from the 'Journal des Débats.' Many of M. Chevalier's works have been translated into English or German, or into both languages; and he has contributed extensively to various serials and periodicals—the 'Revue des Deux Mondes' and the 'Journal des Débats,' as already mentioned; the 'Dictionnaire de l'Économie Politique,' 2 vols. 8vo, Paris, 1852-53, and the 'Journal de la Société de Statistique de Paris,' 8vo, Paris, 1860, &c.

CHEVALIER, SULPICE PAUL. (GAVARNI, E. C. vol. iii. col. 42, and E. C. S.)

CHÉZY, ANTOINE LÉONARD DE, a distinguished French Orientalist, was born at Neuilly, on the 15th of January, 1753. His father, Antoine de Chézy, an engineer of repute, who was

born at Châlons-sur-Marne in 1718, and died in 1798, and who is remembered as the joint constructor of the bridge at Neuilly, and the sole architect of those at Meaux and Tréport, designed his son for his own profession. The genius of the younger Chézy, however, determined him to literature, and especially to the study of oriental languages. He acquired with great rapidity a knowledge of Arabic and Persian, to which he added a more than ordinary acquaintance with the classical and modern European languages. He cultivated also botany and natural philosophy. The year 1798 found him in the employment of the Ministry for Foreign Affairs, and he was one of the band of scholars selected to accompany the expedition of Napoleon to Egypt. But his progress was arrested by malignant fever at Toulon, and he did not proceed farther. In 1799 he was keeper of the oriental manuscripts in the Bibliothèque Nationale, and was incited to undertake the study of Sanskrit, at that time so much a novelty in France that he had to pursue his investigations without the aid of grammar or dictionary. His enthusiasm was rewarded by the King, Louis XVIII., who in 1815 created two chairs, of Chinese and Sanskrit respectively, in the Collège de France, of which the former was filled by M. Abel Rémusat, and the latter by M. de Chézy. The two scholars were also named knights of the Legion of Honour, and elected members of the Institute. M. Chézy's domestic life was not one of contentment; but he continued to solace himself for family afflictions, as well as for disappointments of a more public nature, by continuous devotion to his studies. He died of cholera, at Paris, on the 31st of August, 1832. He is known, amongst other works, by his 'Extrait du Livre des Merveilles de la Nature, par Mohammed,' 8vo, Paris, 1805; 'Medjoun et Leila,' translated from the Persian of Djani, 2 vols. 8vo, Paris, 1807; 'Yadnadatta badha,' &c., an episode from the 'Ramayana,' a Sanskrit epic by Valmiki, 8vo, Paris, 1814, of which a new edition appeared with additions and a modified title as 'Yadnadattabada; ou, la Mort d'Yadnadatta, Épisode Extrait du Ramayana, poème épique sanscrit, donné avec le texte gravé, une analyse grammaticale très-détaillée, une traduction française, et des Notes par A. L. Chézy, et suivi par forme d'appendice d'une traduction latine littérale par J. L. Burnouf,' with fifteen engravings, 4to, Paris, 1827; 'Théorie du Sloka, ou mètre héroïque sanscrit,' 8vo, Paris, 1827; 'La Reconnaissance de Sacountala, Drame sanscrit et pracrit de Calidasa, publié pour la première fois, en original, sur un manuscrit unique de la Bibliothèque du Roi, accompagné d'une traduction française, de notes philosophiques, critiques, et littéraires, et suivi d'une appendice,' 4to, Paris, 1830. Besides the foregoing, M. de Chézy published, under the pseudonym of A. L. Apudy, a translation of the 'Anthologie érotique d'Amarou,' &c., 8vo, Paris, 1831; and at his death left several philological works in manuscript. He was likewise known as a contributor to the 'Journal Asiatique,' 8vo, Paris, 1832, &c.; the 'Annales de la Littérature et des Arts,' 8vo, Paris, 1820, &c., and others.

CHÉZY, HELMINA, or WILHELMINE CHRISTIANE VON, wife of M. A. L. de Chézy, was born at Berlin on the 26th of January, 1783, and was the grand-daughter of Anna Luise Karsch, known in German poetic literature by the name of Karschin. At the age of 16 she became the wife of Herr von Hastfer, from whom she separated in the following year. In 1802 she availed herself of the proffered protection of Madame de Genlis, at Paris, and in 1806 became the wife of M. de Chézy, whose acquaintance she had made at the house of Friedrich von Schlegel, and from whom she finally separated in 1810. She now repaired with her two sons to Germany, where she devoted herself to literary pursuits, enjoying the patronage of Prince von Dalberg, and residing in turn at Heidelberg, Berlin, Dresden, Vienna, and Munich. She died in the last-named city on the 28th of January, 1866. The poems of Madame de Chézy are regarded as favourable specimens of the romantic school; and amongst others she published a collection, entitled 'Gedichte,' 2 vols. 8vo, Aschaffenburg, 1812; Heart-Tones of a Pilgrim, 'Hertzenstone auf Pilgerwegen,' 12mo, Sulzbach, 1833, containing a revised edition of the Three White Roses, 'Die drei Weissen Rosen,' which had first appeared in the 'Urania' for 1821. Amongst her novels may be mentioned the Newly Selected Writings of the grand-daughter of Karschin, 'Neue auserlesene Schriften der Enkelin der Karschin,' 2 parts, 8vo, Heidelberg, 1817: Stories and Novels, 'Erzählungen und Novellen,' 2 parts, 8vo, Leipzig, 1822; Hour-Flowers, 'Stundenblumen,' 4 vols. 12mo, Vienna, 1824-27; and Emma's Trials, 'Emma's Prüfungen,' Heidelberg, 1827. Besides the production of some books of social and topographical interest, Madame de Chézy

is known as the writer of the libretto to Weber's opera of 'Euryanthe,' Vienna, 1824, German and English, and third edition, 1843. Two years after her death an autobiographical memoir of the remarkable circumstances of her life was edited by Bertha Bornträger, with the title of 'Unvergessene. Denkwürdigkeiten aus dem Leben von Helmina von Chézy. Von ihr selbst erzählt,' 2 parts, 8vo, Leipzig, 1858.

* CHÉZY, WILHELM VON, elder son of the above, was born on the 21st of March, 1806; and, following the movements of his mother, was educated at various cities in Germany. In 1829 he studied law at Munich, but, yielding to the greater attraction of literature, soon gave evidence of considerable power and versatility. He acted as a journalist, novelist, and dramatist, fixing himself in 1850 for the discharge of his duties in the first capacity at Vienna. The works by which he has achieved reputation as a delineator of the manners of chivalric and of modern times comprise the Wandering Scholar, 'Der fahrende Schüler,' 3 vols. Zurich, 1835; The Pious Jew, 'Der fromme Jude,' &c., 4 parts, 8vo, Stuttgart, 1844-45; the Last of the Janizaries, 'Der Letzte Janitschar,' &c., 8vo, Vienna, 1855; and Recollections of his Life, 'Erinnerungen aus meinem Leben,' 2 vols. 8vo, Schaffhausen, 1863, &c.

MAX VON CHÉZY, the younger brother of Wilhelm, was a painter, who died at Heidelberg, in the year 1846.

CHIARAMONTI, SCIPIONE (Lat. SCIPIO CLARAMONTIUS), Italian astronomer, was born at Cassena, in Romagna, June 22nd, 1565. After studying philosophy and mathematics at Perugia and Ferrara, he removed to Pisa, where during the greater part of his life he was a teacher of science. Upon the death of his wife he took ecclesiastical vows, and entered the Congregation of the Oratory. He died the 6th of October, 1652. Chiaramonti, who wrote in Latin, controverted one of the theorems laid down by Tycho, concerning comets; 'Anti-Tycho, in quo contra Tychonem Brahe, et nonnullos alios rationibus eorum ex optica et geometricis principiis solutis, demonstratur cometæ esse sublunares, non cœlestes,' 4to, Venice, 1621; Kepler and Galileo supported Tycho's views against those of Chiaramonti. Another astronomical controversy was raised by him in 'Anti-Philolæus, in quo Philolæus redivivus de terræ motu et solis ac fixarum quiete impugnatur, necnon positio eadem de re Copernici confutatur, et Galilæi defensiones rejiciuntur,' 4to, Cassena, 1643; this attempt to overturn the Copernican hypothesis was, of course, a failure. In another work he criticised Aristotle's views on certain astronomical phenomena: 'Commentaria in Aristotelem de iride, de corona, de parheliis, et virgis,' 4to, Cassena, 1654. Two other works from his pen were, 'De conjectandis cujusque moribus et latitantibus animi affectibus,' 4to, Venice, 1625; and 'Cassena historia, libri xvi., ab initio civitatis ad hæc tempora, in quâ totius interdum Italiæ status describitur,' 4to, Cassena, 1641. His 'Opuscula varia Mathematica,' appeared in a now exceedingly scarce quarto volume, Bologna, 1653.

CHLADNI, ERNEST FLORENCE FREDERICK, was born at Wittenberg, 30th of November, 1756, of a family of Hungarian origin. His father wished him to follow his own profession, that of the law, for which purpose he was trained first at home, and then at the provincial school of Grimma. Referring to this period he says:—"My education left me so little leisure, that while others regard their youth as the happiest period of their life, I cannot say as much for mine. This continual restraint, which was not at all necessary, since I was not of a disposition to abuse my liberty, produced an effect quite contrary to that intended, for it gave me an almost irresistible longing to choose my own occupations, to travel, and to contend against opposing circumstances." At length he obtained his degree of Doctor in Philosophy and Law, and returned to Wittenberg to practise his profession. But after the death of his father he gave up law in disgust, and devoted himself to the study of nature, to which he had previously applied some of his scanty leisure. He had already remarked while taking lessons in music, at the age of 19, that the theory of Sound had been more neglected than that of other branches of physics. He felt a strong desire to supply this defect, and to make discoveries of his own. He says, "In 1785 I made some imperfect experiments, and observed that a plate of glass or of metal gave different tones when it was pressed and struck in different places. The journals about this time noticed a musical instrument constructed in Italy by the Abbé Mazzocchi, consisting of bells made to vibrate by means of fiddle bows; this suggested to me the idea of making use of a fiddle bow to examine the vibrations of sonorous bodies. When I applied the bow to a disc of copper fixed in the centre, it gave different notes

which, compared among themselves, were equal to the squares of 2, 3, 4, 5, &c. But the nature of the motions to which these sounds corresponded, and the means of producing any one of them at will, were as yet unknown to me. Calling to mind Lichtenberg's electrical figures, I fancied that the different vibratory motions of a sonorous disk would present different figures if a little sand or similar matter were dusted over the surface. In adopting this device the first figure that struck my eyes on the round disk, resembled a star of ten or twelve radii, and the sharp sound produced corresponded to the square of the number of diametrical lines. One may judge my astonishment in regarding this phenomenon which no one had ever before seen. After having reflected on the nature of these motions, it was not difficult for me to vary and multiply the experiments, the results of which succeeded each other with tolerable rapidity. My first memoir, which contained researches on the vibrations of a circular plate, a square plate, a ring, a bell, &c., appeared at Leipsig in 1787."

Chladni also invented two musical instruments, the Euphonia and the Clavicylinder, which cost him more time, labour, and expense than his experiments on vibration. He says:—"After having worked in vain for a long time, one must sometimes destroy all one's work, and begin again, but the least success makes one forget all these trials of patience." The Euphonia, invented in 1789 and finished in 1790, consisted of small cylinders of glass which were rubbed longitudinally with the moistened fingers. The Clavicylinder, finished in 1800, consisted of a cylinder of glass made to revolve and produce notes by its friction on some interior mechanism, while by means of a key-board notes could be produced at will with the various shades of *crescendo* and *diminuendo*, the instrument never getting out of tune. It was favourably reported on by the Institute of France, and by the Conservatoire de Musique.

In order to make these instruments known, Chladni set out in 1802 on a journey throughout Germany, Holland, France, Italy, Russia, and Denmark. His instrument and his lectures on Acoustics were favourably received. In the same year he published a Treatise on Acoustics, a French translation of which appeared, under his own superintendence, at Paris in 1809. The following is the dedication. "Napoleon le Grand a daigné agréer la dédicace de cet ouvrage, après en avoir vu les expériences fondamentales."

The Emperor was so struck with these experiments that he proposed a prize of 3000 francs for the best essay on the question, "To give the mathematical theory of the vibrations of elastic surfaces, and to compare it with experiment." In the programme issued by the Institut de France we get some idea of the language of adulation which scientific men condescended to use at this period. "Cette nouvelle conception du génie bienfaisant qui anime et dirige les vues grandes et profondes de Sa Majesté pour le progrès, et la propagation des lumières, sera reçue avec reconnaissance par tous les peuples qui honorent et cultivent les sciences." Only one memoir was sent in as a candidate for the prize, and this was not crowned, though honourable mention was made of it.

Chladni is best known by his acoustical figures, which are made out by the symmetrical arrangement of nodal lines. In his published works he attempts to reduce the vast number of figures produced to something like method. Thus he traces the vibrations of square plates to those forms of vibration in which the nodal lines are parallel to one side of the square, and to those in which they are parallel to another side. His notation indicates the modes of vibration. Thus 5—2 is a form in which there are 5 nodal lines parallel to one side and 2 to another, or a form can be traced to a disfigurement of such a type as this. The subject has been largely enriched by contemporary and later physicists.

Chladni published his 'Neue Beiträge zur Akustik' in 1807, a 'Treatise on the Art of Constructing Musical Instruments' in 1822, while the second German edition of his 'Treatise on Sound' appeared in 1830.

Chladni also took great interest in the subject of Meteors. "It was Lichtenberg," he says, "who for the second time gave an impulse to the course of my ideas." Being at Göttingen in 1792 he asked his opinion as to the nature of igneous meteors, or *bolides*, and was so much struck with the opinion that they came from beyond our atmosphere, that he set to work to compile a list of recorded cases of the fall of meteoric iron, &c. This appeared at Leipzig in 1794. He also published in the 'Bulletin de la Société Philomatique' for April, 1809, a Catalogue

of Meteors. Another paper on Fiery Meteors was published at Vienna in 1819.

Chladni died at Breslau, April 4th, 1827. Professor Tyndall, in his published lectures on Sound, gives a portrait of Chladni, with his autograph, as a frontispiece, and quotes a letter which he received from Professor Weber, in which he says:—"I knew Chladni personally. From my youth up, he was my leader and model as a man of science, and I cannot too thankfully acknowledge the influence which his stimulating encouragement during the last years of his life, had upon my own scientific labours."

The short autobiographical sketch from which we have quoted, is prefixed by Chladni to the Paris edition of his 'Treatise on Acoustics' (1809). He says:—"People have often asked by what chance I succeeded in making discoveries. Chance has never favoured me; hard work has. Following the examples of many distinguished persons, I proceed to give some account of the history of my discoveries. These being the result of individual circumstances, I may thus be able to interest some of my readers."

CHOISY, FRANÇOIS TIMOLÉON DE, Prior of Saint Lô, Grand Doyen of the Cathedral of Bayeux, and a member of the Académie Française, was born at Paris on the 16th of August, 1644. His youth and early manhood were a series of irregularities, and for some years he dressed and lived as a woman. He was appointed "coadjuteur d'ambassade" to the Chevalier de Chaumont, who was sent by the French monarch to the King of Siam, who, it is said, wished to become a Christian. The envoys embarked at Brest on the 3rd of March, 1685; and during the voyage M. de Choisy was admitted to priest's orders by the Vicar Apostolic of the Indies, so that he performed his first mass on the open sea. The mission arrived at Brest on their return, on the 18th of June, 1686, having effected little further than to lay the basis of a superficial and untrustworthy volume which the Abbé de Choisy published the following year, with the title of 'Journal du Voyage de Siam fait en 1685 et 1686,' 4to, Paris, 1687; 12mo, Amsterdam, 1688, &c. In 1687 the Abbé was elected a member of the Académie; and some years after published his French version of the 'Imitation de Jésus-Christ,' which was reprinted in 12mo, 1735, and of which the first edition was dedicated to Madame de Maintenon, with the advice curiously applied from the 44th Psalm, "Audi, filia, et vide, et inclina aurem tuam, et concupiscet rex decorem tuum." Such was the man who, at the request of Bossuet, undertook to write an 'Histoire de l'Eglise,' 11 vols. 4to, Paris, 1706-23, in which the author discusses rather too gaily the gallantries of kings and the pleasant sins of the world. The versatile abbé died at an advanced age on the 2nd of October, 1724. He was a voluminous author, and left, *inter alia*, 'Quatre Dialogues: (1) Sur l'Immortalité de l'Âme, (2) Sur l'Existence de Dieu, (3) Sur la Providence, (4) Sur la Religion,' 12mo, 1684; reprinted in 12mo, Paris, 1768, the joint production of M. de Choisy and the Abbé de Dangeau; 'Histoire de la Vie de David,' 4to, about 1687, and 12mo, Amsterdam, 1692; 'La Vie de Salomon,' 12mo, 1687; 'Mémoires pour servir à l'Histoire de Louis XIV.,' 2 vols. 8vo, and another edition in 3 vols. 8vo, Utrecht, 1727; and Histories of several of the Kings of France, which having been already published by instalments at different times, were collected and issued with the title of 'Histoire de France sous les Règnes de Saint Louis, de Philippe de Valois, du Roi Jean, de Charles V., et de Charles VI.,' 4 vols. 12mo, Paris, 1750. Particulars of a life and character which have caused some debate have been supplied by M. P. J. T. d'Olivet, in a work entitled 'Vie de M. l'Abbé de Choisy,' 8vo, Lausanne and Geneva, 1742.

CHOPIN, FREDERIC FRANÇOIS, musical composer and pianist, was born of French parents settled near Warsaw, 8th February, 1810. He acquired his musical education chiefly through the liberality of Prince Radzivil, at Warsaw, and then studied composition under Elsner. After travelling in France, Germany, and Italy, he made his first public appearance as a pianist at Vienna in 1829. During the remaining twenty years of his life he attracted much public attention, as a brilliant pianist, a composer of numerous pieces for that instrument, and a teacher. He resided at Paris from 1831 to 1837, then went to Majorca for the benefit of his health, visited London in 1848, and died at Paris, 17th October, 1849. As a pianist, Chopin held a high rank for delicacy of touch and originality of style; though many other artists (with whom, generally, he was not a favourite) took exception to his method. As a composer he was chiefly successful in polaccas, polonaises, mazurkas, nocturnos, preludes, tarantellas, and other light pieces. As a teacher, he was in high

favour with ladies of rank at Paris, especially the Polish nobility living in exile; his refined manners and fastidious taste conducing to his welcome in such circles.

CHRESTIEN, or CHRESTIENS, DE TROYES, one of the most illustrious of the early French poets who devoted their talents to the glory of King Arthur and the history of the Holy Graal, was born at Troyes, in Champagne, during the reign of Louis VII., and probably between the years 1140 and 1150. He was thus a contemporary of Robiers and Helie Borron. He was emphatically the poet of the nobles, pure in style, delicate, for his age, in thought, fertile in imagination, and an accomplished student of men and manners. He enjoyed the patronage of Philippe d'Alsace, Comte de Flandre, to whom he dedicated most of his works, and to whose court it has been supposed he was attached. There is some reason, also, for thinking that he was in holy orders. He died near the close of the 12th century, or in one of the earliest years of the 13th.

The romances of Chrestien began to appear about the year 1170, and according to the order in which he enumerates them in his opening of the romance of 'Cligés,' or 'Cligét,' that of 'Erec et Enide,' which extends to about 6600 verses, and the characteristic circumstances of which have been lately retold in Mr. Tennyson's 'Idylls of the King,' was the first produced. Fragments of 'Erec et Enide' have appeared in various modern works; and the whole poem was published from the Cangé MS., by Immanuel Bekker, in Haupt's 'Zeitschrift für Deutsches Alterthum,' vol. x. 8vo, Leipzig, 1855. Chrestien's next romance, sometimes called 'Tristram,' but which he himself mentions as 'Le Roi Mare et Ysent la blonde,' and which is believed to have been written previous to 1173, is lost as a whole, and even such fragments as profess to belong to it cannot be identified. A third romance, that of 'Cligés,' has not been edited; but quotations from it appear in the works of Ginguéné and Dr. W. L. Holland, and various MSS. of it are preserved at Paris and elsewhere. The hero, who goes through at least an average round of knightly adventures, is the grandson of Alexander, Emperor of Constantinople, and son of Alexander, who, having been admitted by King Arthur as a Knight of the Round Table, wins the love and the hand of Sore (Sœur) d'Amors, who becomes the mother of Sir Cligés. The author professes to have adapted the story from a MS. which he discovered at Beauvais.

The adventures of a knight who by an opportune act of kindness subdued a lion to devotion and obedience, which form the subject of a fourth romance, have been more than once edited of late years. They are told by Chrestien in nearly 7000 verses, which are given complete in the third volume of Lady Charlotte Guest's 'Mabynogion,' 8vo, London, 1838, and in Dr. Holland's 'Li Romans dou Chevalier au Lyon,' 8vo, Hanover, 1862. Of a fifth romance, Launcelot du Lac is the true hero, 'Li Romans del Chevalier de la Charrette,' a poem of nearly 7000 verses, which, written for the most part by Chrestien, was continued by Godefroid de Laigny (Godefroid de Leigni), and which was published by M. Tarbé as 'Le Roman du Chevalier à la Charrette,' par Chrestien de Troyes et Godefroid de Laigny, 8vo, Reims, 1849. The History of William the Conqueror, which, differing somewhat from the foregoing works, is still not entirely without the realm of the imagination, occupies a poem of 3300 lines, 'Il Contes del Roi Guillaume d'Engleterre,' which has recently been translated into German by H. A. von Keller, and into French by Léon Paulel, and which occurs in the original in a work edited by Dr. Giles for the Caxton Society, 'Scriptores Rerum Gestarum Willelmi Conquestoris,' 8vo, London, 1845, where the version is followed of M. Francisque Michel's 'Chroniques Anglo-Normandes,' 3 vols. 8vo, Rouen, 1840. One other of the larger works of Chrestien remains to be mentioned, and it has been reserved for this place because it offers one of the earliest—perhaps the earliest—examples of the interweaving of the legends of the Holy Graal with those of the Round Table. It is called 'Le Roman de Perceval le Gallois; ou, le Conte du Grail (li Contes del Graal),' of which, in spite of the existence of many MSS., and the interest of many students of Troubadour literature, no complete modern version has been printed, although a large portion appeared in a volume by M. Ch. Potvin, entitled 'Bibliographie de Chrestien de Troyes. Comparaison des Manuscrits de Perceval le Gallois,' 8vo, Bruxelles, Leipzig, &c., 1863. Fragments and passages of it have been given in various works for purposes of illustration; and translations or imitations of the whole poem have appeared in German, French, Flemish, Spanish, and Icelandic. An old English version, 'The Romance of Sir Perceval of Gales,' scarcely one-tenth of the length of the original, is given in 'The Thornton Romances,' 8vo, London, 1844,

a volume edited by Mr. Halliwell for the Camden Society. The original poem, which is over 20,000 lines in length, was written by Chrestien de Troyes, and continued by Gautier de Denet and Manesier.

Of minor productions, the authorship of six Songs can be accurately referred to Chrestien; and he claims several imitations of Ovid, 'Les Comendemens (Remedia Amorum),' 'L'Art d'aimer,' and others, which remain to this day in manuscript. Amongst the many scholarly books of recent issue which are conversant about Chrestien de Troyes, the work of Dr. Wilhelm Ludwig Holland, for its truth and completeness, deserves especial mention, 'Chrestien de Troyes. Eine Literaturgeschichtliche Untersuchung,' 8vo, Tübingen, 1854.

CHRISTIE, SAMUEL HUNTER, was born in London 22nd March, 1784. He displayed at an early age a taste for mathematics. In 1801 he was entered at Trinity College, Cambridge, and in his third year obtained a scholarship. In 1805 he took his degree of Bachelor of Arts as second wrangler, after a severe struggle with Turton (afterwards Bishop of Ely) for the "blue riband" of the University, and being bracketed with him as Smith's prizeman. In 1806 Christie became third mathematical master at the Royal Academy, Woolwich, and devoted himself to the improvement of the mathematical studies of the College. In 1812 he established a system of competitive examinations, but was not able fully to develop his views until 1838, when he became professor of mathematics. It was not until 1854, after forty-eight years' service in the same institution, that he vacated his chair, and went to reside at Lausanne. After some time he returned to England, and took up his abode at Twickenham, where he died, 24th January, 1865, having nearly completed his 81st year.

Christie was elected a Fellow of the Royal Society in January, 1826. He has contributed a number of papers to the 'Transactions,' on magnetism and subjects related thereto. He delivered the Bakerian lecture for 1833, on the magneto-electric conduction of various metals. He served on the "Compass Committee" of the Admiralty, and drew up that part of the British Association Report for 1833 which refers to the magnetism of the earth. He also, in conjunction with Mr. Airey, reported on Humboldt's suggestion for the establishment of permanent magnetic observations. In 1837 he succeeded Mr. Children as one of the secretaries of the Royal Society, and retained that office until 1854. He also published an 'Elementary Course of Mathematics' for the use of the Royal Military Academy.

* CHRISTISON, ROBERT, a Scotch physician and toxicologist, was born in 1798, and was educated partly in London and partly in some of the continental universities, more especially that of Paris. In 1819 he took his doctor's degree at Edinburgh; in 1822 he succeeded to Dr. Alison, as professor of medical jurisprudence in the University of Edinburgh, and in 1832 he succeeded to Dr. Duncan as professor of materia medica in the same institution, which last post he still retains. He has been twice elected president of the College of Physicians in Edinburgh; is one of the vice-presidents of the Royal Society of that town, and also one of the physicians in ordinary in the Queen's household. His best known work is a 'Treatise on Poisons,' of which the first edition appeared in 1829, and the fourth in 1844. He has written a 'Dispensary or Commentary on the Pharmacopœias,' and has edited the 'Edinburgh Pharmacopœia.' He has also written numerous papers, mostly relating to poisons, amongst which may be cited, 'On the Detection of minute quantities of Arsenic in mixed fluids,' in the 'Edinburgh Medical and Surgical Journal,' xxii. p. 60 (1824); 'On the Poisonous Properties of Hemlock and its alkaloid, Conia,' in the 'Transactions of the Royal Society of Edinburgh,' xiii. p. 383 (1836); 'On the Properties of the Ordeal Bean of Old Calabar, Western Africa,' in the 'Edinburgh Monthly Journal of Medical Science,' xx. p. 193 (1855); and 'An Experimental Inquiry on Poisoning by Oxalic Acid,' written in conjunction with M. Coindet, and published in the 'Edinburgh Medical and Surgical Journal,' xix. pp. 163, 323 (1823).

CHRISTY, HENRY, was born July 26, 1810. His early life was spent in business as a member of the firm of Christy & Co., in Gracechurch-street, and as a director of the London Joint Stock Bank. He soon acquired a taste for antiquarian research, and in 1850 he gratified it by travelling in the East, and collecting objects illustrative of the manners and customs of the people he visited. In 1852 he travelled through Denmark, Sweden, and Norway, and it was during these travels that he formed the idea of investigating the similarity in the mode of thought and living and in the state of the arts amongst the modern barbaric tribes, and the earliest races of which evidence has been obtained.

With this view he collected an immense number of implements, fashioned out of flint, obsidian, and other stones, bone, horn, &c., as well as relics from the caves at Dordogne, the lake dwellings of Switzerland, and other storehouses of antiquarian objects. In 1853 he traversed Germany. In 1856 he made a long tour through North America, and accompanied Mr. Tylor to Mexico. In 1863 he visited Algeria and North Africa. Besides this, he explored many other countries, with a view to collecting evidence as to the condition and resources of primitive peoples. Soon after the caves of Dordogne began to occupy the thoughts of French geologists and palæontologists, Mr. Christy entered upon this field of research with his accustomed enthusiasm. In conjunction with M. Lartët, he systematically examined the caves along the banks of the Vézère, from which he collected an immense mass of valuable material. In 1865 his attention was attracted by the caves on the Meuse, near Dinant, in Belgium. While exploring a cave there he caught a cold, but he persisted in his travels, and journeyed on to La Pelisse, Allier, where he was attacked by inflammation of the lungs, and died on May 4. Before his death he had made considerable preparation for a large work on Aquitanian antiquities; and since his death several parts have been issued under the title of '*Reliquiæ Aquitanicæ*,' by Edouard Lartët and Henry Christy, edited by Professor T. Rupert Jones. He bequeathed his museum to the nation, and it now forms the Christy Ethnological Collection attached to the British Museum.

* CIALDINI, ENRICO, an Italian general, was born on the 10th of August, 1813, at his father's villa of Lombardina, near Castelvetro, in Modena. Some time afterwards his father, Giuseppe Cialdini, removed to Reggio, where he fulfilled the duties of *Ingegnere nell' Ufficio di acque e strade*. Here the education of the young Enrico was committed to the Jesuits, who for a time were led to hope that he might become a member of their order. The failure of their expectations is said to have changed their favour into hatred and opposition, and to have led to his expulsion from their seminary. He now repaired to the University of Parma, where he studied philosophy and medicine, and also cultivated painting with some assiduity. On the breaking out of the insurrection in February, 1831, he enrolled himself at Reggio as a volunteer in a regiment of the *Milizie Nazionali*, which marched to Bologna to place itself under the orders of General Zucchi. Upon the termination of this insurrection, and the surrender of Ancona, where he had taken refuge, Cialdini embarked for Marseille, and proceeding from that town to Paris, devoted himself in the latter place to the pursuit of scientific, and especially of medical and chemical studies. But he gave up his prospects of civil distinction for the sake of taking part in the Spanish war of Succession. He landed at Oporto, in March, 1833, and made the campaign of Portugal so successfully, that at its close he had arrived, by rapid but regular promotions, at the rank of sub-lieutenant, having whilst a sergeant so distinguished himself for his valour as to have been created a knight of the order of the Tower and Sword. On the 22nd of October, 1835, he was appointed to a lieutenancy in the *Cacciatori di Oporto*, a force composed chiefly of Portuguese soldiers and officered by Italians. Proceeding to Spain, Cialdini became aide-de-camp to Borso, who had the command in Catalonia; and at the battle of Cherta, 29th of June, 1836, won by his conduct and courage the Cross of St. Ferdinand, a distinction which was soon followed by his promotion to a company. At the conclusion of the war, which, after continuing for seven years, ended in the establishment of the throne of Queen Isabella II., Cialdini applied for admission into the regular Spanish army, in which he was appointed sub-lieutenant in 1839, and captain in the following year. The suspicion into which he fell in October, 1841, of complicity with Diego Leon, Concha, and Borso di Carminati, in their attempts to replace the regency in the hands of the Queen Mother instead of those of Espartero, entailed upon him an inactivity of two years, during which he retired to Valencia, where he married. In 1843 he accepted somewhat reluctantly the post of aide-de-camp to Narvaez; and was appointed in 1844 to a command in the then recently instituted Civil Guard, in which he became lieutenant-colonel in 1847. The movements of 1848 attracted Cialdini to Italy, where he served as a colonel in the army of General Durando. He was severely wounded at the battle of Vicenza, being at first reported dead; and it required many months to effect his restoration to health. He was then employed in the organisation of a regiment of volunteers in the Piedmontese service, consisting of about 3000 men, for the most part belonging to the Italian duchies, at whose head he fought gallantly, but unsuccessfully, against the superior

forces of the Austrians, under Radetzky, at the disastrous battle of Novara, March 23rd, 1849. When Piedmont resolved to take part in the war against Russia, a select force of 15,000 men was despatched to the Crimea under the command of General Alfonso La Marmora. This force was divided into five brigades; and the third was placed under the command of Cialdini, who played a distinguished part at the battle of the Tchernaya on the 6th of September, 1855. Returning to Italy, Cialdini was confirmed in his rank of major-general, and was appointed aide-de-camp to the King, an event of the greater interest because such an office had hitherto been the monopoly of the nobles. He was also made *Ispettore dei Bersaglieri*, a force which had owed its formation to General Alessandro La Marmora.

Placed at the head of the 4th division from the commencement of the war of 1859, Cialdini fought at Palestro, and distinguished himself generally in the campaign which was brought to an end by the treaty of Villafranca, 11th of July, 1859. In the movements of the following year, which had for their aim the "unification" of Italy, General Cialdini occupied an important position. He led his division into the Marches in September, 1860; took Pessaro, Fano, and Urbino; defeated General Lamoricière at Castelfidardo; and on the 29th of September, 14 days after crossing the Papal frontier, entered Ancona as a conqueror, from which, 19 years before, he had embarked as an exile. In 1861 he took Gaeta, after a siege of 17 days, and shortly after captured the citadel of Messina. He was now promoted to the rank of *Generale d'Armata*, equivalent to that of field marshal. In April of the same year he sat in the Italian parliament as deputy of the Electoral College of Reggio; and being offended by some imprudent words of Garibaldi, wrote to the latter such a letter as involved a rupture. But through the good offices of the Marchese Pallavicino, their common friend, the two generals were reconciled. From the 9th of July to the 1st of November, General Cialdini presided in Naples as Lieutenant-General in the southern provinces, from which office, at his own request, he was relieved by La Marmora. In the following year, when Garibaldi endeavoured to provoke in Sicily a movement for the immediate achievement of Italian independence, Cialdini was sent thither with full powers both civil and military; and after this mission was terminated by the victory of Colonel Pallavicini at Aspromonte, he returned to Turin. One of the great military commands was shortly afterwards assigned to him, with Bologna for a residence. In March, 1864, he was named a senator; and in 1866 took a prominent part in the campaign against the Austrians. General Cialdini has received the decorations of various orders, both of his own and other countries. Throughout his career he has shown himself a soldier of courage and resources, of originality of plan, of resolution, and of firm and decisive will.

CIGNA, GIOVANNI FRANCESCO, was born at Mondovì, 2nd July, 1734. He was nephew to the celebrated electrician, Beccaria, whose lectures he attended, and from whom he derived a strong taste for electrical science. He is mentioned a number of times in Priestley's *History of Electricity*: his greatest merit as an electrician consists in supplying the main defect of Dufay's theory, by showing that the two opposite electricities are produced simultaneously. In 1770 he was called to the chair of anatomy in the University of Turin. He early became secretary to a society of savans, which gave birth to the Royal Academy of Sciences at Turin. Cigna edited four volumes of its memoirs, and wrote the Latin preface. He also contributed a number of papers thereto. He died at Turin in 1790.

CIMA DA CONEGLIANO. [CONEGLIANO, G. B. DA, E. C. S.] CIVITALI, MATTEO, an eminent Italian sculptor, was born, about 1435, at Lucca, of which city he has been called the glory. Vasari says he was a scholar of Jacopo della Quercia, but this is inconsistent, not only with the date usually given of his birth, but with the known date of some of his works. The story that he followed the calling of a barber till he was over thirty years old, and then discovered his talent for sculpture almost by accident, appears to be equally mythical. Matteo was probably regarded as a disciple of Jacopo della Quercia from the evident influence of that artist on his style. Matteo's chief productions are in Lucca Cathedral. His statue of San Sebastian, one of the first nude figures of a man executed after the revival of art, is one of the most admired. Another great work is the monument of Pietro de Noceto, secretary to Nicholas V. The grand figure of Abraham, one of six large marble statues executed by him for the Cathedral of Genoa, ranks among the noblest works of the age. Matteo Civitali died in 1501. He appears to have occa-

sionally acted as architect. His chief work in this line was the Bernardini palace at Lucca.

* CLAPARÈDE, JEAN LOUIS RENÉ ANTOINE EDOUARD, the son of Jean Louis Claparède, an evangelical pastor, was born April 24, 1832. He was educated first at the classical school, and afterwards at the university of Geneva, from which latter institution he received his M.A. degree in 1852. He then went to the university at Berlin where he attended lectures by Professors Müller, Alexander Braun, Ehrenberg, Dove, H. Rose, and other eminent cultivators of natural history science. In 1857 he maintained a thesis, 'Cyclostomatis elegantis anatome,' which was published in that year, and others on various subjects in natural history. In that year also he became a member of the Physical Society of Geneva. In 1859 he visited Scotland; in 1863 he stayed some months in the Bay of Biscay; and now he is professor of comparative anatomy at the university of Geneva. His papers relate mainly to invertebrate animals; and he has given especial attention to the development and fecundation of ova. He has also written on binocular vision; and during his visits to Scotland, the Bay of Biscay, and other places he investigated the annelidan fauna, the results of which investigation have been some highly valuable contributions to our knowledge of the *Annelida*. He is, perhaps, best known for his researches on the *Infusoria*, on which he has published an excellent monograph in conjunction with C. F. J. Lachmann, entitled, 'Mémoire sur les Infusoires et les Rhizopodes,' 4to, 1861. It had previously appeared in vols. v. vi. and vii. of the 'Mémoires de l'Institut National Genevois.' Amongst his other more important papers we cite the following:—'Sur la théorie de la fécondation de l'œuf,' in the 'Supplément, à la Bibliothèque Universelle,' vol. xxix. p. 284-330 (1855); 'De la formation et de la fécondation des œufs chez les vers nematodes,' in the 'Mémoires' of the Physical and Natural History Society of Geneva, vol. xv. pp. 1—97 (1860); 'Anatomie und Entwicklungsgeschichte der *Neritina fuvialis*,' in 'Müller's Archiv für Anatomie,' for 1857, pp. 109—248; 'Études Anatomiques sur les Annelides, Turbellaires, Opalines, et Grégaires, observées dans les Hébrides,' in the 'Mémoires' of the Physical Society of Geneva, vol. xvi. pp. 15—165 (1862); 'Recherches Anatomiques sur les Oligochètes,' in the volume last mentioned, pp. 217—291; 'Glansures Zootomiques parmi les Annelides de Port Vendres,' in 'Mem. Soc. Phys. Genève,' vol. xvii. pp. 463—600 (1864); and 'Les Annelides Chétopodes du Golfe de Naples,' in 'Mem. Soc. Phys. Genève,' vols. xix. and xx., which is also reprinted as a distinct quarto volume of 500 pages.

CLARAC, CHARLES OTHON FRÉDÉRIC JEAN-BAPTISTE, COMTE DE, French archæologist, was born at Paris, of a noble Gascon family, June 16, 1777. His father having been driven from France by the revolution, young Clarac completed his education in Germany; travelled through Europe, and acquired a familiarity with modern languages, which was of great service in his future pursuits. By the wish of his father he entered the army of Prince Condé, and afterwards the service of the Emperor of Russia; but when, by the amnesty offered by the First Consul, he was enabled to return to France, he abandoned the military profession and resumed his studies. Having accepted an offer to proceed to Naples as governor of the children of Murat, Clarac found time to conduct various excavations at Pompeii, of which he published an account under the title of 'Fouilles faites à Pompei,' with 16 plates designed by the author, 8vo, Naples, 1813. The restoration opened a career to M. Clarac. He went in the suite of the Duc de Luxembourg, ambassador to Brazil, and made some journeys in South America, and sketched some of its more remarkable scenery, prior to his return by way of the Antilles to France. On his return Louis XVIII. appointed him to succeed Visconti as conservator of the Museum of Antiquities at the Louvre. From this time M. de Clarac made the study of art, and especially ancient art, his chief pursuit. His knowledge was to the last but superficial, but as the head of a great national museum he had access to sources of information beyond the reach of an ordinary student, and was brought into communication with the leading professors and collectors of the day. He was able to assist artists and writers on art, and he added something to its literature, though the text of his contributions is of less value than the accompanying engravings. The Comte de Clarac was of course a member of many learned societies. He was elected into the Institute in 1838, and in the following years nearly all the academies of Europe enrolled his name among their associates. He died suddenly on the 20th of January, 1847. M. de Clarac's chief work is the 'Musée de Sculpture antique et moderne, ou description de ce que le Louvre,

le Musée Royal des Antiques et les Tuileries renferment en statues, bustes, bas-reliefs, inscriptions; accompagnée d'une Iconographie Grecque et Romaine, et de plus de 1200 statues antiques, tirées des principaux musées et de diverses collections de l'Europe,' 6 vols. text, 8vo, and 6 vols. of plates, oblong 4to, Paris, 1826-53. The work contains 1336 plates, not always correct in drawing nor in the purest style of engraving, and is invaluable as affording a compendious view of the principal extant works in sculpture: it was completed after the death of M. de Clarac by M. Alfred Maury. The first part of the text was published separately, under the title 'Mélange d'Antiquités Grecques et Romaines,' 8vo, Paris, 1830; and again, as 'Manuel de l'Histoire d'Art, chez les Anciens,' 3 vols. 8vo, 1847-49. His other works include a monograph on the Venus of Milo, 1821, and an Alphabetical Table of the Artists of Antiquity, 1829.

CLARE, JOHN [E. C. vol. ii. col. 257]. The last days of the Northamptonshire peasant poet were rendered as comfortable as his condition allowed. He was kept as far as possible free from personal restraint, and was for a time permitted to wander about the lanes and fields in the neighbourhood of the asylum, but subsequently his walks were limited to the grounds. Occasionally during the last years of his life he resumed the use of the pen, and composed a few short poems much in his old manner, but devoid of consecutive thought, and imperfect in the versification. These intervals of comparative lucidity were, however, infrequent; there was no permanent improvement in his mental condition, and he died an inmate of the Northampton General Lunatic Asylum on the 19th of May, 1864. By the kindness of a few friends he was buried, as he had desired, in the church-yard of his native village, Helpstone. A 'Life of John Clare,' by Frederic Martin, appeared in 1865.

CLARENDON, GEORGE WILLIAM FREDERICK VILLIERS, EARL OF [E. C. vol. ii. col. 258]. Lord Clarendon resigned with the other members of Lord Palmerston's Cabinet in 1858. On the formation of Lord Palmerston's third ministry, Lord Clarendon remained out of office, but rejoined his colleagues in 1864, having accepted the post of Chancellor of the Duchy of Lancaster. On Lord Palmerston's death, October, 1865, Lord Clarendon became again Secretary of State for Foreign Affairs under Lord Russell; but the ministry lasted only till the following June. The Conservatives remained in power till December, 1868, when Mr. Gladstone was called to form an administration, in which Lord Clarendon resumed his old position of Foreign Secretary, and retained the office till his death, which occurred at his house in Grosvenor-crescent, after an illness of only four days, on the 27th of June, 1870. He was interred in a family vault of recent construction in Watford Cemetery. His title and estates devolve on his eldest surviving son, Edward, Lord Hyde, late M.P. for Brecknock, born 1846.

The services and character of Lord Clarendon are sufficiently indicated in the memoir above cited. Nearly the whole of his life from early manhood had been spent in the public service, and never probably had the public a more laborious or devoted servant. His industry was indeed untiring, and it was as active in the last months of his life, though over 70 years of age, as in the prime of his days. One of the latest matters of a prominent kind in which he was engaged as Minister of Foreign Affairs was that of the murder of English travellers by Greek brigands, and his promptness of action, energy, and keenness, won general admiration. Even on his death-bed he read despatches, and dictated answers. As Minister of Foreign Affairs, Lord Clarendon had long enjoyed the full confidence of the country, men of all parties feeling satisfied that whilst the national honour was safe in his hands he would leave nothing undone which sound judgment, tact, courtesy, forbearance, and clearness of vision could supply to preserve peace, soften dissension, and maintain good feeling. And these characteristics and this assured position were more or less generally recognised in other countries alike by rulers and people, and hence the general confidence with which he was regarded, and the regret everywhere expressed for his loss. In private life he was a universal favourite—accomplished, genial, witty, courteous after the best models of the past school, and free from even the shadow of arrogance.

* CLARK, EDWIN, civil and telegraphic engineer, was born at Great Marlow, January 7th, 1814. After completing his training as a civil engineer, he superintended, under Robert Stephenson, the preliminary experiments relating to the Britannia Tubular Bridge over the Menai Strait, and was closely associated with the construction of the bridge itself between 1846 and 1850. The history of this important undertaking is given in 'The Britannia and Conway Tubular Bridges,

with general inquiries on Beams, and on the properties of materials used in construction,' by Edwin Clark, published under the superintendence of R. Stephenson, 2 vols. 8vo. with a folio Atlas of Plates, London, 1850. Mr. Clark has designed a great number of iron bridges, including the large caisson swing bridge at Arnheim, and the trellis bridges on the Victor Emmanuel Railway in Italy. He perfected, and was part patentee of, the system of construction known as the Warren Iron Girder. He has been engineer of the Smyrna and Aidin Railway, and of many other lines at home and abroad. When the Electric Telegraph Company began to lay down their lines of wire on railways, Mr. Clark introduced the system known as "block signalling," which, when steadily adopted, tends to lessen considerably the liability to accident. In the construction of the Crystal Palace at Sydenham, Mr. Clark acted as engineer. He patented the Hydraulic Lift Graving Dock, the most efficient apparatus yet devised for raising ships out of the water for repairs, and a very striking application of hydraulic power. In 1856 he laid out a general plan of railways for Russia. Mr. Clark has written papers on the 'Hydraulic Lift,' on 'Engineering Philosophy,' on the 'Durability of Materials,' &c., read before the Institution of Civil Engineers, of which he is a member. He has been awarded a medal by the Institution for his Hydraulic Lift, and also the Telford medal; a gold medal from the jurors of the Paris International Exhibition of 1855, for his work on the Britannia Tubular Bridge; a medal from the International Exhibition of 1862, for his Hydraulic Graving Dock; a medal from the Paris Exhibition of 1867, for improvements in Hydraulic Engineering; and a gold medal from the Emperor of Russia, for his services in laying out a general system of Russian railways.

CLARK, SIR JAMES, BART. [E. C. vol. ii. col. 260]. At the date which our memoir reached, Sir James Clark had retired from general practice, though he continued as long as his health permitted to attend her Majesty and the younger members of the Royal Family in the capacity of consulting physician. During his last years he lived chiefly at Bagshot Park, which had been assigned to him by the Queen as a residence, and here he died on the 30th of June, 1870. Scarcely a year before his death he published 'A Memoir of John Conolly, M.D., D.C.L.; comprising a Sketch of the Treatment of the Insane in Europe and America,' 8vo, London, 1869. The greater part of the work is taken up with the Sketch, and it is treated in a discursive and unmethodical manner; but is interesting, not only for the large amount of information it embodies, but also as testifying to the zeal with which to the last Sir James continued to watch the progress of medical improvement.

* CLARK, LATIMER, telegraphic and civil engineer, was born at Great Marlow, in March, 1822. He commenced life as an analytical and manufacturing chemist, but turned his attention to civil engineering at the time when railway enterprise was becoming active and important, in 1846. In 1848 he (like his brother, Mr. Edwin Clark) was employed by Robert Stephenson in the engineering superintendence of the Britannia Tubular Bridge, and remained on that work until its completion in 1851. In this year he became assistant engineer, and afterwards engineer-in-chief, to the Electric Telegraph Company; his connection with that company, under the extended form of the Electric and International Telegraph Company continued until 1870, when the telegraphs were taken by the Government. In 1853 Mr. Clark invented and patented the pneumatic despatch, that is, a system of pneumatic transmission of letters, parcels, and telegrams through tubes. The tubes at first employed were about 30 inches in diameter; but in 1856 and following years he laid down a tube of four feet and a half diameter from Euston Station to the General Post Office. The system is not yet, however (1870), completely developed. Mr. Clark has superintended the erection of an extensive mileage of land telegraphs, and is the inventor of the double inverted bell insulator. Between 1858 and 1870 he assisted in laying submarine telegraphic cables for the Indian Government, the Atlantic Telegraph Company, and various other companies in the Atlantic, the Mediterranean, the Red Sea, the Persian Gulf, and the Indian Ocean. One invention by him, a method of protecting submarine cables by asphalt and silica, has come into extensive use. Mr. Clark has published 'A Description of the Britannia Tubular Bridge' (a pamphlet), 1850; an 'Experimental Investigation of the Laws which govern the Propagation of the Electric Current in long Submarine Cables,' 8vo, London, 1861; an 'Elementary Treatise on Electrical

BIOG. DIV.—SUP.

Measurement,' 1868; and 'Electrical Tables and Formulæ for the Use of Electricians and Telegraph Operators,' 1870.

CLARK, THOMAS, was born in Ayr, 31st March, 1801, and educated at the Ayr Academy. In 1816 he entered the counting-house of C. Macintosh & Co., at Glasgow; he was not an apt accountant, and his employers, seeing the true bent of his mind, recommended him to the post of chemist in Tennant's Chemical Works at St. Rollox. In 1826 he became lecturer on chemistry to the Glasgow Mechanics' Institution. Some idea may be formed of his advanced views on the atomic theory from the fact, that in the programme of his first course of lectures, he gives 16 as the atomic weight of oxygen, and 12 as that of carbon, hydrogen being 1. He also paid great attention to the theory of the constitution of salts, as consisting of a metal or hydrogen united to a radical, simple or compound. His discovery of the pyrophosphate of soda was memorable from the support it gave to the doctrine of isomerism, then in its birth throes; a support gracefully acknowledged by Sir John Herschel, in his Preliminary Discourse in Lardner's Cyclopædia (1830, p. 170), though Mitscherlich, who first announced the law, was less grateful, while he took no notice of Clark's letter to him in 1836, 'On a difficulty in Isomerism and on the received constitution of the oxygen salts.'

With a view to the teaching of chemistry in a medical school, Clark entered the University of Glasgow in 1827, as a medical student. In 1829 he became apothecary to the Glasgow Infirmary, and published in the Glasgow Medical Journal three papers on pharmacy: (1) 'On the precipitated Carbonate of Iron;' (2) 'On Singleton's Golden Ointment;' (3) 'On Medicinal Prussic Acid.' In 1831 he took his Doctor's degree. In 1832 he contributed to the Westminster Review an elaborate inquiry into the existing system of weights and measures, and collected materials for a second article 'On the lost History of English Weights and Measures,' but this was not completed. In 1833 he was appointed to the chair of chemistry in Marischal College, Aberdeen. He was a good lecturer, taking nothing upon trust, and never seeking to make his teaching popular by omitting difficulties. Instead of an exhaustive classification of the elements, he selected important and typical bodies for representing general classes and doctrines.

Clark paid much attention to hydrometry, the instrument constructed by him giving, by its own readings, the true specific gravity. He introduced improved methods of detecting arsenic; he gave the true explanation of the value of the hot-blast in the iron manufacture; but he is best known to the public for his water tests, and his process of softening hard water, patented in 1841.

In the session of 1843—44 he exerted himself greatly on the question of the abolition of the University Tests, when an illness came on which lasted some years, and suspended his work. He was afflicted with such severe headaches as to confine him to his bed for days in succession. After four years of this suffering he was induced to try a course of hydropathic treatment, which restored him to health. In 1849 he married, and although he did not resume the direct teaching of his class, he was very useful in the contest which ended in the union of the Aberdeen universities in 1860. Clark was an ardent politician of the liberal school, sagacious, accurate, and practical in all his work. He died somewhat suddenly on the 27th November, 1867, his latter years having been clouded by the death of the only child of his marriage.

CLAUDET, ANTOINE FRANÇOIS JEAN, an eminent photographer, was born at Lyons in 1797. After receiving a good education, he went into the office of his uncle, M. Roux, the banker, who, after a few years, placed him at the glass-works of Choisy-le-Roi, as director, in conjunction with M. Bontemps. He afterwards visited London in order to introduce the productions of the Choisy glasshouse. In 1833 he invented the machine now in use for cutting cylindrical glass, for which in 1853 he received the medal of the Society of Arts. When Daguerre's process was first published to the world in August, 1839, Claudet saw an opening for the exercise of his scientific tastes, and becoming possessed of a share in a patent which Daguerre had taken out in this country, Claudet commenced in 1840, the practice of portraiture in the Adelaide Gallery. He improved the process, and in June, 1841, laid before the Royal Society his paper on the increased sensitiveness of chloride of iodine over iodine itself. From this time to his death in December 1867, he was one of the most successful practitioners of photography in London, and his improvements in the art were numerous as they were valuable. He was elected a Fellow of the Royal Society in 1853,

c c

and a Chevalier of the Legion of Honour in 1865. A Memoir of him, published in the 'Scientific Review,' was reprinted for distribution at the meeting of the British Association at Norwich in August, 1868, and contains in an appendix, a list of forty papers communicated by him between 1841 and 1867, to the Royal and other societies.

CLENELL, LUKE, was the son of a farmer near Morpeth, Northumberland, where he was born in 1781. He was apprenticed to a tanner, but his passion for art proving incurable, he was removed, and articled to Bewick, the celebrated wood-engraver. His progress was remarkable, and when, on leaving Bewick, he established himself in London, he speedily took rank with the leading men in his profession. Among the happiest efforts of his graver are the charming vignettes, reproductions of Stothard's pen drawings, which adorn the 12mo edition of Rogers's poems, 1816. But Clennell was not content with merely reproducing other men's drawings. He designed with facility, and he was ambitious of fame as a painter. His pictures of 'The Day after the Fair,' and 'The Arrival of the Mackerel Boat,' were much admired; and in 1816 his finished 'Sketch of the Overthrow of the French Army at the Battle of Waterloo,' was awarded a prize of 150 guineas at the British Institution. This led to his receiving a commission from the Earl of Bridgewater to paint a picture of the banquet given by the City of London to the allied sovereigns, but the obstacles and vexations which he met with in executing the work preyed on a too sensitive nervous system, and his mind gave way. He was removed to a lunatic asylum; and his wife, a daughter of Charles Warren, the engraver, dying shortly after, a committee was formed for the purpose of having the Waterloo sketch engraved for the benefit of the bereaved children. The print under the title of 'The Decisive Charge of the Life Guards at the Battle of Waterloo' was very popular, and fully served its purpose. Clennell, who never recovered his reason, was maintained by the aid of that excellent society, the Artist's Annuity Fund, till his death, which occurred at Newcastle-on-Tyne, February 9, 1840.

CLERY, or O'CLERY, MICHAEL, an Irish antiquary, and the principal author of the 'Annals of the Four Masters,' was a native of Donegal, and born about the year 1580. His family were hereditary historians to the O'Donnells, princes of Tyrconnel, now the county of Donegal, and from them held extensive grants of land, on which they resided at their castle of Kilbarron, the ruins of which still remain in the neighbourhood of Ballyshannon. Early in life Michael, who up to this time had been known by his secular name of Tadhg-ant-sleibhe, or Tiede of the Mountain, became a member of the order of St. Francis, and retired to the Irish Franciscan Monastery at Louvain, where his countryman, Hugh Ward, at that time a lecturer at Louvain and guardian of its monastery, encouraged him to rescue from oblivion the annals and antiquities of Ireland. Eagerly embracing the proposal, O'Clery returned to his native country, and for 15 years occupied himself in going from place to place, and from library to library, in order to collect together all the ancient records, civil and ecclesiastical, that could be obtained. He afterwards spent many years in arranging his mass of materials for publication. In the compilation of the 'Annals of the Four Masters' Michael O'Clery bore a chief part, but he was assisted, besides others in a less degree, by Cucogry, or Peregrine O'Clery, and Conary O'Clery, together with Peregrine O'Duigenan; and it was from this combination of labour that the work received its name, while, from the fact of its having been composed in the Franciscan Convent of Donegal, it is sometimes called the 'Annals of Donegal.' Amongst the collections enumerated as used in the compilation of the 'Annals' are the Annals of Clonmacnois; the Annals of Innisfallen; the Book of the Three Bruadins; the Annals of Ulster; the Book of the O'Duigenans of Kilronan, in Roscommon; the Book of the Island of All Saints, in Loughrea, and others. Michael O'Clery died at the Monastery of Donegal, in the year 1643. The 'Annals of the Four Masters,' which O'Clery declared to have been undertaken on the 22nd of January, 1632, in the convent of Donegal, and finished there on the 10th of August, 1636, commence at the earliest period of Irish history, and are carried down to 1616. Part of these, in the original Irish, accompanied by a Latin translation, were published in 1824 by Dr. Charles O'Connor in his great work, 'Rerum Hibernicarum Scriptores Veteres,' bringing down the Annals to the time of the English invasion in 1172. More than 20 years later appeared the 'Annals of Ireland, translated from the original Irish of the Four Masters,' 4to, Dublin, 1846, by Owen Connellan, and annotated by the translator and Dr. Philip MacDermott, which

comprised the 'Annals' from 1171 to their termination in 1616, and contained an ample account of the English invasion. The most elaborate and complete edition of the work, however, is that by Dr. John O'Donovan, who gives the Irish text, and an English translation, with copious notes, from MSS. in the library of the Royal Irish Academy, and of Trinity College, Dublin, 'Annals,' &c., 7 vols. 4to, Dublin, 1851. Dr. O'Donovan, who was a barrister, and professor of Celtic literature in the Queen's College, Belfast, also translated from the original Irish another work of Michael O'Clery's, 'The Martyrology of Donegal: a Calendar of the Saints of Ireland,' 8vo, Dublin, 1864, which was published by the Irish Archaeological and Celtic Society, under the editorial care of James Henthorn Todd, D.D., and William Reeves, D.D.

CLIVE, CATHARINE, an actress who has left an unrivalled reputation for the variety and excellence of her comic powers, was born in the year 1711. Her father was William Raftor, who, from having been a man of considerable landed property in Kilkenny, was ruined by the forfeiture of his estate on account of his adherence to the cause of James II., whom, after the battle of the Boyne, he followed to France. Here he obtained a commission, and afterwards a company, in the service of Louis XVI.; but at length returned to England, where he received a pardon, and married the daughter of a substantial citizen on Fish Street Hill, London. It was whilst residing here that Catharine, of whose early years no details are known, gave the first indications of her genius for the stage, to indulge which she obtained, in 1728, an introduction to Colley Cibber, then one of the managers of Drury Lane Theatre, who engaged her at a small salary to take the part of Ismenes, the page of Ziphores, in Nathaniel Lee's play of 'Mithridates, King of Pontus.' Her duty as a debutante was to appear in boy's clothes and to sing a song, but this she performed so as to please the public, who upon the occasion shortly after of the introduction of Cibber's 'Love is a Riddle,' a pastoral in imitation of the 'Beggars' Opera,' would, owing to party feeling, vouchsafe a hearing to none of the actors except Catharine Raftor, who played the part of Phillida. But her first emphatic triumph dated from the introduction of a ballad farce written chiefly by Coffey, to which, however, several authors had contributed, and which was originally entitled 'The Devil to Pay,' and afterwards, when condensed or curtailed into one act, 'The Wives Metamorphosed.' Miss Raftor's impersonation of Nell in this little operatic piece fixed at once its popularity and her own position as the greatest performer of her time in that species of character. In 1732 she became the wife of George Clive, brother of Mr. Baron Clive, from whom, for some unascertained reason, but without scandal or reproach, she soon and finally separated. For nearly forty years after this event Mrs. Clive—or Kitty Clive, as she was affectionately designated—continued the delight of the stage. She was not beautiful; her features were plain, but flexible, and her figure good. Her eyes were shrewd and mirthful, and her forehead fine and intellectual. Her talents were varied, and her walk in comedy extensive. In the "sprightliness of her humour," Dr. Johnson pronounced her unrivalled. "What Clive did best," he said, "she did better than Garrick; but could not do half so many things well. She was a better romp than any I ever saw." As the chambermaid, she was perfect; but she could soar to the high-bred Lady Fanciful or descend to the vulgar Mrs. Heidelberg. She could personate the country girl, the virago, the superannuated beauty, the dowdy old maid. With the charms of her voice she carried away all her hearers; and nature, in giving her that, had done much in her behalf. But it was the native joyousness of her character, her good humour, her freedom from all art, that constituted, on the stage as in private life, her attraction. No one could be grave when Catharine Clive was gay; and it was gaiety without malice or impropriety. On the 24th of April, 1769, while still in the height of her power and popularity, Mrs. Clive took her leave of the stage; on which occasion the epilogue she spoke was written for her by her neighbour, Horace Walpole, who bestowed upon the home at Twickenham, at which she already resided, and to which she now retired, the name of Cliveden. Here she passed the rest of her life in modest ease and independence, respected by the world, and beloved by her friends, amongst the dearest of whom she reckoned David Garrick, who addressed her as the "Pivy," and with whom she had a retrospect of long professional and social connection. The close of her life, except for the glimpses we gain of it in the 'Letters' of Horace Walpole, is almost as unknown in its details as her earliest years. She died, after a short illness, on the 6th of December, 1785.

Mrs. Clive is not widely known as a dramatic author; but at different benefits of hers she introduced five several slight pieces on the stage, which are not devoid of merit. They are (1) 'The Rehearsal: or Bays in Petticoats. A Comedy in Two Acts. The music composed by Dr. Boyce,' 8vo, London, 1753; (2) 'Every Woman in her Humour,' 1760; (3) 'Sketch of a Fine Lady's Return from a Rout,' 1763; (4) 'The Faithful Irishwoman,' 1765; and (5) 'The Island of Slaves,' 1761. Of these only the first was published, whilst the last is rather a translation made for her than by her of Marivaux' 'Isle des Esclaves.'

CLOSTERMANN, JOHANN, German portrait painter, was born at Osnaburg in 1656, and learnt the rudiments of art from his father, a painter in that city. In 1679 he went to Paris, where he worked with De Troye. Two years later he came to London, and was engaged by Riley as drapery-painter, but later he assisted him in the heads, and at Riley's death Clostermann completed several of his unfinished pictures. He now attracted the notice of the Duke of Somerset, who was for a while a warm patron, but offended by Clostermann's conduct in the purchase of a picture by Guercino, he broke off the connection, and transferred his patronage to Dahl. Clostermann painted the great Duke and Duchess of Marlborough, Queen Anne, Dryden, Purcell, Blackmore, and other distinguished persons; but as works of art the best of his portraits are dull, heavy, and commonplace. His last years were spent in comparative indigence. He died in Covent Garden probably in 1713.

CLOUET, or CLOËT, FRANÇOIS, called JEHNNET or JANET, an eminent French portrait painter, was born, probably at Tours, about 1510. Of a family of painters, he learned his art from his father, whom he succeeded in 1541 in the double office of painter and valet de chambre to the king, Charles IX. He painted many of the distinguished personages of his time, and his works are highly esteemed for their truth, character, and beauty of execution. The Louvre possesses fine portraits of Charles IX. and his wife, Elizabeth of Austria, by François Clouet, and several that are with less certainty attributed to him. Our National Gallery has 'A Man's Portrait in the costume of the 16th century,' of small size (No. 662). F. Clouet died between 1571 and 1574; probably in 1572.

CLOUGH, ARTHUR HUGH, was the son of a cotton merchant at Liverpool, where he was born January 1st, 1819. When Arthur was about four years old his father migrated to Charleston, U.S. There he remained with his family till 1828, when they returned to England. Arthur was now sent to school at Chester, but in 1829 removed to Rugby. Here, under Dr. Arnold, he made great progress; became head of the school, and in November, 1836, won the Balliol scholarship, and went up to Oxford, his schoolfellows and masters anticipating for him a brilliant career there. But his mind had been overstimulated at Rugby. He had accepted too seriously the responsibility of his position as head scholar, he had laboured hard to establish the 'Rugby Magazine,' and still harder to maintain its reputation. He went to Oxford too at a trying time, when the whole atmosphere was redolent of Tractarianism. Without neglecting his academical studies, Clough entered eagerly into the prevalent theological disputes. For awhile he was carried away by the new opinions, but though he recoiled, as was inevitable with a mind constituted like his, when he at length saw their necessary consequence, it was only, in the words of his biographer, to find "when the torrent had subsided, that not only had it swept away the new views which had been presented to him by the leaders of the Romanizing party, but also that it had shaken the whole foundations of his early faith." He did not become an unbeliever, but his opinions were unsettled, and he was never again able to rid himself of scepticism. Still the reputation he had brought from Rugby, and his work at Balliol, kept expectation alive, and it was a great disappointment to his friends, and among others to Dr. Arnold, when at the university examination he only obtained a second class, instead of the double first, on which his friends had confidently reckoned. In the following autumn (1841) he tried for a fellowship at Balliol without success; but in the spring of 1842 he was elected fellow, and in 1843 tutor, of Oriel. He now settled down to hard work as a college tutor, usually spending the long vacation among the Welsh mountains, the Cumberland lakes, or the Scotch Highlands, with a reading party, such as is commemorated in 'The Bothie of Tober-na-Vuolich,' reading the Greek poets, doing Latin prose, and finding matter for many of the verses printed in his works.

But the feeling of religious doubt was not to be got rid of or permanently laid aside; he could not use language

and hold convictions entirely at variance, and thus he found his position at Oxford becoming every day more intolerable. In the early part of 1848 he resigned his tutorship, and in the following October gave up his fellowship also. He had formed a close intimacy with Emerson, who was at this time in England, and with him he went over to Paris, where he "spent a month in seeing the sights of the Revolution." Now, too, he wrote his principal poem, 'The Bothie of Tober-na-Vuolich.' An offer was about this time made to him to become principal of University Hall, London, and after a visit to Rome (where he witnessed the siege of the city by the French), he entered upon his duties in October, 1849. He retained the headship of University Hall about two years. He then resolved to try America, and about the end of 1852 settled at Cambridge, Massachusetts. Here he took private pupils, wrote some articles for periodicals, and began the revision of 'North's Translation of Plutarch's Lives.' But though he met with excellent friends, it was evident that there was no suitable opening for him there, and he returned to England (July, 1853) on receiving the offer of an examinership in the Education Office. Henceforth his time was pretty much occupied by the duties of his office, and the completion of his Plutarch. He had married, and household affections and cares turned aside the current of his thoughts from overmuch introspection. The writing of an occasional poem served as a vent for deeper thoughts, susceptibilities, and perplexities. He was busy and content, but in the midst of his happiness he was seized with illness. Six months leave of absence being granted him, he went in the autumn of 1860 to Malvern; to Freshwater, in the Isle of Wight; and then, as the winter came on, to Greece and Constantinople. After returning home for a few weeks in June, he again set out for Auvergne and the Pyrenees, and went on by way of Switzerland to Florence, whence he was to have gone to Rome; but at Florence he had an attack of fever, and his already enfeebled frame succumbed. He died on the 13th of November, 1861, and was buried in the little Protestant cemetery, just outside the walls of Florence. During this journey he wrote his 'Mare Magno'; as his 'Dipsychus' was written during a hasty visit to Vienna in 1850, and the 'Amours de Voyage' whilst at Rome in 1849.

Clough was greatly beloved, and the personal regard felt for the man has perhaps influenced the criticisms on his poems. He wrote gracefully, sweetly, often with deep feeling and earnestness. But he is deficient in vigour and concentration. He seldom fairly grasps his subject, and where he deals, as he is fond of doing, with the graver problems of life, he plunges into unfathomable depths, or loses himself in a vague and dreamy scepticism. To some extent the vagueness of thought was wearing off with advancing years, and as he came to have a settled purpose; but with the mellowness came some loss of freshness. There were more clear, bright, distinct pictures, but they did not reveal a new nature.

(*Poems and Prose Remains of Arthur Hugh Clough, with a selection from his Letters, and a Memoir, edited by his Wife, 2 vols. 8vo, London, 1869.*)

CLYDE, COLIN CAMPBELL, BARON [E. C. vol. ii. col. 55]. Sir Colin Campbell was decidedly the popular hero of the latter stages of the Crimean war. On his return to England he was made a G.C.B.; and his countrymen presented him with a sword of honour at Glasgow. When the news of the serious nature of the Indian revolt reached England in June, 1857, the general voice pointed to Sir Colin Campbell as the officer most fitted to meet the emergency; and on reception of the intelligence (July 11) of the death of General Anson, commander-in-chief in India, a Cabinet Council was at once called, and Sir Colin Campbell was sent for and offered the command on condition that he could depart immediately. Sir Colin was ready, and actually started for India the next day. He reached Calcutta, August the 14th. The vast labour of organising a sufficient force to take the field with effect occupied his best energies till the 27th of October, when he left Calcutta chief of a small but well-appointed army, impatient to relieve their countrymen still pent up in Lucknow, and to punish the treacherous Sepoys. The events which followed till Sir Colin was able to announce the complete accomplishment of the duty confided to him are narrated at length in the GEOGRAPHICAL SUPPLEMENT of the E. C. cols. 703—706. Here, therefore, it will suffice to say that he reached Cawnpore on the 3rd of November; attacked and took the Secundar Bagh after a desperate conflict, on the 16th, and the next day, after more hard fighting, relieved Generals Outram and Havelock, who with their troops and the sick and wounded of the old

garrison were shut up in the Residency. Having accomplished this, Sir Colin decided on sending the women and children, the sick and the wounded, to Cawnpore. It was a difficult thing to effect, they being in all 2000 in number, in the face of an enemy far more numerous than his own little army; but he carried it out with entire success, while he left a sufficient garrison under General Outram to maintain the Alum Bagh. After defeating the Gwalior Contingent, Sir Colin spent the winter in collecting men and stores, and making preparations for the final attack. His army when on the march in the spring of 1858 consisted of about 18,000 of all arms, but owing to Indian habits it was necessary to have in attendance no fewer than 60,000 non-combatants, and with 6000 camels and twice as many oxen, it formed a very unwieldy mass. However, by the beginning of March, Lucknow was reached, with hardly a misadventure; on the 8th Sir Colin commenced the attack, and, proceeding with deliberate unshaking resolution, by the 19th of March the entire city was in his possession. The rebellion was now effectually crushed. Detached and dispirited bands had still to be scattered, a few strongholds to be taken, partial risings to be suppressed, but the war was at an end. Sir Colin remained in India to complete the work he had undertaken, to assist in the reorganisation of the Indian army, and to suggest plans for future military arrangements. But he had accomplished the task entrusted to him, and was now to receive his reward. Thanks were voted to him by both Houses of Parliament. In August, 1858, he was created Baron Clyde of Clydesdale. He returned to England in July, 1860, and was received with every demonstration of respect and admiration. In November, 1862, he was made field marshal. His arduous labours had, however, undermined his constitution, and he died at Chatham on the 14th of August, 1863. It was felt that England had never lost a truer hero or a nobler soldier, or a commander more faithful to his duty, less heedful of himself, more careful of his soldiers. A statue by Marochetti was in 1867 erected to his memory near the York monument, and not far from the Crimean Memorial. Waterloo Place, Pall Mall: the statue chiefly modelled from Sir F. Grant's portrait is a good and characteristic likeness of him in his ordinary Indian campaigning costume. A fine statue, by Foley, was erected in Glasgow, in 1868, close by Flaxman's statue of Sir John Moore.

* COBBOLD, THOMAS SPENCER, zoologist, was educated at Edinburgh, and is lecturer on botany, zoology, and comparative anatomy at the Medical College, Middlesex Hospital. He has written on various branches of natural history, but his specialty is the subject of *Entozoa*. Most of his papers in scientific and medical journals relate to these internal parasites, as also his principal separate work, '*Entozoa*,' published in 1864, to which a supplement was added in 1869. The complete work is a valuable book of reference on our present knowledge of these creatures. He also drew up the bibliographical account of the *Entozoa*, or *Scolecida*, for vol. i. of the '*Record of Zoological Literature*.' He has edited new editions of the '*Museum of Natural History*' and of '*Maunders' Treasury of Natural History*.' He has written several papers on the anatomy of the giraffe, and is the author of the article '*Ruminantia*' in Todd and Bowman's '*Cyclopædia of Anatomy and Physiology*.' He is an M.D. and a Fellow of the Royal and other learned societies.

COBDEN, RICHARD [E. C. vol. ii. col. 298]. Mr. Cobden's persistent opposition to the Crimean war, and to the foreign policy of Lord Palmerston in general, cost him his seat for the West Riding of Yorkshire at the general election of 1857, and he contested in vain the boroughs of Salford and Huddersfield. Thus shut out from the House of Commons, Mr. Cobden withdrew to his seat at Dunsford, in the hope by country air and rest to restore his enfeebled health. By way of diversion he translated his friend Michel Chevalier's essay, '*De la Basse probable de l'Or*,' which he published, with an original preface and notes, under the title '*On the probable Fall of the Value of Gold*,' 8vo, 1859. About this time he made a visit to America, and during his absence there was elected member for Rochdale at the general election, May, 1859. On his return to England he re-entered eagerly upon his old course of politics, but his attention was soon diverted for a time to a narrower field, he having been selected by Lord Palmerston to negotiate a treaty of commerce with the Emperor of the French. This delicate and difficult undertaking he carried through to the satisfaction of the government, and the treaty was signed in February, 1860. A good deal of feeling was aroused when its terms were published, but after some discussion the treaty was approved as a whole by both

Houses of Parliament, and met with very general favour in the centres of commerce and manufacturing industry. In recognition of his services, Mr. Cobden received the freedom of the City of London at a splendid entertainment given at the Mansion House in celebration of the French Treaty. The treaty was not altogether in accordance with the principles of political science of which Cobden declared himself the disciple and advocate, but he rejoiced over it, and was proud of the share he had in effecting it, because he believed that not only would it tend to increase the national prosperity, but also that in proportion as nations were banded together by commercial and trading interests would peace be rendered more secure, and that as these bonds multiplied it would become more and more difficult for rulers to fling nations into war at their will—a delusion, perhaps, and it may be not altogether a safe one for a nation to adopt, but still possessing a basis of truth.

In the House of Commons Mr. Cobden spoke on various occasions on maritime law and the rights and duties of neutrals and belligerents, on the affairs of Denmark and Prussia, electoral reform, administrative economy, the supply of cotton, navy estimates, and other important questions of public and international policy; but the great struggle between the Northern and Southern States of America broke out, and soon had for him an overwhelming and absorbing interest. From the first he was the avowed and thorough partisan of the North, and for the rest of his days it was his chief thought how he could arouse or deepen the sympathy of his countrymen for her, he from first to last refusing to see in the conduct of the South anything but a wilful and unprovoked rebellion which must be crushed at any cost. The last speech he made in public, delivered at Rochdale, November 23, 1864, was one avowedly on Our Foreign Policy, but was throughout a fervid eulogium on American institutions and the people of the Northern States. He did not live to see the triumph of the cause he had so much at heart. After a short illness, he died at his London residence on the 2nd of April, 1865. The House of Commons was not unmindful of the loss of one of its most distinguished members. On the morrow of his death, before proceeding to the regular business of the day, speeches marked by clear appreciation of his merits as a politician and his worth as a man were delivered by the Prime Minister, Lord Palmerston; by Mr. Disraeli, as leader of the opposition; and by Mr. Bright. Memorials to his memory have been erected in Manchester, Peel's Park, Salford, and several other places, and a marble bust by Woolner has been placed in the north transept of Westminster Abbey. A memorial of a different but not less interesting kind is the work edited by Professor J. E. Thorold Rogers and Mr. John Bright, entitled '*Speeches on Questions of Public Policy*,' by Richard Cobden, 2 vols. 8vo, 1870. The Cobden Club, an association of his political friends and followers, has been formed on the suggestion of Mr. Bright to commemorate his name and carry out his principles, those especially of freedom of trade and the preservation of peace.

COCKERELL, CHARLES ROBERT, R.A. [E. C. vol. ii. col. 301]. Mr. Cockerell resigned the professorship of architecture in the Royal Academy in 1856, and withdrew about this time from active professional practice. His merits as an architect received the highest testimony of professional approbation by his election in 1860 as President of the Institute of British Architects. In 1862 he resigned his position as R.A., and became one of the first of the "honorary retired academicians." He died on the 17th of September, 1863, in his 76th year.

COCKERILL, JOHN, founder of the great machine-works at Seraing, was born at Haslingden, Lancashire, August 3rd, 1790. His father, a machine-maker, went to Belgium in 1797; and three sons, William, James, and John, followed him in later years. James and John set up in business at Liège in 1807; and the latter commenced business alone at Seraing, near Liège, in 1816. Purchasing the summer palace of the Prince Bishop of Liège, he made it the nucleus of an engineering establishment which grew to be one of the largest in the world. John Cockerill owned coal-mines and iron-mines, made iron and steel, and converted those metals into all kinds of engines and machines. The revolution in the Netherlands in 1830, which led to the separation of Belgium from Holland, compelled the king to get rid of a share in the property at Seraing, which he had held; Cockerill bought it, and became sole owner. He travelled into various countries, established commercial and manufacturing arrangements with them, and brought home experienced men whom he placed in responsible positions as heads of departments. His prosperity was suddenly checked by the failure of the Bank of Belgium in 1838; this led to his own failure, for nearly a

million sterling, in 1839. After this he set out for Russia to establish iron-works there, but died on his way in 1840. The wonderful organising power of John Cockerill, however, was not lost to Seraing; the great establishment was purchased by a joint-stock company, and, being conducted on the principles introduced by him, became more complete than ever. The works at Seraing now cover 181 acres, of which 22 acres are occupied by buildings. Coal and ironstone are raised, iron and Bessemer steel made, stationary and marine steam-engines, locomotives, iron steam-boats, iron bridges, armour-plates, railway wheels and axles, are manufactured. When a party of English iron-masters and machine-makers visited Seraing in 1870, they found that there were 7000 persons employed, representing with their families 23,000 souls; that 156 steam-engines supplied 2840 horse power; that the establishment produced in one year 50 locomotives, 70 steam-engines, 1500 machines for various purposes, 2680 tons of iron bridge work, and 5000 tons of iron steam-boats. The company trade under the name of John Cockerill & Co.

CŒUR, JACQUES, a French merchant and financier, was born just before the close of the 14th century, at Bourges, where, after receiving but slight education, he was early introduced by his father to the practice of commerce, for which he developed such a genius that he became the greatest merchant and the richest subject of his time. About the year 1429 he entered into partnership with the brothers Pierre and Barthomé Godart, for carrying on a trade in every kind of merchandise. This association continued until the death of the brothers Godart in 1439, and its object was to divert from the Venetians and the Genoese the trade of the Levant. The better to secure this end, Cœur paid a visit to Egypt and Syria in the course of the year 1432, and upon his return to France founded factories at Montpellier, which enjoyed special privileges in the way of trading with the infidels. His enterprise was so instantaneously and so magnificently successful that he seemed to some of his contemporaries to have discovered the philosopher's stone, a supposition which he appears not entirely to have disfavoured. He had 300 factors in his employ in the different ports of Italy and the Levant, and in the principal inland cities. His prosperity attracted royal countenance and regard; and in 1435 Cœur was made master of the mint at Bourges, the coinage of which he had formerly debased, when from 1427 to 1429 he farmed it from Ravau le Danois. He was next appointed argentier, or treasurer of the household, to King Charles VII., in which capacity he created those resources which made it possible for his master to throw off the yoke of England. In April, 1440, he received a patent of nobility for himself, his wife, and their descendants; in 1444 he was commissioned, along with the Archbishop of Toulouse, to organise the new parliament of Languedoc; and in September of the same year was one of the royal commissioners for presiding over the States General of that province. In 1446 and 1447 he was sent successively upon important missions to Geneva and to Rome; and in both acquitted himself with great ability. He lent 200,000 gold crowns to the king, and by so doing ensured the recovery of Normandy from the English; and when Charles VII. entered Rouen on the 20th of November, 1449, Jacques Cœur, the noble and merchant, had a place of honour in the procession. His prosperity and enterprise were now at their height. He was the proprietor of a paper manufactory, of silver, lead, and copper mines in Lyonnais and Bourbonnais, of more than thirty châtellenies and seigneuries, and of splendid houses at Paris, Tours, Lyon, Beaune, Béziers, St. Pourçain, &c. But his good fortune was his ruin. He became the object of odium at once to the nobles and the traders, the former of whom resented his intrusion into their order and his absorption of the estates of so many of its improvident members, whilst the latter repined at the unprecedented exaltation of one of their own class. Upon the death of Agnes Sorel, the beautiful mistress of Charles VII., which happened in 1450, the envy against Cœur took the form of an accusation that he had poisoned her, and he was arrested on the 31st of July, 1451. The charge fell to the ground by its own weight; but being at length brought to trial on some minor indictments, he was iniquitously condemned at Poitiers to be imprisoned, to make the *amende honorable*, to pay a fine of 400,000 crowns, and to have the rest of his estate confiscated to the king. He made the *amende*, kneeling on a scaffold at Poitiers on the 5th of June, 1453; and in January, 1455, was taken to the convent of the Cordeliers of Beaune, from which he effected his escape, and fled to Rome, where he was honourably entertained by Pope Nicolas V. He passed most of the year 1455 at Rome; and in 1456 was commissioned by Calixtus III.,

the successor of Nicolas, to command a fleet—with the title of Captain-General of the Church against the Infidels—equipped for the defence of the Greek islands against the Turks. On his arrival at the Isle of Chio, Cœur fell sick, and died on the 25th of November, 1456. In compliance with a dying request which he wrote to Charles VII., that monarch, by letters patent dated 5th August, 1457, restored a small portion of their father's property to Ravau and Geoffrey Cœur, the latter of whom subsequently obtained from Louis XI., to whom he acted as *maître-d'hôtel*, a more complete restitution, and the rehabilitation of his father's memory. But this concession did not take full effect till the reign of Charles VIII., and after the death of Geoffrey Cœur, with whose son, Jacques Cœur, named after his grandfather, the direct line of the illustrious and unfortunate financier terminated.

Amongst the works conversant about Jacques Cœur may be mentioned the 'Procès de Jacques Cœur, argentier du roi Charles VII.' 8vo, Paris, 1867, by M. Gabriel Joret-Desclousières; 'Jacques Cœur, the French Argonaut, and his Times,' 8vo, London, 1847, by Louisa Stuart Costello; M. Pierre Clément's 'Jacques Cœur et Charles VII., ou la France au xv^e Siècle. Etude Historique,' &c., 2 vols. 8vo, Paris, 1853, new edition, revised and corrected, 8vo, Paris, 1866; 'Les Grand Ministres Français,' 8vo, Rouen, 1859, a work by M. Jean Louis T. Bachelet, in which Cœur is associated with Suger, Sully, Richelieu, Mazarin, and Colbert; and finally M. Auguste Vallet de Viriville's 'Jacques Cœur. (Extrait de la "Revue des Provinces.") Etude Historique sur le xv^e siècle,' 8vo, Paris, 1864.

* COLENZO, RIGHT REVEREND JOHN WILLIAM, D.D., first Bishop of Natal, the son of John William Colenso, Esq., of Lostwithiel, who was for many years an officer of the Duchy of Cornwall, was born at St. Austell, on the 24th of January, 1814. He was educated successively at the Devonport Proprietary School and at St. John's College, Cambridge; and took his B.A. degree in 1836, when he was second Wrangler and Smith's prizeman, which distinctions were naturally rewarded with a fellowship. He graduated as M.A. in 1839, and in 1853, upon his appointment to the bishopric of Natal, took the degrees of B.D. and D.D. by accumulation. In 1838 he accepted the mathematical mastership at Harrow, and continued to hold it for some years; after which, in 1842, he returned to Cambridge, where he was very successful as a private tutor. In 1846 he became rector of Fornsett St. Mary in Norfolk, and held this preferment until after his promotion to the episcopate. During this period of his life he was chiefly known for his admirable series of elementary mathematical works, the sale of which has been so extensive that each page of the copyrights has been said to be as valuable as a bank-note. They may be indicated or represented rather than exhausted. They comprise 'Elements of Algebra,' 12mo, Cambridge, 2nd edition, 1841, 6th edition, 12mo, London and Cambridge, 1849, &c.; 'Elements of Algebra, adapted for Teachers and Students in the University,' 8vo, London, 1849; 'The Elements of Algebra, adapted for the use of National and Adult Schools,' 18mo, London, 1852, new edition, 12mo, London, 1864; 'Miscellaneous Examples in Algebra,' &c., 12mo, London and Cambridge, 1848; 'Arithmetic, designed for the use of Schools,' 12mo, London, 1843, new edition, stereotyped, 12mo, London and Cambridge, 1848, new edition, thoroughly revised, "with the addition of Notes and Examination Papers," 12mo, London, 1864; 'A Text Book of Elementary Arithmetic,' 16mo, London, 1853, and 'Progressive Examples in Arithmetic,' 16mo, London, 1853, both "designed for the use of National, Adult, and Commercial Schools;" 'Plane Trigonometry,' 12mo, London, second edition, 1851; 'Geometrical Problems, as given in the editions of Euclid's Elements,' 24mo, London, 1846; many of which were followed by 'Keys,' 'Solutions,' and 'Appendices,' by himself and others. Of another order, but belonging to the time of his residence in England, are his 'Cottage Family Prayers,' 12mo, Cambridge, 1846; 'Village Sermons,' 1853, second edition, 16mo, Cambridge and Norwich, 1854, against which the 'Record,' in a review of the book, protested on account of its detection of a tendency to those theological and exegetical positions for which the name of Colenso has since been conspicuous. Against the judgment of the 'Record' the author of the volume appealed in 'A Letter to his Grace the Archbishop of Canterbury, in reply to a Review of "Village Sermons," in the "Record" newspaper of November 10th, 1853. [With the text of the Review], 8vo, London, 1853. Amongst his other activities, Mr. Colenso for some time held the post of organising secretary to the Society for the Propagation of the Gospel, and edited their serial, 'The Church in the Colonies,' 16mo, London,

1844—51, as well as the 'Monthly Record of Church Missions, in connection with the Society for the Propagation of the Gospel in Foreign Parts,' 8vo, London, 1852, &c.

During the year 1847 the attention of the Church of England was attracted by the spiritual wants of South Africa; the bishopric of Cape Town was established, and Dr. Gray was appointed to preside over the diocese, which included the Cape Colony, British Kaffraria, Kaffriland, Natal, the sovereignty beyond the Orange River, and the Island of St. Helena. In 1853 Bishop Gray succeeded in convincing the government and two of the religious societies of the claims of his enormous diocese to subdivision, and two new sees were constituted out of it. On the 30th of November, in the same year, Dr. Armstrong and Dr. Colenso were consecrated at St. Mary's Lambeth, respectively to the sees of Graham's Town and Natal. A very considerable opposition was offered to the appointment of Dr. Colenso. The 'Record' engaged in one of the longest and bitterest of its warfares, founding its antagonism on the 'Village Sermons' just mentioned, and Dr. Colenso's endorsement of the principles of Mr. Maurice. Dr. Colenso's first visit to the colony lasted only ten weeks, and of this he has written an account in a volume entitled 'Ten Weeks in Natal. A Journal of a First Tour of Visitation among the Colonists and Zulu Kaffirs of Natal,' 8vo, London and Cambridge, 1855. Dr. Colenso commenced his missionary work with ardour; and his fervour and charm of manner and address made him one of the most conspicuous ornaments of colonial society. Gradually, however, the divergence of views between Dr. Colenso and Dr. Gray became more evident, and the latter listened to and enforced complaints of the manner in which Dr. Colenso discharged the duties of his bishopric. This brought a reply from Dr. Colenso in the shape of 'Remarks upon the recent Proceedings and Charge of Robert, Bishop of Cape Town, at his primary Metropolitan Visitation of the Diocese of Natal,' &c., 8vo, London, first and second editions, 1864. On the other hand, the Rev. Lewis Grout, an American missionary, with fifteen years' knowledge of South Africa, who published a work called 'Zulu Land; or, Life among the Zulu Kaffirs of Natal,' praises the "resolution, zeal, and perseverance" of Dr. Colenso's devotion to missionary work in 1858, notwithstanding that the latter had not only not realised, but not even begun, much that his more sanguine inexperience had at first suggested. Mr. Grout found the native schools in good order, and Mrs. Colenso an active coadjutor in some branches of instruction; whilst Dr. Colenso's labours, "aside from a general superintendence of the stations, seem to be mainly directed to the preparation of Zulu books—a department in which he has done much, and done it well, and in which there is also much to be done." These words may serve as an introduction to the following works, published by Dr. Colenso, which are concerned with Zulu life and philology:—'First Steps in Zulu-Kafir; an Abridgment of the Elementary Grammar of the Zulu-Kafir Language,' 12mo, Ekukanyeni (Anglicè, In the Light), 1859; 'Three Native Accounts of the Visit of the Bishop of Natal to Umpunde, King of the Zulus; edited, with explanatory Notes, and a literal Translation, and a Glossary,' 12mo, Maritzburg, 1860; and a 'Zulu-English Dictionary,' 12mo, Pietermaritzburg, 1861. The question of native polygamy was one in which Dr. Colenso took a decided part; and in his first visit to Natal he formed the opinion that a convert with a plurality of wives was not required to put any of them away. On this subject he published a 'Letter to the Archbishop of Canterbury upon the question of the proper Treatment of Cases of Polygamy, as found already existing in Converts from Heathenism,' 8vo, Cambridge, 1862.

The Journals and Letters of the Bishop of Natal have to a large extent been published, and from these, and from the publications of the S. P. G., a more favourable idea of his character and labours is impressed on the mind than is left by the narrative of Dr. Gray, and the statements of various other persons. From the Report of the Propagation Society for 1860 it appears that Dr. Colenso was "seriously contemplating a noble and most disinterested scheme for the evangelisation of the country. That scheme is, to resign his present diocese, and to go forth as a missionary bishop, accompanied by his fellow-labourers, to plant the Gospel in the heart of the heathen land." He proposed to take only 500*l.* a year himself, and 1000*l.* a year for his band of missionaries, and this the Society for the Propagation of the Gospel was prepared to grant. The Report for the ensuing year is, however, silent on the subject; and it appears that the Bishop was then engaged with a new scheme—the formation of a distinct settlement for the Christian converts, that they might at

once engage in labour, and obtain such a position as would ensure self-respect and self-dependence.

The "philosophising theories" of the Bishop were now destined to bring about perhaps the most important theological controversy of the generation, in which his theological positions were attacked, and his calculations impugned, by dozens of champions—Jews, Episcopalians, Presbyterians, Baptists, Wesleyans, &c.—for the veracity and integrity of the Pentateuch, which his criticism seemed to have endangered. This was by the publication of the 'Pentateuch and Book of Joshua critically examined. Part I. The Pentateuch examined as an Historical Narrative,' 8vo, London, 1862, fifth edition, revised, 1863, &c. The next three parts were each published in 8vo, London, 1863, and were entitled respectively 'The Age and Authorship of the Pentateuch considered;' 'The Book of Deuteronomy;' and 'The First Eleven Chapters of Genesis;' whilst the fifth part appeared as 'The Book of Genesis analysed and separated, and the Ages of its Writers determined,' 8vo, London, 1865. Many editions of the Pentateuch, &c., have been issued, of which may be specially mentioned a 'People's Edition,' in five parts, the first of which was published in 8vo, London, 1864, and the remaining four in 1865. During the whole time of the publication of this work and its preparation for the press, which was completed by the issue of 'The Preface and Concluding Remarks of Part V. of the Pentateuch,' &c., 8vo, London, 1865, and "printed separately by request," Dr. Colenso was in England. Towards the end of the year 1863 proceedings were at the instance of Bishop Gray taken against the author of this work upon a charge of heresy contained in it and in a former publication. The trial came off in St. George's Cathedral, Cape Town, on the 17th of November. Bishop Gray, of Cape Town, who claimed that the diocese of Natal was within his metropolitan jurisdiction, Bishop Cotterill, the successor of Dr. Armstrong in the see of Graham's Town, and Bishop Twells, of Orange Free State, sat as judges. The accusing clergy were Dean Douglas and two provincial archdeacons. So far as Dr. Colenso could be said to be represented, he was represented by Dr. Bleek. The result of these proceedings, which are recorded in the 'Trial of the Bishop of Natal for Erroneous Teaching,' &c., 8vo, Cape Town and London, 1863, and against which Dr. Colenso on the 16th December protested as being illegal, was a decree of deposition from his see, which was to take effect, unless in case of retraction, on the 16th of April, 1864. When Dr. Bleek, on behalf of Bishop Colenso, gave notice of appeal, the Bishop of Cape Town expressed his inability to "recognise any appeal except to his Grace the Archbishop of Canterbury." The effect of this decision was a lively discussion on the subject of the judicial functions of metropolitans, and a challenge to Convocation to express its condemnation of the book which had occasioned it, and the two Houses of Convocation of the Province of Canterbury did in 1864 condemn it accordingly. Meanwhile the Bishop of Cape Town and his assessors had issued a 'Letter to the Clergy and Faithful Laity of the Diocese of Natal,' to which Dr. Colenso replied by an appeal to the laity, 'A Letter to the Laity of the Diocese of Natal,' &c., 8vo, London, second edition, 1864. A subscription, opened in February, 1864, in aid of the defence of Dr. Colenso was furthered by many persons of culture in England, including several clergymen who gave their names and livings, the occurrence of which on the list was not understood as pledging them to any of the Bishop's opinions, but only as affording a protest in favour of free discussion and inquiry. A petition which Dr. Colenso presented to the Privy Council was referred to the Lords of the Judicial Committee, by her Majesty's order in Council of the 10th of June, 1864; and on the 20th of March, 1865, judgment was delivered to the effect that the Bishop of Cape Town had no jurisdiction. "There was no power," it was decided, "to confer any jurisdiction on the respondent as metropolitan. The attempt to give appellate jurisdiction to the Archbishop of Canterbury is equally invalid. This important question can be decided only by the Sovereign as head of the Established Church, and depository of the ultimate appellate jurisdiction. . . . Their lordships, therefore, will humbly report to her Majesty their judgment and opinion that the proceedings taken by the Bishop of Cape Town, and the judgment and sentence pronounced by him against the Bishop of Natal, are null and void in law." The ecclesiastical position of Dr. Colenso as thus defined, has been discussed in 'Reports,' 'Observations,' &c.; his own view of it, as given in the 'Preface' to Part V. of the 'Pentateuch,' &c., dated June 13th, 1865, may be quoted:—"As Bishop of Natal, I am now at full liberty to continue and complete the laborious work in which I have been engaged, and to publish the result of my inquiries,—relieved

from the intolerable yoke of absolute church authority, but subject always to that of her Majesty the Queen, from whom I received my appointment, and from whom I may at any time, for just cause shown, receive my dismissal." Soon after the decision thus given in his favour, and the complete publication of his 'Pentateuch,' &c., Dr. Colenso returned to his diocese of Natal; whilst Dr. Gray gave effect to his theories of spiritual or ecclesiastical supremacy by the consecration of the Rev. W. K. Macrorie to the rival diocese of Pietermaritzburg.

A few of the works of Dr. Colenso remain to be mentioned. They include 'The Communion-Service from the Books of Common Prayer, with select Readings from the Writings of the Rev. F. D. Maurice,' 16mo, Cambridge, 1855; 'The Epistle of St. Paul to the Romans, newly translated, and explained from a Missionary Point of View,' 8vo, London, 1861; 'The Worship of Baalim in Israel. Based upon the Work of R. Dozy, "The Israelites at Mecca." Translated from the Dutch, and enlarged with Notes and Appendices,' 8vo, London, 1865; 'The Pentateuch and the Book of Joshua critically examined. Translated from the Dutch of Abraham Kuenen, and edited with Notes,' 8vo, London, 1865; 'An Ordination and three Missionary Sermons,' 12mo, Cambridge, 1855; 'Abraham's Sacrifice: a Sermon on Genesis xxii. 1, 2, for Claybrooke Sunday School,' &c., 12mo, London, 1864; 'Sermons on 1 Cor. iv. 5; Heb. ii. 10—13; Rom. xv. 4—7,' separately published in 8vo, Maritzburg, 1865; 'Two Sermons (on Phil. i. 9, 10, and Isa. xxxiii. 14) preached in St. Paul's, Durham, November 12th, 1865, and in the Cathedral Church of St. Peter's, Maritzburg, November 19th, 1865,' 4to, London, 1866; and 'Natal Sermons. A Series of Discourses preached in the Cathedral Church of St. Peter's, Maritzburg,' 2nd series, 8vo, London and Bungay, 1866—68.

*COLES, CAPTAIN COWPER PHIPPS, was born at Ditcham House, near Petersfield, Hants, in 1819. Entering the navy in 1831, he gradually worked his way up in the service: was appointed mate of the *Ganges*, 84, in 1838; mate of Sir William Parker's flag-ship, the *Hibernia*, in 1846; and lieutenant soon afterwards. In 1853, as flag-lieutenant to Admiral Lyons, in the *Agamemnon*, he was in a position to take a busy part in the naval operations connected with the Russian war, which broke out soon afterwards. He was engaged successively in the bombardment of Odessa, the reduction of the forts on the Circassian coast, the attacks on the sea defences of Sebastopol, the operations in the Sea of Azof, and the attack on Taganrog. For these services he was made commander in 1854, second captain in 1855, and senior captain in 1856, and was decorated with various honours. Since the last-named year he has been on half-pay. Captain Coles invented tripod iron masts of peculiar construction. He is, however, best known as the chief inventor of the now celebrated turret principle of ship-building, in which a few very heavy guns are placed in revolving turrets on deck, instead of numerous smaller guns being arranged in broadside. Having patented his invention in England, he sought to bring it into practical use. After long-continued discussion with the Admiralty, Captain Coles was permitted to finish the *Royal Sovereign* as a turret ship, it having been commenced as a wooden three-decker. Notwithstanding the disadvantage attendant on this change of structure, the *Royal Sovereign* gave many evidences of great power and adaptability, and led, in 1866, to the adoption of the turret principle in the *Scorpion* and the *Wyvern*. The Earl of Derby's government, in the year just named, ordered the construction of powerful iron-clad turret ships. Two turret cruising frigates have been launched in 1870, to test the relative merits of two modes of construction—the *Captain*, by Captain Coles; and the *Monarch*, by Mr. Reed. The *Captain* has two turrets, each in effect a revolving fortress, containing two enormous guns of 25 tons weight each; the turrets, as well as other parts of the ship, being protected by very thick armour-plates: in a carefully-conducted trial, May, 1870, the ship proved remarkably successful. Captain Coles has, however, had much difficulty in inducing the Admiralty to adopt his plans; and it is still doubtful how far they will be carried out. The *Devastation* and the *Thunderer*, supposed to be the most powerful ships in the world, are now (1870) being built on the turret principle, but rather on Mr. Reed's than Captain Coles's plan.

COLLAS, ACHILLE, an ingenious inventor of engraving-machines, was born at Paris, on the 25th of February, 1795. After learning the trade of a watch-tool maker, and turning his hand to many modes of employment, he invented in 1822 a machine for making clasps and lockets; in 1825 a machine for engraving the ground or neutral tints on copper-plates; in 1826 a machine for engraving iridescent buttons; in 1826 a machine for engraving

wave-lines on cylinders for calico-printing; and (about 1830) a machine for producing copper and steel-plate engravings of coins and medallions. This last-named invention was brought into practical use for a beautifully illustrated work, Lenormant's *Treasure of Numismatique et de Glyptique, ou Recueil Général de Médails, &c.* . . . gravé par les procédés de Achille Collas, fol. Paris, 1834. An English work illustrated in a similar way was Chorley's *Authors of England, a series of Medallion Portraits* . . . engraved by Achille Collas, 4to, London, 1838. In 1836 Collas invented a mode of applying the pantograph to copying sculptures and other works of statuary on a reduced scale. The first antique statue reproduced in this way was the *Venus of Milo*, in 1839. The method was not wholly new, something like it having before been used in England and in Germany, but Collas brought it to a higher degree of completeness. Between 1840 and 1844 he devoted his attention to new modes of moulding clay into ornaments, hollow bricks, and draining tiles. Collas died at Paris on the 6th of June, 1859. The sculpturing machine, which was rewarded with medals by the juries of the International Exhibitions in 1851 and 1855, has been largely used by M. Barbedienne of Paris in the reproduction of works of art.

COLLIER, ARTHUR, a divine and metaphysician, was born at the rectory of Langford Magna, or Steeple Langford, in Wiltshire, on the 12th of October, 1680. His great-grandfather, Egidius Collier, a clothier of Bristol, who held the advowson, presented his grandfather, the Rev. Joseph Collier, to the living of Langford in 1608; and Arthur Collier was the fourth of the family who enjoyed that benefice. It is probable that after a preliminary education at home he was sent to the Grammar School of Salisbury, and certain that he was entered at Pembroke College, Oxford, in July, 1697; whence, on the 22nd of October, 1698, he migrated to Balliol College in the same university. Having graduated and been admitted into holy orders, he was instituted in 1704 to the family living of Langford, on the presentation of his mother, who had been left a widow in 1697. He held this preferment until his death, the precise day of which is unknown. His burial, however, took place on the 9th of September, 1732, in Langford Church. His eldest son is described in Coote's *Lives of the Civilians* as an advocate at the Commons, and as an ingenious but eccentric person. His daughter, Jane Collier, was the author of *An Essay on the Art of Ingeniously Tormenting*; and the other daughter, Mary, accompanied Fielding the novelist in his voyage to Lisbon. No descendants of Arthur Collier are supposed to be now alive.

The early determination of Collier's genius was to philosophical speculation; and at the age of 23 he came to the conclusion that there is no such thing as an external world, to which proposition he adhered with great pertinacity throughout the remainder of his life. Among his MSS., under the date of January, 1708, there remains the outline of an essay, in three chapters, on the question of the visible world being without us or not. In 1712 he wrote two Essays, still in manuscript, one of which was on 'Substance and Accident,' and the other entitled 'Clavis Philosophica.' At length, as the result of what he declares to have been "a ten years' pause and deliberation," he published the work on which his reputation as a philosopher depends, *Clavis Universalis*: or, a New Inquiry after Truth; being a Demonstration of the Non-existence or Impossibility of an External World, 8vo, London, 1713. This work, which had grown extremely scarce, was privately printed and edited, with an introductory notice and appendix of letters, by Mr. Thomas Maitland, 8vo, Edinburgh, 1836. The impression, which was intended chiefly for presentation, was limited to forty copies. The *Clavis Universalis*, as well as the *Specimen of True Philosophy*; in a Discourse on Genesis, the first chapter and the first verse, 8vo, London, 1730, was made more readily accessible by being incorporated in Dr. Samuel Parr's *Metaphysical Tracts of English Philosophers of the 18th Century*, 8vo, London, 1837, a collection of posthumous publication, but which Dr. Parr had left in a state of preparation for the press. The *Clavis Universalis*, which enjoyed the commendation of Reid, Dugald Stewart, and others, was made known in Germany by Professor Eschenbach's translation in 1756; and its author claimed complete independence of the reasoning of Bishop Berkeley, although the latter's *Principles of Human Knowledge*, and *Theory of Vision*, had been published respectively three and four years before the appearance of the *Clavis*. Collier's theological opinions were closely connected with his metaphysics, and his views of the Second Person of the Trinity, as stated in his own words, were nearly identical with those of Apollinaris, Bishop of

Laodicea towards the latter end of the fourth century. He held "that the pre-existent Word, or Son of God, was not united to a created human soul or spirit, but was himself the man called Jesus, or the Christ." This position, which he deemed essential to the doctrine of the atonement, he embodied, as one of the last acts of his life, in a volume entitled 'Logology: or, a Treatise on the Logos or Word of God, in seven Sermons on the 1st, 2nd, 3rd, and 14th verses of the First Chapter of St. John's Gospel,' a work of extreme rarity, of which an analysis is given in Dr. Parr's 'Metaphysical Tracts.' Collier published a small treatise 'Of Justification by Faith, as in opposition to Justification by Works: in a Sermon upon Romans 1, v. 17, preached at the Cathedral Church of Sarum, July 8, 1716,' 8vo, London, 1716; and wrote on various controversial subjects, particularly those of Occasional Conformity, and the Sacheverell and Bangorian controversies. He left also in manuscript a 'Commentary on the Septuagint Version of the Bible,' which, except a few sheets, was employed for fire-lighting by an ignorant housemaid, who had access to it in the lumber-room of a house in the Close at Salisbury, where fifty sermons and other productions, principally correspondence, were likewise found by the late Robert Benson, M.A., Recorder of Salisbury, the author of 'Memoirs of the Life and Writings of the Rev. Arthur Collier, M.A., Rector of Langford Magna, in the County of Wilts, from A.D. 1704 to A.D. 1732; with some Account of his Family,' 8vo, London, 1837.

* COLLOMB, ÉDOUARD, geologist, has been for many years one of the officers of the Geological Society of France, first as a councillor and a secretary, and latterly as the treasurer, which last-mentioned office we believe he still holds. He is best known for his original observations on glaciers, more especially those of the Vosges Mountains, and for his researches into the geological structure of Spain, undertaken in conjunction with Verneuil, with whom he travelled in that country in 1851 and 1852, and on more than one occasion since that period. In 1853 he explored most parts of the Italian peninsula and adjacent islands. His principal writings are 'Preuves de l'existence d'anciens glaciers dans les vallées des Vosges,' 1847; 'Mémoire sur les glaciers actuels' in 'Annales des Mines,' xi. pp. 177—216, (1857); 'Essai sur l'ancien glacier de la vallée d'Argeles,' 1868, written in conjunction with M. Martius. In connection with M. Verneuil he has written 'Coup d'œil sur la constitution géologique des quelques provinces de l'Espagne,' in 'Bull. Soc. Geol. Fr.,' 2nd series, x. pp. 61—147 (1853); 'Observations géologiques et barométriques faites en Espagne en 1855,' in vol. xiii. pp. 674—728, of the same series; and 'Note sur une partie du Pays Basque espagnole, accompagnée par une carte,' in vol. xvii. pp. 333—372 (1860). He has written many other papers for these 'Bulletins,' as also for the 'Supplément à la Bibliothèque Universelle et Revue Suisses,' 'Comptes Rendus,' and one or two other serials.

COLT, SAMUEL, whose name is associated with the revolving pistol, was born at Hartford, Connecticut, July 19th, 1814. When a young man, assuming the name of Dr. Coult, he lectured on chemistry in various towns of the United States, and thereby obtained money sufficient to enable him to make experiments on a revolving pistol, which he had designed and modelled in wood at the age of 15, while at sea as a sailor-boy. In 1835 he secured patents for his invention in America, England, and France. New York capitalists subscribed 300,000 dollars, and established the Patent Arms Company at Paterson, New Jersey. In 1837 some of Colonel Harney's troops used Colt's revolvers in the Florida war, and the beautifully constructed weapon excited much admiration; but the slackness of the demand during peace led to the suspension of the manufacture. In 1843 Mr. Colt introduced one of the first submarine electric cables, for local use, in the waters near New York; the copper wire was wrapped round with cotton yarn, saturated with asphaltum and beeswax, and enclosed in a leaden pipe. When the Mexican war began in 1847, Colt recommenced operations as pistol manufacturer, at the same time introducing many improvements in construction. The migration consequent on the discovery of gold in California gave a great impetus to the demand for revolvers; and Colt thereupon built a factory on a vast scale just outside Hartford. At this place, stocked with fine machinery, 1000 revolving pistols could be made per day. While in England in 1851, Mr. Colt read a paper before the Institution of Civil Engineers, minutely explaining the points of difference between the various kinds of revolvers known up to that time. The rush of emigrants to Australia in 1852—53, the Russian war in 1854—56, and the Indian mutiny in 1857—58, all tended to increase the demand for the arms made at Hartford.

An important part of the work carried on by Mr. Colt was the fabrication of the machines for making revolvers; he furnished many sets of such machines to the English, Russian, and other governments. The factory supplied balls, cartridges, bullet-moulds, powder-flasks, and lubricators, to be used with the arms. Mr. Colt, who held the militia rank of Colonel, died on the 10th of January, 1862.

COMBE, GEORGE [E. C. vol. ii. cols. 340, 341], the celebrated Scotch phrenologist, died at Moor Park, Surrey, Aug. 14, 1858, wanting just two months to the completion of his 70th year.

COMBE, WILLIAM, a prolific writer, was born at Bristol in 1741. His birth, like his life, is veiled in obscurity; by some he is said to have been the illegitimate son of Alderman Alexander, by others the legitimate son of a merchant named Combe, of that city. By one or other of these he was sent to Eton, and thence, about 1761, proceeded to Oxford University, but left abruptly after residing there a year or two. At the age of 24 he came into possession of a legacy of 2000*l.* (not 16,000*l.* or 20,000*l.* as is commonly said), bequeathed to him by Alderman Alexander, who calls him his godson, and spells his name Combes. Assuming the habits and extravagances of a man of extreme fashion (and gaining thereby the sobriquet of Count Combe), he soon managed to dissipate his legacy, and then settled in London, professedly to study law, but trusting to authorship for a livelihood. He had already published a few essays under the title of 'The Philosopher in Bristol,' 1775; his first venture in London was a satire, which owed its success to its personality, 'The Diaboliad,' 1776. From this time for forty years he continued to write on all sorts of subjects, and in the most various classes of literature. Much that he wrote was for magazines and newspapers, his separate works being all booksellers' jobs, and all published anonymously. Their number, considering the strange life he led, was surprising. He appears to have been always in debt, often in the debtor's prison, and his last years were spent within the rules of the King's Bench. His conduct during a large part of his life appears to have been profligate, but towards the end became more regular; and he went much into society, where he was greatly admired for his gentlemanly manners, animation, and conversational skill. Yet he was distrusted by every one, and even his personal honesty has been impeached. The most popular of his works is the well-known 'Three Tours of Doctor Syntax'—First Tour, 1812 (originally published in the 'Poetical Magazine,' 1809—11); Second, 1820; Third, 1821. This work had an amazing run, but its popularity was doubtless at least as much due to Rowlandson's clever designs as to Combe's text. In the same vein, and illustrated like Dr. Syntax by Rowlandson, followed 'The Military Adventures of Johnny Newcome,' 1815; 'The English Dance of Death,' 1815—16; 'The Dance of Life,' 1816—17; and the 'History and Life of Johnny Quæ Genus, the Little Foundling,' 1822. All these were published by Ackermann, who appears to have been Combe's chief employer. He also wrote for Ackermann the text accompanying his splendidly illustrated Histories of the Universities of Oxford and Cambridge, and the great Grammar Schools, Harrow, Rugby, Westminster, the Charter House, Christ's Hospital, St. Paul's, &c.; his Picturesque Tours along the Rhine, the English Lakes, the Thames, the Ganges and Jumna, and many more of the same kind, as well as the 'History of Madeira,' Cave's 'Antiquities of York,' and many miscellaneous works. He also furnished the text for Boydell's magnificent 'History of the River Thames' (one of the finest specimens of Bulmer's press), 2 vols. folio, 1794—96, and wrote the descriptions to Turner's 'Southern Coast,' vol. i. 1817. He claims further to be the author of 'Lord Lyttleton's Letters,' to which some importance was attached as long as they were assumed to be genuine; the Letters supposed to have passed between Sterne and Eliza; and it is pretty certain that these are not the only letters by many which he forged. The satire, 'All the Talents,' 8vo, 1807, which ran through some twenty editions, is probably correctly attributed to him, as are also 'The Devil upon Two Sticks in London,' and 'The First of April;' but the Hudibrastic jingle called the 'Life of Napoleon Bonaparte,' the 'Heroic Epistle to Sir William Chambers,' and various other productions, have been given to him on very insufficient grounds. Those who wish to know what he really wrote may be content with the list drawn up by himself, and printed in the 'Gentleman's Magazine' for May, 1852. Combe died at his residence, South Lambeth, on the 19th of June, 1823. Shortly after his death appeared what purported to be his 'Letters to Marianne,' the perusal of which will probably satisfy any one of the writer's

thorough want of principle. A new edition of 'The Three Tours of Doctor Syntax in Search of the Picturesque, Consolation, and a Wife,' with 'The Life and Adventures of the Author,' by J. C. Hotten, and "80 illustrations drawn and coloured after the originals by T. Rowlandson," was published in 1868, but the life is inaccurate and the adventures legendary, while the illustrations libel the originals. A good deal about Combe appeared in 'Notes and Queries' for 1869, and his name frequently occurs in the 'Diary of H. Crabb Robinson,' 8vo, 1869.

COMBERMERE, STAPLETON COTTON, VISCOUNT [E. C. vol. ii. col. 341]. Notwithstanding his advanced age, Lord Combermere continued to take part in his old employments and in the occupations of the society in which he moved; and in the summer of 1864 the gallant old general, then turned of 91, rode over to Chester along with Baron Marochetti to select a site for the statue which the people of Cheshire proposed to erect in his honour. He lived but a few months longer, dying at Clifton on the 21st of February, 1865. He was born in 1773. The statue, which has been erected just outside the castle gates, Chester, is of bronze, 12 feet high, on a granite pedestal of the same height. It represents Lord Combermere on horseback, in his field-marshal's uniform, and is a good unaffected likeness. The artist was Baron Marochetti.

COMTE, ACHILLE JOSEPH, biologist, was born at Grenoble, Sept. 29, 1802. Imbued from a very early age with a desire for the study of natural history, he retained this liking throughout his career as a medical student at Paris. Soon after his education was completed he obtained the post of professor of natural history at the Charlemagne College, and then that of principal clerk to the minister of public instruction; but in the stormy period of 1848 he was obliged to seek other occupation. He subsequently became director of a preparatory school, where he himself taught the natural history. He was a member of several societies, amongst others that of the 'Gens de Lettres,' of which he was first vice-president and then president. He died in 1866. His works are numerous, but those which are best known are the books he wrote for the use of students. The following may be mentioned:—'*Règne Animale de Cuvier, disposé en tableaux méthodique*,' 1832—41; '*Physiologie pour les collèges et les gens du monde*,' &c., 1834, 4th edition, 1841; '*Traité complet d'histoire naturelle*,' 1844—48. He helped M. Milne-Edwards in drawing up the '*Cahiers d'histoire naturelle à l'usage des collèges*,' &c., 1836—45; edited an edition of Buffon's works, and contributed to Bouillet's '*Dictionnaire Universel des Sciences*,' &c. His wife also obtained some reputation as a writer of educational works, and of comedies.

COMTE, AUGUSTE, [E. C. vol. ii. col. 344]. The author of the positive philosophy (whose full name was Isidore Auguste Marie François Xavier Comte), died at Paris on the 5th of September, 1857. A '*Notice sur l'Œuvre et sur la Vie d'Auguste Comte*,' by M. E. Robinet, Paris, 1860; '*A General View of Positivism, Translated from the French of Auguste Comte*,' by J. H. Bridges, M.D., 8vo, London, 1865; Mr. John Stuart Mill's '*Auguste Comte and Positivism*,' 8vo, 1865; and M. Littré's '*Comte et la Philosophie Positive*,' 8vo, Paris, 1863, may be usefully added to the list of works on Comte and his philosophy given in the original article.

CONDAMINE, CHARLES MARIE LA [LA CONDAMINE, C. M., E. C. vol. iii. col. 763].

CONECTE, THOMAS, a Carmelite monk, who acquired great popularity as a preacher in the early part of the 15th century, and whose death has invested his name with a painful interest. He was by birth a Breton, and is first mentioned as a monk in the Carmelite convent at Rennes, distinguished by holiness of life, austerity of manners, and fervid eloquence. "He was the most persuasive preacher of his age," says a writer of the time, and incredible numbers flocked to his sermons. In 1428 he set out on a missionary crusade against the dissolute manners and extravagant fashions then prevalent. He travelled through Amiens, Artois, and Flanders, denouncing everywhere the popular vices. Wherever he went he was followed by multitudes of all classes; "by the common people he was received as if he had been an apostle of our Lord Jesus Christ sent down from heaven," writes Monstrelet; "the mule on which he rode was led by knights or persons of high rank;" when he entered a town, the churches not being large enough to contain the thousands who came to listen to him, platforms were erected for him to preach from. These the chief burghers hung with costly tapestries, and a band of priests attended to perform mass. Crowds of 15,000 or 16,000, says Argentre, ordinarily assembled at his sermons, and Conecte caused them to be separated by a cord, the women

on one side, the men on the other. Bonfires used to be made within sight of the platform, into which the women cast their obnoxious ornaments and gaudy apparel, the men their dice and cards. His remonstrances were not, however, confined to the vices of the vulgar and the luxury of the rich; he condemned in the strongest language the licentiousness of the clergy, and deplored the unhappy condition of the church. Later (1432) he made a journey into Italy, where he preached with almost equal success. At Mantua he reformed the order of the Carmelites. At Venice he was received with great respect and distinction, and he accompanied the Venetian ambassadors to Rome. Shortly after his arrival, the Pope, Eugenius IV., sent for him, "desiring to hear him preach." But Conecte hesitated; he had denounced the evil lives of the clergy, had condemned the immorality of the papal court, and questioned the authority of a papal excommunication; he knew the perfidy of the Pope, and he shrank from trusting himself in his hands. His prudence was too late. The Pope caused him to be seized and handed over to the Inquisition. He was thrown into prison, condemned as a heretic, and burned alive, 1434.

CONEGLIANO, GIOVANNI BATTISTA, called CIMA, an eminent Venetian painter, was born at Castello di Conegliano, near Treviso, about 1460. He is said to have been a pupil and afterwards the rival of Giovanni Bellini, whom he surpassed in technical skill, but hardly equalled as a colourist, and to whom he was decidedly inferior in poetical feeling and elevation of style. His works are numerous in Venice, but good examples are comparatively scarce elsewhere. The National Gallery possesses two of his pictures, both signed—No. 300, 'The Infant Christ standing on the knees of the Virgin,' and No. 634, also 'A Madonna with the Infant Christ standing on her knees,' but smaller in size. The time of Conegliano's death is uncertain. The latest date on a painting by him is 1517.

CONINGTON, JOHN, professor of Latin literature in the University of Oxford, was born on the 10th of August, 1825, at Boston, Lincolnshire, where his father, the Rev. Richard Conington, held the incumbency of the chapel-of-ease. He was educated at Rugby, from which he passed in July, 1843, to Oxford, where he was demy of Magdalen College. In March, 1846, and May, 1847, respectively, he became scholar and fellow of University College; and, having been first class in Literis Humanioribus in the B.A. examination in Michaelmas Term, 1846, took his bachelor's degree in 1847, and graduated as M.A. in due course. He was Ireland and Hertford scholar in 1844, prizeman for Latin verse in 1847, for the English essay in 1848, for the Latin essay in 1849, in which year he was also Eldon scholar. This last distinction indicates some taste for the law, and Mr. Conington did actually become a student of Lincoln's Inn in June, 1849, although he was never called to the bar. In 1854 the professorship of Latin literature at Oxford was instituted by the president and fellows of Corpus Christi College, in accordance with the intention of their founder, Bishop Fox, and endowed from the revenues of the college. To this office Mr. Conington was elected, and *ipso facto* became an honorary fellow of the college from which he derived his title of "Corpus" Professor. In the fulfilment of his duties his encouragement and friendship were open to every youth of promise; and when he died, suddenly and prematurely, at his mother's house at Boston, on the 30th of October, 1869, it was felt not only that the university had lost a scholar, but that every student had lost a friend.

In 1850 Mr. Conington edited Dr. Maginn's 'Homeric Ballads,' to which he contributed a preface and annotations; but before this he had published a spirited version of the 'Agamemnon,' with the title of 'The Agamemnon of Æschylus; the Greek Text, with a Translation into English Verse, and Notes critical and explanatory,' 8vo, London, 1848. In 1852 he addressed Dr. Gaisford on the subject of certain Fragments of Greek Plays, in a pamphlet entitled 'Epistola Critica de quibusdam Æschyli, Sophocles, et Euripidis Fragmentis,' the Latinity of which seemed to revive the times when scholars corresponded only in the dead languages. In 1855 Professor Conington published his inaugural lecture 'On the Academical Study of Latin;' two years after which he brought out what has been regarded as his completest contribution to classical literature, 'The Choephore of Æschylus: with Notes, critical and explanatory,' 8vo, London, 1857; and furnished to the 'Oxford Essays,' 8vo, London, 1858, an article on the 'Poetry of Pope,' an interesting contribution to the study of English literature, in which the author compares Pope with various ancient and modern poets, and analyses his characteristics as they appear in the more important of his works. The

next work of Professor Conington was the production, for Messrs. Long and Maclean's 'Bibliotheca Classica,' of the first volume of 'P. Vergili Maronis Opera. The Works of Virgil, with a Commentary,' 8vo, London, 1858. In the preparation of this volume the editor was much assisted by Mr. Goldwin Smith, at that time professor of Modern History at Oxford. The first volume contained the Eclogues and Georgics, and the second, 8vo, London, 1863, comprised the first six Books of the *Æneid*; whilst the third, in completion of the work, was in the press at the time of the editor's death. The text of Professor Conington's Virgil was published with the title of 'Publi Vergili Maronis Opera,' as one of the 'Cambridge Greek and Latin Texts,' 8vo, Cambridge and London, 1859. He next published 'The Odes and Carmen Seculare of Horace, translated into English Verse,' 8vo, London, 1863, fourth ed., 1870; which he followed up with the most generally known of all his works, 'The *Æneid* of Virgil, translated into English Verse,' 8vo, London, 1866, third edition, 1870. He completed his Horatian translations with 'The Satires, Epistles, and Art of Poetry of Horace, translated into English Verse,' 8vo, London, 1870, which, in spite of the date, was published shortly before his death. It may, in addition, be mentioned that Professor Conington contributed in 1863 a very moderate pamphlet with reference to the controversy about the Greek professorship, in which he insisted on the moral obligation of the university to the Crown, and on the circumstance that the published opinions of Professor Jowett were not a sufficient ground for withholding an augmentation of his stipend; and that on the 9th of March, 1867, he delivered a lecture, afterwards published, on 'The Style of Lucretius and Catullus as compared with that of the Augustan Poets,' 8vo, Oxford and London. He was further a contributor to the 'Edinburgh Review,' the 'Rheinisches Museum,' the 'Athenæum,' in which he reviewed Lord Derby's translation of the *Iliad*, and the 'Academy,' to the first number of which—the second number, November 13th, 1869, contained an obituary notice of him—he contributed a short review of Dr. A. Weidner's Commentary on Virgil's *Æneid*, 'Commentar zu Vergil's *Æneis*, Buch i. und ii., Leipzig, 1869.

CONNELL, ARTHUR, born at Edinburgh, 30th November, 1794, died 31st October, 1863. He was educated at the High School, and entered the university in 1808. He also became a student at the University of Glasgow, and having obtained a Snell exhibition, went to Balliol College, Oxford, in 1812. In 1817 he passed advocate at the Scotch bar, but never practised, preferring to study chemistry. In 1840 he was appointed professor of that science in the University of St. Andrew's, and continued to teach until 1866. He became Fellow of the Royal Society of Edinburgh in 1829, in whose 'Transactions' and in the 'Edinburgh Philosophical Journal' many of his papers appeared. He became Fellow of the Royal Society in 1855. He had great skill in mineral analysis. He determined the constitution of greenockite from a single grain of that mineral. He established several new mineral species, and showed that in certain minerals baryta exists in combination with silicic acid.

CONOLLY, JOHN, M.D., was born in 1794 at Market Rasen, Lincolnshire; served awhile as an officer of militia; in 1817 entered on the study of medicine at Edinburgh University, and in 1821 graduated M.D. He commenced practice as a physician at Chichester; removed after awhile to Stratford-upon-Avon, and finally settled in London in 1827 on his appointment to the professorship of medicine in the London University (now University College). Resigning this post in 1833, he returned to private practice till 1839, when he was elected resident physician to the Middlesex County Lunatic Asylum, Hanwell. Here the great work of his life was accomplished. Before his time much had been done to improve the treatment of the insane, but, generally speaking, their treatment was still harsh and often cruel. One of Conolly's first measures upon assuming the control of Hanwell Asylum was to remove all instruments of mechanical restraint, "amounting to about 600, half of them being handcuffs and leg-locks," and to abolish restraint entirely. The non-restraint system had already been tried under Dr. Charlesworth and Dr. Gardner Hill, at Lincoln Asylum; but that was a small institution, whereas Hanwell contained 800 inmates. And he carried his reform throughout the entire establishment in a much more thorough and systematic manner than his predecessors, combining with the freedom from restraint on the part of the patients, ample occupation, amusement, and absence of seclusion; with constant kindness of manner and sleepless vigilance on the part of the attendants, and unceasing watchfulness by the superiors. And this course he pursued with

unfailing success during the many years he resided in the hospital, and afterwards urged by counsel and remonstrance when, having resigned the superintendence, he acted as consulting physician to the asylum. The wonderful success of the system at Hanwell brought to it visitors from all parts of the world, and, with Dr. Conolly's Reports, which were everywhere read by professional men and the public at large with great interest, contributed to the general adoption of the system in a more or less complete form. The effect of Dr. Conolly's labours on behalf of the insane it is impossible to overrate, but looking at recent cases of death from violence (whether accidental or otherwise) in our own overgrown establishments, and the accounts given of asylums abroad, it is to be feared that there has, in the last few years, been a marked deterioration, partly from insufficient superintendence, but perhaps still more from the neglect to make provision for a succession of properly educated attendants.

Dr. Conolly died at his residence, the Lawn, Hanwell, on the 5th of March, 1866. Besides his numerous Reports, and various contributions to the 'British and Foreign Medical Review,' the 'Lancet,' &c., he wrote an essay on 'The Construction of Lunatic Asylums;' 'An Inquiry concerning the Indications of Insanity;' and a 'Study of Hamlet' (1863), the result of his retirement, in which he sought to prove that Hamlet's madness was not simulated, and that Ophelia became insane from sympathy. Dr. Conolly took an active share in founding the Earlswood Asylum for Idiots, of which he acted as honorary physician.

(A *Memoir of John Conolly, M.D., D.C.L.; comprising a Sketch of the Treatment of the Insane in Europe and in America.* By Sir James Clark, Bart. K.C.B., M.D., F.R.S., 8vo, London, 1869).

* CONRAD, TIMOTHY ABBOTT, an American geologist and conchologist, was born in the State of New Jersey in 1803. At first he gave his attention to geology with the intention of making a life-long study of it, but he afterwards directed his researches to shells also, more especially the extinct forms. In the early days of the geological survey of the State of New York he was attached to it as palæontologist, and as such he contributed the palæontological portion of the Annual Reports on the Survey of that State, prior to Hall's appointment in 1843. He also contributed to the palæontological portion of Gilliss's Report of his expedition to the Southern Hemisphere; to Blake's Reports on the Geology of California; and to the 'Report on the U. S. and Mexican Boundary Territory,' 1857. He has also written 'New Fresh-water Shells of the United States,' 1834; 'American Marine Conchology,' 1831; and a Monograph of the Unionidae, 1835—38. In addition he has contributed numerous papers to the 'Proceedings' and 'Journal' of the Academy of Science at Philadelphia, mostly relating to shells and the tertiary strata of the United States; and latterly he has furnished several papers to the 'American Journal of Conchology.'

* CONSCIENCE, HENDRIK, a distinguished novelist, and the reviver of modern Flemish literature, is the son of a shipbroker of French origin, and was born at Antwerp on the 3rd of December, 1812. Being left very much to himself in the conduct of his education, he indulged his passion for reading in the most desultory manner. In 1830, at the time of the Belgian revolution, he gave up the calling of a teacher, which he had adopted in 1829, in order that he might volunteer for military service. He soon became the poet of the soldiers; and his stirring songs achieved a great popularity in the army, which he quitted in 1836 with the rank of serjeant-major. The unhappy temper and disposition of his step-mother estranged him from his family, and forced him to unassisted efforts to gain a livelihood. Through various employments, at first very humble, but gradually rising in importance, he received in 1845 the appointment of assistant professor, and in 1847 that of professor, in the University of Ghent, and became the instructor of the children of King Leopold in the Flemish language and literature, to the revival of which, as an assertion of independence against the French, he now devoted himself with enthusiasm. He was subsequently appointed commissary of the administrative arrondissement of Courtrai.

As a writer of fiction, Conscience is remarkable for the quiet humour which underlies the most homely and trivial of his incidents, and for the faithfulness and photographic reality of his descriptions—qualities which, by a happy gift of nature, do not exclude breadth of treatment, movement, vigour, tenderness, gentleness, and simplicity. His works, which are exceedingly numerous, include the Year of Wonders, a series of dramatic pictures of the Spanish period of Flemish history, 'In't Wonderjaer [1566]. Historische Tafereelen uit de xvi^e Eeuw,' 8vo,

Antwerp, 1837; 'Phantazy,' 8vo, Antwerp, 1837, a collection of Legends and Flemish Poetry; a Romance entitled 'De Leeuw van Vlaenderen; of de Slag der Gulden Sporen,' 1838, third edition, 3 vols. 12mo, Antwerp, 1848, of which an English translation was published as the 'Lion of Flanders; or the Battle of the Golden Spurs,' 8vo, London, 1855; the History of Count Hugo van Craenhove and his Friend Abulfaragus, 'Geschiedenis van Graef Hugo van Craenhove en van zynen vriend Abulfaragus,' 4to, Antwerp, 1845, English translations, 8vo, London, 1855, and 12mo, Baltimore and Philadelphia, U.S., 1867; History of Belgium, 'Geschiedenis van België,' 8vo, Antwerp and Brussels, 1845; a Page out of the Book of Nature, 'Eenige Bladzijden uit het Boek der Natuur,' 8vo, Antwerp, 1846; 'Jacob van Artevelde,' 1849, second edition, 2 vols. 8vo, Antwerp, 1857; Historical Picture, &c., entitled 'De Boerenkryg [1798]. Historisch Tafereel uit de xviii^e Eeuw,' 1853, second edition, 2 vols. 8vo, Antwerp, 1857; Historical Pictures of the 5th century entitled 'Hlodwig en Clothildis,' &c., 1854, second edition, 2 vols. 8vo, Antwerp, 1857; Historical Picture of the 17th century, entitled 'Batavia,' &c., 3 vols. 8vo, Antwerp, 1858. Among his more familiar novels and stories of modern life may be mentioned his 'Lambrecht Hensmans,' 2 vols. 16mo, Antwerp, 1847; 'Siska van Roosemael,' 8vo, Antwerp, fourth edition, 1857; The Conscript, 'De Loteling,' 1850, fourth edition, 8vo, Antwerp, 1857, English translations, 8vo, Edinburgh, 1854, 12mo, Baltimore, &c., 1856 and 1867; 'Baes Gansendonck,' 1850, second edition, 8vo, Antwerp, 1857, English translation, with the title of 'The Village Innkeeper,' 12mo, Baltimore, &c., 1867; Wooden Clara, 'Houten Clara,' 8vo, Antwerp, 1850, English translations, 8vo, London, 1855, and 12mo, Baltimore, &c., 1867; 'Blinde Rosa,' 8vo, Antwerp, 1851, second edition, 1853, English translations, 8vo, Edinburgh, 1854, and 12mo, Baltimore, &c., 1867, Spanish translation, as 'Rosa la Ciega' in the second volume of a South American periodical, 'Semana Literaria de "El Porvenir,"' 8vo, Bogota, 1858; The Poor Nobleman, 'De Arme Edelman,' 1851, second edition, 8vo, Antwerp, 1857, English translations, 8vo, Edinburgh, 1854, and 12mo, Baltimore, &c., 1867; The Curse of the Village, 'De Plaeg der Dorpen,' and The Happiness of being Rich, 'Het Geluk van Ryk te zyn,' 8vo, Antwerp, 1855, English translations, 8vo, London, 1855, and of the latter, 12mo, Baltimore, &c., 1867; Mother Job, 'Moeder Job,' 8vo, Antwerp, 1856; 'De Jonge Doctor,' 2 vols. 4to, Antwerp, 1860, and 'De Geldduivel,' 2 vols. 8vo, Antwerp, 1856, both of them described as Pictures of our own Time, 'Tafereelen uit onzen Tyd,' and of the latter of which an English translation was published as 'The Demon of Gold,' 8vo, London, 1857; 'De Gierigaerd,' and 'Rikke-Tikke-Tak,' 8vo, Antwerp, second edition, 1857, English translations, entitled respectively 'The Miser,' and 'Ricketicketack,' 8vo, London, 1855, and 12mo, Baltimore, &c., 1867; The Progress of a Painter, 'Hoe Men Schilder word't,' 8vo, Antwerp, sixth edition, 1861, English translation, 12mo, New York, 1852; The Land of Gold, 'Het Goudland,' 2 vols. 8vo, Antwerp, 1862, being the adventures of three Flemings in California; 'Veve,' &c., or the War of the Flemish Peasants against the French in 1793, of which an English translation was published in 8vo, London, 1855, and reprinted in 12mo, Baltimore, &c., 1856; Pictures of our own Time, entitled 'Moederliefde,' 2 vols. 8vo, Antwerp, 1862; The Merchant of Antwerp, &c., 'De Koopman van Antwerpen. Eene Geschiedenis onzer Dagen,' 2 vols. 8vo, Antwerp, 1863; Human Blood, &c., 'Menschenbloed; Zedetafereel onzes Tyds,' 8vo, Antwerp, 1864; a Story of our own Days, entitled 'Valentijn,' 2 vols. 8vo, Antwerp, 1865; Story of two Labouring Children, 'Baro en Lieveken,' 8vo, Antwerp, 1865; The Imaginary Sickness, 'De Ziekte der Verbeelding,' 8vo, Antwerp, 1865; and a novel called 'Levenslust,' 3 vols. 12mo, Antwerp, 1868. Almost all the works of Hendrik Conscience have been promptly translated into German; and many are to be found in Danish, and, as has been shown, in English, and a few in Italian. In France two volumes of his works have been translated and published by M. Léon Wocquier, as instalments of what was intended should be the 'Œuvres Complètes de Henri Conscience,' 8vo, Paris, 1854 and 1855.

CONYBEARE, VERY REV. WILLIAM DANIEL, Dean of Llandaff [E. C. vol. ii. col. 369]. This distinguished geologist and excellent man died on the 12th of August, 1857.

* COOKE, EDWARD WILLIAM, R.A., F.R.S., was born in London in 1811. His father, Mr. George Cooke, was a good engraver of landscapes and buildings, and he himself commenced his career as an engraver with every promise of success. At this time he made numerous sketches, drawings, and etchings in a

style of distinctive originality and spirit. It was not till about 1831 or '32 that he began to paint in oil. From the first he has chiefly painted views of mingled land and sea—our low sea-banks and river mouths, the Dutch coast, the lagoons of Venice, the sandy dunes of France, peopled each with its own barges, boats, and luggers, all unimpeachably drawn, and sitting on the waters like a gull or puffin. With the coasts and craft of Holland he is as familiar as a Dutch boatman, and seems to love them as well. Of late he has toyed much with Venice ashore as well as afloat, but neither the craft nor the climate seems exactly to suit him. Mr. Cooke was elected A.R.A. in 1851, and R.A. in 1863. In this latter year he was also chosen F.R.S., and about the same time became member of the Linnean, Geological, and several other learned societies. Whether his scientific studies have given something too much of precision to his thoughts, or his scientific honours have weighed heavily on his hand, or his theory of painting has become somewhat more severe, it is certain that the character of his pictures has of late years greatly changed. The old firmness and accuracy of drawing and clearness of style are there, but the play of touch and freedom and spontaneity of manner are missing. All is hard and sharp and precise, as though modelled for a demonstration; the waves are in curves that would satisfy a mathematician; the rocks along the shore are studies for a geologist; and, without referring to his book, the botanist would determine the species and genera of every plant growing upon them. Several of Mr. Cooke's earlier pictures are in the Vernon and Sheepshanks collections.

COOKE, HENRY, English historical painter, was born in 1642, and studied painting in Italy under Salvator Rosa. "On his return," writes Walpole, "neither rich nor known, he lived obscurely in Knave's Acre, in partnership with a house-painter." Cooke and his partner were not what are now called house-painters; they decorated walls and ceilings of halls and staircases with pictorial designs in the manner then fashionable of Verrio and Laguerre. Thus in the sentence following that just quoted, Walpole remarks that Cooke was paid 150*l.* for painting the house of Sir Godfrey Copley. He seems to have been engaged in copying and assisting other painters. Walpole says that having killed a man in a quarrel, he fled to Italy, stayed there some years, and returning, lived privately till the affair was forgotten. In his later years he was much employed. He made a copy in tempera of Raffaele's Cartoons at Hampton Court, and was employed by King William to repair the originals—and he deserves our gratitude for not having irreparably injured them. He painted the staircases at Ranelagh, at Lord Carlisle's house, and elsewhere; but his great work in this way was the choir of New College chapel, Oxford, a very elaborate composition with a representation of the Salutation in the centre: it was all, however, cleared away for Wyatt's restorations in 1789. Cooke sometimes painted portraits, but he must not be confounded with the Henry Cooke who in 1640 painted several of the portraits still in the Hall of the Ironmongers' Company, London, as well as others that have disappeared. The subject of this notice died November 18, 1700.

COOKE, THOMAS, telescope and scientific instrument maker, was born at Allertorpe, Yorkshire, on the 8th of March, 1807. His father, a shoemaker, could only give him two years' education at a National-school, and then took him to work at the lapstone. The boy, disliking the trade, managed to pick up a little further instruction, and in 1824 opened a village school, educating himself in spare hours. From 1829 to 1836, while an usher and a private teacher at York, he studied mathematics and optics, made a reflecting telescope, and then a refractor, with an object-glass ground out of the thick bottom of a tumbler. Encouraged by Professor Phillips, he set up in York as an optician. His first important work was a 4½-inch equatorial telescope. At that period, owing partly to the influence of the glass duty in discouraging improvements in manufacture, 4½ inches were regarded as rather a large diameter for an English made lens. Mr. Cooke gradually became famous for his large telescopes. In 1851 he made an equatorial of 7-inch aperture for Mr. Pattinson, of Newcastle; this was the instrument with which Professor Piazzi Smyth made his astronomical observations at Teneriffe. In 1855 Mr. Cooke established the Buckingham Optical Works at Bishopscill, near York, which grew to considerable magnitude. Within a few years he made nine equatorials, of 8 to 10 inches diameter each, and 12 others of 5 to 8 inches. In 1863 he commenced, for Mr. Newall, of Gateshead, the largest equatorial refractor ever made. Up to that period the greatest diameter of lens known in an actually mounted

equatorial was 15 inches, in a telescope at Paris; Mr. Newall's was to be 25 inches. This gigantic instrument, for which Mr. Cooke had to invent new tools, machines, and processes, occupied him till his death, and was finished by his son. Mr. Cooke invented a new form of graduated dividing engine for his own use; constructed surveying instruments for the Ordnance Survey of India; made several astronomical clocks, some with sidereal time and solar time shown on the same dial; invented a machine for engraving figures on graduated instruments; and made, for the Ordnance Survey of India, the largest portable transit instrument ever constructed, with aluminium bronze axes. He died October 19th, 1868.

* COOKE, SIR WILLIAM FOTHERGILL, was born at Ealing, near London, in 1806; was educated at Durham School and Edinburgh University; entered the army of the East India Company in 1826, and filled various staff appointments till 1831. Returning to Europe, he studied anatomy and physiology at Paris and Heidelberg. In 1836 a circumstance occurred which determined his future course of life. Being at Heidelberg preparing wax anatomical models for the use of his father (who was professor of anatomy at Durham), Mr. Cooke attended a lecture given by Professor Müncke, during which was explained the action of an electro-magnetic telegraph, which had been invented some years previously by Baron Schelling. Struck with the possible applicability of the system to railways, which were then becoming important, Mr. Cooke devoted himself closely to the subject, constructed a pair of three-needle telegraphs, with key and reciprocal systems, invented a telegraph alarm and detector, made five clock-work telegraphs and alarms, and drew up a scheme for an organisation of railway telegraphs. In November, Faraday saw the instruments, and expressed a favourable opinion concerning them. Early in 1837, Mr. Cooke introduced the subject to the London and Birmingham (London and North-Western) Railway Company, and elucidated his plan by means of a pamphlet and instruments. The pamphlet, published at the end of 1838, sketches a comprehensive scheme:—"Plans for establishing on the most extensive scale, and at a trifling expense, a rapid telegraphic communication for political, commercial, and private purposes, especially in connection with the extended lines of railroad now in progress between the principal cities of the kingdom, through the means of electro-magnetism." In the spring of 1837 Mr. Cooke was introduced by Dr. Roget to Professor Wheatstone [WHEATSTONE, CHARLES, E. C. vol. vi. col. 1030], who had made many important discoveries and inventions connected with electric currents and their application to useful purposes. A patent was taken out in the joint-names of both inventors in May, 1837. In November, in accordance with terms settled by Sir Benjamin Hawes as arbitrator, a deed of partnership was executed. Circumstances, three years afterwards, rendered desirable a settlement of the question as to whom the honour was due of being the originator of practical electro-telegraphy. Sir M. I. Brunel and Professor Daniell were appointed arbitrators; all necessary documents and testimony were placed in their hands; and they gave their award April 27th, 1841, as quoted under WHEATSTONE, E. C. vol. vi. col. 1031. In 1843 the patents were by agreement made over wholly to Mr. Cooke, Professor Wheatstone to receive a royalty on the mileage of telegraph constructed. Lines were laid down on Cooke and Wheatstone's system from Paddington to West Drayton in 1838—9, from the Minories to Blackwall in 1840, from the terminus to Cowlairs station at Glasgow in 1841, and from West Drayton to Slough in 1842. In this year Mr. Cooke published a pamphlet entitled 'Telegraphic Railways; or the Single Way recommended by Safety, Economy and Efficiency, under the safeguard and control of the Electric Telegraph.' The system was extended by two or three short English and Irish lines in 1843, and from London to Southampton in 1844. In 1846 Mr. Cooke assisted in forming the Electro-Telegraph Company; Professor Wheatstone received payment for the reversion of his royalties, Mr. Cooke's remuneration depending rather on the actual profits of the company. In 1854 an article in the 'Quarterly Review,' on the electric telegraph, assigned the honours of invention in a marked way to Professor Wheatstone, ignoring the claims of Mr. Cooke. This led to the publication by Mr. Cooke of 'The Electric Telegraph: was it invented by Professor Wheatstone?' 1854; 'A Reply to Professor Wheatstone,' 1856; and 'Arbitration Papers and Drawings,' 1857. In 1866, when the success of the Atlantic Cable drew all men's attention, hints were thrown out in some of the public journals that such honours as the Crown could legitimately bestow were due to Professor Wheatstone, as the
